Iowa State University's Center for Transportation Research and Education (CTRE) is the umbrella organization for the following centers and programs:

Bridge Engineering Center
Center for Weather Impacts on Mobility and Safety
Construction Management & Technology
Iowa Local Technical Assistance Program
Iowa Statewide Urban Design and Specifications
Iowa Traffic Safety Data Service
Midwest Transportation Consortium
National Concrete Pavement Technology Center
Partnership for Geotechnical Advancement
Roadway Infrastructure Management & Operations Systems
Sustainable Transportation Systems Program
Traffic Safety and Operations

Research and Education

IOWA STATE
UNIVERSITY

Focus on recent ISU research for improving local roads

Several ISU researchers have recently completed projects with implications for local roads. This issue of *Technology News* briefly summarizes three studies: improving the performance of granular shoulders, best practices for successful cold-in-place recycled

asphalt pavements, and using contracts with flexible start dates. Full reports for all projects, plus brief technical summaries, are online: www.ctre.iastate.edu/research.htm. Click "Completed research," or search for keywords using the Search CTRE function at the top of the page.

Improving granular shoulder performance

Stabilizing granular shoulders through a variety of materials and techniques can improve shoulder performance and safety to some degree, and reduce the need for repair activities.

These conclusions were recently reported by David White, associate professor of civil engineering at ISU. Along with a team of professors and students, White inspected various granular shoulders across the state, evaluated several stabilization techniques, and provided recommendations and tools for designing and constructing granular shoulders.

The project was sponsored by the Iowa Highway Research Board (TR-531).

Potential cost/performance issues

Roadway shoulders perform important functions. They provide space for extra-wide agricultural vehicles, emergency stops, and recovery of errant vehicles, as well as structural support and drainage for the pavement. Depending on traffic and other factors, those can be some pretty hefty performance requirements.

Compared to paved shoulders, granular shoulders can cost as much as 30 percent less to construct. But they also can experience performance problems like edge drop-off

(figure 1), rutting (figure 2), erosion, irregular slope, and settlement.

Granular materials are commonly used for roadway shoulders in Iowa, and local agencies can expend significant effort and money for frequent regrading, placement of additional virgin material or recycled hot-mixed asphalt or concrete, and recompaction, increasing short- and long-term maintenance costs.

granular shoulders continued on page 2

Figure 1. Edge drop-off was a feature of several granular shoulders examined in White's study

Giving contractors some flexibility in project timing

Contractors benefit from flexible-start/fixed-duration contracts, which provide less-rigid project start dates. What about the owner-agencies? What risks, benefits, and/or drawbacks, if any, do they experience with these contracts?

To answer that question, civil engineering professors Kelly Strong, Amr Kandil, and Tom Maze at ISU recently reviewed common practices and experiences with flexible-start/fixed-duration contracts, from the owner-agencies' point of view. They surveyed the DOTs in Washington, Minnesota, and Missouri, all states with a fair amount of experience with flexible-start/fixed-duration contracting. Although only state agencies were surveyed, findings may be useful for city and county agencies.

Innovative contracting

To reduce construction costs and traffic disruptions for transportation projects without sacrificing quality, several agencies are trying innovative bidding and contracting methods.

One such method is flexible-start/fixed-duration contracting. In general, such contracts allow the contractor flexibility in when to start the project, as long as the project is completed within a contracted period of time.

The researchers found that agencies have used various features in flexible-start/fixed-duration contracts to retain a necessary level of control over project timing. For example,

- Combine a flexible start-date window with a latest-allowable project completion date.
- Require a minimum lead-time for the contractor to notify the agency before starting work.
- Include an incentive/disincentive clause (see sidebar).

Potential benefits

In general, flexible-start/fixed-duration contracts ultimately benefit the owner-agency and the public by potentially reducing construction costs and, often, the duration of traffic closures.

When contractors have some latitude in starting specific projects, they can allocate resources like labor and material supplies more efficiently among various projects. As a result, they can submit lower bids.

Briefer traffic closures not only expose construction workers to work zone hazards for shorter periods of time, but make travelers happier.

Good candidates

Flexible-start/fixed-duration contracting could be considered for almost any job, but

it is probably best suited for projects that require

- Closing roads or sections of roads, causing major traffic disruption.
- Substantial off-site pre-construction preparation work.

Poor candidates

Flexible-start/fixed-duration contracting is probably less suited for projects if

- Delaying the start date would cause major inconvenience to local businesses or the public. For example, banks, emergency service providers, and hospitals may need more lead time than required by the contract if traffic will have to be rerouted in their locale during construction.
- A major trip-generating event, like a state fair or major athletic event, will occur during the potential construction period.
- Emergency or fast-track work is involved.

Other considerations

Giving the contractor some flexibility means that staff at the local agency will have to be flexible, too. This can be a challenge, especially for onsite project inspectors.

In general, flexible-start/fixed-duration contracting hasn't compromised project safety. Still, the agency should pay close attention to critical-path activities, especially if the contract offers an early-completion bonus.

Some contracts include early-completion incentives for only the portion of a project that involves closing the roadway. Such contracts should clearly state the effect on any earned incentive if the overall project is not completed within the contracted time.

For more information

Contact Strong, 515-294-1460, kstrong@iastate.edu, or Maze, 515-294-9523, tmaze@iastate.edu. The full report is available online, <http://www.ctre.iastate.edu/smartwz/reports/2007-maze-flex-schedule.pdf>.

This project was sponsored by the Midwest Transportation Consortium and Smart Work Zone Deployment Initiative. ■

Other innovative bidding methods

A+B bidding can lower project costs by reducing project duration. The A parameter represents the estimated cost of the project; the B parameter represents the length of time the contractor estimates for conducting the project. In general, the lowest A + B bid is awarded the contract.

Incentive/disincentive contracts

motivate contractors to complete projects quickly by offering a bonus for completing work ahead of schedule. If work is completed late, pay is reduced by a monetary penalty—often a value per unit of time the project extends beyond contracted end date.

Low-cost safety improvements for horizontal curves

Nearly 25 percent of fatal crashes occur at or near a horizontal curve.

Addressing safety problems at horizontal curves is one of 22 emphasis areas in AASHTO's Strategic Highway Safety Plan and is also a goal of FHWA's safety focus area related to road departures.

As a result of these emphases, the FHWA has recently developed a publication providing practical information on several low-cost treatments to address identified or potential safety problems at horizontal curves.

The 60-page booklet, *Low-Cost Treatments for Horizontal Curve Safety*, concisely describes each treatment, shows examples, suggests when the treatment might be applicable, provides design features, and includes information about potential safety effectiveness and costs, if available. It concludes by describing maintenance activities to maximize the duration of treatment effectiveness.

Suggested treatments include the following:

- Basic traffic signs and markings found in the MUTCD
- Enhanced traffic control devices
- Additional traffic control devices not found in the MUTCD
- Rumble strips
- Minor roadway improvements
- Innovative and experimental treatments

Free copies of the publication are available from the FHWA Report Center, 9701 Philadelphia Ct., Unit Q, Lanham,

MD 20706. Call 301-577-0906, and ask for report no. FHWA-SA-07-002.

The booklet is also online for download as a pdf: http://safety.fhwa.dot.gov/roadway_dept/pubs/sa07002/index.htm. ■

Help with upgrading signs on high-speed curves

In Iowa, 39 percent of fatal crashes result from single vehicles running off roads, which often happens when drivers under-estimate curves.

A CTRE study found that 11 percent of fatalities on primary highway curves in Iowa occurred at just 30 curves.

Because of that finding, safety funds were awarded to supply oversized, fluorescent yellow chevron signs to those locations, with good results.

If you have a high-speed curve that has a documented history of multiple severe crashes, you may want to consider

upgrading the chevron signing.

Stanley L. Ring Memorial Library:

New acquisitions

Note about delivery of materials: *The library now send orders through the U.S. Postal Service. This change is resulting in important savings for LTAP, but ordered materials do not arrive as quickly. If you have an urgent need for library materials, let us know when you place your order and we will arrange faster delivery.*

Three ways to order LTAP library materials

- Use the online catalog, www.ctre.iastate.edu/library/search.cfm.
- Contact Jim Hogan, library coordinator, 515-294-9481, hoganj@iastate.edu, fax 515-294-0467.
- Mail or fax the order form on the back cover of *Technology News*.

CD-ROM

CR 89 Access Management Library

This CD contains the proceedings of the Sixth National Conference on Access Management (2005), plus more than 100 reference documents on access management. It complements DVD 151.

CR 90 Reduce Congestion through Access Management

This CD contains the results of a scanning tour of Dakota County, Minnesota, and the Gateway 1 Corridor in Brewer, Maine. It also contains a video overview of access management illustrating how reducing conflict points increases traffic capacity and safety.

DVD

DVD 151 Access Management Library

This DVD contains videos on access management from FHWA, Missouri, New Hampshire, Florida, Kansas, and Iowa. It complements CR 89.

Publications

P 1707 Journal of the Transportation Research Board No. 1989: Low-Volume Roads

Two volumes contain 80 technical papers related to low-volume road systems that were presented at TRB's 2007 International Low-Volume Roads Conference. Topics include planning, environment, design, maintenance, structures, materials, pavements, and construction.

P 1702 Access Management, Location, and Design

This is a participant workbook designed to be used with a three-day National Highway Institute course but can be used as a stand-alone document. The course provides technical background for evaluating existing access location and design standards and guidelines, together with the rationale for "best practices."

P Access Management Manual

This TRB-sponsored manual provides a summary of the state of the art on access management. It is intended to assist state transportation agencies, metropolitan planning organizations, and local governments in developing and implementing access management programs.

P 1704 Roadside Weed Management

This FHWA-sponsored handbook is a guide to best practices for managing invasive vegetative species along roadsides. It contains essays on prevention and control of pest plant invasions, summaries of relevant regulations and policies at federal and state levels, and a state-by-state compilation of noxious species lists and agency contacts.

LTAP Materials

- ✓ Order library materials
- ✓ Send *Technology News* to a friend
- ✓ Correct your mailing information

To make a change to the *Technology News* mail list or to order library materials, please complete the information below and mail or fax this page (including mail label) to CTRE's address below:

Center for Transportation Research and Education

2711 S. Loop Drive, Suite 4700

Ames, IA 50010-8664

Fax: 515.294.0467

- Add the following name/address to the *Technology News* mail list.
- Correct the name and/or address below on the *Technology News* mail list.
