## IOWA'S 5 PERCENTSAFETY REPORT

## Background

Section 1401 of the Safe, Accountable, Flexible, Effic ient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) amended Section 148 of Title 23 USC to create a new Highway Safety Improvement Program (HSIP) as a "core" Federal Highway Administration program with separate funding. The purpose of the HSIP is to reduce traffic fatalities and serious injuries on public roads. As part of the new HSIP, states are required to submit an annual report describing not less than 5 percent of their highway locations exhibiting the most severe safety needs. The intent of this provision is to raise the public a wareness of the highway safety needs a nd challenges in the states.

This report must include an assessment of:

- potential remedies to haza rdous locations identified;
- estimated costs associated with remedies; and
- impediments to implementation other than cost.

## Discussion

Highway crashes are very complex. Contributing factors can include a roadway's design, pavement conditions (e.g. rain, snow and ice), a vehicle's mechanical condition (e.g. tires, brakes, lights), a driver's behavior (e.g. speed ing, inattentiveness a nd seat belt usage), as well as the driver's condition (e.g. alcohol use, age-related conditions, physic al impaiment). In fact, the driver's behavior and condition factors are the primary cause in an estimated 67 percent of highway crashes and a contributing factor in an estimated 95 percent of all crashes.

Assuch, highway safety needs go beyond just physic al improvements to a specific roadway or intersection, and include changes to driver behavior. These are best addressed with a multi-disc iplinary approach using engineering, enforcement, emergency response, and education strategies.

## lowa's most severe safety needs

Based on an analysis of lowa's 2001-2005 fatal and major injury crashes, lowa's most severe safety needs are related to crashes involving:

- intersections;
- single vehic les running off the road;
- vehic les crossing the medians on freeways;
- unbelted drivers and passengers;
- impaired drivers; and
- speeding.

The a nalysis following this discussion identifies the 5 percent of lowa's most severe safety needs in each of the a reas listed above.

Historic ally the lowa DOTs intersection "Safety Candidate List" identified the 200 highest ranked intersections relative to crash history. lowa's 5 percent most severe intersection safety needs are the highest 5 percent of these intersections. There are more than 100,000 miles of public roads in lowa. Candidate roadway safety projects are the 5,000 miles of roadway with the greatest crash history. Therefore, lowa's5 percent most severe comidor safety needs are 5 percent of this 5,000 miles.

## Proposed Improvements and Schedules

In establishing engineering, education, enforcement, and emergency response prionties, state agencies considerfactors beyond those depicted in this report. For instance, decisions regarding any roadway or intersection improvements a re based on deta iled engineering studies that consider the strategies most appropriate for site-specific conditions, as well as the cost and a ntic ipated effectiveness of those improvements. Scheduling of these improvements is also contingent upon the availability of highway safety improvement funds.

The following pages detail lowa's most severe 5 percent safety needs.

## Rural two－lane intersection crashes

（Highest 5 percent based on data from 2001－2005）

SITE SELECTION CRITERIA:
FIVE PERCENT OF THE 5,000 MLES WITH THE HIGHEST AVERAGE ANNUAL FATAL AND MAJOR INJURY SINGLE VEHICLE RUN-OFF-THE-ROAD CRASH DENSITY DURING $2001-200$
Footnotes:
(1) Potential Remedies
(a) Paving a part of the shoulder and installing shoulder rumble strips
(c) Upgrading roadway by adding lanes, partial paved shoulders or intermittent shoulder rumble strips
(2) For those without a cost entry, cost estimate is unknown until ater study is completed.
(3) Impediments:
** Possible impediments are unknown until atter a study is completed. There could be environmental or right-of-way impediments if shoulder widening is required.

Rural expressway and two-lane primary roads with the highest fatal and major injury crash density for speed-related crashes (Highest 5 percent based on data from 2001-2005)

*Driver contributing circumstances: exceeded authorized speed, drove too fast for conditions, lost control, followed too close or over corrected/over steered
SITE SELECTION CRITERIA:
IVE PERCENT OF THE 5,000 MILES WITH THE HIGHEST AVERAGE ANNUAL FATAL AND MAJOR INJURY CRASH DENSITY FOR SPEED-RELATED CRASHES DURING 2001-2005 (STATEWIDE AVERAGE $=0.029$ FATAL AND MAJOR INJURY CRASHES/MILE/YEAR)
(1) Potential remedies include
public awareness and educatio
increased speed enforcement in these corridors; and
improved signing at curves.
(2) The estimated cost is unknown and variable. Identification of these corridors provides an opportunity for state and local agencies to target these corridors for additional speed enforcement and public awareness/education using existing staff and funding resources. Seeking funding for additional enforcement and public awareness/education will be considered.
(3) Competing demands for current enforcement and public awareness/education staff time

Rural primary roads with highest fatal and major injury crash density of unbelted drivers and passengers (Highest 5 percent based on data from 2001-2005)

| COUNTY | ROUTE | DESCRIPTION | LENGTH (MILES) | FATALITIES AND MAJOR INJURIES INVOLVING AN UNBELTED DRIVER/PASSENGER | ANNUAL UNBELTED FATALITY AND MAJOR INJURY DENSITY (CRASHES/MI/YR) | Potential Remedies (1) | Estimated Costs <br> (2) | Impediments Other Than Cost (3) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| CASS | INTERSTATE 80 | POTTAWATTAMIE COUNTY TO ADAIR COUNTY | 23.28 | 15 | 0.129 |  |  |  |

SITE SELECTION CRITERIA
FIVE PERCENT OF THE 5,000 MILES WITH THE HIGHEST AVERAGE ANNUAL FATAL AND MAJOR INJURY CRASH DENSITY OF UNBELTED DRIVERS/PASSENGERS DURING 2001-2005 (STATEWIDE AVERAGE $=0.023$ FATAL AND MAJOR INJURY CRASHES/MILE/YEAR)

Footnotes:
(1) Potential remedies include:
public awareness and education; and
increase seat belt enforcement in these corridors.
(2) The estimated cost is unknown and variable. Identification of these corridors provides an opportunity for state and local agencies to target corridors for additional seat belt use enforcement and education using existing staff and funding resources. Seeking funding for additional enforcement and education efforts will be considered.
(3) Competing demands for current enforcement and public awareness/education staff time.

Rural primary roads with the highest fatal and major injury crash density involving an impaired driver * (Highest 5 percent based on data from 2001-2005)

* blood alcohol content greater than zero, alcohol test refused, drug test positive, drug test refused or driver condition classified as under the influence of alcohol/drugs/medication

SITE SELECTION CRITERIA:
FIVE PERCENT OF THE 5,000 MILES WITH THE HIGHEST AVERAGE ANNUAL FATAL AND MAJOR INJURY CRASH DENSITY INVOLVING AN IMPAIRED DRIVER DURING 2001-2005 (STATEWIDE AVERAGE $=0.011$ FATAL AND MAJOR INJURY CRASHES/MILE/YEAR)

Footnotes:
(1) Potential remedies include-

Increased public awareness and education and impaired-driver enforcement in these corridors.
(2) The estimated cost is unknown and variable. Identification of these corridors provides an opportunity for state and local agencies to increase public awareness/education and monitoring of driver behavior within these corridors using existing staff and funding resources. Seeking funding for additional enforcement and public awareness/education will be considered.
(3) Competing demands for current enforcement and public awareness/education staff time.

## Rural Primary Roads with the Highest Fatal and Major Injury Crash Density Involving an Impaired Driver*

## Rural Primary Roads with the Highest Fatal and Major Injury Crash Density of Unbelted Drivers and Passengers*

Rural Primary and Paved Secondary Roads with Highest Fatal and Major Injury Crash Density for Single Vehicle Run-off-the-Road Crashes

## Rural Expressway and Two-lane Primary Roads with the Highest Fatal and Major Injury Crash Density for Speed-related* Crashes

Rural Interstate/Freeway Segments with the Highest Fatal and Major Injury Crash Density of Multiple-vehicle, Cross-median Crashes
