Crop Production, August 1

IOWA: Crop development remains ahead of a normal pace. By July, soil moisture supplies became a concern, particularly in western and southern Iowa, and crop conditions deteriorated over the course of the month.

Corn: Iowa's corn planted and harvested for grain acreage is estimated at 12.7 million and 12.4 million acres, respectively. As of August 1, Iowa's corn crop is forecast to yield 173.0 bushels per acre. If realized, this would equal Iowa's second highest yield, behind 2004's 181.0 bushels per acre. Production forecasted at 2.15 billion bushels would be Iowa's third largest, nearly 1 percent below last year.

Soybeans: The August 1 yield forecast of 45.0 bushels per acre is down 8.0 bushels from 2005. If realized, soybean production would be 452.3 million bushels, down 15 percent from last year's production of 532.7 million bushels. This year, Iowa farmers planted 10.1 million acres of soybeans and plan to harvest 10.05 million acres.

Oats: Oat production is forecast at 9.6 million bushels, down from 9.9 million bushels last year. The forecast yield of 74.0 bushels per acre is unchanged from the July 1 forecast.
Other Crops: The hay yield for alfalfa and alfalfa mixtures is expected to be 3.9 tons per acre with a total production of 4.60 million tons, down 10 percent from 2005. The other hay yield is projected at 1.9 tons per acre with a total production of 798,000 tons, up 9 percent from 2005. The August 1 apple forecast of 4.5 million pounds is up 114 percent from the previous year.

UNITED STATES: Corn production is forecast at 11.0 billion bushels, down 1 percent from last year and 7 percent below 2004. Based on conditions as of August 1 , yields are expected to average 152.2 bushels per acre,
up 4.3 bushels from last year. If realized, yield would be the second largest and production would be the third largest on record. Forecast yields across the Great Plains and western Corn Belt are at or below last year as scarce precipitation and above normal temperatures depleted soil moisture levels and caused crop conditions to decline. Expected yields are generally higher than last year in the eastern Corn Belt and Ohio Valley as frequent rainfall and near normal temperatures throughout much of the growing season helped maintain adequate soil moisture. The largest yield increase from last year is in Illinois where farmers expect to average 172 bushels per acre, 29 bushels above last year's drought-reduced yield. The largest yield decreases are expected in Alabama, Mississippi, Georgia, and North Dakota.

Soybean production is forecast at 2.93 billion bushels, down 5 percent from 2005 and down 6 percent from 2004. Based on August 1 conditions, yields are expected to average 39.6 bushels per acre, down 3.7 bushels from the record high U.S. yield set last year. Yields are lower than 2005 throughout the Great Plains, the western Corn Belt, and the Gulf Coast States, while yields are expected to remain unchanged or increase in the Ohio Valley, Arkansas, Missouri, and the Atlantic Coast States. Area for harvest, at 73.9 million acres, remains unchanged from June but is up 4 percent from 2005.

Reminder: All crop forecasts in this report are based on conditions on August 1 and do not reflect any possible weather effects since that time. The next corn and soybean production forecasts, based on conditions as of September 1, will be released on September 12.

August 2006 Production Summary - Iowa and United States
