# Metric Short Course <br> for the <br> Office of Bridges and Structures 

Sponsored by the
Iowa Department of Transportation Highway Division and the lowa Highway Research Board
lowa DOT Project HR-378

#### Abstract

This metric short course was developed in response to a request from the Office of Bridges and Structures to assist in the training of engineers in the use of metric units of measure which will be required in all highway designs and construction after Sept. 30, 1996 (CFR Presidential Executive Order No. 12770).

The course notes which are contained in this report, were developed for an one-half day course. The course contains a brief review of metrication in the U.S., metric units, prefixes, symbols, basic conversions, etc. The unique part of the course is that it presents several typical bridge calculations (such as capacity of reinforced concrete compression members, strength of pile.caps, etc.) worked two ways: inch-pound units throughout with end conversion to metric and initial hard conversion to metric with metric units throughout. Comparisons of partial results and final results (obtained by working the problems the two ways) are made for each of the example problems.

## 1. HISTORICAL REVIEW OF THE METRIC SYSTEM

Before the metric system, every nation used measurement units that had grown from local customs. For example, England once used 3 barleycorns, round and dry as their standard for an inch. Grains of barley varied in size...and so did the inch.

1600 Some people recognized the need for a single, accurate, worldwide measurement system.
1670 Gabriel Mouton - A French clergyman - proposed a decimal system of measurement based on a fraction of the earth's circumference. The fraction was $1 / 10,000,000$ of the distance from the North Pole to the equator. French scientists named this unit of length the meter, from the Greek word metron, meaning a measure.

1790 National Assembly of France requested the French Academy of Sciences to develop a standard system of weights and measures. The system developed became known as the Metric system.

Thomas Jefferson (U.S. Secretary of State) recommended that the U.S. use a decimal system of measurement; Congress rejected the idea.

1795 France adopted the metric system but allowed people to continue using other measurement units.

1821 John Quincy Adams (U.S. Secretary of State) proposed conversion to the metric system; Congress again rejected the proposal.

1837 France passed a law requiring all Frenchmen to begin using the metric system Jan. 1, 1840.
1866 Congress legalized the use of the metric system in the U.S. but did not require that it be used.

1870- An international conference was held to update the metric system and to adopt new 1875 measurement standards for the kilogram and meter. Seventeen nations (including the U.S.) participated and in 1875 they signed the 'Treaty of the Meter' which established a permanent organization to change the metric system as necessary. This organization, International Bureau of Weights and Measures, is headquartered near Paris.

1893 U.S. began defining all its measurement units as fractions of the standard meter and kilogram.

1890's Several attempts in Congress to change U.S. measurements to metric - none were successful. Many people, especially those in industry, opposed any changes.

1957 U.S. Army and Marine Corps adopted the metric system as the basis for their weapons and equipment.

1960 An international conference of the Bureau of Weights and Measures met and adopted the current Systeme International d'Unite's.

1960's NASA began using metric units.
1965 Great Britain began the changeover to the metric system:
1968- U.S. Congress explored the costs and benefits of converting and recommended U.S. make a planned conversion.

1970 Australia began a scheduled 10-year conversion to the metric system.
1975 Canada began a gradual changeover to the metric system. U.S. Congress passed the Metric Conversion act which called for a voluntary changeover to the metric system.

1988 Trade and Competitiveness Act (Sec 5164b of Public Law 100-418) amended the 1975 Metric Conversion Act declaring that the metric system is the preferred system of weights and measures for the U.S. trade and commerce. It required each Federal agency to convert to the metric system to the extent feasible by the end of fiscal year 1992. A qualifier was included which noted conversion may not be required if it is impractical, causes significant inefficiencies, or causes loss of markets.

1991 President Bush signed the Executive Order 12770-Metric Usage in Federal Government Programs. The intent of this order was that Federal agencies are to convert to metric, under the Secretary of Commerce within a fixed period of time.

## 2. CONVERSION AND ROUNDING

The conversion of inch-pound units to metric is an important part of the metrication process. However, conversion can seem deceptively simple because most measurements have implied, not expressed, tolerance and many products are identified in easy-to-use nominal sizes, rather than actual sizes.

People working in a particular area have an intuitive feel for allowable tolerances in measurements they specify and know the difference between nominal and actual sizes. This knowledge must be relied upon when converting to metric.

For example, a given guardrail detail notes that anchor bolts are to be imbedded on concrete 8 in . What should this depth be in millimeters?

A strict conversion results in an exact dimension of 203.2 mm which implies an accuracy of 0.1 mm ( $1 / 254 \mathrm{in}$.) and a tolerance of $\pm 0.05 \mathrm{~mm}$ ( $1 / 508 \mathrm{in}$.) which is not possible to achieve (or needed) in the field. Likewise, 203 mm (accuracy 1 mm , tolerance of $\pm .5 \mathrm{~mm}$ ) is overly precise.

An acceptable practical tolerance for setting anchor bolts is at least $\pm 1 / 4 \mathrm{in}$. ( 6 mm ). Applying this to the 203.2 mm , the converted 8 in . requirement is in the $197-209 \mathrm{~mm}$ range. Actually, the range is 197 mm and larger since 8 in . was a minimum depth.

As metric measuring devices emphasize 10 mm increments, converting the 8 in . requirement to 200 mm would be a convenient depth for use in the field. In this case then, a reasonable metric conversion for 8 in . is 200 mm .

This example illustrates the need for experience, common sense, and consideration on how the measurement will be used.

Basic points to remember in conversion and rounding are the following:

- Conversion should be performed by experienced professionals. Any automated conversion program should be used with care.
- Understand the allowable tolerance for the measurements you are converting.
- Always convert with the end application or use in mind. Remember, dimensional tolerance on the job are rarely less than a few millimeters and that it is considerably easier for field personnel to measure in 10 mm increments.
- The most common conversion error is under-rounding which implies more precision than is inherent in the inch-pound number. If your linear conversions are accurate to 0.1 mm or even 1 mm , you are probably doing them incorrectly. Any dimension over a few inches, can usually be rounded to the nearest 5 mm and any dimension over a few feet, can be rounded to the nearest 10 mm .
- Practice helps improve speed and confidence!

### 2.1. Example 1

In the metric system, switching to larger (or/smaller) units is fast and easy and calculations are more efficient.

For example, determine the volume of concrete in a given concrete floor:
Floor: 200 ft long
180 ft wide
$51 / 2$ in. thick
a.) Inch - units

First calculation: $51 / 2 \mathrm{in} . \times \frac{1 \mathrm{ft}}{12 \mathrm{in} .}=.458 \mathrm{ft}$
Second calculation: Volume $=200 \times 180 \times .458=16,500 \mathrm{cu} \mathrm{ft}$
Third calculation: $16,500 \mathrm{cuft} \times \frac{1 \mathrm{cu} \mathrm{yd}}{27 \mathrm{cu} \mathrm{ft}}=611 \mathrm{cu} \mathrm{yd}$
Therefore three calculations were required.
b.) Metric-units

Floor: 61 m long
55 m wide
140 mm thick
Volume $=61 \times 55 \times .14=470 \mathrm{~m}^{3}$
Therefore, only one calculation ( $140 \mathrm{~mm} \rightarrow 0.14 \mathrm{~m}$ was mentally converted) was required.

### 2.2. Example 2

Significant digits...a simple rule is to retain the number of significant digits that neither sacrifices nor exaggerates accuracy.

For example:
564 lbs . of cement $/ \mathrm{cu} \mathrm{yd}=? \mathrm{~kg} / \mathrm{m}^{3}$

$$
\frac{564 \mathrm{lb}}{\mathrm{cu} \mathrm{yd}} \times \frac{.4536 \mathrm{~kg}}{\mathrm{lb}} \times \frac{1 \mathrm{cu} \mathrm{yd}}{.7646 \mathrm{~m}^{3}}=334.6212 \mathrm{~kg} / \mathrm{m}^{3}
$$

which is rounded to $335 \mathrm{~kg} / \mathrm{m}^{3}$.
The value, $334.6212 \mathrm{~kg} / \mathrm{m}^{3}$, implies that cement is batched to the nearest 0.0001 kg .
Since cement batching tolerance is $1 \%, 335 \mathrm{~kg} / \mathrm{m}^{3}$ (or even $340 \mathrm{~kg} / \mathrm{m}^{3}$ ) is the appropriate rounded values.

Note: Neither original units nor conversion factors are rounded before multiplying. Only the product is rounded.

### 2.3. Rationalization and Pitfalls of Hard Conversion

Some agencies converted 4000 psi concrete to 30 MPa concrete. A 30 MPa concrete is actually a 4350 psi concrete - nearly $9 \%$ higher than the old design strength.

Concretes proportioned for a 4000 psi design strength may not have an adequate overdesign to meet acceptance requirement for a 30 MPa requirement.

Many mixes with established performance histories may have to be reproportioned thus requiring development of new data on strengthen variability. Also mix cost will increase.

ACI requires taking steps to increase the average strength of a concrete mix if a strength test falls below the design strength by more than 500 psi . This 500 psi converts to 3.45 MPa . Hard converting this value to 3 MPa produces a more stringent requirement and would result in more failing tests. Hard converting to 4 MPa would relax the requirement and have structural safety implication! A compromise is to retain two significant digits - 3.5 MPa . In the metric version of the ACI code, this has been done.

## 3. CONVERSION EXPERIENCES OF OTHER NATIONS

(Great Britain, Canada, South Africa, Australia, and New Zealand)

1. There was no appreciable increase in either building design or construction costs. Conversion costs for most sectors of the construction industry were minimal or offset by later savings.
2. Engineering/Architecture community liked metric dimensioning since it was less prone to error and easier to use.
3. Metric offered a one-time chance to reduce many product sizes and shapes.
4. Engineering/Architecture firms in these countries found that it took a week or less to learn to think and produce in metric.

Based on worldwide experience, the two areas that will require the highest investment of funds will be

- converting existing standards, specifications and computer programs to the metric system.
- converting traffic signs.

## 4. OVERVIEW OF SI UNITS

3 classes: base units, derived units, and supplementary units

### 4.1. Basic Units

## Basic Units

| Quantity | Unit | Symbol |
| :---: | :---: | :---: |
| length | meter | m |
| mass | kilogram | $\mathbf{k g}$ |
| time | second | $\mathbf{s}$ |
| electric current | ampere | $\mathbf{A}$ |
| temperature | kelvin | $\mathbf{K}$ |
| luminous intensity | candela | mol |
| amount of substance | mole |  |

Meter - length equal to 1650763.73 wave lengths in a vacuum of the orange-red line of the spectrum of the krypton - 86 atom.

Football field goal line to goal line $=$ slightly more than 91 m .
Height of the average male $=$ a little less than 1.8 m
Distance between the bases in baseball $=\approx 27 \mathrm{~m}$.
Length of full-size bed $=\approx 2 \mathrm{~m}$.
Kilogram - standard for the unit of mass is a cylinder of platinum - iridium alloy kept by the International Bureau of Weights and Measures in Sevres, France.

1 kilogram $\approx 2.2 \mathrm{x}$ the pound (mass)
5 -pound bag of flour $=\approx 2-\mathrm{kg}$.
Professional football defensive lineman $=\approx 115 \mathrm{~kg}$.
Temperature - Celsius ( ${ }^{\circ} \mathrm{C}$ ) is more common than kelvin (K), however both have the same temperature gradients.
${ }^{\circ} \mathrm{C}=\mathrm{K}+273.15$
${ }^{\circ} \mathrm{C}=5 / 9\left({ }^{\circ} \mathrm{F}-32\right)$

## Equivalent Temperatures

| Event | ${ }^{\circ} \mathrm{C}$ | ${ }^{\circ} \mathrm{F}$ | $\mathbf{K}$ |
| :--- | :---: | :---: | :---: |
| Water Freezes | $0^{\circ}$ | $32^{\circ}$ | 273.15 |
| Water Boils | $100^{\circ}$ | $212^{\circ}$ | 373.15 |
| Body Temperature | $37^{\circ}$ | $98.6^{\circ}$ | 310 |
| Very Cold Day | $-18^{\circ}$ | $0^{\circ}$ | 255 |

Second - the duration of 9192631770 periods of the radiation corresponding to the transition between the two hyperfine levels of the ground state of the cesium - 133 atom.

### 4.2 Supplementary Units

Supplementary Units*

| Quantity | Unit | Symbol |
| :---: | :---: | :---: |
| Plane angle | radian | rad |
| Solid angle | steradian | $\mathbf{s r}$ |

*11th General Conference on Weights and Measures declined to designate these as base or derived units, thus the third category.

Radian - the plane angle with its vertex at the center of a circle that is subtended by an arc equal in length to the radius.
$1 \mathrm{rad}=57.2958^{\circ}$
$2 \pi \mathrm{rad}=$ the angle of a complete circle ( $360^{\circ}$ )
Steradian - the solid angle with the vertex at the center of a sphere that is subtended by an area of the spherical surface equal to that of a square having sides equal in length to the radius.

A sphere $=4 \pi$ sterdians

### 4.3. Derived Units

The largest class of SI units, derived units, is formed by combining base, supplementary and other derived units according to the algebraic relations linking the corresponding quantities.

When two or more units expressed in base or supplementary units are multiplied or divided as required to obtain derived quantities, the result is a unit value. No numerical constant is introduced, thus a coherent system is maintained.

Derived Units

| Quantity* | Name | Symbol | Expression |
| :--- | :--- | :---: | :--- |
| frequency | hertz | Hz | $\mathrm{Hz}=\mathrm{s}^{-1}$ |
| force | newton | N | $\mathrm{N}=\mathrm{kg} \cdot \mathrm{m} / \mathrm{s}^{2}$ |
| pressure, stress | pascal | Pa | $\mathrm{Pa}=\mathrm{N} / \mathrm{m}^{2}$ |
| energy, work, quantity of heat | joule | J | $\mathrm{J}=\mathrm{N} \cdot \mathrm{m}$ |
| power, radiant flux | watt | W | $\mathrm{W}=\mathrm{J} / \mathrm{s}$ |
| electric charge, quantity | coulomb | C | $\mathrm{C}=\mathrm{A} \cdot \mathrm{s}$ |
| electric potential | volt | V | $\mathrm{V}=\mathrm{W} / \mathrm{A}$ or $\mathrm{J} / \mathrm{C}$ |
| capacitance | farad | F | $\mathrm{F}=\mathrm{C} / \mathrm{V}$ |
| electric resistance | ohm | $\Omega$ | $\Omega=\mathrm{V} / \mathrm{A}$ |
| electric conductance | siemens | S | $\mathrm{S}=\mathrm{A} / \mathrm{V}$ or $\Omega^{-1}$ |
| magnetic flux | weber | Wb | $\mathrm{Wb}=\mathrm{V} \cdot \mathrm{s}$ |
| magnetic flux density | tesla | T | $\mathrm{T}=\mathrm{Wb} / \mathrm{m}^{2}$ |
| inductance | henry | H | $\mathrm{H}=\mathrm{Wb} / \mathrm{A}$ |
| luminous flux | lumen | lm | $\mathrm{lm}=\mathrm{cd} \cdot \mathrm{sr}$ |
| illuminance | lux | lx | $\mathrm{lx}=\mathrm{lm} / \mathrm{m}^{2}$ |

*Fifteen derived units with special names are used in engineering calculations.

## 5. SI STYLE AND EDITORIAL GUIDELINES

### 5.1. Unit Names

The SI unit names, including prefixes, are not capitalized when used within a sentence, except the first letter is capitalized when used as the first word of a sentence. An exception to this is when the name of the unit is derived from the name of a person.

Examples of lower cased and capitalized symbols

| Lowercase <br> symbols |  | Capitalized symbols |  |  |
| :---: | :---: | :---: | :---: | :--- |
| meter | m | ampere | A | A.M. Ampere |
| gram | g | kelvin | K | Wm. Thompson |
| second | s |  |  | 1st Baron Kelvin |
| area | $\mathrm{m}^{2}$ | pascal | Pa | Blaise Pascal |
| volume | $\mathrm{m}^{3}$ | newton | N | Isaac Newton |
| radian | rad | degree Celsius | ${ }^{\circ} \mathrm{C}$ | Anders Celsius |
|  |  | hertz | Hz | Heinrich R. Hertz |

### 5.2. Prefixes

All prefix names (and SI names) when fully written out in a sentence are written in lowercase letters. Prefixes are used to form decimal multiples and submultiples of SI units. The most common prefixes are shown in the following table:

| Prefix | Multiplication | Symbol* | Pronunciation |
| :---: | :---: | :---: | :---: |
| mega | $10^{6}$ | M | megg-ah |
| kilo | $10^{3}$ | K | kill-oh |
| milli | $10^{-3}$ | m | mill-ee |
| micro | $10^{-6}$ | $\mu$ | mike-ro |

*Note: Short forms of prefixes as well as the short forms of SI unit names are called symbols. It is incorrect to refer to them as abbreviations or acronyms.

When symbols are used, some exceptions to the lowercase rules are noted in the following table:

## Capital and lower case symbols

| G for giga | g for gram |
| :--- | :--- |
| K for Kelvin | k for kilo |
| M for mega | m for milli or meter |
| N for Newton | n for nano |
| T for tera | t for metric ton |

### 5.3. Punctuation

Period - a period is not used after a symbol, except at the end of a sentence.

|  | Preferred | Acceptable |
| :--- | :---: | :---: |
| newton meter | $\mathrm{N} \cdot \mathrm{m}$ | $\mathrm{N} . \mathrm{m}$ |
| pascal second | $\mathrm{Pa} \cdot \mathrm{s}$ | $\mathrm{Pa} . \mathrm{s}$ |

Decimal marker - a period is used as a decimal marker. A zero is written before the decimal marker to prevent the possibililty that a faint decimal marker will be overlooked.

For example: 0.5 kg
0.65 N
0.27 KPa

### 5.4. Plurals

When written in full, the names of metric units are made plural (i.e., adding a 's') when appropriate. Symbols of SI units are never plural.

For example: $1.7 \mathrm{~m} \quad-30^{\circ} \mathrm{C}$
$1 \mathrm{~m} \quad 0^{\circ} \mathrm{C}$
$0.75 \mathrm{~m} \quad 100^{\circ} \mathrm{C}$

### 5.5. Grouping Digits

All numbers are separated into groups of three on each side of the decimal marker. Do not use a comma to separate the group of three digits.

For example: 1234.56789
99123.7655
5432987.2109

The only exception to the writing of numbers in groups of three is when one has a four-digit number. Four-digit numbers are given special consideration and are treated differently depending upon the context in which they are used - text or tabular format.

In text material, numbers having four or less digits on either side of the decimal marker are to be written with no spaces (4321.5678). In tabular listing, it is acceptable to leave columns of numbers - none of which have more than four digits on either side of the decimal marker - written without space. However, the three-digit grouping and spaces format is preferred.

## Miscellaneous Numbers

There are certain numbers to which the previous grouping rules do not apply.

| Social security numbers | $505-42-7612$ |
| :--- | :--- |
| Part numbers | $16 \mathrm{P} 76 \mathrm{AC}-123477 / 231$ |
| Currency | $\$ 21,263.21$ |

The symbol for angular degree ( ${ }^{\circ}$ ) and degree Celsius $\left({ }^{\circ} \mathrm{C}\right.$ ) should always be used when giving a measurement. When describing the measuring scale and not a specific measurement, use the full name.

## 6. FEATURED UNITS

#### Abstract

Area

The U.S. customary acre is replaced with the hectare (ha) in the SI system. Hectare, a special name for the square hectometer $\left(\mathrm{hm}^{2}\right)$ equals $10000 \mathrm{~m}^{2}$. The hectare is the preferred measure of land and water areas. However, the square meter ( $\mathrm{m}^{2}$ ) remains the preferred SI unit for other measures of area. 1 hectare $\approx 2.5$ acres 0.5 hectare $\approx$ a football field including end zones 1 hectare $\approx \quad$ the whole playing area (fare and foul) of a major league

$\quad$| baseball field. |
| :--- |

## Force, Weight, and Mass

In SI, there is one basic unit for force - newton (N)- and one basic unit for mass - kilogram (kg).

Kilogram - the kilogram is a measure of an object's mass; the mass of an item is constant and does not change with the gravitational field or its rate of acceleration. The term 'kilogram mass' is redundant and should not be avoided.

Newton - the newton is the SI unit of force. Using Newton's equation ( $F=m \mathrm{~m}$ a), a newton is 1 kilogram times 1 meter per second squared. Acting under Earth's gravitational pull, a mass of 1 kg exerts a force of 9.80665 newtons.

The use of weigh and weight should be avoided. They should not be used to indicate the measuring process or the measure of mass. Rather than say "it weighs" say "it has a mass of". Rather than "weighing the object" say "measuring the object's mass".

## Pressure and Stress

Pressure - a pressure is a force per unit area; the SI unit of force, Newton, divided by the SI unit of area, the square meter, results in $\mathrm{N} / \mathrm{m}^{2}$. A newton per square meter is given the special name pascal ( Pa ). A dollar bill lying flat on a surface exerts a pressure of 1 Pa . Since the pascal is so small, all pressures should be given in kilopascals ( kPa ).

The pascal is also used to express stress levels and material modulus of elasticity values. Because of the magnitude of these values, stress levels should be given in megapascals (MPa) and the modules of elasticity values in gigapascals (GPa).

Use of GPa for the modulus of elasticity, MPa for stress and kPa for pressure provides a quick indication of the physical quantity being referenced.

## 7. CONVERSION FACTORS

In "soft" conversion, an inch-pound measurement is mathematically converted to its exact (or nearly exact) metric equivalent. With "hard" conversion, a new rounded, rationalized metric number is created that is convenient to work with and remembered.

### 7.1. Length, Area and Volume

One metric unit - the meter - is used to measure length, area, and volume in most design and construction works.

### 7.1.1. Rules for Linear Measurement

- Use only the meter and millimeter in design and construction.
- Use the kilometer for long distances and the micrometer for precision measurements.
- Avoid use of the centimeter.
- For survey measurement, use the meter and the kilometer.

### 7.1.2. Rules for Area

- The square meter is preferred.
- Very large areas may be expressed in square kilometers and very small areas in square millimeters.
- Use the hectare (10 000 square meters) for land and water measurement only.
- Avoid use of the square centimeter.
- Linear dimensions such as $40 \times 90 \mathrm{~mm}$ may be used; if so, indicate width first and height second.

### 7.1.3. Rules for Volume and Fluid Capacity

- Cubic meter is preferred for volumes in construction and for large storage tanks.
- Use liter (L) and milliliter (mL) for fluid capacity (liquid volume). One liter is $\mathbf{1 / 1 0 0 0}$ of a cubic meter or 1000 cubic centimeters.

Area, Length, and Volume Conversion Factors

| Quantity | From Inch-Pound Units | To Metric Units | Multiply by |
| :---: | :---: | :---: | :---: |
| Length | mile <br> yard <br> foot <br> inch | km <br> m <br> m <br> mm <br> mm | $\begin{aligned} & \frac{1.609344}{\underline{0.9144}} \\ & \frac{0.3048}{304.8} \\ & \frac{25.4}{} \end{aligned}$ |
| Area | square mile acre <br> square yard square foot square inch | $\begin{gathered} \mathrm{km}^{2} \\ \mathrm{~m}^{2} \\ \text { ha }\left(10000 \mathrm{~m}^{2}\right) \\ \mathrm{m}^{2} \\ \mathrm{~m}^{2} \\ \mathrm{~mm}^{2} \end{gathered}$ | $\begin{aligned} & 2.59000 \\ & 4046.856 \\ & 0.4046856 \\ & \underline{0.83512736} \\ & \underline{0.09290304} \\ & \underline{645.16} \end{aligned}$ |
| Volume | acre foot cubic yard cubic foot cubic foot cubic foot 100 board feet gallon cubic inch cubic inch | $\begin{gathered} \mathrm{m}^{3} \\ \mathrm{~m}^{3} \\ \mathrm{~m}^{3} \\ \mathrm{~cm}^{3} \\ \mathrm{~L}\left(1000 \mathrm{~cm}^{3}\right) \\ \mathrm{m}^{3} \\ \mathrm{~L}\left(1000 \mathrm{~cm}^{3}\right) \\ \mathrm{cm}^{3} \\ \mathrm{~mm}^{3} \end{gathered}$ | $\begin{aligned} & 1233.49 \\ & 0.764555 \\ & 0.0283168 \\ & 28316.85 \\ & 28.316 .85 \\ & 0.235974 \\ & 3.78541 \\ & 16.387064 \\ & 16387.064 \\ & \hline \end{aligned}$ |

NOTE: Underline denotes exact number.

### 7.2. Civil and Structural Engineering

The metric units used in civil and structural engineering are meter, kilograms, second, newton, and pascal.

### 7.2.1. Rules for Civil and Structural Engineering

- There are separate units for mass and force.
- The kilogram (kg) is the base unit for mass, which is the unit quantity of matter independent of gravity.
- The newton $(\mathbb{N})$ is the derived unit force (mass times acceleration, $\mathrm{kg} \cdot \mathrm{m} / \mathrm{s}^{2}$ ).
- Do not use the joule to designate moment, which is always designated newton meter ( $\mathrm{N} \cdot \mathrm{m}$ ).
- The pascal $(\mathrm{Pa})$ is the unit for pressure and stress $\left(\mathrm{Pa}=\mathrm{N} / \mathrm{m}^{2}\right)$.
- Structural calculations should be shown in MPa or $\mathbf{k P a}$.
- Plane angles in surveying (cartography) will continue to be measured in degrees (either decimal degrees or degrees, minutes, and seconds) rather than the metric radian.
- Slope is expressed in nondimensional ratios. The vertical component is shown first and then the horizontal.
- For slopes less than $45^{\circ}$, the vertical component should be unitary (for example, 1:20). For slopes over $45^{\circ}$, the horizontal component should be unitary (for example, 5:1).

Civil and Structural Engineering Conversion Factors

## 8. WORKED EXAMPLES

### 8.1 Examples of Conversion:

### 8.1.1 Integral Wearing Surface

$1 / 2 \mathrm{in} . \times \frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}=12.70 \mathrm{~mm} \rightarrow 13 \mathrm{~mm}$

### 8.1.2 Construction Load

$50 \mathrm{lb} / \mathrm{ft}^{2} \times \frac{4.448 \mathrm{~N}}{1 \mathrm{lb}} \times \frac{1 \mathrm{ft}^{2}}{.0929 \mathrm{~m}^{2}}=2394.0 \mathrm{~N} / \mathrm{m}^{2}=2394 \mathrm{~Pa} \rightarrow 2400 \mathrm{~Pa}$
$50 \mathrm{lb} / \mathrm{ft}^{2} \times \frac{47.880 \mathrm{~Pa}}{\mathrm{lb} / \mathrm{ft}^{2}}=2394.0 \mathrm{~Pa} \rightarrow 2400 \mathrm{~Pa}$
8.1.3 Temperature
$10^{\circ} \mathrm{F} \rightarrow{ }^{\circ} \mathrm{C}=5 / 9(10-32)=-12.22^{\circ} \mathrm{C} \rightarrow-10^{\circ} \mathrm{C}$
8.1.4 Bridge Length

3 spans: $30^{\prime}-6,39^{\prime}-0,30^{\prime}-6$, Total length $=100^{\prime}$
$30^{\prime}-6=30.5 \mathrm{ft} \times \frac{12 \mathrm{in} .}{\mathrm{ft}} \times \frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}=9296.4 \mathrm{~mm} \rightarrow 9100 \mathrm{~mm}$
$39^{\prime}-0=39 \mathrm{ft} \times \frac{12 \mathrm{in} .}{\mathrm{ft}} \times \frac{25.4 \mathrm{~mm}}{\mathrm{in} .}=11887.2 \mathrm{~mm} \rightarrow 11800 \mathrm{~mm}$
Total Bridge Length ${ }_{1}=100 \mathrm{ft} \times \frac{12 \mathrm{in} .}{\mathrm{ft}} \times \frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}=30480 \mathrm{~mm}$

Total Bridge Length $_{2}=2(9100)+11800=30000 \mathrm{~mm}$ 480 mm (18.9 in) shorter

### 8.1.5 Concrete Strength

$\mathrm{f}_{\mathrm{c}}{ }^{\prime}=4000 \mathrm{psi}$
$4000 \mathrm{psi} \times \frac{4.448 \mathrm{~N}}{\mathrm{lb}} \times \frac{1 \mathrm{in}^{2}}{645.16 \mathrm{~mm}^{2}} \times \frac{10^{6} \mathrm{~mm}^{2}}{1 \mathrm{~m}^{2}}$
$=27.58 \times 10^{6} \mathrm{~N} / \mathrm{m}^{2}=27.58 \times 10^{6} \mathrm{~Pa}$
$=27.58 \mathrm{MPa} \rightarrow 28 \mathrm{MPa}$
$28 \mathrm{MPa}(4060 \mathrm{psi}) 1.5 \%$ 'stronger'

### 8.1.6 Grade of Steel

$\mathrm{f}_{\mathrm{y}}=60,000 \mathrm{psi}$
$60,000 \mathrm{psi} \times \frac{6.895 \mathrm{kPa}}{1 \mathrm{psi}}=413700 \mathrm{kPa}=414 \mathrm{MPa}-400 \mathrm{MPa}$
$400 \mathrm{MPa}(58 \mathrm{ksi}) 3.3 \%$ 'weaker'

### 8.2 Reinforcement

A given reinforced concrete girder requires 6 - \#8 bars. What metric reinforcement is required to provide the girder with the same capacity? Remember, not only have the bar cross-sectional areas changed but also the yield strength of the reinforcement. Thus, metric replacement reinforcement is a function of bar size and grade of steel. In slabs, where reinforcement is given as a particular bar at a certain spacing, the conversion to metric will involve three variables: bar size, bar spacing, and grade of steel.

On the following page, information is provided on the metric bars as well as a comparison between the metric bars and the inch-pound bars. Several example problems for determining required metric reinforcement follow.

Table 1. Design Force, $\mathrm{F}_{\mathrm{e}}$, for in. lb Bars (kips)

| Bar Size | Grade 40 | Grade 50 | Grade 60 | Grade 75 |
| :---: | :---: | :---: | :---: | :---: |
| $\# 3$ | 4.400 | 5.500 | 6.600 | - |
| $\# 4$ | 8.000 | 10.000 | 12.000 | - |
| $\# 5$ | 12.400 | 15.500 | 18.600 | - |

8.2.1 Converting required number of inch-pound bars to number of metric bars required.
$\mathrm{N}_{\mathrm{m}}=$ number of metric bars
$\mathrm{N}_{\mathrm{e}}=$ number of in- lb bars
$\mathrm{F}_{\mathrm{e}}=$ force provided by in-lb bars (Table 1)
$F_{m}=$ force provided by metric bars (Table 2)
$\mathrm{N}_{\mathrm{m}} \mathrm{F}_{\mathrm{m}}=\mathrm{N}_{\mathrm{c}} \mathrm{F}_{\mathrm{e}}$
$N_{m}=N_{e}\left(F_{e} / F_{m}\right)$

### 8.2.1.1 Example 1

Required 8 - \#6 bars, Grade 60
Replace with? \#25 M bars, Grade 400
Replace with? \#30 M bars, Grade 400
$\mathrm{N}_{\text {H2SM }}=8(26.4 / 44.960)=4.7$
$\therefore$ Use 5 - \#25M bars, Grade 400
$\mathrm{N}_{430 \mathrm{M}}=8(26.4 / 62.944)=3.35$
$\therefore$ Use 4 - \#30M bars, Grade 400

### 8.2.1.2 Example 2

Required 5 - \#8 bars, Grade 60
Replace with? \#25M bars, Grade 400
Replace with \#35M bars, Grade 350
$N_{4 / 25}=5(47.4 / 44.960)=5.3$
$\therefore$ Use 6 - \#25M bars, Grade 400
$N_{\# 35}=5(47.4 / 78.680)=3.0$
$\therefore$ Use 3 - \#35M bars, Grade 350
8.2.2 Converting inch-pound bars spaced at ' $x$ ' inches to metric bars spaced at 'y' mm.
$S_{e}=$ spacing of in-lb bars, in.
$\mathrm{S}_{\mathrm{m}}=$ spacing of metric bars, mm
$\mathrm{F}_{\mathrm{c}}=$ force provided by in-lb bars (Table 1)
$F_{m}=$ force provided by metric bars (Table 2)
$F_{m} / S_{m}=F_{e} / S_{c} \times \frac{1 \text { in. }}{25.44 \mathrm{~mm}}$
$\mathrm{S}_{\mathrm{m}}=\mathrm{S}_{\mathrm{e}} \times 25.4\left(\mathrm{~F}_{\mathrm{m}} / \mathrm{F}_{\mathrm{e}}\right)$

### 8.2.2.1 Example 1

\#9 (Grade 60) at 10 in equals \#30M (Grade 400) at 'y' spacing

$$
y=S_{m}=10 \times 25.4(62.944 / 60)=266.5 \mathrm{~mm}
$$

$\therefore$ Use \#30 (Grade 400) at 270 mm

### 8.2.2.2 Example 2

\#6 (Grade 60) at 8 in.
Equals \#20M (Grade 400) at 'x' spacing.
Equals \#15M (Grade 400) at 'z' spacing.

$$
x=8 \times 25.4(26.4 / 26.976)=198.9 \mathrm{~mm}
$$

$\therefore$ Use \#20M at 200 mm

$$
z=8 \times 25.4(26.4 / 17.984)=298.3 \mathrm{~mm}
$$

$\therefore$ Use \#15M at 300 mm
8.2.3 Calculations have determined that a given slab requires $1.86 \mathrm{~mm}^{2} / \mathrm{mm}$ (Grade 400). Reinforcement at what spacing will satisfy this requirement?

| Bar <br> Designation | Bar <br> Area $\left(\mathrm{mm}^{2}\right)$ | Required Spacing | Area Steel Provided <br> $(\mathrm{mm})^{2} / \mathrm{mm}$ |
| :---: | :---: | :---: | :---: |
| 20 M | 300 | $161.3 \mathrm{~mm}^{*}-160 \mathrm{~mm}$ <br> $(6.3 \mathrm{in})$. | 1.88 |
| 25 M | 500 | $268.8 \mathrm{~mm}-270 \mathrm{~mm}$ <br> $(10.6 \mathrm{in})$. | 1.85 |
| 30 M | 700 | $376.3 \mathrm{~mm}-(375 \mathrm{~mm})$ <br> $(14.8 \mathrm{in})$. | 1.87 |

* $300 \mathrm{~mm}^{2} /\left(1.86 \mathrm{~mm}^{2} / \mathrm{mm}\right)=161.3 \mathrm{~mm}$
Required:
Design composite section
Given:
H.S. 20 Loading
Roadway width $=40 \mathrm{ft}$
Bridge span $=54 \mathrm{ft}$
Beam spacing $=9.25 \mathrm{ft}$ ( 5 beams)
Deck thickness $=8$ in. Haunch $=1$ in.
$\mathrm{F}_{\mathrm{y}}=50 \mathrm{ksi}$
$\mathrm{f}_{\mathrm{c}}{ }^{\prime}=3.5 \mathrm{ksi}$
Barrier rail $=2.47$ $\mathrm{ft}^{3}$
FWS $=20 \mathrm{psf}$
Density of concrete $=150 \mathrm{lb} / \mathrm{ft}^{3}$
Problem 1: U.S. Customary: Simple Span Composite Stringer25
Solution:
Assume steel section:
U.S. Customary W36x135

## W36 x 135:

$\mathrm{D}=35.55 \mathrm{in}$.
$\mathrm{A}=39.7 \mathrm{in}^{2}$
$\mathrm{b}_{\mathrm{f}}=11.95$ in.
weight/unit length $=135$ plf
$\mathrm{I}_{\mathrm{x}}=7800 \mathrm{in}^{4}$
$\mathrm{S}_{\mathrm{x}}=439 \mathrm{in}^{3}$
Composite section:

$$
\mathrm{t}_{\mathrm{slab}}=8 \mathrm{in}
$$

deduction for wear $=1 / 2$ in.
$\therefore$ reduced $\mathrm{t}_{\text {slab }}=8-0.5=7.5 \mathrm{in}$.
effective width $=12 \times 7.5 \mathrm{in} .=90 \mathrm{in} .\left(\frac{\mathrm{L}}{4}\right.$ or $12 \mathrm{t}_{\text {slab }}$ or S$)$
Haunch Dimensions:

$$
\begin{aligned}
& b=b_{f} \text { of } W \text {-section }=11.95 \mathrm{in} \\
& t=1 \mathrm{in}
\end{aligned}
$$

## Diaphragm:

Assume wt. $=10 \mathrm{lb} / \mathrm{ft}$

Composite Section Properties ( $\mathrm{N}=9$ and $3 \mathrm{~N}=27$ for long term)

& \mathrm{I}=7800+39.7(26.54-17.775)^{2}+0.4(36.05-26.54)^{2}+117+ \\
& 25(40.3-26.54)^{2}=15,737 \mathrm{in}^{4} \\
& \mathrm{~S}_{\mathrm{BF}}=\frac{15,737 \mathrm{in}^{4}}{26.54 \mathrm{in}}=593 \mathrm{in}^{3}
\end{aligned}
$$

Non-Composite DL:
Deck: $9.25 \mathrm{ftx} 8 \mathrm{in} . \times\left(\frac{1 \mathrm{ft}}{12 \mathrm{in}}\right) \times 150 \frac{\mathrm{lb}}{\mathrm{ft}^{3}}=925 \mathrm{plf}$
Beam + Diaph: (Assume Diaph: 10 plf) $=135+10=145$ plf
Composite DL:
Rail: $2.47 \frac{\mathrm{ft}^{3}}{\mathrm{ft} \text { length of rail }} \times 150 \frac{\mathrm{lb}}{\mathrm{ft}^{3}} \times 2$ rails $/ 5$ beams $=148$ plf
FWS: $20 \mathrm{psfx} 40 \mathrm{ft} / 5$ beams $=160$ plf
DL Mom. (non comp.) $=1 / 8 \times(0.925+0.145) \mathrm{kip} / \mathrm{ft} \mathrm{x}(54)^{2} \mathrm{ft}^{2}=390.0 \mathrm{k}-\mathrm{ft}$ DL Mom. $($ comp. $)=1 / 8 \times(0.148+0.160) \mathrm{kip} / \mathrm{ft} \times(54)^{2} \mathrm{ft}^{2}=112.3 \mathrm{k}-\mathrm{ft}$ $\mathrm{LL}+\mathrm{I}$ Mom. $=1.279 \times 1.682 \times 349.7 \mathrm{k}-\mathrm{ft}=752.2 \mathrm{k}-\mathrm{ft}$
where:

$$
\begin{aligned}
& \text { LL Dist. Factor } \frac{\mathrm{S}}{5.5}=\frac{9.25}{5.5}=1.682 \text { wheel lines per beam } \\
& \mathrm{I}=\frac{50}{\mathrm{~L}+125}=\frac{50}{54+125}=0.279 \\
& \mathrm{LL}_{\text {Moment }}=\frac{699.3 \mathrm{k}-\mathrm{ft}}{2}=349.7 \mathrm{k}-\mathrm{ft} \text { (AASHTO Appendix) } \\
& \mathrm{F}_{\text {all }}=27 \mathrm{ksi}
\end{aligned}
$$

$$
\begin{aligned}
\mathrm{f}_{\mathrm{BF}} & =\frac{(390 \mathrm{k}-\mathrm{ft}) \frac{12 \mathrm{in} .}{1 \mathrm{ft}}}{439 \mathrm{in}^{3}}+\frac{(112.3 \mathrm{k}-\mathrm{ft}) \frac{12 \mathrm{in} .}{1 \mathrm{ft}}}{593 \mathrm{in}^{3}}+\frac{(752.2 \mathrm{k}-\mathrm{ft}) \frac{12 \mathrm{in} .}{1 \mathrm{ft}}}{656 \mathrm{in}^{3}} \\
& =10.7+2.3+13.8=26.8 \mathrm{ksi}<27 \mathrm{ksi} \text { O.K. }
\end{aligned}
$$

## LOAD FACTOR DESIGN: MAX. MOMENT CHECK ONLY

## Check for compact section:

AASHTO [10.50.1.1.2] $\frac{2 \mathrm{D}_{\mathrm{cp}}}{\mathrm{t}_{\mathrm{w}}}<\frac{19230}{\sqrt{\mathrm{~F}_{\mathrm{y}}}}$ Eq. 10-93

## Plastic N.A. position:

$$
\mathrm{C}_{\text {slab }}=0.85 \times 7.5 \mathrm{in} . \times 90 \mathrm{in} . \times 3.5 \mathrm{ksi}=2008 \mathrm{k}
$$

(Disregard slab reinforcement)

$$
\begin{aligned}
\mathrm{C}_{\text {beam }} & =50 \mathrm{ksi} \times 39.7 \mathrm{in}^{2}=1985 \mathrm{k} \\
& <2008 \mathrm{k}=\mathrm{C}_{\text {slab }}
\end{aligned}
$$

$\therefore$ Plastic N.A. is in the slab and Eq. $10-93$ is satisfied.

$$
\mathrm{D}_{\mathrm{p}}=\frac{1985 \mathrm{k}}{.85 \times 90 \mathrm{in} \times 3.5 \mathrm{ksi}}=7.41 \mathrm{in}
$$

Check eqn. 10-128a:

$$
D_{p}=7.41 \text { in. }<\frac{d+t_{s}+t_{h}}{7.5}=\frac{35.55+7.5+1}{7.5}=5.87 \mathrm{in} .
$$

(Check not satisfied)

Check maximum stress in flange:

$$
\begin{aligned}
& 32 \\
& \mathrm{f}_{\mathrm{BF}}=\frac{\mathrm{M}}{\mathrm{~S}}=\frac{1.3 \times 390 \mathrm{k}-\mathrm{ft} \times \frac{12 \mathrm{in} .}{1 \mathrm{ft}}}{439 \mathrm{in}^{3}}+\frac{1.3 \times 112.3 \mathrm{k}-\mathrm{ft} \times \frac{12 \mathrm{in} .}{1 \mathrm{ft}}}{593 \mathrm{in}^{3}}+ \\
& \frac{1.3 \times 1.67 \times 752.2 \mathrm{k}-\mathrm{ft} \times \frac{12 \mathrm{in} .}{1 \mathrm{ft}}}{656 \mathrm{in}^{3}} \\
& =13.9+3.0+29.9=46.8 \mathrm{ksi}<\mathrm{F}_{\mathrm{y}}=50 \mathrm{ksi} \\

& =(50-13.9-3.0) \mathrm{ksi}\left(656 \mathrm{in}^{3}\right)\left(\frac{1 \mathrm{ft}}{12 \mathrm{in} .}\right)=1809 \mathrm{k}-\mathrm{ft} \\
& \mathrm{M}_{\mathrm{y}}=1809+(390+112.3)(1.3)=2462 \mathrm{k}-\mathrm{ft} \\
& \mathrm{M}=(1.3)(390+112.3+(1.67)(752.2))=2286 \mathrm{k}-\mathrm{ft}<\mathrm{M}_{\mathrm{y}} \\
& \therefore \text { O.K. }
\end{aligned}
$$

## Problem 1: Metric: Simple Span Composite Stringer

## Required:

Design composite section

## Given:

HS-20 Loading (MS 18 AASHTO 1977, Sec. 1.2.5)
Roadway width $=40 \mathrm{ft} \times\left(\frac{0.3048 \mathrm{~m}}{1 \mathrm{ft}}\right)=12.192 \mathrm{~m}$
Use 12.0 m Iowa DOT Handbook pg. 11

Bridge span $=54 \mathrm{ft} \mathrm{x}\left(\frac{0.3048 \mathrm{~m}}{1 \mathrm{ft}}\right)=16.46 \mathrm{~m}$
Use 16.5 m

Beam spacing $=9.25 \mathrm{ft} \mathrm{x}\left(\frac{0.3048 \mathrm{~m}}{1 \mathrm{ft}}\right)=2.819 \mathrm{~m}$
Use 2.7 m Iowa DOT Handbook pg. 11

Deck thickness $=8$ in. $x\left(\frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}\right)=203.2 \mathrm{~mm}$
Use 200 mm Iowa DOT Handbook pg. 19

$$
\mathrm{F}_{\mathrm{y}}=50 \mathrm{ksi} \times\left(\frac{6.89476 \mathrm{MPa}}{1 \mathrm{ksi}}\right)=344.7 \mathrm{MPa}
$$

Use 345 Mpa Iowa DOT Handbook pg. 9
$\mathrm{f}_{\mathrm{c}}^{\prime}=3.5 \mathrm{ksix}\left(\frac{6.89476 \mathrm{MPa}}{1 \mathrm{ksi}}\right)=24.13 \mathrm{Mpa}$
Use $f^{\prime}{ }_{c}=24 \mathrm{MPa}$ Iowa DOT Handbook pg. 22

Barrier rail $=2.47 \frac{\mathrm{ft}^{3}}{\mathrm{ft}} \times\left(\frac{0.3048 \mathrm{~m}}{1 \mathrm{ft}}\right)^{2}=0.229 \mathrm{~m}^{3} / \mathrm{m}$ length of rail
FWS $=20$ psf $\times\left(\frac{47.8803 \mathrm{~Pa}}{1 \mathrm{psf}}\right)=957.6 \mathrm{~Pa}$
Use 960 Pa Iowa DOT Handbook pg. 10a
Density of concrete $=150 \mathrm{lb} / \mathrm{ft}^{3} \times 0.157087 \frac{\mathrm{kN} / \mathrm{m}^{3}}{\mathrm{lb} / \mathrm{ft}^{3}}=23.56 \mathrm{kN} / \mathrm{m}^{3}$
Use $24 \mathrm{kN} / \mathrm{m}^{3}$ Iowa DOT Handbook pg. 22

## Solution:

Assume steel section:
U.S. Customary W36x135 - SI W920 x 201
(Metric properties of structural shapes)
W920 x 201:
$\mathrm{D}=903 \mathrm{~mm}$
$A=25600 \mathrm{~mm}^{2}$
$\mathrm{b}_{\mathrm{f}}=304 \mathrm{~mm}$
mass $/$ unit length $=201 \mathrm{~kg} / \mathrm{m}$

$$
\begin{aligned}
& \mathrm{I}_{\mathrm{x}}=3250 \times 10^{6} \mathrm{~mm}^{4} \\
& \mathrm{~S}_{\mathrm{x}}=7200 \times 10^{3} \mathrm{~mm}^{3}
\end{aligned}
$$

## Soft Conversion:

U.S. Customary W36 x 135:

METRIC W920 x 201:

$$
\begin{array}{ll}
\mathrm{d}=35.55 \mathrm{in} \mathrm{x}\left(\frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}\right)=903.0 \mathrm{~mm} & 903 \mathrm{~mm} \\
\mathrm{~b}_{\mathrm{f}}=11.95 \mathrm{in} \mathrm{x}\left(\frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}\right)=303.5 \mathrm{~mm} & 304 \mathrm{~mm}
\end{array}
$$

$$
\mathrm{t}_{\mathrm{f}}=0.79 \mathrm{in} \mathrm{x}\left(\frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}\right)=20.07 \mathrm{~mm}
$$

$$
20.1 \mathrm{~mm}
$$

$$
\mathrm{t}_{\mathrm{w}}=0.6 \mathrm{in} \mathrm{x}\left(\frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}\right)=15.24 \mathrm{~mm}
$$

$$
\mathrm{A}=39.7 \mathrm{in}^{2} \mathrm{x}\left(\frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}\right)^{2}=25613 \mathrm{~mm}^{2}
$$

$$
25600 \mathrm{~mm}^{2}
$$

$$
\mathrm{I}_{\mathrm{x}}=7800 \mathrm{in}^{4} \times\left(\frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}\right)^{4}=3246.6 \times 10^{6} \mathrm{~mm}^{4} \quad 3247 \times 10^{6} \mathrm{~mm}^{4}
$$

$$
S_{x}=439 \mathrm{in}^{3} \times\left(\frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}\right)^{3}=7194 \times 10^{3} \mathrm{~mm}^{3} \quad 7200 \times 10^{3} \mathrm{~mm}^{3}
$$

Note: Steel sections are essentially the same.
Composite section:
$\mathrm{t}_{\mathrm{slab}}=200 \mathrm{~mm}$
deduction for wear $=1 / 2 \mathrm{in} . x\left(\frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}\right)=12.7 \mathrm{~mm}$
Use 13 mm Iowa DOT Handbook pg. 19
$\therefore$ reduced $\mathrm{t}_{\text {slab }}=200-13=187 \mathrm{~mm}$
effective width $=12 \times 187=2244 \mathrm{~mm}$
Haunch Dimensions:

$$
\begin{aligned}
& \mathrm{b}=\mathrm{b}_{\mathrm{f}} \text { of } \mathrm{W} \text {-section }=304 \mathrm{~mm} \\
& \mathrm{t}=1 \mathrm{in} . \mathrm{x}\left(\frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}\right)=25.4 \mathrm{~mm}
\end{aligned}
$$

Use 25 mm
Diaphragm:

$$
\text { Assumed mass }=10 \mathrm{lb} / \mathrm{ft} \times\left(\frac{1.488 \mathrm{lb} \mathrm{~kg} / \mathrm{m}}{1 \mathrm{lb} / \mathrm{ft}}\right)=14.88 \mathrm{~kg} / \mathrm{m}
$$

Use $15 \mathrm{~kg} / \mathrm{m}$

## COMPOSITE SECTION DIMENSIONS

Composite Section Properties $(\mathrm{N}=9$ and $3 \mathrm{~N}=27$ for long term)

|  | $\mathrm{A}\left(\mathrm{mm}^{2}\right)$ | $\mathrm{Y}(\mathrm{mm})$ | $\mathrm{AY}\left(\mathrm{mm}^{3}\right)$ | $\mathrm{AY}^{2}\left(\mathrm{~mm}^{4}\right)$ | $\mathrm{I}_{0}\left(\mathrm{~mm}^{4}\right)$ |

$\mathrm{N}=9: \quad \mathrm{Y}=821 \mathrm{~mm}$
$3 \mathrm{~N}=27: \quad[\overline{\mathrm{Y}}=668 \mathrm{~mm}]$
$\mathrm{I}=8760 \times 10^{6} \mathrm{~mm}^{4}$
$\left[I=6451 \times 10^{6} \mathrm{~mm}^{4}\right]$
$S_{B F}=10676 \times 10^{3} \mathrm{~mm}^{3}$
$\left[\mathrm{S}_{\mathrm{BF}}=9651 \times 10^{3} \mathrm{~mm}^{3}\right]$

$$
\text { Note: } \begin{aligned}
\mathrm{S} & =656 \mathrm{in}^{3} \times\left[\frac{25.4 \mathrm{~mm}}{1 \mathrm{in}}\right]^{3} \\
& =10750 \times 10^{3} \mathrm{~mm}^{3}(0.7 \% \text { difference }) \\
& \mathrm{S}=593 \mathrm{in}^{3} \times\left[\frac{25.4 \mathrm{~mm}}{1 \mathrm{in}}\right]^{3} \\
& =9718 \times 10^{3} \mathrm{~mm}^{3}(0.7 \% \text { difference })
\end{aligned}
$$

## HELPFUL HINT

If $S$ to the nearest $1 \mathrm{in}^{3}$ is sufficient accuracy, then corresponding accuracy in metric is:
$1 \mathrm{in}^{3} \mathrm{x}\left[\frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}\right]^{3}=16387 \mathrm{~mm}^{3}$
see Iowa DOT Handbook pg. 7 for general recommendation
For example
Rounding $S=10676 \times 10^{3} \mathrm{~mm}^{3}$ to $S=10700 \times 10^{3} \mathrm{~mm}^{3}$ would imply an equivalent accuracy in $\mathrm{in}^{3}$ of:
$24 \times 10^{3} \mathrm{~mm}^{3} \times\left[\frac{1 \mathrm{in} .}{25.4 \mathrm{~mm}}\right]^{3}=1.5 \mathrm{in}^{3}$

Loads and Moments for Interior Beam Line:
Non-Composite DL:

$$
\begin{aligned}
\text { Deck: } & 2.7 \mathrm{~m} \times 200 \mathrm{~mm} \times 24 \mathrm{kN} / \mathrm{m}^{3} \\
= & 2.7 \mathrm{~m} \times 0.2 \mathrm{~m} \times 24 \mathrm{kN} / \mathrm{m}^{3} \\
= & 12.96 \mathrm{kN} / \mathrm{m}
\end{aligned}
$$

Beam + Diaph: (Assume Diaph: $15 \mathrm{~kg} / \mathrm{m}$ )
$=201 \mathrm{~kg} / \mathrm{m}+15 \mathrm{~kg} / \mathrm{m}=216 \mathrm{~kg} / \mathrm{m}$
To convert to (force/length) units, multiply by acceleration of gravity
$=216 \mathrm{~kg} / \mathrm{m} \mathrm{x} 9.806 \mathrm{~m} / \mathrm{sec}^{2}=2118 \mathrm{~N} / \mathrm{m}$

$$
=2.12 \mathrm{kN} / \mathrm{m}
$$

Composite DL:
Rail: $0.229 \frac{\mathrm{~m}^{3}}{\mathrm{~m} \text { length of rail }} \times 24 \mathrm{kN} / \mathrm{m}^{3} \times 2 \mathrm{rails} / 5$ beams

FWS: $960 \mathrm{~Pa} \times 12.0 \mathrm{~m} / 5$ beams $=960 \mathrm{~N} / \mathrm{m}^{2} \times 12.0 \mathrm{~m} / 5=2304 \mathrm{~N} / \mathrm{m}$ $=2.30 \mathrm{kN} / \mathrm{m}$

DL Mom. (non comp.) $=1 / 8 \times(12.96+2.12) \mathrm{kN} / \mathrm{mx}(16.5)^{2} \mathrm{~m}^{2}$
$=513.2 \mathrm{kN} \cdot \mathrm{m}$
DL Mom. (comp.) $=1 / 8 \times(2.20+2.30) \mathrm{kN} / \mathrm{mx}(16.5)^{2} \mathrm{~m}^{2}=153.1 \mathrm{kN} \cdot \mathrm{m}$
$\mathrm{LL}+\mathrm{I}$ Mom. $=1.28 \times 1.611 \times(474.06) \mathrm{kN} \cdot \mathrm{m}=977.6 \mathrm{kN} \cdot \mathrm{m}$.
where:
LL Dist. Factor $=\frac{2.7}{1.676}=1.611$ wheel lines per beam (AASHTO 1977, sec. 1.3.1)

If a formula you need is not available in Metric, make a soft conversion.
LL Distribution Factor $=\frac{S}{5.5}$
where $S$ is measured in ft
$1 \mathrm{ft}=0.3048 \mathrm{~m}$
$\therefore \mathrm{S}($ in ft$)=\frac{\mathrm{S}(\text { in m) })}{0.3048}$
$\therefore$ D.F $=\frac{\mathrm{S}}{0.3048 \times 5.5}$ where S is measured in m .
D.F $=\frac{S}{1.676}$

Note: 1.682 U.S. Customary vs. 1.611 Metric (4.4\% difference)

$$
\begin{gathered}
\mathrm{I}=\frac{15.24}{\mathrm{~L}+38}=\frac{15.24}{16.5+38}=0.28 \quad \text { (AASHTO Sec. 3.8.2, Appendix E) } \\
\mathrm{LL}_{\text {moment }}=\frac{948.12 \mathrm{kNm}}{2}=474.06 \mathrm{kNm}(\text { AASHTO Appendix A 1977) } \\
\mathrm{F}_{\text {all }}=27 \mathrm{ksi} \mathrm{x}\left(\frac{6.89476 \mathrm{MPa}}{1 \mathrm{ksi}}\right)=186.2 \mathrm{MPa} \\
\text { Use } 185 \mathrm{MPa}
\end{gathered}
$$

$$
\begin{aligned}
\mathrm{f}_{\mathrm{BF}}=\mathrm{M} / \mathrm{S}= & \left(\frac{513.2 \mathrm{kNm}}{7200 \times 10^{3} \mathrm{~mm}^{3}}+\frac{153.1 \mathrm{kNm}}{9651 \times 10^{3} \mathrm{~mm}^{3}}+\frac{977.6 \mathrm{kNm}}{10676 \times 10^{3} \mathrm{~mm}^{3}}\right) \\
& \times\left(\frac{10^{9} \mathrm{~mm}^{3}}{1 \mathrm{~m}^{3}}\right) \\
= & 178.7 \times 10^{3} \mathrm{kN} / \mathrm{m}^{2}=178.7 \mathrm{MN} / \mathrm{m}^{2} \\
= & 178.7 \mathrm{MPa}<185 \mathrm{MPa}
\end{aligned}
$$

$$
\therefore \mathrm{O} . \mathrm{K}
$$

Note: $26.8 \mathrm{ksi} x\left(\frac{6.89476 \mathrm{MPa}}{1 \mathrm{ksi}}\right)=184.8 \mathrm{MPa}(3.4 \%$ difference $)$

## LOAD FACTOR DESIGN: MAX. MOMENT CHECK ONLY

## Check for compact section:

AASHTO [10.50.1.1.2] $\frac{2 \mathrm{D}_{\mathrm{cp}}}{\mathrm{t}_{\mathrm{w}}} \leq \frac{1597}{\sqrt{\mathrm{~F}_{\mathrm{y}}}}$ Eq. 10-93
Plastic N.A. position:
$\mathrm{C}_{\text {slab }}=0.85 \times 0.187 \mathrm{~m} \times 2.244 \mathrm{~m} \times 24 \mathrm{MPa}\left(\frac{1 \mathrm{MN} / \mathrm{m}^{2}}{1 \mathrm{MPa}}\right)=8.56 \mathrm{MN}$
(Disregard slab reinforcement)

$$
\begin{aligned}
\mathrm{C}_{\text {beam }} & =345 \mathrm{MPa}\left(\frac{1 \mathrm{MN} / \mathrm{m}^{2}}{1 \mathrm{MPa}}\right) \times 25600 \times 10^{-6} \mathrm{~m}^{2}=8.83 \mathrm{MN} \\
& =8.83 \mathrm{MN}>8.56 \mathrm{MN}=\mathrm{C}_{\text {slab }}
\end{aligned}
$$

$\therefore$ Plastic N.A. is below compression flange - using plastic stress block N.A. located 1 mm below top of top flange ( $\mathrm{D}_{\mathrm{cp}}=1 \mathrm{~mm}$ ) and Eq. $10-93$ is satisfied.

$$
\begin{aligned}
\mathrm{D}_{\mathrm{p}} & =187 \mathrm{~mm}+1 \mathrm{~mm} \\
& =188 \mathrm{~mm}
\end{aligned}
$$

Check eqn. 10-128a:

$$
D_{p}=188 \mathrm{~mm}<\frac{d+t_{s}+t_{\mathrm{h}}}{7.5}=\frac{903+187+25}{7.5}=149 \mathrm{~mm}
$$

(Check not satisfied)
Check maximum stress in flange:
$\mathrm{f}_{\mathrm{BF}}=\frac{\mathrm{M}}{\mathrm{S}}=\frac{1.3 \times 513.2 \mathrm{kNm}}{7200 \times 10^{-6} \mathrm{~m}^{3}}+\frac{1.3 \times 153.1 \mathrm{kNm}}{9651 \times 10^{-6} \mathrm{~m}^{3}}+$

$$
\frac{1.3 \times 1.67 \times 977.6 \mathrm{kNm}}{10676 \times 10^{-6} \mathrm{~m}^{3}}
$$

$=92661 \mathrm{kN} / \mathrm{m}^{2}+20623 \mathrm{kN} / \mathrm{m}^{2}+198798 \mathrm{kN} / \mathrm{m}^{2}$
$=312082 \mathrm{kN} / \mathrm{m}^{2}=312 \mathrm{MN} / \mathrm{m}^{2}$
$=312 \mathrm{MPa}<\mathrm{F}_{\mathrm{y}}=345 \mathrm{MPa}$
$\therefore$ O.K. and AASHTO Eqn. 10-128a does not need to be checked
Note: $46.8 \mathrm{ksi} \mathrm{x}\left[\frac{6.89476 \mathrm{MPa}}{1 \mathrm{ksi}}\right]=322.7 \mathrm{MPa}(\mathbf{3 . 4 \%}$ difference $)$
$\mathrm{M}_{\mathrm{u}}=\mathrm{M}_{\mathrm{y}}=$ Mom. at first yielding
L +I Mom. Capacity $=\left(\mathrm{f}_{\mathrm{y}}-\mathrm{f}_{\mathrm{DLL}}-\mathrm{f}_{\mathrm{DL} 2}\right)\left(\mathrm{S}_{\mathrm{c}}\right)$

$$
\begin{aligned}
& =(345 \mathrm{MPa}-92.6 \mathrm{MPa}-20.6 \mathrm{Mpa}) \times \frac{\mathrm{MN} / \mathrm{m}^{2}}{\mathrm{MPa}} \times 10676 \times 10^{-6} \mathrm{~m}^{3} \\
& =2474.7 \mathrm{kN} \mathrm{~m}
\end{aligned}
$$

$$
\mathrm{M}_{\mathrm{y}}=2474.7 \mathrm{kN} \mathrm{~m}+(513.2 \mathrm{kN} \mathrm{~m}+153.1 \mathrm{kN} \mathrm{~m}) 1.3=3340.9 \mathrm{kN} \cdot \mathrm{~m}
$$

$$
\mathrm{M}=1.3(513.2 \mathrm{kN} \cdot \mathrm{~m}+153.1 \mathrm{kN} \mathrm{~m}+(1.67)(977.6 \mathrm{kN} \cdot \mathrm{~m}))
$$

$$
=2988.6 \mathrm{kNm}<3340.9 \mathrm{kNm} \text { ok }
$$

Note: $2286 \mathrm{k}-\mathrm{ft} \mathrm{x}\left(\frac{1.35582}{1 \mathrm{k}-\mathrm{ft}}\right)=\mathbf{3 0 9 9 . 4} \mathbf{k N} \cdot \mathrm{m}(\mathbf{3 . 7 \%}$ difference $)$

## Problem 2: U.S. Customary: Continuous Three-Span Bridge

## Required:

Maximum moment @ Pier and @ 0.4 point of Span 1 of interior beam line.

## Given:

HS-20 Loading

## Constant I

Beam spacing $=7.401 \mathrm{ft}$
Span lengths: $\mathrm{L}_{1}=68.625 \mathrm{ft}$

$$
\mathrm{L}_{2}=87.75 \mathrm{ft}
$$

Total length $=\mathrm{S}=225 \mathrm{ft}$
Uniform DL $=1.0 \mathrm{kip} / \mathrm{ft}$

## Solution:

Impact: $I=\frac{50}{L+125}$
@ Pier: $\mathrm{I}=\frac{50}{\left(\frac{68.625+87.75}{2}\right)+125}=0.246$
@ 0.4 point of Span $1: I=\frac{50}{68.625+125}=0.258$

POSITIONS OF SECTIONS ALONG THE BRIDGE LENGTH

- Uniform DL Moment:

$$
\begin{aligned}
\mathrm{M}_{\mathrm{DL}} & =1.0 \mathrm{k} / \mathrm{ft} \times\left(0.005545 \mathrm{~S}^{2}+0.008332 \mathrm{~S}^{2}-0.00155 \mathrm{~S}^{2}\right) \\
& \text { where } \mathrm{S}=225 \mathrm{ft} \\
\mathrm{M}_{\mathrm{DL}} & =-624.1 \mathrm{k}-\mathrm{ft}
\end{aligned}
$$

- HS20 Loading, LL Mom:

## LANE:

$$
\begin{aligned}
& \mathrm{M}_{\mathrm{uniform}}=\frac{0.64 \mathrm{klf}}{2} \times \frac{7.401}{5.5}(0.005545+0.008332)(225 \mathrm{ft})^{2} \\
& \quad=-302.5 \mathrm{k}-\mathrm{ft}
\end{aligned}
$$

$$
\mathrm{M}_{\text {concentrated }}=\frac{18 \mathrm{k}}{2} \times \frac{7.401}{5.5}(0.02788+0.03448)(225 \mathrm{ft})
$$

$$
=-169.9 \mathrm{k}-\mathrm{ft}
$$

$$
\mathrm{M}_{\text {lane }}=\mathrm{M}_{\text {uniform }}+\mathrm{M}_{\text {concentrated }}=-472.4 \mathrm{k}-\mathrm{ft}
$$

## TRUCK:

Place truck in Span 2 at high pt. of IFL

$$
\begin{aligned}
\mathrm{M}_{\text {truck }} & =\frac{7.401}{5.5}\left(\left[\frac{32 \mathrm{k}}{2} \times(0.03448+0.030038)\right]\right. \\
& \left.+\left[\frac{8 \mathrm{k}}{2} \times 0.029104\right]\right) \times 225 \mathrm{ft}=-347.8 \mathrm{k}-\mathrm{ft}
\end{aligned}
$$

$\therefore$ Total DL and LL moment @ Pier $=-624.1+(-472.4)(1.246)$

$$
=-1213 \mathrm{k}-\mathrm{ft}
$$

## Moment@ 0.4 point of Span 1 on Beam Line:

- Uniform DL Moment:

$$
\begin{aligned}
\mathrm{M}_{\mathrm{DL}} & =1.0 \mathrm{k} / \mathrm{ft} \times(0.00893-0.00329+0.000612)(225 \mathrm{ft})^{2} \\
& =+316.5 \mathrm{k}-\mathrm{ft}
\end{aligned}
$$

- HS20 Loading, LL Mom:

## LANE:

$$
\begin{aligned}
\mathrm{M}_{\text {uniform }} & =\frac{0.64 \mathrm{k} / \mathrm{ft}}{2} \times \frac{7.401}{5.5}(0.00893+0.000612)(225 \mathrm{ft})^{2} \\
& =+208.0 \mathrm{k}-\mathrm{ft}
\end{aligned}
$$

$\mathrm{M}_{\text {concentrated }}=\frac{18 \mathrm{k}}{2} \times \frac{7.401}{5.5}(0.06320)(225 \mathrm{ft})=+172.2 \mathrm{k}-\mathrm{ft}$
$\mathrm{M}_{\text {lane }}=\mathrm{M}_{\text {uniform }}+\mathrm{M}_{\text {concentrated }}=+380.2 \mathrm{k}-\mathrm{ft}$

## TRUCK:

Place truck in Span 1 at high point of IFL

$$
\begin{aligned}
\mathrm{M}_{\text {truck }} & =\frac{7.401}{5.5}\left[\frac{32 \mathrm{k}}{2} \times(0.06320+0.03733)+\frac{8 \mathrm{k}}{2} \times 0.0298\right] \\
& \times 225 \mathrm{ft}=523.1 \mathrm{k}-\mathrm{ft}
\end{aligned}
$$

## TRUCK CONTROLS 52

$\therefore$ Total DL and LL moment @ 0.4 point of Span $1=+316.5+523.1 \times$

$$
1.258=974.6 \mathrm{k}-\mathrm{ft}
$$

## Problem 2: Metric: Continuous Three-Span Bridge

## Required:

Maximum moment @ Pier and @ 0.4 point of Span 1 of interior beam line.

## Given:

HS-20 Loading (MS 18 AASHTO 1977 Sec. 1.2.5)
Constant I
Beam spacing $=7.401 \mathrm{ft} \mathrm{x}\left(\frac{0.3048 \mathrm{~m}}{1 \mathrm{ft}}\right)=2.256 \mathrm{~m}$
Use 2.2m Iowa DOT Handbook pg. 11
Span lengths: $\mathrm{L}_{1}=68.625 \mathrm{ft} \times\left(\frac{0.3048 \mathrm{~m}}{1 \mathrm{ft}}\right)=20.917 \mathrm{~m}$
Use 20.9 m Iowa DOT Handbook pg. 10a

$$
\mathrm{L}_{2}=87.75 \mathrm{ft} \mathrm{x}\left(\frac{0.3048 \mathrm{~m}}{1 \mathrm{ft}}\right)=26.746 \mathrm{~m}
$$

Use 26.7 m
Total length $=\mathrm{S}=225 \mathrm{ft} \times\left(\frac{0.3048 \mathrm{~m}}{1 \mathrm{ft}}\right)=68.58 \mathrm{~m}$
Use 68.6 m

Check for ripple effect:
Total length $=2 \times 20.9 \mathrm{~m}+26.7 \mathrm{~m}=68.5 \mathrm{~m} \neq 68.6 \mathrm{~m}$ ( 0.1 m difference)
$\therefore$ Center-span length is adjusted.
$L_{2}=26.7+0.1=26.8 \mathrm{~m}$
Uniform $\mathrm{DL}=1.0 \mathrm{kip} / \mathrm{ft} \times\left(\frac{14.5939 \mathrm{kN} / \mathrm{m}}{1 \mathrm{kip} / \mathrm{ft}}\right)=14.6 \mathrm{kN} / \mathrm{m}$

## Solution:

Impact: $I=\frac{15.24}{L+38}$
@ Pier: $\mathrm{I}=\frac{15.24}{\left(\frac{20.9+26.8}{2}\right)+38}=0.246$
@ 0.4 point of $\operatorname{Span} 1: I=\frac{15.24}{20.9+38}=0.259$

Moment at Pier on Beam Line:

- Uniform DL Moment:
$\mathrm{M}_{\mathrm{DL}}=14.6 \mathrm{kN} / \mathrm{m} \times\left(0.005545 \mathrm{~S}^{2}+0.008332 \mathrm{~S}^{2}-0.00155 \mathrm{~S}^{2}\right)$
where $S=68.6 \mathrm{~m}$
$\mathrm{M}_{\mathrm{DL}}=-847.0 \mathrm{kN} \cdot \mathrm{m}$
Note: $624.1 \mathrm{k}-\mathrm{ft} \times\left(\frac{1.35582 \mathrm{kNm}}{1 \mathrm{k}-\mathrm{ft}}\right)=846.2 \mathrm{kN} \cdot \mathrm{m}(0.1 \%$ difference $)$
- MS18 Loading, LL Mom:

POSITIONS OF SECTIONS ALONG THE BRIDGE LENGTH

LANE:
$\mathrm{M}_{\text {uniform }}=\frac{9.4 \mathrm{kN} / \mathrm{m}}{2} \times \frac{2.2}{1.676}(0.005545+0.008332)(68.6 \mathrm{~m})^{2}$

$$
=-402.9 \mathrm{kN} \cdot \mathrm{~m}
$$

$\mathrm{M}_{\text {concentrated }}=\frac{80 \mathrm{kN}}{2} \times \frac{2.2}{1.676}(0.02788+0.03448)(68.6 \mathrm{~m})$

$$
=-224.6 \mathrm{kN} \cdot \mathrm{~m}
$$

$M_{\text {lane }}=M_{\text {uniform }}+M_{\text {concentrated }}=-627.5 \mathrm{kN} \cdot \mathrm{m}$
Note: $472.4 \mathrm{k}-\mathrm{ft} \times\left(\frac{1.35582}{1 \mathrm{k}-\mathrm{ft}}\right)=\mathbf{6 4 0 . 5} \mathbf{k N} \cdot \mathrm{m}(\mathbf{2 . 1} \%$ difference $)$ TRUCK:

Place truck in Span 2 at high pt. of IFL

$$
\begin{aligned}
\mathrm{M}_{\text {track }}= & \frac{2.2}{1.676}\left(\left[\frac{144 \mathrm{kN}}{2} \times(0.03448+0.030038)\right]\right. \\
& \left.+\left[\frac{36 \mathrm{kN}}{2} \times 0.029104\right]\right) \times 68.6 \mathrm{~m}=-465.5 \mathrm{kN} \cdot \mathrm{~m}
\end{aligned}
$$

Note: $347.8 \mathrm{k}-\mathrm{ft} \mathrm{x}\left(\frac{1.35582 \mathrm{kNm}}{1 \mathrm{k}-\mathrm{ft}}\right)=471.6 \mathrm{kN} \cdot \mathrm{m}(1.3 \%$ difference $)$

## LANE CONTROLS

$\therefore$ Total DL and LL moment @ Pier $=-847.0+(-627.5)(1.246)=$ $-1628.9 \mathrm{kN} \cdot \mathrm{m}$

## NOTE

The MS 18 vehicle dimensions are exact soft values of HS 20 vehicle dimension. Therefore, IFL ordinates will be the same as used for HS 20 vehicle.
$14 \mathrm{ft} \times\left[\frac{.3048 \mathrm{~m}}{1 \mathrm{ft}}\right] \quad=4.267 \mathrm{~m}$ vs. 4.267 m
$6 \mathrm{ft} \mathrm{x}\left[\frac{.3048 \mathrm{~m}}{1 \mathrm{ft}}\right] \quad=1.829 \mathrm{~m} \mathrm{vs} .1 .830 \mathrm{~m}$

However, vehicle loads are not exact soft values.
32 kips $x\left[\frac{4.44822 \mathrm{kN}}{1 \mathrm{kip}}\right] \quad=142.3 \mathrm{kN}$ vs. 144 kN
$.640 \mathrm{k} / \mathrm{ft} \mathrm{x}\left[\frac{14.5939 \mathrm{kN} / \mathrm{m}}{\mathrm{k} / \mathrm{ft}}\right]=9.3 \mathrm{kN} / \mathrm{m}$ vs. $9.4 \mathrm{kN} / \mathrm{m}$
$18 \mathrm{kips} \mathrm{x}\left[\frac{4.44822 \mathrm{kN}}{1 \mathrm{kip}}\right] \quad=80.1 \mathrm{kN}$ vs. 80 kN

Note: 1213 k -ft x $\left(\frac{1.35582 \mathrm{kN} \cdot \mathrm{m}}{1 \mathrm{k}-\mathrm{ft}}\right)=1644.6 \mathrm{kN} \cdot \mathrm{m}(1.0 \%$ difference $)$ Moment @ 0.4 point of Span 1 on Beam Line:

Note: $974.6 \mathrm{k}-\mathrm{ft} \mathrm{x}\left(\frac{1.35582 \mathrm{kN} \cdot \mathrm{m}}{1 \mathrm{k}-\mathrm{ft}}\right)=1321.4 \mathrm{kN} \cdot \mathrm{m}(\mathbf{0 . 8 \%}$ difference $)$

## THINK IN METRIC

In the future, no need to convert any of the following values:
$\mathrm{F}_{\mathrm{y}}=345 \mathrm{MPa}$
$\mathrm{f}_{\mathrm{c}}^{\prime}=24 \mathrm{MPa}$
Density of concrete $=24 \mathrm{kN} / \mathrm{m}^{3}$
FWS $=960 \mathrm{MPa}$

Get these values from the
Iowa DOT Handbook right away.

## Problem 3: U.S. Customary: Reinforced Concrete Compression Member

## Required:

Check the stresses in reinforced concrete compression member under the effects of axial load only and combined axial load and moment.

## Given:

$\mathrm{f}_{\mathrm{c}}{ }^{\prime}=3.5 \mathrm{ksi}$
$\mathrm{F}_{\mathrm{y}}($ reinforcement $)=60 \mathrm{ksi}$
Column size $=12$ in. $\times 12$ in.
Reinforcement: 4 - \#8 bars
Concrete cover $=2.0 \mathrm{in}$.
Lateral ties
$\mathrm{K} \frac{\mathrm{lu}}{\mathrm{r}}<34-\left(12 \mathrm{M}_{16} / \mathrm{M}_{2 \mathrm{~b}}\right)$
$\therefore$ the column is non-slender and minimum load eccentricities are not applicable. (AASHTO 8.16.5.2.4)

Load Case A: Axial Load Only
Factored axial load = 340 kips
Load Case B: Axial load + flexure
Factored axial load = 300 kips

COLUMN CROSS-SECTION

## Solution:

Case A: $P_{u}=340$ kips
$\phi \mathrm{P}_{\mathrm{n}}=\phi(0.80)\left[0.85 \mathrm{f}_{\mathrm{c}}^{\prime}\left(\mathrm{A}_{\mathrm{g}}-\mathrm{A}_{\mathrm{st}}\right)+\left(\mathrm{A}_{\mathrm{st}}\right)\left(\mathrm{f}_{\mathrm{y}}\right)\right](\mathrm{AASHTO}$ 8.16.4.1.2b)
where $P_{n}=$ nominal axial load strength of the section.
$\mathrm{A}_{\mathrm{g}}=12$ in. x 12 in. $=144 \mathrm{in}^{2}$
$\mathrm{A}_{\text {st }}=4 \times 0.79 \mathrm{in}^{2}=3.16 \mathrm{in}^{2}$
$\phi \mathrm{P}_{\mathrm{n}}=0.70 \times 0.80 \times\left[0.85 \times 3.5 \mathrm{ksi} \times\left(144 \mathrm{in}^{2}-3.16 \mathrm{in}^{2}\right)\right.$
$\left.+60 \mathrm{ksi} \times 3.16 \mathrm{in}^{2}\right]=340.8 \mathrm{kips}>\mathrm{P}_{\mathrm{u}}=340 \mathrm{kips}$
$\therefore \mathrm{OK}$
Case B: $P_{u}=300$ kips, $M_{u}=40$ ft-kips
$\phi \mathrm{P}_{\mathrm{n}}=340.8 \mathrm{kips}$ (from Case A).
Check if $\left(\frac{A_{z}-A_{s}^{\prime}}{b d}\right) \geq 0.85 \beta_{1}\left(\frac{f_{c}^{\prime} d^{\prime}}{f_{y} d}\right)\left(\frac{87,000}{87,000-f_{y}}\right)$
(AASHTO 8.16.3.4.1 Eq. 8-24)

$$
\mathrm{A}_{\mathrm{s}}=\mathrm{A}_{\mathrm{s}}^{\prime}=2 \times 0.79 \mathrm{in}^{2}=1.58 \mathrm{in}^{2}
$$

$$
\left(\frac{\mathbf{A}_{\mathbf{s}}-\mathbf{A}_{s}^{\prime}}{\mathrm{bd}}\right)=0
$$

which is less than that required by (AASTHO Eq. 8-24)
$\therefore$ Use Eq. 8-16 for $\mathrm{M}_{\mathrm{N}}$
$\phi M_{n}=\phi\left[A_{s} f_{y}(d-a / 2)\right] \quad(A A S H T O$ 8.16.3.2.1. Eq. 8-16)
where $a$ is the depth of the equivalent rectangular stress block

$$
\begin{aligned}
& \mathrm{a}=\frac{\mathrm{A}_{\mathrm{B}} \mathrm{f}_{\mathrm{y}}}{0.85 \mathrm{f}_{\mathrm{c}}^{\prime} \mathrm{b}}=\frac{1.58 \mathrm{in}^{2} \times 60 \mathrm{ksi}}{0.85 \times 3.5 \mathrm{ksi} \times 12 \mathrm{in} .}=2.655 \mathrm{in} . \\
& \mathrm{d}=12 \mathrm{in} .-2 \mathrm{in} .(\text { cover })-\frac{1 \mathrm{in} .}{2}=9.5 \mathrm{in} . \\
& \mathrm{d}^{\prime}=2 \mathrm{in} .+\frac{1 \mathrm{in} .}{2}=2.5 \mathrm{in} .
\end{aligned}
$$

$\phi \mathrm{M}_{\mathrm{n}}=0.9 \times 1.58 \mathrm{in}^{2} \times 60 \mathrm{ksi} \times\left(9.5 \mathrm{in} .-\frac{2.655 \mathrm{in} .}{2}\right) \times\left(\frac{1 \mathrm{ft}}{12 \mathrm{in}}\right)$
$=58.1 \mathrm{k}-\mathrm{ft}$
$\phi \mathrm{P}_{\mathrm{o}}=\phi \mathrm{P}_{\mathrm{n}} / 0.8=\frac{340.8 \mathrm{kips}}{0.8}=426 \mathrm{kips}$
where $P_{0}$ is the nominal axial load strength of the section at zero eccentricity
$\phi P_{b}=\phi\left[0.85 f^{\prime}{ }_{c} b a_{b}+A_{s}^{\prime} f^{\prime}{ }_{s}-A_{s} f_{y}\right]$ (AASHTO 8.16.4.2.3. Eq. 8-32)
where $a_{b}=$ depth of equivalent rectangular stress block for balanced strain conditions

$$
a_{b}=\left(\frac{87,000}{87,000+f_{y}}\right) \quad \beta_{1} d \quad \text { where } \beta_{1}=0.85
$$

(AASHTO 8.16.4.2.3. Eq. 8-34)

$$
\begin{aligned}
& =\left(\frac{87,000}{87,000+60,000 \mathrm{psi}}\right) \times 0.85 \times 9.5 \mathrm{in} .=4.779 \mathrm{in} . \\
f_{s}^{\prime} & =87,000\left[1-\left(\frac{\mathrm{d}^{\prime}}{d}\right)\left(\frac{87,000+\mathrm{f}_{\mathrm{y}}}{87,000}\right)\right]
\end{aligned}
$$

(AASHTO 8.16.4.2.3. Eq. 8-35)
$=87,000\left[1-\left(\frac{2.5 \mathrm{in} .}{9.5 \mathrm{in} .}\right)\left(\frac{87,000+60,000 \mathrm{psi}}{87,000}\right)\right]$
$=48,316 \mathrm{psi}<60,000 \mathrm{psi}$
$\phi \mathrm{P}_{\mathrm{b}}=0.7\left[0.85 \times 3.5 \mathrm{ksix} 12 \mathrm{in} . \mathrm{x} 4.779 \mathrm{in} .+1.58 \mathrm{in}^{2} \times 48.32 \mathrm{ksi}\right.$
$\left.-1.58 \mathrm{in}^{2} \times 60 \mathrm{ksi}\right]=106.5 \mathrm{kips}$
$\phi M_{b}=\phi\left[0.85 f_{c}^{\prime} b_{b}\left(d-d^{\prime \prime}-a_{b} / 2\right)+A_{s}^{\prime} f_{s}^{\prime}\left(d-d^{\prime}-d^{\prime \prime}\right)+A_{s} f_{y} d^{\prime \prime}\right]$
(AASHTO 8.16.4.2.3. Eq. 8-33)
$d^{\prime \prime}=$ distance from centroid of gross section, neglecting the reinforcement, to centroid of tension reinforcement

$$
=6-2-1 / 2=3.5 \mathrm{in}
$$

$$
\begin{aligned}
\phi \mathrm{M}_{\mathrm{b}} & =0.7[0.85 \times 3.5 \mathrm{ksi} \times 12 \mathrm{in} . \times 4.779 \mathrm{in} . \mathrm{x} \\
& \left(9.5 \mathrm{in} .-3.5 \mathrm{in} .-\frac{4.779 \mathrm{in} .}{2}\right)+1.58 \mathrm{in}^{2} \times 48.32 \mathrm{ksi} \mathrm{x} \\
& \left.(9.5 \mathrm{in} .-2.5 \mathrm{in} .-3.5 \mathrm{in} .)+1.58 \mathrm{in}^{2} \times 60 \mathrm{ksi} \times 3.5 \mathrm{in} .\right] \times\left(\frac{1 \mathrm{ft}}{12 \mathrm{in} .}\right) \\
& =70.9 \mathrm{k} \mathrm{ft}
\end{aligned}
$$

To obtain an accurate plot of the interaction diagram, "PCACOL" program is used.

## Problem 3: Metric: Reinforced Concrete Compression Member

## Required:

Check the stresses in reinforced concrete compression member under the effects of axial load only and combined axial load and moment.

## Given:

$\mathbf{f}_{\mathrm{c}}{ }^{\prime}=\mathbf{3 . 5} \mathrm{ksi}$
$\mathrm{F}_{\mathrm{y}}$ (reinforcement) $=60 \mathrm{ksi} \quad$ Use 400 MPa
Column size $=12$ in. $\times 12$ in. $\quad$ Use $300 \mathrm{~mm} \times 300 \mathrm{~mm}$
Reinforcement: 4-\#8 bars
Area $=4 \times 0.79$ in $^{2}=3.16$ in $^{2}$
$\mathrm{F}_{\text {max }}=3.16 \mathrm{in}^{2} \times 60 \mathrm{ksi}=189.6 \mathrm{kips}\left(\frac{4.448 \mathrm{k} \mathrm{kN}}{1 \mathrm{kip}}\right)=843.4 \mathrm{kN}$
Area of equivalent metric bars $=\frac{0.8434 \mathrm{MN}}{400 \mathrm{MPa}}$
$=0.002108 \mathrm{~m}^{2}=2108 \mathrm{~mm}^{2}$
4 \#25M bars: $4 \times 500 \mathrm{~mm}^{2}=2000 \mathrm{~mm}^{2}$ (Difference: $-5 \%$ )
4 \#30M bars: $4 \times 700 \mathrm{~mm}^{2}=2800 \mathrm{~mm}^{2}$ (Difference $+33 \%$ )
Try 4 \#25M
Concrete cover $=2.0$ in. $x\left(\frac{25.4 \mathrm{~mm}}{1 \mathrm{in} .}\right)=50.8 \mathrm{~mm}$

COLUMN CROSS-SECTION

## Lateral ties

$K \frac{\mathrm{l}_{u}}{\mathrm{r}}<34-\left(12 \mathrm{M}_{1 \mathrm{~b}} / \mathrm{M}_{2 \mathrm{~b}}\right)$
$\therefore$ the column is non-slender and minimum load eccentricities are not applicable. (AASHTO 8.16.5.2.4)

Loading:

## Case A: Axial Load Only

Factored axial load $=340 \mathrm{kips} \times\left(\frac{4.44822 \mathrm{kN}}{1 \mathrm{kip}}\right)=1512 \mathrm{kN}$
Case B: Axial load + flexure:

$$
\begin{aligned}
& P_{\mathrm{u}}=300 \text { kips } x\left(\frac{4.44822 \mathrm{kN}}{1 \mathrm{kip}}\right)=1334 \mathrm{kN} \\
& \mathrm{M}_{\mathrm{ux}}=40 \mathrm{ft}-\mathrm{kips} \times\left(\frac{1.35582 \mathrm{kN} \mathrm{~m}}{1 \mathrm{ft}-\mathrm{kip}}\right)=54 \mathrm{kN} \cdot \mathrm{~m}
\end{aligned}
$$

## Solution:

Case A: $P_{u}=1512 \mathrm{kN}, \mathrm{M}_{\mathrm{u}}=0$
$\phi P_{n}=\phi(0.80)\left[0.85 f_{c}^{\prime}\left(A_{g}-A_{s t}\right)+\left(\mathrm{A}_{s t}\right)\left(f_{y}\right)\right]$
(AASHTO 8.16.4.1.2b)

$$
\begin{aligned}
& \mathrm{Ag}=0.3 \mathrm{~m} \times 0.3 \mathrm{~m}=0.09 \mathrm{~m}^{2} \\
& \mathrm{~A}_{\mathrm{st}}=4 \times 500=2000 \mathrm{~mm}^{2}=0.002 \mathrm{~m}^{2}
\end{aligned}
$$

$$
\begin{aligned}
& \phi \mathrm{P}_{\mathrm{n}}= 0.70 \times 0.80 \times\left[0.85 \times 24 \mathrm{MPa} \times\left(0.09 \mathrm{~m}^{2}-0.002 \mathrm{~m}^{2}\right)\right. \\
&+\left.400 \mathrm{MPa} \times 0.002 \mathrm{~m}^{2}\right]=1.453 \mathrm{MN}=1453 \mathrm{kN}<\mathrm{P}_{\mathrm{u}}=1512 \mathrm{kN} \\
& \therefore \text { not O.K. }
\end{aligned}
$$

$\therefore$ Either increase the column dimensions or steel area.
Use Column 0.35 mx 0.30 m
$\phi \mathrm{P}_{\mathrm{n}}=0.70 \times 0.80 \times\left[0.85 \times 24 \mathrm{Mpax}\left(0.35 \mathrm{mx} 0.3 \mathrm{~m}-0.002 \mathrm{~m}^{2}\right)+400\right.$
$\mathrm{MPa} \times 0.002 \mathrm{~m}^{2} \mathrm{~J}=1.625 \mathrm{MN}=1625 \mathrm{kN}>\mathrm{P}_{\mathrm{u}}=1512 \mathrm{kN}$

$$
\therefore \text { O.K. }
$$

Case B: $P_{u}=1334 \mathrm{kN}, \mathrm{M}_{\mathrm{u}}=54 \mathrm{kN} \cdot \mathrm{m}$
$\phi \mathrm{P}_{\mathrm{N}}=1453 \mathrm{kN}$ (from Case A).
Check if $\left(\frac{A_{s}-A_{s}^{\prime}}{b d}\right) \geq 0.85 \beta_{1}\left(\frac{f_{c}^{\prime} d^{\prime}}{f_{y} d}\right)\left(\frac{599.843}{599.843-f_{y}}\right)$
(AASHTO 8.16.3.4.1 eq. 8-24)

$$
\begin{aligned}

## End of Problem 3

Problem 4: U.S. Customary: Concrete Footing on Piles

## Required:

Check footing on piles for shear and moment.

## Given:

Piles: HP $10 \times 42$, each 37 T
Equivalent square column $2.66 \mathrm{ft} \times 2.66 \mathrm{ft}$
All bars Grade 60

Reinforcement: 18 - \#7 bars

Soil cover $=1.577 \mathrm{ft}$
Concrete density $=150$ pcf
Soil density $=120 \mathrm{pcf}$

## Solution:

## Beam Shear:

Check shear on Sec. $\mathrm{X}^{\prime \prime}-\mathrm{X}^{\prime \prime}$ @ a distance (d) from the face of the equivalent square column

$$
\begin{aligned}
& \mathrm{d}_{\mathrm{x}-\mathrm{x}}=42 \mathrm{in} .-6 \mathrm{in} .-\frac{0.875 \mathrm{in} .}{2}=35.56 \mathrm{in} . \\
& \mathrm{d}_{\text {ave }}=42 \mathrm{in} .-6 \mathrm{in} .-0.875 \mathrm{in} .=35.13 \mathrm{in} .
\end{aligned}
$$

Total pile load $=3 \times 37 \mathrm{~T} \times\left(\frac{2 \mathrm{kips}}{1 \mathrm{~T}}\right)=222 \mathrm{kips}$

PLAN

ELEVATION

According to AASHTO 4.4.11.3.2, the fraction of the pile loads to be considered on Sec $\mathrm{X}^{\prime \prime}-\mathrm{X}^{\prime \prime}$ is to be computed as follows:
$\mathrm{d}_{\mathrm{p}}=$ depth of H-pile section $=9.75 \mathrm{in}$.
$\mathrm{d}_{\mathrm{p}} / 2=4.875 \mathrm{in}$.
Distance between center of H -piles and $\operatorname{Sec} \mathrm{X}^{\prime \prime}-\mathrm{X}^{\prime \prime}=$
$1.707 \mathrm{ft} \mathrm{x}\left(\frac{12 \mathrm{in} .}{1 \mathrm{ft}}\right)-18 \mathrm{in} .=2.48 \mathrm{in}$.
Load fraction to be considered $=\frac{(1.00) \times(2.48+4.875) \mathrm{in} .}{9.75 \mathrm{in} .}$ $=0.754$
$V=0.754 \times 220 \mathrm{k}-1.707 \mathrm{ft} \times 10 \mathrm{ft} \times$
$\left(3.5 \mathrm{ft} \times 0.15 \mathrm{k} / \mathrm{ft}^{3}+1.577 \mathrm{ft} \times 0.12 \mathrm{k} / \mathrm{ft}^{3}\right)=153.7 \mathrm{kips}$

$$
\begin{aligned}
& \mathrm{v}=\frac{\mathrm{V}}{\mathrm{~b}_{\mathrm{o}} \mathrm{~d}}=\frac{153.7 \mathrm{k}}{10 \mathrm{ft} \mathrm{x}\left(\frac{12 \mathrm{in} .}{1 \mathrm{ft}}\right) \times 35.56 \mathrm{in} .} \\
& \quad=0.036 \mathrm{ksi}<0.9 \sqrt{\mathrm{f}_{\mathrm{c}}^{\prime}}=0.9 \sqrt{3500 \mathrm{psi}}=53 \mathrm{psi}=0.053 \mathrm{ksi} \\
& \text { (AASHTO 8.15.5.6.4c) } \quad \therefore \text { O.K. }
\end{aligned}
$$

## Beam Shear about Y"-Y":

Similar procedure

## Two-Way Shear:

Shear plane perimeter $=b_{o}=\left(\frac{35.13 \mathrm{in} .}{2} \times\left(\frac{1 \mathrm{ft}}{12 \mathrm{in} .}\right)+1.33 \mathrm{ft}\right) \times 2 \times 4$

$$
=22.35 \mathrm{ft}
$$

Area outside shear plane $=(12 \times 10) \mathrm{ft}^{2}-(2 \times 2.79 \mathrm{ft})^{2}=88.86 \mathrm{ft}^{2}$
$\mathrm{V}=10 \times 74 \mathrm{k}-88.86 \mathrm{ft}^{2} \times\left(3.5 \mathrm{ft} \times 0.15 \mathrm{k} / \mathrm{ft}^{3}+1.577 \mathrm{ft} \times 0.12 \mathrm{k} / \mathrm{ft}^{3}\right)$

$$
=676.5 \mathrm{k}
$$

$v=\frac{V}{b_{0} d}=\frac{676.5 \mathrm{k}}{22.35 \mathrm{ft} \times\left(\frac{12 \mathrm{in} .}{1 \mathrm{ft}}\right) \times 2.927 \mathrm{ft} \times\left(\frac{12 \mathrm{in} .}{1 \mathrm{ft}}\right)}$
$=0.072 \mathrm{ksi}$
$<1.8 \sqrt{\mathrm{f}_{\mathrm{c}}^{\prime}}=1.8 \sqrt{3500 \mathrm{psi}}=106 \mathrm{psi}=0.106 \mathrm{ksi}$
(AASHTO 8.15.6.3. Eq. 8-13) $\quad \therefore$ O.K.

## Flexural Check:

$\mathrm{M}_{\mathrm{x}-\mathrm{x}}=74 \mathrm{k}[2 \times 0.17 \mathrm{ft}+3 \times 3.17 \mathrm{ft}]$
$-10 \mathrm{ft} \times\left(3.5 \mathrm{ft} \times 0.15 \mathrm{k} / \mathrm{ft}^{3}+1.577 \mathrm{ft} \times 0.12 \mathrm{k} / \mathrm{ft}^{3}\right) \times\left(\frac{4.67^{2} \mathrm{ft}^{2}}{2}\right)=651.0 \mathrm{k}-\mathrm{ft}$
Location of N.A.:

$$
\begin{aligned}
\frac{\frac{b \overline{x^{2}}}{2 n}}{2 n} & =A_{s}(\mathrm{~d}-\overline{\mathrm{x}}) \\
\mathrm{A}_{\mathrm{s}} & =18-\# 7 \mathrm{bars} \\
& =18 \times 0.6 \mathrm{in}^{2}=10.8 \mathrm{in}^{2} \\
\mathrm{~b} & =10 \mathrm{ft}=120 \mathrm{in}
\end{aligned}
$$

$$
\begin{aligned}
& \therefore \frac{120 \mathrm{in} .(\bar{x})^{2}}{2(9)}=10.8 \mathrm{in}^{2}(35.56 \mathrm{in} .-\overline{\mathrm{x}}) \\
& 6.67\left(\overline{\mathrm{x})^{2}+10.8 \overline{\mathrm{x}}-384.05=0}\right. \\
& \overline{\mathrm{x}}=\frac{-10.8 \pm \sqrt{(10.8)^{2}-4(6.67)(-384.05)}}{2(6.67)}=6.82 \mathrm{in} . \\
& \mathrm{I}=\mathrm{A}_{\mathrm{z}}(\mathrm{~d}-\overline{\mathrm{x}})^{2}+1 / 3 \frac{\mathrm{~b}(\overline{\mathrm{x}})^{3}}{\mathrm{n}} \\
& \quad=10.8 \mathrm{in}^{2}(35.56 \mathrm{in} .-6.82 \mathrm{in} .)^{2}+\frac{120 \mathrm{in} . \mathrm{x}(6.82 \mathrm{in} .)^{3}}{3 \times 9} \\
& \quad=10331 \mathrm{in}^{4}
\end{aligned}
$$

## Check of Stresses:

$$
\begin{aligned}
f_{\mathrm{s}} & =\frac{\mathrm{M} \mathrm{c}}{\mathrm{I}}=\frac{651.0 \mathrm{k}-\mathrm{ft} \times \frac{12 \mathrm{in} .}{1 \mathrm{ft}} \times(35.56 \mathrm{in} .-6.82 \mathrm{in} .)}{10331 \mathrm{in}^{4}} \\
& =21.73 \mathrm{ksi}<24 \mathrm{ksi}(\text { allowable }) \quad \therefore \text { O.K. } \\
\mathrm{f}_{\mathrm{c}} & =\frac{651.0 \mathrm{k}-\mathrm{ft} \times\left(\frac{12 \mathrm{in} .}{1 \mathrm{ft}}\right) \times 6.82 \mathrm{in} .}{9 \times 10331 \mathrm{in}^{4}} \\
& =0.573 \mathrm{ksi}<1.4 \mathrm{ksi}(\text { allowable }) \quad \therefore \text { O.K. }
\end{aligned}
$$

Flexural check about $Y^{\prime}-Y^{\prime}$

Similar procedure

## Required:

## Check footing on piles for shear and moment.

## Given:

Piles: HP 250x62, each 330 kN
Equivalent square column $800 \mathrm{~mm} \times 800 \mathrm{~mm}$
All bars Grade 400
Reinforcement: 24 \#20M bars (+ 3\% difference in area)
Soil cover $=0.50 \mathrm{~m}$
Concrete density $=24 \mathrm{kN} / \mathrm{m}^{3}$
Soil density $=19 \mathrm{kN} / \mathrm{m}^{3}$ (see Iowa DOT Handbook p. 10a)

## Beam Shear:

Check shear on Sec. $\mathrm{X"}-\mathrm{X"} \mathrm{@}$ a distance (d) from the face of the column

$$
\begin{aligned}
& \mathrm{d}_{\mathrm{x} \cdot \mathrm{x}}=1050 \mathrm{~mm}-150 \mathrm{~mm}-\frac{20 \mathrm{~mm}}{2}=890 \mathrm{~mm} \\
& \mathrm{~d}_{\mathrm{ave}}=1050 \mathrm{~mm}-150 \mathrm{~mm}-20 \mathrm{~mm}=880 \mathrm{~mm}
\end{aligned}
$$

Total pile load $=3 \times 330 \mathrm{kN}=990 \mathrm{kN}$

PLAN

According to AASHTO 4.4.11.3.2, the fraction of the pile loads to be considered on Sec $\mathrm{X}^{\prime \prime}-\mathrm{X}^{\prime \prime}$ is to be computed as follows:
$d_{p}=$ depth of H-pile section $=246 \mathrm{~mm}$
$\mathrm{d}_{\mathrm{p}} / 2=123 \mathrm{~mm}$
Distance between center of H-piles and Sec $\mathrm{X}^{\prime \prime}-\mathrm{X}^{\prime \prime}=510$ - 450

$$
=60 \mathrm{~mm}
$$

Load fraction to be considered $=\frac{(1.00) \times(60+123) \mathrm{mm}}{246 \mathrm{~mm}}=0.744$

$$
\begin{aligned}
& \mathrm{V}=0.744 \times 990 \mathrm{kN}-0.51 \mathrm{~m} \times 3.0 \mathrm{~m} \mathrm{x} \\
&\left(1.05 \mathrm{~m} \times 24 \frac{\mathrm{kN}}{\mathrm{~m}^{3}}+0.5 \mathrm{~m} \times 19 \frac{\mathrm{kN}}{\mathrm{~m}^{3}}\right)=683.5 \mathrm{kN} \\
& \mathrm{~V}=\frac{\mathrm{V}}{\mathrm{~b}_{\mathrm{o}} \mathrm{~d}}=\frac{683.5 \mathrm{kN}}{3.0 \mathrm{~m} \times 0.89 \mathrm{~m}} \\
&= 256 \mathrm{kPa}<0.075 \sqrt{\mathrm{f}_{\mathrm{c}}^{\prime}}=0.075 \sqrt{24 \mathrm{MPa}}=0.367 \mathrm{MPa}= \\
& \underline{367 \mathrm{kPa}}
\end{aligned}
$$

(AASHTO 8.15.5.6.4c \& AASHTO App. E)

## Beam Shear about Y"-Y":

Similar procedure

## IF YOU CANNOT REMEMBER WHAT UNITS TO USE

Allowable shear stress $=0.075 \sqrt{\mathrm{f}_{\mathrm{c}}^{\prime}}(\mathrm{SI}) \quad 0.9 \sqrt{\mathrm{f}_{\mathrm{c}}^{\prime}}$ (U.S. Customary) where $f_{c}{ }_{c}$ is measured in: ? psi

1st method: try an example:

$$
\begin{aligned}
\mathrm{v}_{\text {all }} & =0.9 \sqrt{3500 \mathrm{psi}} \\
& =53 \mathrm{psix}\left(\frac{6.89476 \mathrm{kPa}}{1 \mathrm{psi}}\right) \\
& =\underline{365 \mathrm{kPa}}
\end{aligned}
$$

$\mathrm{Pa}: 0.075 \sqrt{24 \times 10^{6} \mathrm{~Pa}}=367 \mathrm{~Pa}$
$=0.367 \mathrm{kPa}$ (incorrect)
$\mathrm{kPa}: 0.075 \sqrt{24000 \mathrm{kPa}}=1800 \mathrm{kPa}$ (incorrect)
$\mathrm{MPa}: 0.075 \sqrt{24 \mathrm{MPa}}=0.367 \mathrm{MPa}=367 \mathrm{kPa}$ (correct)
$\therefore$ Use MPa

2nd Method: Convert the equation.

$$
\begin{aligned}
& \mathbf{v}_{\text {all }}(\text { in } \mathrm{psi})=0.9 \sqrt{\mathrm{f}_{c}^{\prime}(\text { in } \mathrm{psi})} \\
& 1 \mathrm{ksi}=6.89476 \mathrm{MPa} \\
& 1 \mathrm{MPa}=0.145 \mathrm{ksi}=145.0 \mathrm{psi} \\
& 145 \mathrm{v}_{\text {all }}(\text { in MPa })=0.9 \sqrt{145 \mathrm{f}_{\mathrm{c}}^{\prime}(\text { in } \mathrm{MPa})} \\
& \mathrm{v}_{\text {all }}(\text { in } \mathrm{MPa})=\frac{0.9 \sqrt{145}}{145} \sqrt{\mathrm{f}_{\mathrm{c}}^{\prime}(\text { in } \mathrm{MPa})} \\
& =0.075 \sqrt{\mathrm{f}_{\mathrm{c}}^{\prime}(\text { in MPa })} \\
& \therefore \text { Use MPa in this equation }
\end{aligned}
$$

Shear plane perimeter $=b_{o}=(400+440) \mathrm{mm} \times 2 \times 4$

$$
=6720 \mathrm{~mm}=6.72 \mathrm{~m}
$$

Area outside shear plane $=(3.6 \times 3.0) \mathrm{m}^{2}-(1.68)^{2} \mathrm{~m}^{2}=7.98 \mathrm{~m}^{2}$
$\mathrm{V}=10 \times 330 \mathrm{kN}-7.98 \mathrm{~m}^{2} \mathrm{x}$
$\left(1.05 \mathrm{~m} \times 24 \frac{\mathrm{kN}}{\mathrm{m}^{3}}+0.5 \mathrm{~m} \times 19 \frac{\mathrm{kN}}{\mathrm{m}^{3}}\right)=3023 \mathrm{kN}$
$v=\frac{V}{b_{0} d}$
$=\frac{3023 \mathrm{kN}}{6.72 \mathrm{~m} \mathrm{x} \mathrm{0.88m}}=511 \mathrm{kPa}$
$<0.149 \sqrt{\mathrm{f}_{\mathrm{c}}^{\prime}}=0.149 \sqrt{24 \mathrm{MPa}}=0.730 \mathrm{MPa}=730 \mathrm{kPa}$
(AASHTO 8.1.5.6.3. Eq. 8.13)
O.K.

Flexural Check:
$\mathrm{M}_{\mathrm{x}-\mathrm{x}}=330 \mathrm{kN}[2 \times 0.05 \mathrm{~m}+3 \times 0.95 \mathrm{~m}]$

$$
\begin{aligned}
& -3.0 \mathrm{~m}\left(1.05 \mathrm{~m} \times 24 \frac{\mathrm{kN}}{\mathrm{~m}^{3}}+0.5 \mathrm{~m} \times 19 \frac{\mathrm{kN}}{\mathrm{~m}^{3}}\right) \times \frac{(1.4 \mathrm{~m})^{2}}{2} \\
& =871.5 \mathrm{kN} \cdot \mathrm{~m}
\end{aligned}
$$

$$
\begin{aligned}
& \text { Location of N.A.: } \\
& \frac{b \overline{x^{2}}}{2 n}=A_{B}(d-\bar{x}) \\
& A_{s}=24 \# 20 \mathrm{M} \text { bars } \\
& =24 \times 300 \mathrm{~mm}^{2} \\
& =7200 \mathrm{~mm}^{2} \\
& \text { b }=3.0 \mathrm{~m}=3000 \mathrm{~mm} \\
& \therefore \frac{3000 \mathrm{~mm}(\overline{\mathrm{x}})^{2}}{2(9)}=7200 \mathrm{~mm}^{2}(890 \mathrm{~mm}-\overline{\mathrm{x}}) \\
& 166.67(\bar{x})^{2}+7200 \bar{x}-6408000=0 \\
& \bar{x}=\frac{-7200 \pm \sqrt{(7200)^{2}-4(166.67)(-6408000)}}{2(166.67)}=176 \mathrm{~mm} \\
& I=A_{s}(d-\bar{x})^{2}+1 / 3 \frac{b(\bar{x})^{3}}{n} \\
& =7200 \mathrm{~mm}^{2}(890-176)^{2} \mathrm{~mm}^{2}+\frac{3000 \mathrm{~mm} \times(176)^{3} \mathrm{~mm}^{3}}{3 \times 9} \mathrm{~mm}^{3} \\
& =4276 \times 10^{6} \mathrm{~mm}^{4}
\end{aligned}
$$

Check of Stresses:

$$
\begin{aligned}
& \mathrm{f}_{\mathrm{s}}=\frac{\mathrm{M} \mathrm{c}}{\mathrm{I}}=\frac{871.5 \mathrm{kNm} \times(0.89-0.176) \mathrm{m}}{4276 \times 10^{-6} \mathrm{~m}^{4}} \\
&=145522 \mathrm{kPa}=146 \mathrm{MPa}<165 \mathrm{MPa} \text { (allow.) } \\
& \therefore \text { O.K. } \\
& \mathrm{f}_{\mathrm{c}}=\frac{871.5 \mathrm{kNm} \times 0.176 \mathrm{~m}}{9 \times 4276 \times 10^{-6} \mathrm{~m}^{4}} \\
&=3986 \mathrm{kPa}=4.00 \mathrm{MPa}<9.65 \mathrm{MPa} \text { (allow.) }
\end{aligned}
$$

Flexural check about $Y^{\prime}-Y^{\prime}$ is similar

|  | U.S. Customary | Metric | \% Difference |
| :---: | :---: | :---: | :---: |
| Beam Shear |  |  |  |
| Load (V) | $153.7 \mathrm{k}=683.7 \mathrm{kN}$ | 683.5 kN | $0.0 \%$ |
| Stress (v) | $36 \mathrm{psi}=248 \mathrm{kPa}$ | 256 kPa | $-3.1 \%$ |
| Two-way Shear |  |  |  |
| Load (V) | $676.5 \mathrm{k}=3009 \mathrm{kN}$ | 3023 kN | $-0.5 \%$ |
| Stress (v) | $72 \mathrm{psi}=496 \mathrm{kPa}$ | 511 kPa | $-2.9 \%$ |
| Flexure |  |  |  |
| Moment (M) | $651.0 \mathrm{k}-\mathrm{ft}=882.6 \mathrm{kN} \cdot \mathrm{m}$ | $871.5 \mathrm{kN} \cdot \mathrm{m}$ | $1.3 \%$ |
| Stress (f f$)$ | $21.73 \mathrm{ksi}=150 \mathrm{MPa}$ | 146 MPa | $2.7 \%$ |
| Stress (f f$)$ | $0.573 \mathrm{ksi}=3.95 \mathrm{MPa}$ | 4.0 MPa | $-1.2 \%$ |

## Basic Conversions:

Mass: 1 lb mass $=0.4536 \mathrm{~kg}$
Length: $1 \mathrm{ft}=0.3048 \mathrm{~m}$
Time: 1 second $=1$ second
$\mathrm{g}=9.806 \mathrm{~m} / \mathrm{s}^{2}$
All other conversion factors can be derived from these.
Example:

$$
\begin{aligned}
1 \mathrm{ksi} & =\frac{1 \mathrm{kip}}{\mathrm{in}^{2}}=10^{3} \frac{\mathrm{lb}}{\mathrm{in}^{2}} \\
& =10^{3} \frac{\mathrm{lb}}{\mathrm{in}^{2}} \times\left(\frac{0.4536 \mathrm{~kg}}{1 \mathrm{lb}}\right) \times\left(\frac{1 \mathrm{in} .}{25.4 \mathrm{~mm}}\right)^{2} \\
& =0.7031 \frac{\mathrm{~kg}}{\mathrm{~mm}^{2}} \\
& =703100 \frac{\mathrm{~kg}}{\mathrm{~m}^{2}} \times 9.806 \frac{\mathrm{~m}}{\mathrm{sec}^{2}}(\text { to change from mass to force }) \\
& =6.895 \times 10^{6} \frac{\mathrm{~N}}{\mathrm{~m}^{2}}=6.895 \mathrm{MPa}
\end{aligned}
$$

## 9. Acknowledgment

The metric course presented in these course notes was developed by the Bridge Engineering Center under the auspices of the Engineering Research Institute of Iowa State University. The course was sponsored by the Highway Division, Iowa Department of Transportation, and the Highway Research Board under Research Project HR-378.

The authors wish to extend sincere appreciation to several engineers of the Iowa DOT, Office of Bridges and Structures for their support, cooperation and counseling. In particular, we wish to thank William A. Lundquist, Bridge Engineer, who had the original idea for the metric course. We wish to acknowledge and also thank the following engineers for their contributions in various phases of the course: John P. Harkin, Sandra Q. Larson, and Ronald Meyer.

We also wish to acknowledge our secretary, Denise K. Wood, who typed the course notes and made countless revisions, corrections, and alterations for the authors.
