A COMPUTER BASED INFORMATION SYSTEM FOR COUNTY EQUIPMENT COST RECORDS

1.0 INTRODUCTION

This report describes the work accomplished to date on research project HR-173, A Computer Based Information System for County Equipment Cost Records, and presents the initial design for this system. The specific topics discussed here are findings from the analysis of information needs, the system specifications developed from these findings, and the proposed system design based upon the system specifications. The initial system design will include tentative input designs for capturing input data, output designs to show the output formats and the items to be output for use in decision making, file design showing the organization of information to be kept on each piece of equipment in the computer data file, and general system design explaining how the entire system will operate.

The Steering Committee¹ appointed by Iowa Highway Research Board is asked to study this report, make appropriate suggestions, and give approval to the proposed design subject to any suggestions made. This approval will permit the designer to proceed promptly with the development of the computer program implementation phase of the design.

2.0 ANALYSIS OF INFORMATION NEEDS

In this section a report is made concerning our:

 Study of the equipment cost record systems in a representative group of counties.

1See Appendix A for Steering Committee members.

- Study of the applicable Iowa Department of Transportation, Highway Division systems for equipment cost record collection, storage and use.
- 3. Review of applicable texts and other information relating to equipment costs and information systems.
- 4. Investigation of the computer facilities available at the Highway Division to determine the possibility of using these facilities for the operational phase.

These studies and investigations were made consistent with our original proposal [1] for this project.

The information obtained from each of these studies will now be discussed in detail.

2.1 STUDY OF EQUIPMENT COST RECORD SYSTEMS IN A REPRESENTATIVE GROUP OF COUNTIES

The investigators visited with county engineers or their representatives in nine selected counties. These counties were selected based upon advice of the Steering Committee and included counties in different parts of the state with varying population and geographical sizes. Two of these counties have already implemented computerized cost record keeping systems.

The counties and persons visited, and dates of the visits are shown below.

1.	Poweshiek County	M. O. Hansen	November 26, 1974
2.	Linn County	Bill Harrington	January 9, 1975
3.	Montgomery County	Cleo Smith	January 14, 1975
4.	Madison County	Tim Waddingham, Admin. Asst.	January 16, 1975

5.	Jasper County	Chuck Cabalka	January 16, 1975
6.	Warren County	Bob Sandy	January 21, 1975
7.	Boone County	Carl Schnoor	January 21, 1975
8.	Clayton County	Milt Johnson	January 28, 1975
9.	Black Hawk County	Paul Schwarting	March 18, 1975

Montgomery and Black Hawk counties have already developed computer based equipment cost accounting systems.

From our discussions we found that all these counties are collecting data on direct operating cost items to include fuel, oil, tires, grease, antifreeze, expendable parts (e.g., blades and filters), repair and overhaul parts, and maintenance and repair labor. Each county has its own forms for collecting these direct cost items as well as the number of miles or hours each piece of equipment was used during a given time period. Forms used for collecting cost data were obtained from each county as well as equipment inventory lists. Representative forms may be found in Appendix C.

Basically two ways are used to capture direct cost data for each piece of equipment. The first way is by the operator recording items on his time card or on other forms for specific cost items, e.g., a fuel ticket. The second way that the direct cost items are captured is by shop personnel recording cost items on shop maintenance and repair forms. Then, periodically, say monthly, the data on these forms are transferred to a summary form. Usually, there is one summary form for each piece of equipment, containing sufficient space for direct operating cost data for one year.

At the end of the year (calendar year in the counties visited) the direct operating costs are totaled. In five counties, a depreciation figure is also then recorded for the particular piece of equipment. In Jasper County, the depreciation amounts come

from detailed graphs of depreciation which have been developed for each piece of equipment. However, the other counties use less formal means of establishing depreciation charges. At any rate, the appropriate totals are then divided by the total number of hours or miles the equipment has been operated during the year. The result gives the annual cost per hour or mile for operating the equipment.

The resulting cost per hour or mile figures are being used in a number of different ways, to include establishing rental rates for entire classes of equipment (i.e., all motor graders, trucks, etc.), comparing operating costs for similar equipment made by different manufacturers, and determining which equipment to rebuild or trade due to high operating costs.

None of the counties appear to be including indirect costs in the cost per hour or cost per mile figures. Indirect costs are costs which cannot be directly attributed to a piece of equipment; such overhead costs must be allocated on an equitable basis to ensure that each piece of equipment assumes its fair share of these costs. Representative indirect costs include insurance, storage, supervisory and clerical overhead. Although some of these costs are more attributable to ownership than operation, they should, none-the-less, be included in the development of total cost per hour or cost per mile figures.

Another observation is that each county engineer visited appeared to be willing to adopt a uniform computer based system. County engineers in Black Hawk and Montgomery counties, which already have computer based systems, stated that the new system would undoubtedly duplicate some existing procedures, thereby adding some additional costs to their current operation. However, it appears that the added cost will be minimal.

Based upon equipment counts from the nine counties visited, it appears that there are about 9000 pieces of equipment state wide which should be reported upon once this system is operational. This number has been determined by including all self-propelled equipment and any other equipment with a list price over \$5000. This is an average of about 90 pieces of equipment per county.

Operating the proposed system on an annual basis seemed to be most favorable to the county engineers visited. Most of the existing systems gather and report annual data. While it would be possible to make all reports on a monthly, quarterly, or semiannual basis, the value of such added information does not appear to be in proportion to the added cost that would be incurred.

Finally, the additional output desired by the county engineers includes reporting average costs per hour or mile figures for a given class of equipment within each county, and for a representative district in which the county is located, as well as for the whole state. They also desire cost per hour or mile figures for equipment, subcategorized by manufacturer and age of the equipment.

2.2 STUDY OF APPLICABLE HIGHWAY DIVISION SYSTEMS

The investigators visited the Highway Division of the Iowa Department of Transportation on February 11, 1975, to study the Highway Division's system of equipment cost accounting. The Highway Division's A & B-F Equipment System and computer system were discussed with Mr. J. F. Hoag, Data Processing Director, and Mr. Kenneth L. Shafer, Systems Project Manager. The investigators also met with Mr. Stephen E. Roberts of the Steering Committee during this period.

Three main areas were investigated during these meetings. These included a study of the Highway Division's A Equipment Cost System, the Highway Division's computer hardware system and its potential for use with the system proposed here, and an attempt to find a contact point for entering the counties data into the Highway Division's Data Processing Department for computer processing. The Highway Division's computer system and Data Processing Department will be discussed in detail in Section 2.4.

We were interested in obtaining documentation of the Highway Division's A Equipment System because the A Equipment most nearly matches the type of equipment we are working with in this research study. The A Equipment System is a computerized billing, inventory, and accounting system which is used to keep track of all selfpropelled equipment owned and operated by the Highway Division of the Iowa Department of Transportation. This system stores operating cost information for each piece of equipment for both the fiscal year and for the life of the equipment. Costs include operation charges, depreciation charges, fuel expense, parts, and labor. Total mileage or hours are also stored for the current year and for the life of the equipment. We spent several hours discussing this system with Mr. Shafer and obtained written documentation [9] of it.

Our further studies of the A Equipment System have indicated that while it is a most worthwhile system for state purposes, it is not directly applicable or adaptable to processing summary data in the form needed by county engineers. None-the-less, we have learned much from our study of this system and have incorporated many of its concepts into the design proposed here.

In our discussion with Mr. Hoag and Mr. Shafer, it was learned that while the Highway Division's Data Processing Department would be pleased to provide computer services for the proposed system, their group does not act as an initial entry point for input data from outside groups. Therefore, another initial entry point would be required to collect data from the various counties and turn it over to the Data Processing Department. We discussed this need with Mr. Roberts, and he suggested the Secondary Roads Department as a possibility. However, no decision has yet been made concerning this point.

2.3 REVIEW OF APPLICABLE TEXTS AND MANUFACTURERS INFORMATION

Equipment costs refer to the over-all cost entailed in providing and utilizing the services of equipment. These costs may be classified several ways. Some of these classifications are: a) operating and ownership costs, b) variable and fixed costs, and c) direct and indirect costs [5]. The elements making up total equipment costs fall into various general categories depending on the classification system used. For example, one cost element is fuel. The cost of fuel is an operating cost under classification a), a variable cost under b), and a direct cost under c). A review of literature applicable to county equipment cost record keeping [2,8], has shown that the most appropriate and common way to classify costs is to use the direct and indirect cost system. Another important part of over-all equipment cost, in addition to direct and indirect costs, is depreciation. A discussion of these three cost factors taken from the NACE Action Guide Series [8] follows.

"Direct cost is composed of two parts, repair and operating cost. Repair cost means the cost of parts and materials installed or consumed in repairing or overhauling equipment, together with the labor expended in these operations. Also included are the costs of services performed by commerical shops. Operating cost means the cost of supplies consumed in operating and servicing equipment, including servicing obtained from commerical services. It includes the cost of consequential amounts of labor involved in servicing, other than that of operators on duty with the equipment. The following are typical operating cost items: fuel, lubricants, grease, tires and tubes, tire repairing, and expendable accessories (spark plugs, batteries, fan belts, etc.).

Indirect costs are those not identified with any particular unit or equipment, thus requiring prorating costs to all equipment benefited. Following are typical examples of indirect costs:

- Salaries and expenses of supervisory employees not directly employed in servicing or repairing equipment.
- Clerical salaries of employees engaged in accounting and preparing reports for equipment.
- 3. Shop storage and miscellaneous costs of an overhead nature relating to the care and handling of equipment, such as:

- a) Utilities.
- b) Office and shop building depreciation, rental and maintenance.
- c) Depreciation of shop equipment.
- d) Replacement of expendable shop tools.
- e) Office supplies.
- f) Salary of shop foreman or superintendent.
- g) Moving equipment.
- h) Equipment Insurance

Depreciation is the measure of the declining value of property due to age and wear. It is normally based on the original cost of the equipment including erection, attachments, and transportation, less the estimated salvage value at the time the equipment is retired from service. This is the depreciation base. Thus a unit costing \$14,000 less an estimated salvage value of \$2,000 at replacement time would have a depreciation base of \$12,000....

The depreciated value (purchase price less accumulated depreciation) of a unit of equipment will seldom equal the actual secondhand market value of the particular unit. The age, amount of use and mechanical condition will determine the resale or trade-in value, which may be greater or less than the depreciated or book value."

Iowa law apparently prohibits the use of revolving funds [2] in accounting procedures for county-owned equipment. Therefore a separate fund cannot receive depreciation charges from each job performed. This has been interpreted by county engineers as implying that depreciation figures should not be included in determining rental rates for costing out jobs. They should be included, however, for internal control purposes such as determinations affecting equipment replacement and purchase of new equipment.

When this system was originally proposed, it was thought that extensive studies of equipment manufacturers information would be needed for determining such things as equipment classifications. However, the A Equipment System and reference [4] obviated the need for a detailed study of equipment manufacturers materials.

2.4 INVESTIGATION OF COMPUTER FACILITIES AVAILABLE

At the start of this study it was felt that the Highway Division's computer facility would be an ideal one on which to operate the information system for county equipment cost records. Our subsequent studies have shown that this is indeed the case.

The Highway Division's computer is an IBM 370/145. The IBM S/370 is the newest line from IBM and the 145 is a medium sized model within the S/370 line. This system has 1 million bytes (positions for storing characters) of storage in the main computer memory. This computer operates under a system which makes it look to users as if there are 16 million bytes of main memory available. This is more than adequate for our intended use.

Some of the peripherals attached to the 370/145 include an IBM 3300 magnetic disk, six magnetic tape drives for reading and writing data from and to magnetic tapes, a punched card reader, a line printer which produces the printed output, and approximately 25 remote terminals. The main computer and peripheral gear are compatible with the computer system at the University of Iowa on which the computer programs for the equipment cost accounting system are being developed.

Moreover, a working relationship already exists between the counties and the Highway Division with their analysts, programmers and computer personnel already attuned to county road and equipment needs. In addition, formal assurance has been received from Mr. Howard Gunnerson (see Appendix B) that their data processing services are available for this purpose.

The computer programming languages available for use on this system include COBOL and PL/1. The A Equipment System is written in COBOL, mainly because its development began before PL/1 was widely used or available. However, it is our intention to use the PL/1 language when writing the computer programs for the new system being developed. PL/1 is a powerful language with data handling and manipulation capabilities even stronger than COBOL's and its computational capabilities are unmatched in commonly available general purpose languages.

An estimate has been made of anticipated data processing operational costs. The maximum cost for one hour of computer central processing time is about \$175. It would probably take no more than one hour of such time each time the county equipment cost system is run. The major cost would probably be the cost of keypunching, that is, punching cards suitable for entering the data into the computer

from the forms submitted on each piece of equipment from each county. The cost for keypunchers is about \$4.00 per hour. If this system is run on an annual basis it may take 200 hours of keypunching time. Other costs include cards, magnetic tapes, and continuous form paper (the paper the output is printed on), and postage. With all counties taking part on an annual basis, and costs allocated equally to all counties, the estimated cost per county is approximately \$20 per year. This does not include the costs of data collection and preparation on the county level prior to submitting summaries to the data processing facility.

3.0 GENERAL SYSTEM SPECIFICATIONS

This section documents and summarizes the developmental work accomplished to date. It is the end result of the system study subphase of the application development process. The system study has focused on the determination of the new system's objectives and the development of the input-output processing system specifications.

3.1 SYSTEM DESCRIPTION-EXISTING SYSTEMS²

There is at the present time no uniform state-wide system for analyzing county equipment costs. A minority of the counties have implemented systems for equipment cost records. The existing systems are all different. Most of the data collected is on direct cost items; however, a few counties include depreciation figures. There is little uniformity among direct cost elements collected and depre-

²See Section 2.1 also.

ciation methods used. Most of the counties with existing systems use manual or machine bookkeeping and accounting methods; however, several counties have recently implemented computer data processing systems. While the present systems determine cost per hour or cost per mile figures for individual pieces of equipment, these figures are not available by equipment class, manufacturer, or age. Few counties have maintained historical records of equipment costs.

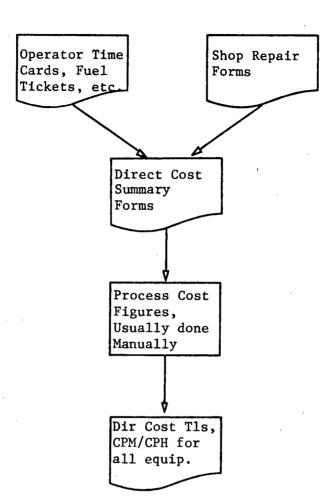

3.2 OBJECTIVES OF THE NEW SYSTEM

The primary objective of the computer based information system for county equipment cost records is to provide a uniform system in all counties for gathering, storing, processing, and using data and information on equipment costs.

To achieve this objective the system should have the capability of specifying and gathering all appropriate direct, indirect, and depreciation costs; establishing and maintaining an equipment cost data base containing general information on all applicable equipment owned by the counties, and historical cost information on that equipment; and providing output in neat, readable form which will aid county engineers in making new equipment purchases and establishing equipment rental rates. In addition the proposed system should have the side benefit of serving as an equipment inventory list for classes of equipment maintained by the system.

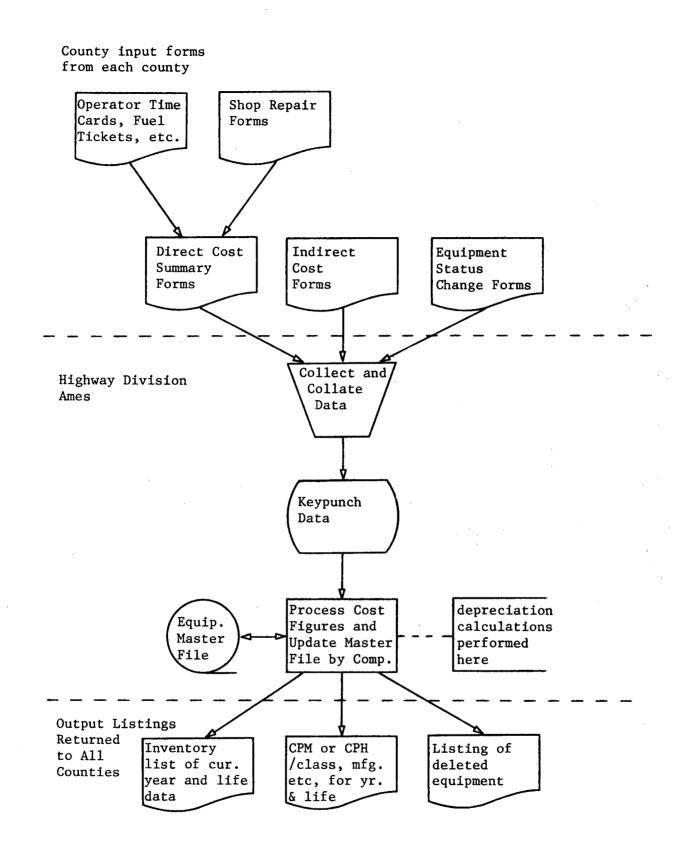

3.3 GENERAL FLOWCHARTS

This section of this report presents a flowchart comparison of a typical existing manual equipment cost system with that of the proposed system. A typical existing system is shown on the following page.

Each existing system we studied handled only direct costs for equipment owned by that county with little or no summary capability; moreover, no regular capability for exchange of information exists between counties.

The proposed system is designed to incorporate indirect costs and depreciation information as well as that pertaining to direct costs, for all counties in the state, and to provide appropriate summary data and reports. Flow of information for the proposed system is shown in the following diagram.

The operation of the system and particular information gathered will be discussed subsequently in this report.

3.4 INPUT/OUTPUT REQUIREMENTS

Three input forms are required for entering data from each county into the data processing system. They are the Direct Cost Summary Forms, the Indirect Cost Form, and Equipment Status Change Form. The Direct Cost Summary Forms will contain the periodic (most probably annual) direct cost summaries on each piece of equipment from each county. The Indirect Cost Form will contain all the indirect equipment costs for the period. The Equipment Status Change Form will be used to enter new equipment into the data base, change or correct data items on a piece of equipment already in the data base, or to delete a piece of equipment from the data base. The items included on each of these three input forms are shown in Figures 1, 2, and 3.

Figures 4, 5, 6, 7, and 8 give examples of the three basic outputs from the system: 1) an inventory listing of all equipment by county (Figure 4); 2) a listing of calculated cost per hour or mile for each individual piece of equipment and class, by county (Figure 5), average cost per hour or mile for each class of equipment by county, district, and state (Figure 6), and an average cost per hour or mile for each class of equipment by manufacturer and age (Figure 7); and 3) a listing of equipment being deleted from the equipment master file (Figure 8). These outputs will be produced by the information system and returned to each county by the appropriate contact group in the Highway Division.

3.5 FILE CONSIDERATIONS

The Equipment Master File will contain each of the fields shown below. There will be one record, each containing all these fields,

3.6 VOLUMES OF DATA AND OTHER SPECIFICS

- The equipment to be included in the data base is all selfpropelled equipment and all other equipment having a list price over \$5,000.
- An average of 90 pieces of such equipment per county is expected, or about 9000 pieces of equipment in the entire data base.
- 3. About fifteen to twenty change in equipment status reports are expected from each county per year.
- 4. Cost data are to be gathered daily in each county. For convenience monthly summaries should be prepared prior to preparing the annual input data summary which will be submitted for computer data processing in January of each year.
- 5. The system's output listings produced by the information system will be returned to each county in February of each year.

3.7 COMPLEMENTARY SYSTEMS

The computer programs to be developed for the proposed system will not directly be a part of any other existing system. However, the computer programs will produce an updated yearly equipment inventory listing by county from the Equipment Master File. This inventory listing (Figure 4) will be provided to each county along with the other output from the system.

3.8 ESTIMATED OPERATIONAL COSTS

The following estimates are based upon participation by all 99 counties, an estimated data base of 9000 pieces of equipment, and computer processing being done once a year at the Highway Division's Data Processing Department.

- Data Processing Costs Computer time, keypunching and verification, cards, computer output paper, magnetic tapes, and postage - Twenty dollars (\$20) per county per year. See Section 2.4.
- 2. Clerical salaries of employees in each county engaged in preparing input forms for submission to data processing -\$600 to \$1000 per county per year. This estimate is based upon two days per month spent in collecting, sorting, and transcribing equipment cost data from their original forms to the summary forms.
- 3. Input forms \$200 to \$500 dollars per county per year.

3.9 OTHER GROUND RULES

The proposed system is being designed such that the total number of pieces of equipment in the Equipment Master File could increase by

100% and still be handled easily by the computer hardware. However, any large increase in the data base will somewhat increase the turnaround time from the submission of the input forms to the data processing service until receipt of computer output. This would occur mainly because the majority of the data processing time is spent in keypunching and verification and because county data processing requests are considered to be of lower priority than state needs within the Highway Division's Data Processing Department.

The Equipment Master File is being designed so that some blank space is being left in each record. This will allow additional data to be stored on each piece of equipment, if this is desired in the future. Approximately 30 blank spaces will be included in each record. Adding data items to each record sometime in the future, however, would require some modification of the computer programs used to process the records.

Although the system being designed is viewed as an annual one, if a decision is made to run it more often, it must be recognized that the data processing cost projections of Section 3.8 will increase approximately linearly with the number of runs made and that the probability of slower turnaround time increases because of the added burden on the keypunch staff.

The proposed system is oriented toward use by all counties in the state. However, the county code has been designed with an allowance for expansion. This would allow cities to enter their equipment into the equipment data base and to receive the same type of outputs as received by the counties.

4.0 PROPOSED SYSTEM DESIGN

The design phase consists of such design considerations as output design, input design, file design, and the general system design. Items presented in the sections which follow include the proposed design of input and output formats; suggestions for capturing (initially recording) input data; data file organization, access method, and storage medium choices; detailed system flowcharts; proposed design of coding systems for equipment classification; and plans for handling equipment depreciation and indirect costs.

4.1 INPUT AND OUTPUT FORMATS

Input Formats

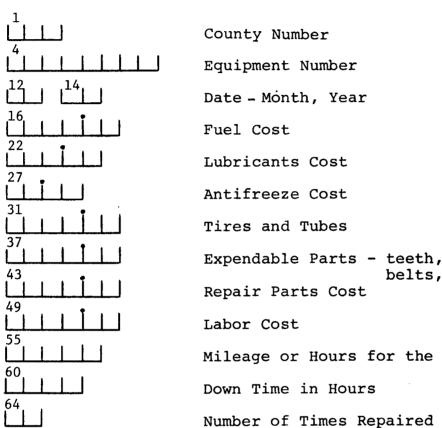

As mentioned previously, three input forms will be needed to input data into the data processing system. They are the Direct Cost Summary Form, the Indirect Cost Form, and the Equipment Status Change Form. Figures 1, 2, and 3 of Section 3.4 presented data items included on each of these forms. The designs which follow attempt to make completion of the forms easy while also making them easy to process.

Direct Cost Summary Form

The Direct Cost Summary Form contains a dollar total of all the direct cost items, the hours or miles operated, the down time, and the number of times repaired during the time period. Two design alternatives are presented. The first alternative, Figure 9, uses one form per piece of equipment. The second alternative, Figure 10, calls for placing the data of 15 pieces of equipment on one form. Both forms have been designed for ease of completion and keypunching.

Figure 9. Direct Cost Summary Form

Alternative 1

County Number Equipment Number Date - Month, Year Fuel Cost Lubricants Cost Antifreeze Cost Tires and Tubes Expendable Parts - teeth, blades, filters, plugs belts, etc. Repair Parts Cost Labor Cost Mileage or Hours for the Reporting Period Down Time in Hours

Figure 10. Direct Cost Summary Form

Alternative 2

Cty. Equipment Date Fue1 Lubr. Anti- Tires/ Expendable Repair Labor Miles/ Down Times No. No. M Y Cost Costs Freeze Tubes Parts Parts Cost Hours Time Repaired 49 22 27 60 64 ,16 31 43 12 14 37 55 ,1 የ 1 1 1 1 1 1 1 1 1 1 1 1 . . 1 . . . **T** . 11191 1 1 1 9 1 1 1111 1111 1 1 1 9 1 | 1 . 7 . 1 1 . . 9 . 8 . . 1 . I T 1111 11191 1111 1 1 1 1 1 1 111111111 111 1 1 1 1 1111 11 1 1 1 9 1 1 P 1 1 1 9

A decision on which form to implement is needed; however, either form will work with the planned design.

In comparing the two alternatives, there are several tradeoffs which should be recognized. Alternative 1 would have fewer coding and keypunching errors because it is easier to read and understand. However, the volume of these type forms is great because one form is needed for each piece of equipment. Alternative 2, will decrease the volume of Direct Cost Summary Forms needed by a factor of 15 over Alternative 1, but is not as readable and would not be as easy to fill out. With either alternative design, one card would be punched for each piece of equipment. We prefer the use of Alternative 2.

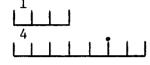

Indirect Cost Form

The Indirect Cost Form contains all of a county's indirect equipment costs for the time period just completed. There will be just one form per county. It is recognized that indirect costs will be more difficult than direct costs to determine accurately, however, they are a part of the total equipment cost and should be included in cost per hour or cost per mile calculations. Figure 11 shows the proposed Indirect Cost Form.

Following the annual submission of the Indirect Cost Form the total indirect equipment cost for a county will be allocated by the computer to each piece of equipment in that county's equipment inventory. It is proposed that the portion of the total indirect cost allocated to each piece of equipment be calculated as follows [2]:

 Find the total indirect equipment cost for a county by adding individual cost components shown on the Indirect Cost Form.

Figure 11. Indirect Cost Form

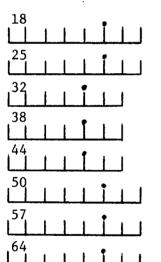

County Number

Salaries and expenses of supervisory employees not directly employed in servicing or repairing equipment

11 Salaries of clerical employees engaged in accounting and preparing reports for equipment

Shop storage and miscellaneous overhead costs relating to equipment care and handling

- a) Utilities
- b) Shop and office building depreciation, maintenance, and/or rental
- c) Depreciation of shop equipment
- d) Replacement cost of expendable shop tools
- e) Office supplies
- f) Cost of moving equipment
- g) Equipment insurance
- h) Mobile radio equipment

- Divide the total in Step 1 by the total current book value (original cost depreciated to date) of all equipment in that county's inventory.
- For each piece of equipment, multiply the result of Step
 by the current value of each piece of equipment. This gives an indirect cost for each piece of equipment.

Equipment Status Change Form

The Equipment Status Change Form will be used for a variety of functions. It will be used to enter the data on new equipment into the data base. It will be used to change or correct data items already in the data base which may have been entered incorrectly the previous time period. It will also be used to delete from the data base equipment which has been sold, junked, or traded during the previous time period. It is planned to use one form for each addition, deletion, or change. Three punched cards can result from each of these forms. The proposed design is shown in Figure 12.

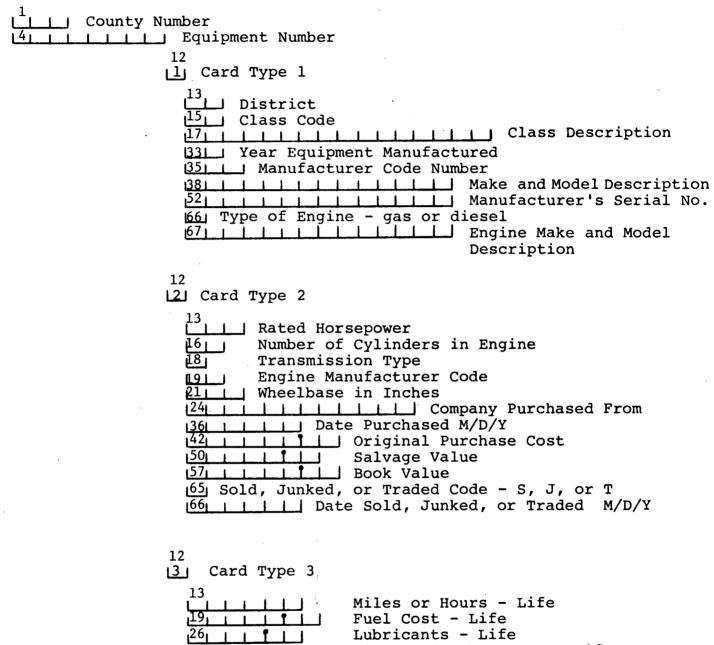

Output Formats

The designs for the output formats were presented in Section 3.4 in Figures 4 through 8. It is projected that the total amount of printed output to be returned to each county will be approximately 200 pages each year presuming annual runs. The majority of this output, about three-fourths, will come from the output shown in Figure 6.

4.2 COLLECTING DIRECT COST INPUT DATA

To be successful, this new system must provide a way to collect direct cost data accurately and easily. All repairs and supplies must be charged to a particular unit of equipment as they are fur-

Fuel Cost - Life Lubricants - Life Tires and Tubes Cost - Life Expendable Parts - Life Antifreeze Cost - Life Parts Cost - Life Labor Cost - Life nished. Several forms are appropriate for capturing these charges, they are: 1) a county repair order form, 2) a daily report of fuel and lubricants supplied, 3) a daily operators time and equipment report, and 4) a monthly summary form. It is our understanding, however, that the design decisions on the type of forms mentioned above will be made by the Bookkeeping Committee of the Iowa Highway Research Board, and that the detailed design of these forms is not directly a part of this research project. See Appendix C for examples of forms which could be adopted with minor alterations. Several are from References [2] and [8]. The remainder are currently being used in different Iowa counties.

Whatever design is chosen for the above forms care must be taken to capture the data items needed for the Direct Cost Summary Form. A review of those items is given here to insure proper collection:

- Each form must provide space for the equipment or machine number - all equipment within each county must have a unique identification number.
- Each form must have spaces to contain the date; when these forms are used for a period of time, space must be allowed for the beginning and ending date.
- 3. Space must be given for recording quantities of fuel, lubricants (crankcase oil, transmission oil, grease), and antifreeze. Space may be allowed for the cost of these items, or the cost may be calculated from current rates when a transfer is made to the monthly summary form.
- Space must be allowed for recording the cost of tires and tubes.

- 5. Space must be allowed for recording the cost of expendable parts such as teeth, blades, filters, sparkplugs, ignition points, belts, batteries, etc. It would be a good idea to provide space to list these items also when their cost is charged to a piece of equipment.
- Space must be allowed for listing repair part items and their cost.
- Space must be allowed for listing repair and maintenance labor costs.
- 8. Space must be allowed to list the current odometer or hour meter reading. The net mileage or hours can then be calculated for the summary form by finding the difference between the reading at the beginning of the period and that at the end of the period.
- 9. Space should also be allowed to keep track of down time in hours, that is, the working time in hours a piece of equipment is not operational.
- 10. Space should also be allowed to keep track of the number of times each piece of equipment required repairs during the time period.
- 11. It appears appropriate to allow space for several other items which could be used for internal county control. Some of these are operator's name, mechanic's name, project worked on, location of project within county, and operation codes to charge projects to.

4.3 DATA FILE DESIGN

The design of the equipment data file consists of record layout, a choice of file organization, the choice of a method by which to access the file, and choosing the medium on which to store the file. The record layout design is given in Section 3.5.

Sequential organization has been chosen as the type of file organization. File organization refers to how records are actually arranged on the file. It is the physical structure of the file. Sequential organization exists when the physical and logical organization of the file are the same. For example, consider the logical organization of our equipment master file to be first, all the equipment from Adair County in order by their equipment number, followed by all the equipment from Adams County in sequence by their equipment number, and so on. If we had each of the equipment records on punched cards in the same sequence as the logical organization, we have an actual physical sequential organization. Although we are not using punched cards for the master file, the same analogy holds for magnetic tape or magnetic disk.

Sequential organization is the most widely used file organization. It is the easiest to understand, and is applicable to all media (punched cards, magnetic tape, magnetic disk, etc.) used in data processing. However, when a file is organized sequentially it can only be accessed sequentially. Access refers to how records are written to a file or retrieved from it. With sequential access, the file is read, one record at a time from the beginning of the file to the end or until the desired record is read.

The justification for choosing sequential file organization and access is as follows. The file will be read and updated infrequently, probably only once a year, but when it is read, all the records in the whole file will be read. Since all the records must be updated, it is simplest from a computer programming viewpoint to just start

from the beginning of the file and read each record sequentially. Sequential organization is the recommended file organization when the frequency of use of the file is low, but the percentage of the file used is high, which is the case here. Also, by using sequential organization the size and possible growth of the file will pose no problems.

The file medium chosen for the equipment master file is magnetic tape. The entire equipment master file will fit easily on one reel of tape. Magnetic tape is inexpensive, offers fairly good protection for the file (a backup copy of the file can be stored somewhere else), can be easily transferred from one data processing site to another, can be used with various brands of computer hardware, can be read fairly rapidly by the computer, and is being used by the Highway Division's A-Equipment System. Backup systems for the master file will be discussed in our final report.

4.4 SYSTEM FLOWCHARTS

The system flowcharts shown in Figures 13, 14, 15, 16, and 17 were developed from the general flowchart of the proposed system given in Section 3.3. These flowcharts show a more detailed flow of data and information and provide an expanded concept of the processing functions which will take place.

4.5 CODING SYSTEMS

A number of coding systems have been designed to aid in the complete classification of all pieces of equipment. Codes have been designed for the following:

Figure 13.

System Flowchart

Page 1

Counties

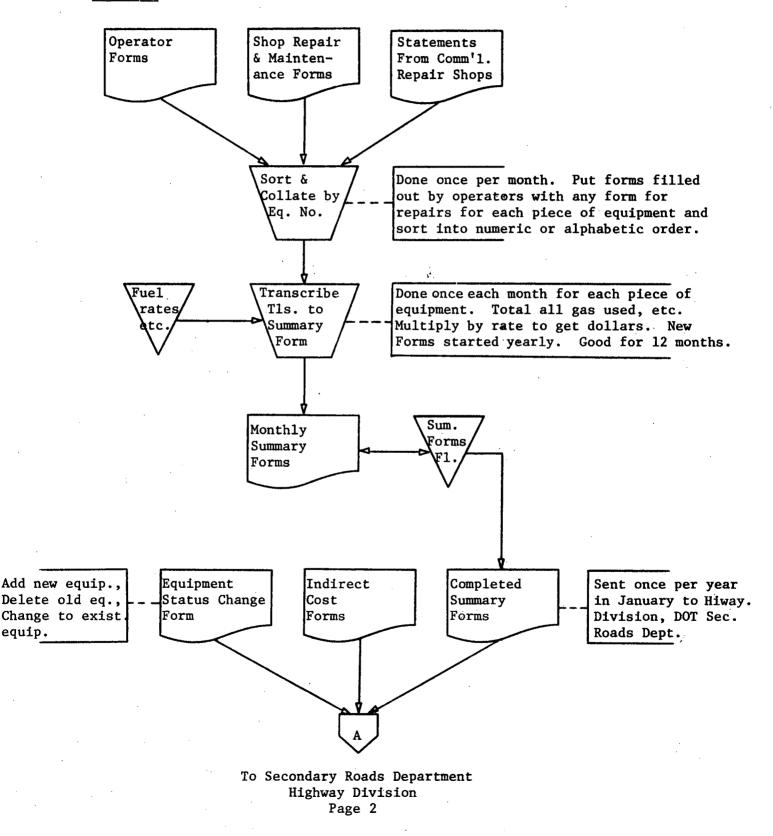

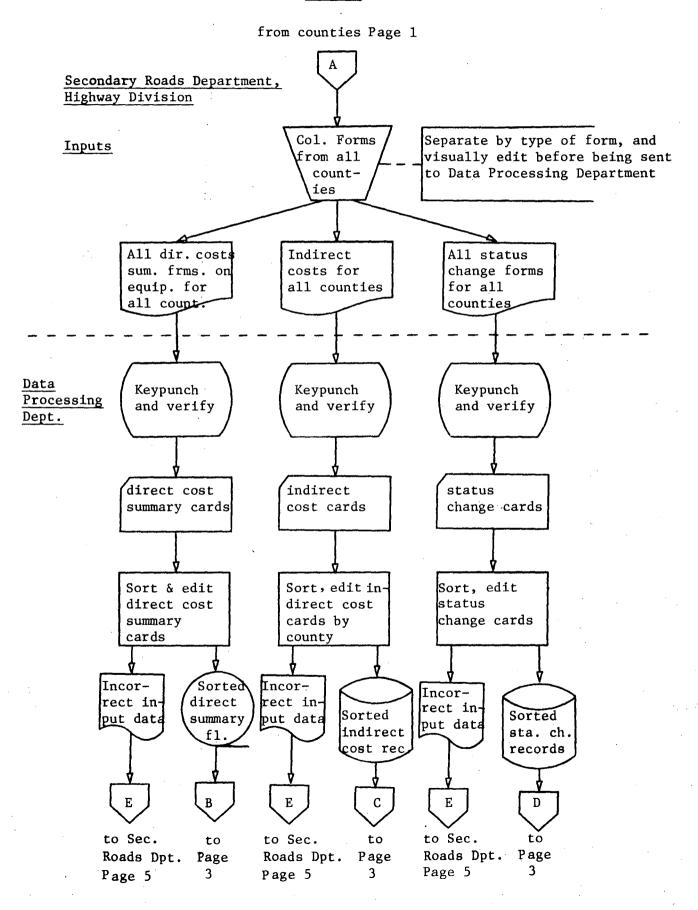

Figure 14.

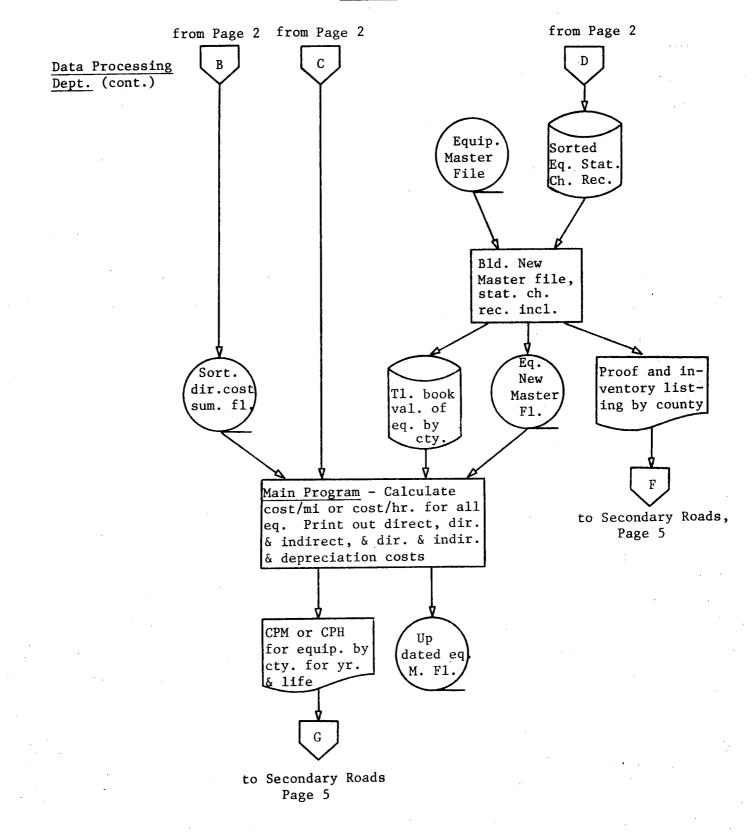

System Flowchart

Page 2

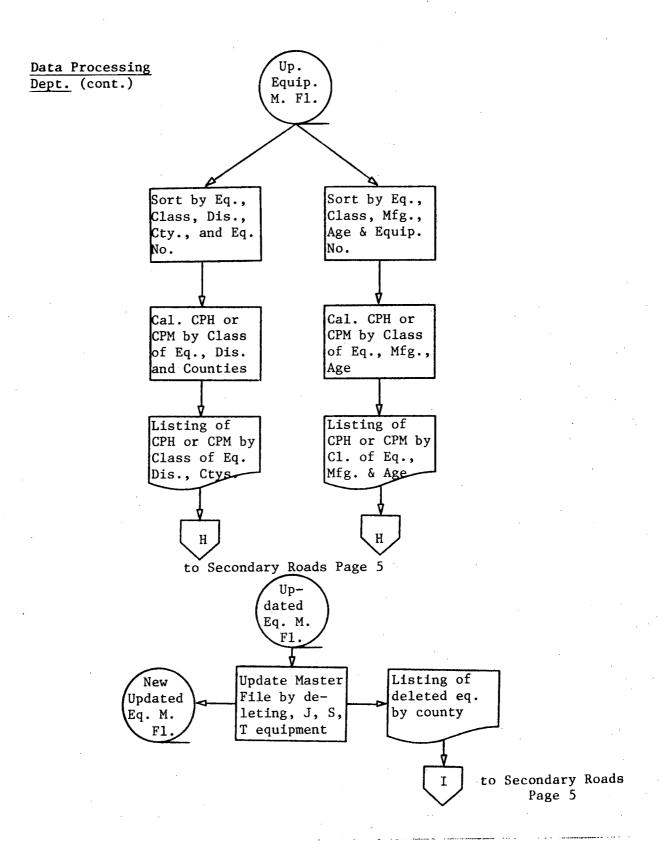

System Flowchart

System Flowchart

Page 4

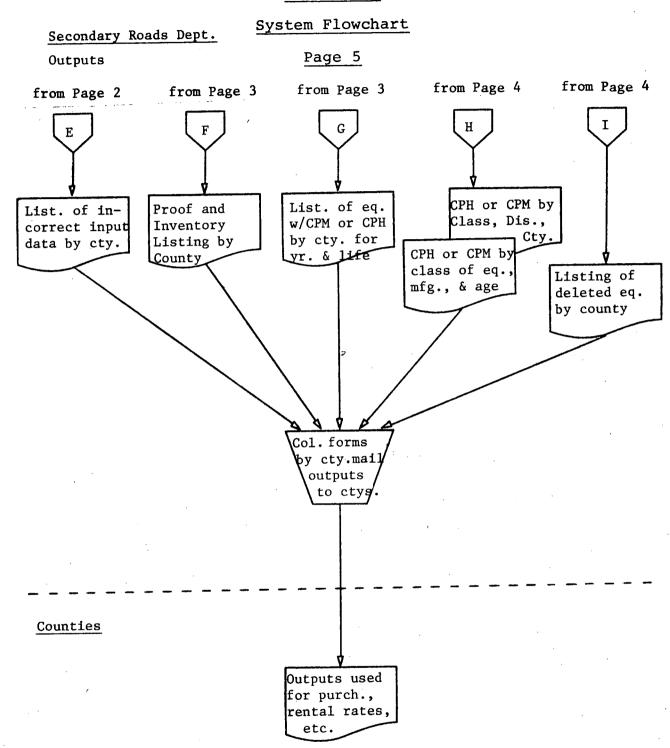

Figure 17.

- 1. Counties
- 2. Equipment Classes
- 3. Equipment Manufacturers
- 4. Engine Manufacturers
- 5. Transmission Code
- 6. Districts of the State
- 7. Number of Cylinders in the Engine
- 8. Fuel Burned
- 9. Disposal Code

Each will be explained in the following paragraphs.

The code chosen for the county code is the well known method of alphabetizing the counties and numbering them in ascending order. This is shown in Figure 18. Note a three digit code is shown to allow for expansion if some cities use this system in the future.

The code chosen for equipment classification is shown in Figure 19. This classification is a modified form of the class code used in the Highway Division's A Equipment System. The equipment with codes 01 through 16 will yield cost per mile figures. The rest will yield cost per hour figures.

A list of equipment manufacturers and codes is given in Figure 20. If the list is incomplete, names of additional manufacturers will be added in the final design.

A list of engine manufacturers and codes is given in Figure 21. This list should also be checked for completeness.

The transmission code chosen is simply an A for automatic transmissions, and an S for standard transmissions.

It is planned to divide the state into a number of districts so counties can make cost comparisons with counties in the same geo-

graphical part of the state. No final design has been made on the arrangement or number of districts. However, six possible district arrangements are presented in Figures 22, 23, 24, 25, 26, and 27. The Steering Committee should select one of these six or suggest some other arrangement. The district arrangement shown in Figure 25 is favored by the investigators.

The number of cylinders in the engine will be recorded in the equipment data base. The code will simply be the number of cylinders (2, 4, 6, 8, 12).

The type of fuel used in the engine of each piece of equipment will be recorded. The letter G will be used for a gasoline engine, and a D for a diesel engine.

A disposal code will be used to show why equipment is being dropped from the data base. The planned code is J for Junked, S for Sold, and T for traded.

4.6 EQUIPMENT DEPRECIATION

It is planned to include depreciation calculations in the computer programs being written for this system. Initial planning is oriented toward using the straight line depreciation method, mainly because of its ease of understanding and implementation. It is planned to establish a useful lifetime for each equipment class over which to completely depreciate the equipment.

Figure 28 presents three sources of useful lifetimes for depreciation purposes for the various equipment classes. The Highway Division's lifetimes were taken from those used in the A Equipment System [9]. The Forke Brothers Blue Book [6] figures were determined by analyzing the age of used heavy equipment sold by Forke Brothers.

The <u>Public Works</u> [7] figures were given in the November, 1974 issue. One figure for each equipment class must be selected by the Steering Committee before final computer program design can be accomplished.

The original cost of the equipment less any salvage value will be divided by the useful life to arrive at a yearly (or other period) depreciation cost. This cost will be included in the total equipment cost for the time period. Book value will be updated each time period by subtracting the depreciation cost for each time period from the book value of the previous period.

It is planned to provide output figures of cost per hour or cost per mile both including depreciation cost and without including depreciation cost.

5.0 SUMMARY

This report has presented ways and means of collecting direct costs, indirect costs, and depreciation charges for county equipment. It has also presented a proposed design for processing this data into appropriate output useful for decision making. Outputs include proposed tabulations by county, district, and state levels as well as classifications by manufacturers and age of equipment.

Throughout the report an attempt has been made to explicitly point out items requiring decisions by the Steering Committee. The content of this report should be discussed at an early meeting of the investigators and the Steering Committee.

REFER TO: 350

Mr. Bob G. Sandy, President Iowa County Engineer's Association County Engineer's Office Indianola, IA 50125

Dear Bob:

The counties may use the Iowa State Highway Commission's data processing services for the County Highway Equipment cost accounting system that is being developed if you wish.

The services will be provided on a reimbursement basis and with the understanding that there may be times that there will be delays because other priority items are being processed.

If there are any questions related to programming, feel free to contact J.F. Hoag, P.E., Data Processing Director.

Very truly yours,

Howard E. Gunnerson Director - Chief Engineer

This field report is designed to more easily report time of men and machines; where & what is done; for charging to the proper accounts, fill in your card carefully and clearly, using numbers to describe what you are doing. File your card promptly at the end of each reporting period. If you are in doubt about how to list something, ask your superior or the bookkeeper.	100 ENGINEERNOG 110 Preliminary Engineering 112 Office engineering 113 Material tests 114 Test borings 115 Traffic & speed studies 117 Plans, specs & estimates 118 Aerial surveys 119 Other costs 120 Right of Way 123 Appraisers; salaries & expense 125 Reonomic studies; surveys 129 Other costs 129 Other costs 150 Construction Engineering	 421 Mud jacking and undersealing 423 Plant-mix seal (-1M) 424 Scarifying and remixing 425 Bit.treatment(inv.penetration) 426 Resurfacing (bit.sand seal) 427 Protection & traffic handling during above operations 429 Other costs 440 Shoulders and side approaches 441 Patching 442 Reseeding and resolding 443 Bituminous resealing 444 Replacing in kind 445 Other costs 440 Other costs 440 Other costs 440 Diver costs 440 Other costs 440 Diver costs 440 Diver costs 440 Diver costs 440 Diver costs 440 Reseation and washouts 461 Brosion and washouts 462 Prainage channels & structures 	 510 Snow and ice control 511 Snow removal 512 Snow fence; erection & removal 513 Sanding icy surfaces 514 Application of chemicals 515 Ice removal 516 Opening inlets & channels 529 Other costs 530 Traffic control, service facilities 531 Painting, striping & markings Repairing, maintaining: 532 Signal equipment 533 Traffic signs 534 Neural rails 535 Right-of-way fences 538 Highway lighting system 549 Outer facilities
