Study of Pavement Marking Retroreflectivity	18

DISCLAIMER

The contents of this report reflect the views of the author and do not necessarily reflect the official views of the Iowa Department of Transportation. This report does not constitute any standard, specification or regulation.

RESEARCH DATA AND FINAL REPORT

This final report contains two separate reports which describe the retroreflectivity levels of various traffic signs and pavement markings on the Iowa primary road system. The data was collected in the fall/winter of 1994 and given to the Federal Highway Administration in March of 1995. This information is currently being combined with similar information from other jurisdictions across the country for the purpose of determining the impact of mandated minimum retroreflectivity levels. The FHWA will be releasing their report sometime in 1996.

In October 1992, Congress mandated (Public Law 102-388) the Secretary of Transportation to revise the Manual of Uniform Traffic Control Devices to include a minimum level of retroreflectivity for pavement markings and traffic signs which shall apply to all roads open to public travel. In 1994, the FHWA initiated research studies to determine the retroreflectivity levels which currently exist for signs and markings in an attempt to develop standards which are reasonable to implement. The Iowa Department of Transportation participated in both of the studies and the final reports are included.

After compilation and analysis of the collected retroreflectivity data, the FHWA will propose the new MUTCD standards through the federal rule making process. It is estimated that the actual MUTCD change will occur sometime in late 1997 or early 1998.

STUDY OF SIGN RETROREFLECTIVITY

Iowa Department of Transportation

March 8, 1995

Mr. Ernest Huckaby
Federal Highway Administration (HHS-21)
400 Seventh Street, SW
Washington, D.C. 20590

Dear Mr. Huckaby:

The Iowa Department of Transportation's study of sign retroreflectivity has determined the following results for each type of sign category. Refer to the enclosed tables for specific information regarding each reference.

Warning signs: Of the 164 warning signs measured, only three signs did not exceed the proposed minimum retroreflectivity. The three failing signs were all object markers. This may be caused by the close placement of the object markers to the roadway where they receive much more abrasive and chemical abuse from the traffic flow. Also, they are not a "typical" sign and may not be given as high of priority during inspection.

White on red regulatory: Only one white on red regulatory signs (of the 266 surveyed) failed to pass minimum retroreflectivity. The failing stop sign looked to be in excellent condition, but the sheeting appeared to be defective.

Black on white regulatory: Of the 222 black on white regulatory signs sampled, none failed the proposed minimum retroreflectivity.

Guide signs: One-hundred white on green guide signs were sampled. None of the sampled signs failed the minimum retroreflectivity.

Mr. Ernest Huckaby

March 6, 1995

Page 2

From the 752 signs surveyed in the minimum retroreflectivity study, our results show a very small percentage of signs which will need to be replaced if the proposed minimum retroreflectivity levels are implemented. The summary of our collected data is compiled in the following categories:

- Number of signs needed to be replaced:

From the gathered data, a maximum of 2,500 signs would need to be replaced as a result of implementing the proposed minimum retroreflectivity values.

- Percentage of signs needed to be replaced:

The overall percentage of signs to be replaced is less than 1%.

- Cost of sign replacement:

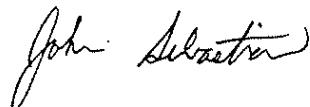

The cost will be approximately \$50,000.

- Impact on budget and staffing:

Due to the small number of signs effected, no budget or staffing levels will be changed by implementing the proposed minimum retroreflectivity levels.

With such a small number of effected signs, the existing method of determining sign replacement (visually conducting daytime and nighttime reviews) probably will not change. A statewide retroreflectivity monitoring of random signs will probably be implemented to insure compliance, to determine trends, and to check for uniformity throughout the state.

Sincerely,

John Sebastian
Traffic Engineering

STUDY OF PAVEMENT MARKING RETROREFLECTIVITY

Iowa Department of Transportation

800 Lincoln Way, Ames, IA 50010

515 239-1129

515-239-1891 FAX

March 23, 1995

Mr. Ernest Huckaby
Federal Highway Administration
400 Seventh Street, SW
Washington, D.C. 20590

Dear Mr. Huckaby:

We have analyzed the pavement marking retroreflectivity readings taken on Iowa Department of Transportation roadways and offer the following comments. The attached data and charts are helpful when interpreting this information.

WATERBORNE PAINT - RURAL FREEWAY

Average Reading	163
Standard Deviation	94
Total Readings	300
Readings below 80	25%
Readings below 100	32%
Readings below 120	39%

As can be seen from the attached chart, the readings are evenly distributed throughout the 40 to 290 mcd/lux/m² range with no sign of a bell curve.

WATERBORNE PAINT - OTHER RURAL

Average Reading	128
Standard Deviation	65
Total Readings	385
Readings under 80	23%
Readings under 100	35%
Readings under 120	48%

The data looks similar to a bell curve with the peak being located near the average of 130 mcd/lux/m².

Mr. Ernest Huckaby
Page 2
March 20, 1995

WATERBORNE PAINT - URBAN FREEWAY

Average Reading	144
Standard Deviation	90
Total Readings	275
Readings under 80	36%
Readings under 100	44%
Readings under 120	50%

Forty-four percent of the readings are between 40 and 120 mcd/lux/m² and most of the other readings were evenly distributed between 120 and 290 mcd/lux/m².

WATERBORNE PAINT - OTHER URBAN

Average Reading	184
Standard Deviation	98
Total Readings	149
Readings under 80	21%
Readings under 100	22%
Readings under 120	23%

In general, the readings are evenly distributed between a wide range of values; however 16% of the readings are greater than 300 mcd/lux/m².

EPOXY MARKINGS - URBAN FREEWAY

Average Reading	164
Standard Deviation	74
Total Readings	180
Readings under 80	12%
Readings under 100	21%
Readings under 120	32%

Forty-six percent of the readings fall between 100 and 170 mcd/lux/m² with most of the remaining readings being higher than 170 mcd/lux/m².

EPOXY MARKINGS - RURAL FREEWAY

Average Reading	166
Standard Deviation	80
Total Readings	130
Readings under 80	9%
Readings under 100	15%
Readings under 120	22%

Mr. Ernest Huckaby
Page 3
March 20, 1995

The attached chart for these markings shows some resemblances to a bell curve with the peak being located near the average of 160 mcd/lux/m².

As part of this retroreflectivity study, each participating jurisdiction was asked to answer the following three questions regarding the proposed minimum retroreflectivity levels of 80, 100 and 120 mcd/lux/m².

1. How often would the markings have to be replaced?

Currently, 95% of our roadways are marked using traffic paints. As a minimum, all center lines and lane lines are repainted each year and the edgelines are repainted every other year. Most edge lines and some center/lane lines are repainted more often. Considering the substantial percentage of readings below the proposed levels, and the high standard deviations found in the study, it is safe to say that the Department will always have a percentage of readings below any minimum level. A program would have to be implemented to increase the frequency of painting and increase the glass bead application rate. Also, a statewide program to place more durable markings would have to be initiated.

2. Cost of replacement for each of the three above levels?

Following is a proposed marking improvement program with estimated costs.

80 mcd/lux/m² :

Increase painting frequency 20%	= \$ 800,000
Increase glass bead rate 30%	= \$ 150,000
Statewide durable marking projects	= \$1,000,000

Total Estimated Annual Cost	= \$1,950,000
-----------------------------	---------------

100 mcd/lux/m² :

Total Estimated Annual Cost	= \$4,000,000
-----------------------------	---------------

120 mcd/lux/m² :

Total Estimated Annual Cost	= \$6,000,000
-----------------------------	---------------

Mr. Ernest Huckaby
Page 4
March 20, 1995

3. Impact on existing and proposed budget and staffing for each of the above levels?

The annual budgets would be impacted as noted above. The staffing levels of the State would not change, however, more private industry personnel would be contracted.

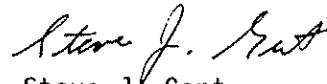

The Department hopes that the FHWA carefully considers all of the issues facing minimum retroreflectivity standards. We believe it is important to stress the importance of good retroreflective markings but we don't know if setting minimum standards is the most appropriate method. Our concern lies in the fact that pavement markings cannot be effectively measured and the measurements are not repeatable because of the large variability associated with pavement markings. The high standard deviations are proof of this statement. In addition, pavement marking retroreflectivity changes constantly due to wear on the markings, moisture on the roadway surface, soil particles/dirt, dried salt brine, etc. The fact is that any individual with a hand-held retroreflectometer can go to a short section of roadway anywhere in the United States and "hand-pick" hundreds of very poor readings.

On the other hand, setting minimum retroreflectivity values for traffic signs does make sense. We can measure signs effectively and those measurements are repeatable. Sign retroreflectivity does not change dramatically over time and the readings are fairly consistent throughout a given sign.

We were very disappointed to hear that Tonya, Inc. will not be coming back to Iowa to recheck the same locations this spring. This information would have enabled the Iowa DOT and the FHWA to determine how snow removal practices affect pavement marking retroreflectivity. This is an area where northern states have a lot of concerns regarding minimum levels because of the inability to effectively place markings from December through April of each year.

Thank you for allowing us to participate in this very important study.

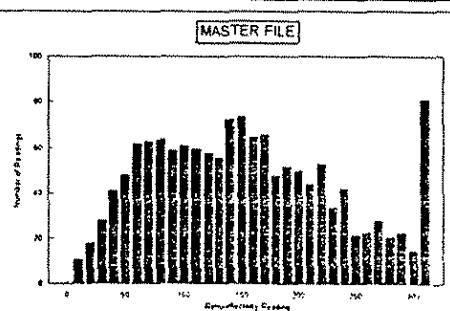

Sincerely,

Steve J. Gent
Traffic Operations Engineer
