Suite 312  
Des Moines, Iowa 50309

# CHALLENGING TRENDS

INDICATORS OF WELL-BEING FOR IOWA CHILDREN

1992

Iowa Kids Count is affiliated with National Kids Count  
and funded by the Annie E. Casey Foundation

The Iowa Kids Count Initiative is funded by a grant from the Annie E. Casey Foundation, which also supports a national Kids Count data book tracking trends in child well-being across the fifty states. Iowa was one of the first eight state projects funded and 1993 will mark the third year of the Iowa Kids Count Initiative. The Iowa Kids Count Initiative is administered by the Child and Family Policy Center with a steering committee composed of representatives from the Iowa State University Extension Service, the Iowa State Library, the Commission on Children, Youth and Families, the Office of the Governor, and the Iowa Department of Human Services.

# Introduction: Challenging Trends

The Iowa Kids Count Initiative has two major goals:

- To track and present important trends in child well-being in Iowa, and
- To mobilize Iowa leaders to develop results-oriented, outcome-based policies to improve child well-being in Iowa.

To achieve the first goal, the Initiative produces and disseminates an annual data book, and publishes a *Kids Count Quarterly Report*. *Challenging Trends* is the second annual data book produced by Iowa Kids Count.

To achieve the second goal, the Initiative works with a broad-based Kids Count Leadership Collaborative, composed of one hundred and twenty Iowa leaders, in defining policy issues and policy responses vital to the well-being of Iowa children.

Last year's Iowa Kids Count data book, *World-Class Futures*, both presented important data on the well-being of Iowa children at a state and a county level and provided vision statements prepared by the Leadership Collaborative on what Iowans want to see for children at different developmental stages and in response to different societal demands. This year's data book, *Challenging Trends*, provides additional data and analysis on the well-being of Iowa's children, as well as updates of the data

on eight specific indicators of child well-being found in *World-Class Futures*. It also summarizes the work of the Leadership Collaborative during 1992 and spells out the Collaborative's goals for 1993.

*Challenging Trends* is divided into three parts, the first two providing data on Iowa children and the third summarizing the work of the Leadership Collaborative.

"Part One: Child Poverty in Iowa" provides important census information on child poverty in Iowa, data not released by the Census Bureau at the time of publication of last year's book. Since poverty has such a profound impact upon child well-being, these trend data are regarded as particularly important for policy formation.

"Part Two: Decade-Long Trends in Child Well-Being" provides a ten-year statewide trend analysis on eight key indicators of child well-being. These indicators, also presented in *World-Class Futures*, include health, educational and social dimensions of child well-being:

- Infant mortality
- Low birthweight
- Child deaths
- Teen violent deaths
- Births to 16- and 17-year-olds
- Teen unmarried births
- Foster care
- High school graduation

**The trends presented in this analysis are ones that should challenge Iowa leaders.**

The trends presented in this analysis are ones that should challenge Iowa leaders. On four of the eight measures (low birthweight, births to 16- and 17-year-olds, teen unmarried births, and foster care), the well-being of Iowa children has declined significantly. On only one (infant mortality) has it improved. On the remaining three (child deaths, teen violent deaths and high school graduation), child well-being has shown little change.

In addition to providing trend data, county-by-county data on these indicators also are provided. This information updates and complements much of the

information provided in *World-Class Futures*.

"Part Three: Setting an Agenda for Action" reports on the activities of the Iowa Kids Count Leadership Collaborative for the year. Through

eight regional meetings, the Leadership Collaborative helped establish an agenda for 1993 that will focus upon state public policies for children in their most formative, early years. The goal is to produce a "Blueprint for Iowa's Young" that can become part of state policy debates in 1994 and beyond. The Leadership Collaborative will sponsor a summer Kids Count Summit to more thoroughly define and determine a course of action for the themes expressed in this Blueprint.

# Part One:

## Child Poverty in Iowa

The effects of poverty upon the well-being of children of all ages are profound. At a societal level, poverty has a strong impact upon child health, child educational performance, and child social adjustment and happiness.

While many children whose families live in poverty excel and most grow into productive adults and leaders, research has consistently shown that children living in poverty are at much greater risk than their peers in failing to thrive. Moreover, this impact of poverty is not limited to economic deprivation. Poverty produces stress and hopelessness within families that limits parental capacity to provide support and a nurturing home environment for their children.

Over the last two decades in the United States, while significant gains have been made in combatting poverty among the nation's senior citizens, child poverty increased by 18.5%. According to the 1990 Census, almost one in five children in the United States (17.9%) were poor. Children are now the age group in society most likely to be poor.

The increase in child poverty rates in the United States between 1970 and 1990 cannot be attributed to economic cycles. Instead, it is related to two important, long-term trends: the stagnation in adult wages (when adjusted for inflation) and the increase in the proportion of children living in single-parent families.

While the percentage of child poverty in Iowa (14.0%) is below that of the nation as a whole, Iowa's rate has been growing and is catching up with the national rate. Like the national trend, Iowa's children represent that age group in Iowa most likely to be poor. Because poverty has such an impact upon the overall well-being of children, several sets of data are provided that describe child poverty in Iowa.

*Child Poverty in Iowa — 1990.* Of the 705,446 related children living in Iowa, 98,463 live in families with incomes below the federal poverty level.

*Trends in Child Poverty.* Between 1980 and 1990, the child poverty rate increased more rapidly in Iowa, by over 20%, than in the country as a whole.

*Poverty Among the Very Young — Single Parent Families.* Nearly two-thirds of all female headed households with infants and toddlers (0-4 years of age) live in poverty in Iowa, four times the rate for all families.

*Poverty By Age Groupings.* In Iowa, the poverty rate among children is one-quarter higher than it is for senior citizens and over one-third higher than working age adults (age 18-64).

*The Impact of Poverty on Well-Being.* In high poverty areas in Iowa, children are at much greater risk of poor outcomes on important indicators of child health, social support and educational performance.

# Child Poverty in Iowa

The 1990 Census provides the first county-by-county information on poverty available to the state since the 1980 Census. In addition, the 1990 Census provides information on poverty on the basis of family composition (two-parent, female headed and male headed households) and by age.

In 1990, of the 705,446 related children in Iowa, 98,463 (14.0%) lived in households with incomes below the federal poverty level (\$8,343 annual income for a family of two, \$9,885 for a family of three, and \$12,674 for a family of four for the 1990 Census).

Within the Iowa poverty figures, however, there are significant variations. The child poverty rate ranged from a

low of 6.9% in Warren County to a high of 28.2% in Appanoose County.

In addition, poverty generally is slightly higher in Iowa's rural counties and this holds for child poverty as well as adult poverty. More significant, however, is the fact that child poverty is greatest among very young children, those aged 0-4. That rate, 17.5%, is much closer to the national rate than is the rate for 5-17 year-olds.

## Iowa & United States Child Poverty Rates, 1990

	Iowa	U.S.
Rate for All Children	14.0%	17.9%
Rate for 0-4 year-olds	17.5%	20.1%
Rate for 5-17 year-olds	12.6%	17.0%
Rate in Rural Counties*	15.2%	N.A.
Rate in Small Urban Counties	13.5%	N.A.
Rate in Metropolitan Counties	13.9%	N.A.

# Trends in Child Poverty

**P**overty among children in Iowa, as in the United States, has risen dramatically since 1970. While economic cycles and employment rates play a role in determining poverty rates, the trend toward increased child poverty exists irrespective of economic cycles.

In fact, the increase in poverty among children largely is attributed to two factors — the dramatic increase in the number of single parent families and the lack of improvement in wage income for those employed in the workforce. Much of the rise in child poverty between 1980 and 1990 is connected to the increased proportion of children living in single parent families and the persistence of poverty among those families (see next table). Another large part, however, is connected to the decline, when adjusted for inflation, of the earnings of males in families with children.

The child poverty rate in Iowa increased 21.7% from 1980 to 1990, almost twice the rate increase of the United States (11.9%). Iowa's child poverty rate still remains substantially below that for the United States, although this gap is narrowing.

This increase in child poverty in Iowa and in the United States would have been even greater during this period if two-parent families had not spent increasing time in the work force with both parents working. By 1990, two-thirds of all families in Iowa with pre-school children (both single-parent and two-parent) had all parents working at least part-time.

# Poverty Among the Very Young — Single Parent Families

**P**overty is potentially damaging to all children, but the risk for damage is greatest for very young children. Unfortunately, poverty is most pronounced among very young children, from birth through age 4. In part, this is due to the fact that parents of younger children are likely to be younger themselves, with less employment experience and earning potential. In part, it is due to the fact that families with very young children have difficulty leaving the home to work, at least to work full time.

In fact, while the poverty rate for all families with young children is higher than for families with only older children, poverty is the norm for single parent families of young children that are headed by women. While Iowa's poverty rate is lower than the national average for all families with very young children, it is substantially higher in female headed

households. Nearly two-thirds (64.1%) of all female headed households in Iowa with infants and toddlers live in poverty, compared with a national rate of 57.4%.

Single parenting alone places substantial stress on families with very young children, and living in poverty makes the stress that much greater. In Iowa, single parent families with very young children are much more prone to this additional stress of poverty than in the country as a whole.

# Poverty By Age Groupings

One of the challenges to policy makers is to change the perception among the public that children are not one of the prime victims of poverty. While children are much more likely to live in poverty than the population as a whole, that is not the current perception of the public.

In a 1992 public opinion poll, the Iowa Kids Count Project asked registered voters in Iowa what age group in society they thought was most likely to be poor. Only one in five respondents correctly identified children as being most susceptible to poverty in Iowa. Many more respondents (30%) selected senior citizens, whose poverty rate has declined dramatically over the last two decades in Iowa, in large part due to government attention and improvements in social security and other retirement systems.

Although poverty is higher in rural counties than in more

urban ones and a larger proportion of senior citizens live in rural counties than in urban ones, the poverty rate among children is higher than it is for senior citizens in most rural, as well as urban, counties. The poverty rate among senior citizens in Iowa is slightly below that for the state as a whole but remains above that for working age adults.

Only in Johnson and Story counties is the child poverty rate below the overall poverty rate. For the state as a whole, the child poverty rate is 21.7% above the overall poverty rate and 35.9% above that among the state's 18-64 population.

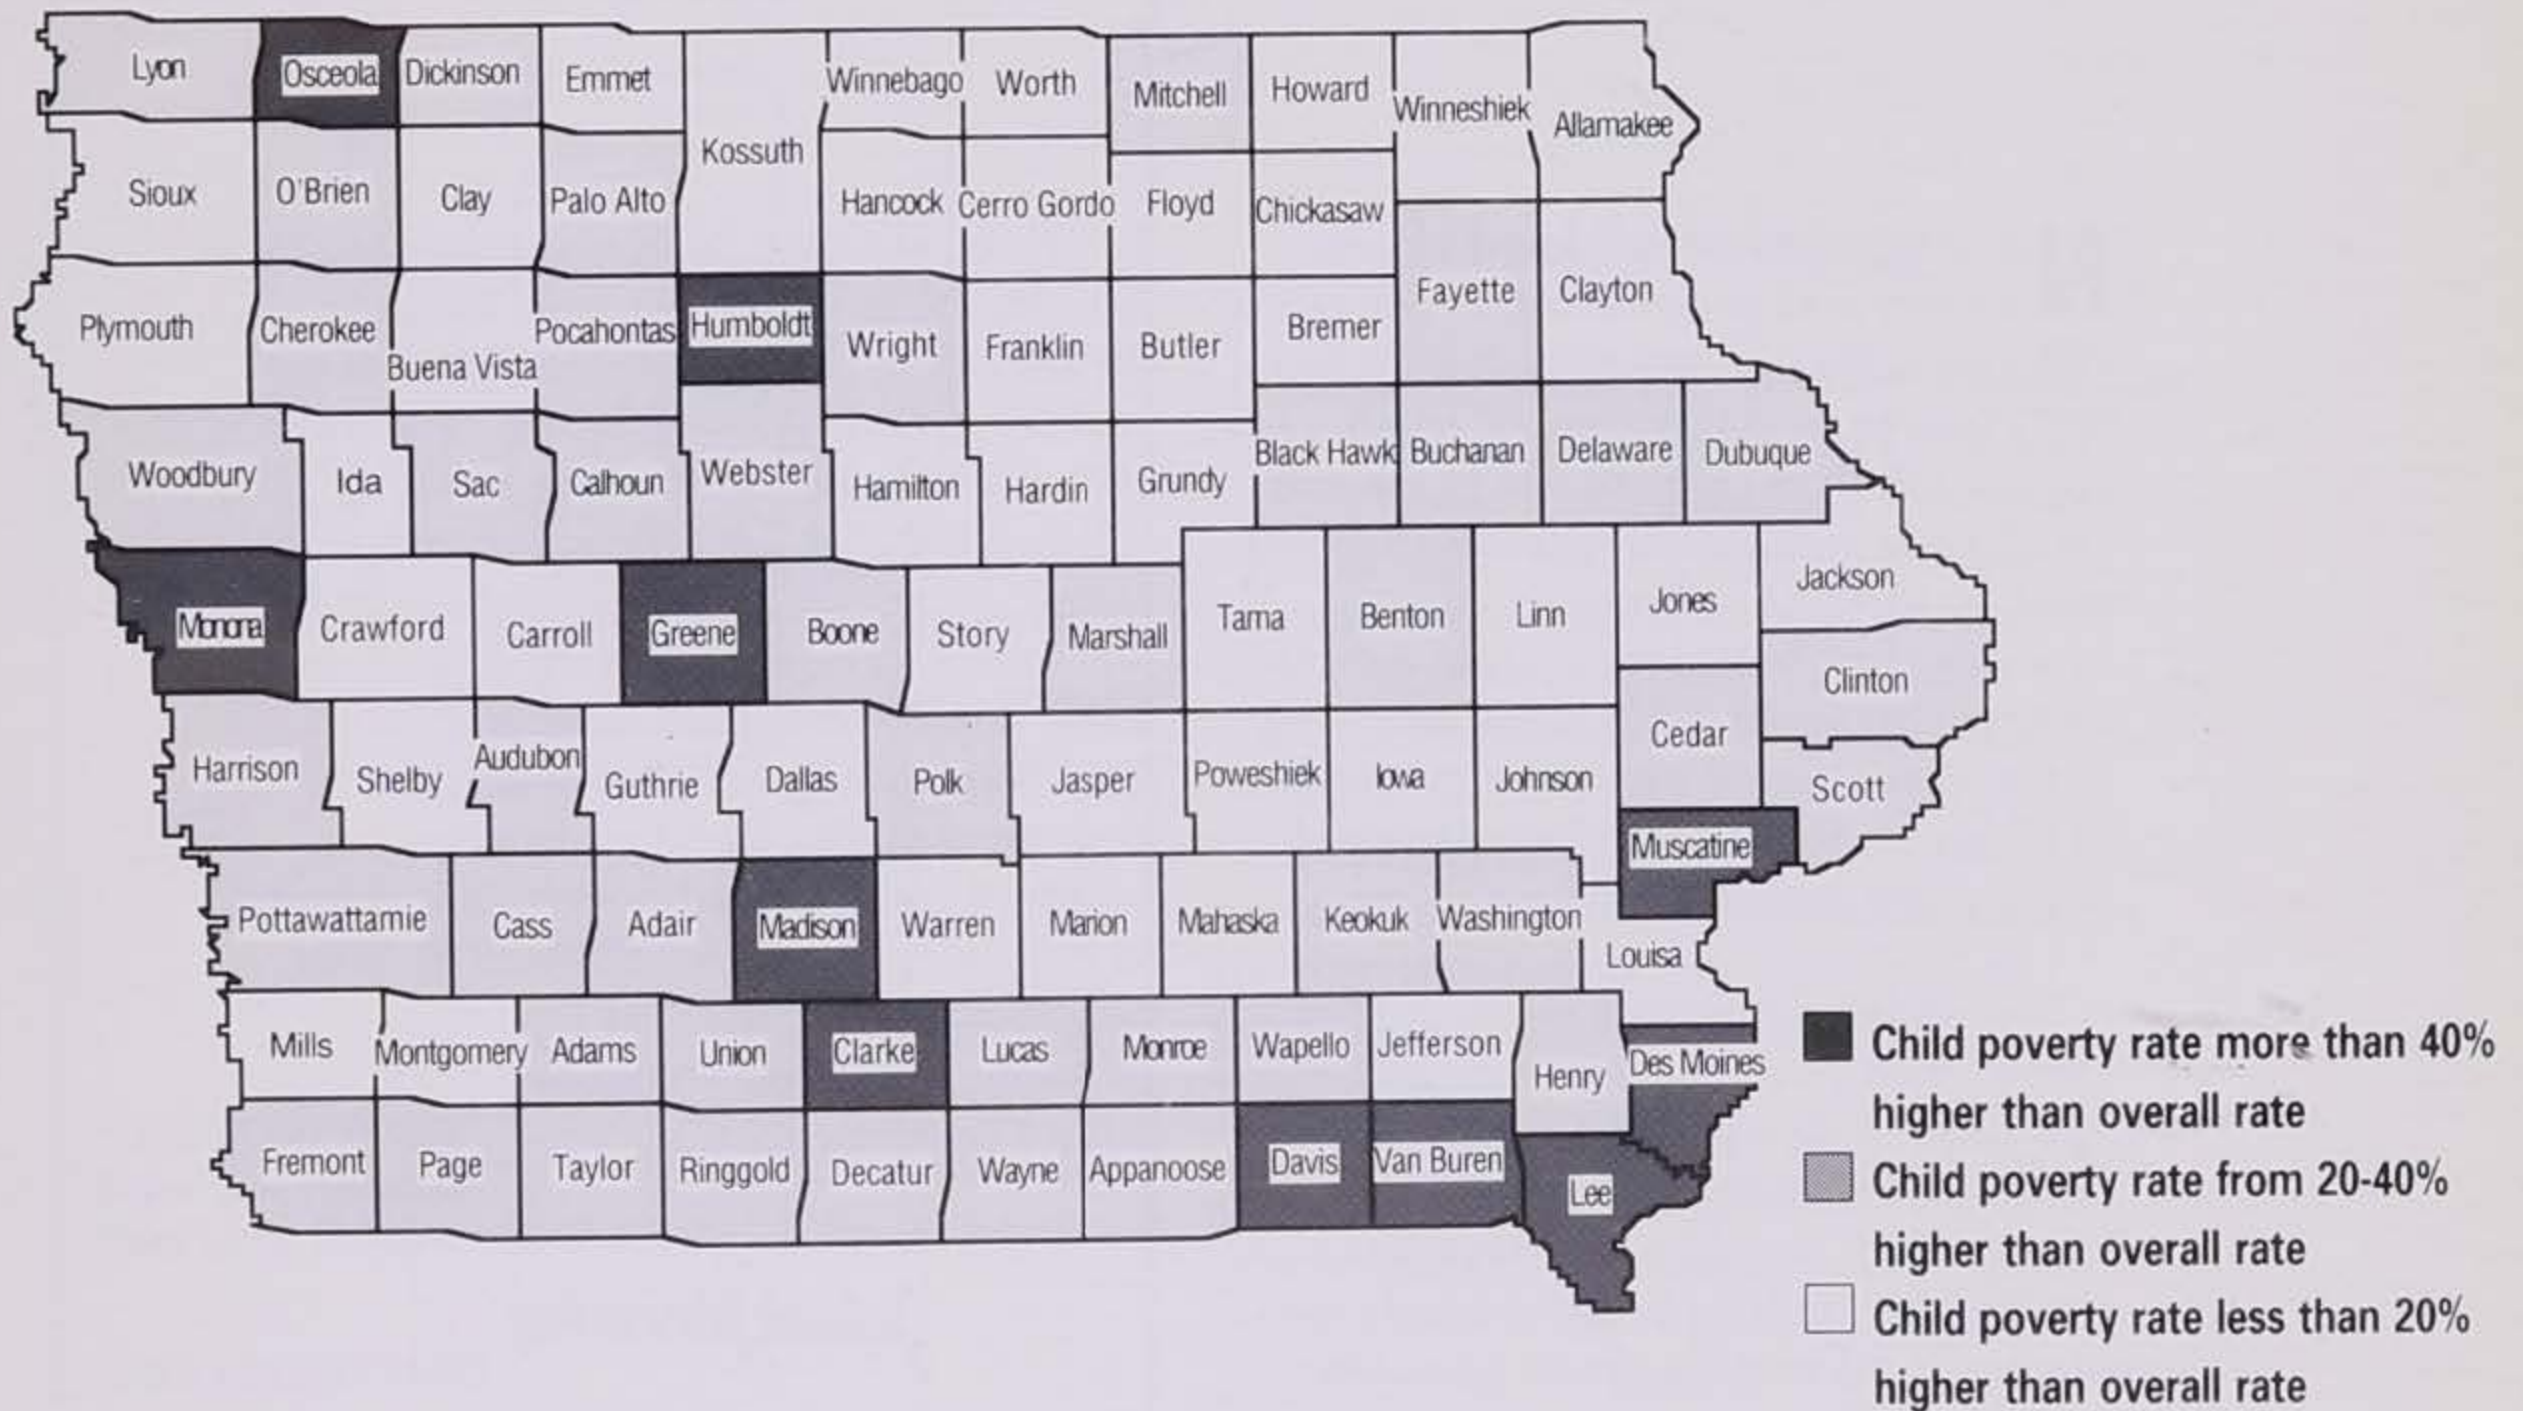

## Poverty Rates by Age Group, Iowa & United States, 1990

# The Impact of Poverty on Well-Being

**N**ationally, the association between poverty and poor outcomes for children is strong. Research has shown that children in poverty are at much greater risk than children not in poverty on all eight measures of child well-being used by Iowa Kids Count — infant mortality, low birthweight, child mortality, teen violent death, adolescent parenting, births to unmarried teens as a proportion of all births, foster care placement and high school graduation.

In addition, national research also shows child poverty to be strongly associated with such other health, social and educational outcomes as anemia, hyperactivity, neurological disorders, preventable birth defects, founded cases of abuse and neglect, grade retention, school labelling as behavioral disordered or seriously emotionally disturbed, delinquency, criminal arrests, and violent behavior.

Moreover, when children grow up in neighborhoods of concentrated poverty, all children in those neighborhoods are at greater risk of these poor outcomes. Poor outcomes for children are most pronounced in neighborhoods of concentrated poverty and limited opportunity. The immediate environment for children in these neighborhoods places them at risk, whether or not their own parents are poor. In such neighborhoods, strategies to improve child well-being require neighborhood-wide, as well as family-based, responses.

**Children in poverty are at much greater risk than children not in poverty on all eight measures of child well-being used by Iowa Kids Count.**

Three separate analyses conducted by the Iowa Kids Count Initiative illustrate the impact of concentrated neighborhood poverty upon child well-being. The three indicators of child well-being were selected because they represent important health, education and social indicators for well-being. The results of these analyses, while limited to specific sites and therefore illustrative rather than comprehensive, are striking. Children in neighborhoods of concentrated poverty are at four to five times the risk of children in other neighborhoods with regard to infant mortality, foster placement and poor school performance.

## Infant Mortality

Between 1987 and 1990, the overall infant mortality rate for the city of Des Moines, at 13.1 per 1,000 live births, masked huge differences within neighborhoods. The two neighborhoods with the highest poverty rates in Des Moines, the near west and near east sides, had infant mortality rates similar to those of third world countries (36.7 and 33.1, respectively) while the remainder of Des Moines's infant mortality rate approximated the state average (8.5). These high rates correspond to the poverty rates for young children in these neighborhoods (58.7% and 30.4%, respectively), which are twice to four times as high as for the remainder of the city (15.8%).

As a result of this analysis, special efforts have been undertaken to provide prenatal care services and supports to these two highest risk neighborhoods.

## Variations in Foster Care Placement Rates in Linn County, 1991 DHS Cases

	Inner City	Remainder of Cedar Rapids	Non Inner City Linn County
<b>FOSTER CARE FIGURES</b>			
Foster Care Placement Rate/1,000 Children	13.6	3.6	2.9
<b>CHILD POVERTY RATES</b>			
Children Age 0-17	29.9%	8.4%	7.8%

### Foster Placement

In 1991, Linn County's foster care placement rate was 6.3 per 1,000 children, slightly above the statewide average of 5.2 per 1,000 children. In examining the foster care cases under the supervision of the Iowa Department of Human Services (approximately three-quarters of all children in foster care, the remainder are under the supervision of the Court), the poverty-stricken neighborhood in downtown Cedar Rapids accounted for 37.0 % of all placements, although representing only 11.1% of the child population. The placement rate of 13.6 per 1,000 children was four times the placement rate for the remainder of Linn County, as was the child poverty rate.

### School Performance

In 1991, fourteen elementary schools in Iowa's eight largest cities had free and reduced price lunch participation rates of 75 % or more, making these elementary schools the poorest schools in the state. When these schools' fourth grade test scores on the Iowa Test of Basic Skills were compared with schools nationally, their median ranking was in the 30th percentile, while the median score for metropolitan elementary schools as a whole was in the 64th percentile.

If school performance in fourth grade can be equated with likelihood of graduation from high school, this would mean that students in the neighborhoods served by these poorest elementary schools are five times as likely to drop out of school as students from other metropolitan schools.

### Conclusion

As with national studies, these Iowa analyses show a strong connection between poverty and resultant poor child outcomes on health, social and educational dimensions. The county-by-county census data on child poverty presented earlier are important in showing the growing challenge that poverty presents to improving child well-being in Iowa.

In addition, however, these analyses also help define specific neighborhoods where children suffer the most risk of failing to thrive and develop. If Iowa policy is to reduce the harm that is done to children through failing to guarantee their health, education and social welfare, that policy must direct a significant portion of its attention to those neighborhoods where poverty is most concentrated.

# Part Two:

## Decade-Long Trends in Child Well-Being

In its 1991 publication, *World-Class Futures*, the Iowa Kids Count Initiative provided county-by-county data on the well-being of Iowa children on eight important, and available, measures of well-being. Updated county-by-county figures are provided in this 1992 Kids Count report, as well.

In addition, however, this report provides annual data over the last ten years on these indicators on a statewide basis. Because many of these data fluctuate when examined on a county-by-county basis, annual comparisons are only meaningful on many of these measures on a statewide basis.

The results of this decade-long examination are sobering.

The well-being of Iowa's children has shown steady, decade-long improvement in only one of the eight Iowa Kids Count indicators of child well-being — infant mortality. On four key measures — low birthweight, births to 16- and 17-year-olds, teen unmarried births, and foster care — there has been a steady erosion in well-being. Performance on the remaining three measures — child deaths, teen violent deaths and high school graduation — has changed little over the period.

### Infant Mortality and Low Birthweight

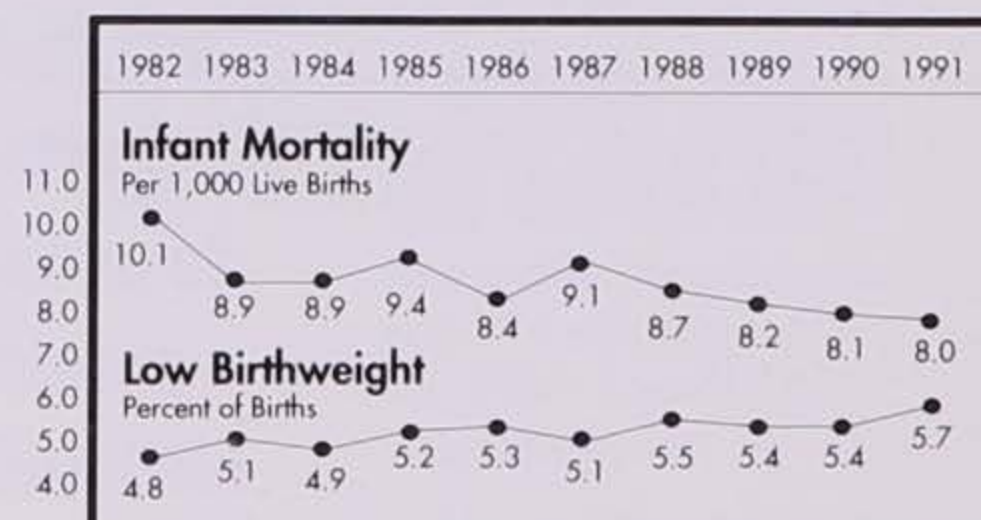

Infant mortality is the one measure of child well-being that has improved steadily over the last ten years in Iowa as well as in the country as a whole. Since 1982, infant mortality in Iowa has declined by 20.8%, to 8.0 infant deaths per 1,000 live births. Over the last decade, however, most of the improvements in infant mortality in the country have been

attributed to improvements in medical technology in keeping premature, low birthweight infants alive, rather than from women bearing healthier infants.

Although infant mortality rates have improved, the exact opposite has occurred in Iowa with respect to low birthweight. Over the last decade, the number of infants born at low birthweight has increased by 18.8%. Low birthweight, which is very closely related to prematurity, is preventable in most cases through comprehensive prenatal care.

The costs associated with low birthweight, however, are significant. In 1990, the average medical costs for the birth of a low birthweight baby were \$21,000, compared to an average cost of \$2,800 for a normal birthweight baby. In addition to the immediate medical costs associated with intensive neonatal services, however, low birthweight babies are three times more likely than normal birthweight babies to experience neurological problems such as cerebral palsy and seizure disorders and to require special education services or experience grade repetition. They are twice as likely to experience hyperactivity and much more likely to experience other preventable handicapping conditions.

Because of the impact upon medical and health care costs and long-term child health and well-being, the increase in the rate of low birthweight babies in Iowa is of particular concern.

## Child and Teen Violent Deaths

Once past the perinatal period (the first year of age), death is a very rare event among children. Automobile accidents represent the leading cause of both deaths among children and violent deaths among teens. Since all accidents are avoidable, even though Iowa has reached the national health goal of no more than 28 child deaths per 100,000 children, there still is room for improvement on both these measures of child well-being.

While substantial changes have occurred in the last decade to reduce automobile fatalities (raising the drinking age, lowering the speed limit, and requiring child safety restraints and seat belts), child death rates have not experienced a significant decline since the mid-1980s.

Teen violent death (motor vehicle deaths, homicides and suicides) rates, while fluctuating year-to-year, are as high today as they were in 1982. The teen motor vehicle death rate, which constituted 66.7% of all violent deaths in 1991, showed a small decline over the decade. While the suicide rate remained constant over this period (11.5 deaths per 100,000 teens for both 1982 and 1991), however, the homicide rate increased significantly (2.3 per 100,000 teens in 1982 and 6.0 in 1991).

Moreover, improved emergency medical care and treatment have resulted in a reduction in fatalities among those receiving life-threatening injuries, which suggests that serious injury rates for children and youth likely have increased over this time. Prevention efforts are needed if reductions in the death — and serious injury — rates for children and youth are to be achieved.

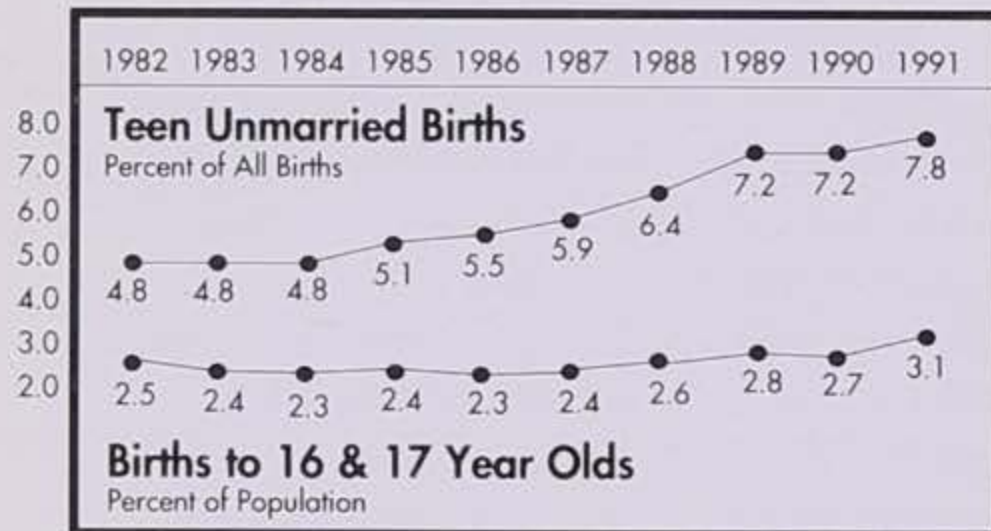

## Adolescent Parenting

Accounting for a small portion of the increase in low birthweight over the last decade has been the increase in the number and proportion of births to adolescents in Iowa. Adolescent mothers have a generally higher rate of giving birth to low birthweight babies than women in their twenties.

On two measures, adolescent parenting has increased substantially over the last decade in Iowa.

First, the proportion of all 16- and 17-year-old women in Iowa giving birth has increased from 2.5% to 3.1% of all young women in any given year, a 24.0% increase. The likelihood that any adolescent would have a child prior to reaching age eighteen is more than double this percentage, as she might bear a child at age 17, age 16, age 15, or younger.

This increase in the birth rate among 16- and 17-year-olds stands in sharp distinction to a declining birth rate for women in their twenties. Further, in addition to being more likely to bear low birthweight and premature infants with attendant health problems, 16- and 17-year-old mothers also are more likely to live in poverty, to drop out of school, and to fail to adequately care for their chil-

dren (as evidenced by higher rates of child abuse and neglect).

While the vast majority of births to women under 18 occur to 16- and 17-year-olds (83.4% of all under-18 births in 1991), the birth rate among women 15 and younger has been growing at an even higher rate than for those 16 and 17. Over the last decade, the birth rate among women aged 12 to 15 increased from 0.207% to 0.286%, an increase of 38.1%.

Second, the proportion of all births in Iowa to unmarried teens (women under the age of 20) has increased from 4.8% to 7.8% of all Iowa births, a 62.5% increase. While below the national average of 8.6%, Iowa's rate of growth is so much above the national growth average of 14.7% that, should current trends continue, Iowa will soon be at the national average. As was described earlier in the section of this report on poverty, most of these unmarried teens will live in poverty. They will be much more likely to enter the welfare system than women who wait until they reach adulthood to have their first children.

As with low birthweight, these trends regarding adolescent parenting increase the proportion of very young children at-risk as well as producing strains upon public expenditures.

## Foster Care

One of the gravest actions a democratic society that highly values both individual and family rights can take is to remove a child from his or her parents. Removal of a child into a foster family home or residential setting is only warranted in Iowa to protect the safety of the child from abuse and neglect or to protect society from the child's own dangerous behaviors.

Not only is foster care costly to the state, it also produces damage to the child so removed, even when that must occur for the child's long-term safety. Children who have been removed into foster care remain at significantly higher risk for poor outcomes on a variety of other measures of child and adult well-being. For instance, foster children are at least ten times as likely as other children to grow into adults who become homeless, who are incarcerated in jails and prisons for criminal activities, and who are part of the mental health institutional population. While it is not foster care itself that produces these adult problems, the health of society is dependent upon addressing childhood concerns before placement of children into foster care becomes the only available option.

Since 1982, the proportion of Iowa children removed from their homes and living in foster care settings has increased steadily and dramatically, by 63.2%. In 1991, over 6 in every 1,000 Iowa children lived in foster care. While Iowa continues to be below the national average in the proportion of children placed into foster care, Iowa's rate of placement is rapidly approaching the national average.

## High School Graduation

Over the last two decades, the structure of the workforce in Iowa and the United States has undergone dramatic change, with new workers expected to exhibit much higher skills in order to command decent, family-sustaining wages. If young adults are to have any realistic chance of finding employment that provides career opportunities and more than a minimum wage salary, a high school education represents a bare minimum level of educational attainment.

Despite the change in workforce demands, however, the graduation rate from Iowa high schools has remained virtually constant over the last decade, with 15% of all Iowa youth dropping out of high school at some point before graduation. A portion of these later return to complete their high school degrees or to attain G.E.D.s and even to complete community college degrees, but many are left in positions with little chance of finding family-sustaining employment.

While Iowa ranks well above the national average in terms of literacy and high school graduation, the 1990 Census shows Iowa fares less well with respect to higher education. Among states, Iowa's 25-and-older population ranks 13th nationally in the proportion of high school graduates, but only 30th in post-secondary associate degrees, 40th in college graduates and 45th in post-graduate degrees. While some of this is the result of the out-migration of Iowa's more highly educated adults, the figures themselves present significant challenges to Iowa's economic growth and to the capacity of Iowa families to provide for their children.

## Conclusion

These decade-long trends present major challenges to the state. Iowa's economic vitality into the 21st century requires a healthy and well-educated new workforce, a workforce that increasingly will come from those who are children today.

Among the most troubling trends are those related to the youngest of Iowa's children. The increase in low birthweight rate means an increase in preventable, life-long handicapping conditions and greater numbers of children at high risk of a variety of poor social and educational outcomes. The rise in adolescent parenting means that increasing numbers of infants and toddlers will be raised in families least equipped to address their needs and concerns.

The connection between Iowa's long-term economic vitality and the health and well-being of its future workforce needs to be clearly made. The cost of failing to act upon these important trends and their adverse impact on Iowa children are pronounced.

The goal of the Iowa Kids Count Project is to identify these trends so that results-oriented public policies can be developed to effectively address them. The figures presented here clearly identify these important trends and place a challenge upon policy makers to develop policies to effectively address them.

# Infant Mortality

# Low

While the infant mortality rate in Iowa has steadily improved over the last two decades, the state has not yet achieved the Healthy People 2000 goal of no more than seven deaths per 1,000 live births. Moreover, Iowa's infant mortality

rate among African-Americans remains substantially above that for whites. In 1991, for instance, the African-American infant mortality rate was 11.7 compared to a white infant mortality rate of 8.0.

While Iowa ranks seventh nationally among the states in low birthweight, the increase in the proportion of low birthweight babies over the last decade is disturbing and hinders Iowa in achieving the Healthy People 2000

County	Live Births	Infant Deaths	Inf. Mort. Rate
Adair	87	1	11.5
Adams	64	0	0.0
Allamakee	174	1	5.7

# Child Deaths

Even though Iowa has reached the Healthy People 2000 goal of no more than 28 child deaths per 100,000 children, the majority of child deaths in Iowa are caused by accidents and therefore are pre-

ventable. Iowa's rate of 26.4 deaths per 100,000 children is below the national average of 32.4 deaths and places Iowa 17th among states in the 1992 National Kids Count report.

# Teen Violent Deaths

The preponderance of teen violent deaths presented here involve motor vehicle accidents, representing 66.7% of all violent deaths in 1991. The percentage of teen violent deaths by motor

vehicle accidents and suicide has shown a slight decrease the last few years; however, the percentage of teen violent deaths by homicide has shown a marked increase, doubling in just two years.

# Teen Unmarried Births

The proportion of all Iowa births to unmarried teens, at 7.8%, is near the national average of 8.6%. This proportion, however, is increasing at a much greater rate than the national average and will,

at this current rate, surpass the national percentage by the year 2000. Moreover, teen unmarried parenting is a powerful predictor of most of the other indicators of child well-being presented here.

# Foster Care

Foster care placement rates vary widely across Iowa counties because they measure both the rates of abuse, neglect and delinquency among children and local philosophies toward addressing those problems. Facing a dramatic

growth in foster care expenditures over the last six years, the state instituted a "cap" on foster care placements in 1992-93 (a monthly average of 1,405 children) and placement rates will reflect this action in later years.

# Rural, Small Urban & Metropolitan County Comparisons

Many of Iowa's counties are small enough that variations on the eight indicators of child well-being will be pronounced from year to year. For this reason, counties were divided into three county groupings for further analysis: counties with no population center of 5,000 inhabitants or more (designated rural counties), counties with the largest population center being from 5,000 to 49,999 inhabitants (designated small urban counties) and counties with a population center of 50,000 or more inhabitants (designated metropolitan counties).

# Part Three:

## The Leadership Collaborative —

### Setting an Agenda for Action

In December, 1991, the Iowa Kids Count Leadership Collaborative convened in Des Moines to release the 1991 Kids Count Data Book, *World-Class Futures*, and to chart a course of action for 1992. Two-thirds of the 120-member Collaborative attended this Congress to discuss the progress made during 1991 and the challenges facing Iowa children and the Kids Count Initiative during 1992.

At the Congress, collaborative members directed Kids Count staff to make use of Iowa organizations and associations in disseminating Kids Count publications and to convene regional Kids Count meetings to further extend the discussion of important trends in child well-being. Collaborative members also urged Kids Count staff to seek involvement from Iowa's business and corporate community in raising child and family issues to greater public visibility and to develop a media strategy that would stress the importance of child and family issues. Finally, collaborative members stressed the need to develop policy directions and options to improve the well-being of Iowa's children, based upon the trends in child well-being identified through Kids Count.

Following this direction from the Leadership Collaborative, Iowa Kids Count staff concentrated 1992 activities on broadly disseminating Kids Count information, conducting regional meetings, conferring with Iowa business and corporate leaders, and developing a 1993 agenda for Kids Count emphasizing policy directions and options to affect trends in child well-being.

Through a commissioned public opinion poll, the Kids Count Initiative provided policy makers and the public with important information on Iowans'

attitudes about children and child and family policy. This poll, published as *Where Iowa's Children Rate*, formed the basis for regional meetings of the Kids Count Leadership Collaborative in July. These meetings provided further feedback to Kids Count staff on developing *Challenging Trends* and the 1992 Kids Count agenda. Four regional meetings of the Leadership Collaborative at the end of 1992 and beginning of 1993 helped establish an agenda for Kids Count 1993 that includes development of a "Blueprint for Iowa's Young" to form the basis of a policy dialogue in the state.

### Highlights of 1992 Activity

**Leadership Collaborative Congress.** The December, 1991 Kids Count Leadership Collaborative Congress capped the first year's activities of Kids Count, which involved both the development of trend data on important indicators of child well-being and the development by the Leadership Collaborative of vision statements regarding Iowa youth.

Following a program offering a national perspective on Iowa's efforts by national Kids Count Director Judy Weitz, Collaborative members set the following as 1992 goals:

- Broadly disseminate *World-Class Futures*, making use of Leadership Collaborative members to distribute it among key constituencies,
- Seek greater involvement from the business community in future Kids Count activities,
- Build upon the vision statements established by the Leadership Collaborative in developing more specific policy statements, and

- Conduct regional meetings to further develop the identity of the Iowa Kids Count Initiative.

These goals were used as the basis for 1992 Kids Count work, which involved dissemination and media activities as well as two sets of regional Kids Count meetings.

**Dissemination.** Initially, 5,000 copies of *World-Class Futures* were printed and nearly 3,000 were distributed to state and community policy makers, Collaborative members, libraries, schools, and extension offices. Due to the demand for *World-Class Futures* by a wide variety of state and community organizations, two additional printings were made and over 7,500 copies have been disseminated. In addition, Mike Crawford and Charles Bruner, as Kids Count staff, have presented the information from *World-Class Futures* at over 20 different public forums, including a number of presentations at association meetings.

Given the popularity of *World-Class Futures*, an executive summary of that report was included within the publication of the public opinion poll, *Where Iowa's Children Rate*. Over 3,500 copies of *Where Iowa's Children Rate* have been disseminated.

**Media.** Media coverage of both publications has been extensive, with stories appearing in over 50 newspapers throughout the state and with Mike Crawford appearing on a half dozen radio programs outlining the results from the

## 1992 Kids Count work involved dissemination and meeting activities as well as two sets of regional Kids Count meetings.

poll and the data analysis. In addition to direct coverage of Kids Count publications, the Kids Count Initiative frequently has been called on by the media to provide background data for stories requiring information on the status of Iowa's children and families.

**July Regional Meetings.** Over 80 Kids Count Leadership Collaborative members participated in four regional meetings conducted in July, 1992 to receive a briefing on the information from the public opinion poll, and to discuss future dissemination and policy development activities for the Kids Count Initiative.

Two of the meetings were conducted in Des Moines, with other meetings in Council Bluffs and Cedar Rapids. The discussion from these meetings was synthesized and used as a basis for developing a work plan for 1993.

**December-January Regional Meetings.** One hundred Kids Count Leadership Collaborative members participated in winter follow-up meetings to the July regional meetings in Storm Lake, Waterloo, Des Moines and Davenport. These meetings provided Collaborative members with a review of the contents of the 1992 Kids Count report, *Challenging Trends* and presented an outline for a framework paper discussing options for designing new policies for Iowa's youngest children. The purpose of this "Blueprint for Iowa's Young" is to further a public dialogue on Iowa policy toward investments in prenatal care, family support services and early childhood education to improve child well-

being, and to contrast that policy and its implications with the costs of failing to take such steps.

Collaborative members at the meetings agreed that the focus upon the youngest years (prenatal to school age) was appropriate for 1993 Kids Count activity, especially given the current emphasis upon meeting the first national education goal, that "all children start school ready to learn." Members also emphasized that Kids Count should establish a long-term strategy that includes similar work on children at other developmental stages.

### **Agenda for Action in 1993**

The activities undertaken in 1992 under the direction of the Leadership Collaborative have shaped the Iowa Kids Count Initiative agenda for 1993. While including broad-based dissemination of *Challenging Trends* and other Kids Count materials, the 1993 agenda also is based upon the direction provided by the Leadership Collaborative to connect trends in child well-being with policy options and solutions.

In endorsing the development of the "Blueprint for Iowa's Young" at the December and

January regional meetings, Leadership Collaborative members called upon Kids Count staff to use the Blueprint as a vehicle for public discussion. In keeping with the mission of the Kids Count Initiative, the "Blueprint" will focus upon "results-oriented, outcome-driven policies" that show evidence for impacting trends in child well-being in a positive direction.

While Kids Count staff are charged with developing the "Blueprint" drafts, the Leadership Collaborative will make decisions regarding its final form and its use in public policy advocacy. A summer "policy summit" hosted by the Kids Count Leadership Collaborative will provide an opportunity for dialogue on the "Blueprint" and its implications, with a special focus at that symposium on the response from the business community.

For 1993, the agenda for Kids Count includes continued tracking, analysis and dissemination of information on important trends in child well-being in Iowa—the first goal for the Kids Count Initiative.

1993 also marks the year the Collaborative will foster public dialogue on developing results-oriented state and community policies to improve the well-being of Iowa's youngest children.

**1993 marks the year the Collaborative will foster public dialogue on developing results-oriented state and community policies to improve the well-being of Iowa's youngest children.**

# Acknowledgements

This publication and the Iowa Kids Count Initiative were made possible through a grant from the Annie E. Casey Foundation to the Child and Family Policy Center. The Child and Family Policy Center is a nonprofit organization designed to better link research and policy on issues vital to children and families. The Center was founded by Tanager Place, a charitable organization in Cedar Rapids, Iowa.

The Center would like to thank the Annie E. Casey Foundation for its support of this effort. In addition, the Center would like to thank in particular those who have collaborated in this effort through their service on the Steering Committee: Harold Coleman from the Commission on Children, Youth, and Families; Phil Dunshee from the Governor's Office; Beth Henning from the State Library of Iowa; Mary Nelson from the Department of Human Services; and Lesia Oesterreich and Karen Shirer from the Iowa State University Extension Service. The Center also thanks Willis Goudy for the technical assistance he has provided to this effort. Finally, the Center thanks Karman Wittry for her help in designing the publication.

## For Further Information

In addition to its annual report on the well-being of Iowa children, the Iowa Kids Count Initiative publishes a quarterly newsletter and is preparing a county-by-county statistical report that includes more detailed information on each of the indicators described in this report. This statistical information also will be available on computer disk, in Lotus 1-2-3, for persons wishing to conduct further analysis.

Persons and organizations wishing to receive further publications of the Iowa Kids Count Initiative should contact Mike Crawford, Project Director, Child and Family Policy Center, 100 Court Avenue, Suite 312, Des Moines, IA 50309 (ph: 515-280-9027; fax:515-243-5941).
