INTRODUCTION

For the third consecutive year, the State Department of Public Instruction has prepared a booklet containing the name and a brief statement of important information about each school in Iowa which offers academic work above the high school level.

Copies are being sent to each high school in Iowa for use in administrative offices and high schools, and to the college officials who submitted data for the booklet. A limited number of additional copies are available for distribution to school personnel upon their request. It is impossible to provide a copy for each high school senior.

The State Department has been gratified by the reception that was accorded the previous issues, and hopes that the current booklet will prove to be even more useful because it is being made available earlier in the school year. By its very nature, this work, admittedly, is too brief to provide complete information about each school listed. Seniors will need to contact institutions of their choice for complete scholarship and curricular offerings.

Although the entries for each institution have been revised to show the proposed charges to be made by each school for the school year 1963-1964, the schools reserve the right to change their rates at any time. Charges listed are those under the jurisdiction of the colleges only. School supplies, clothing, entertainment and incidentals are not included.

The State Department of Public Instruction wishes to thank college officials for their hearty cooperation in furnishing materials to be used in this publication.

Education

and

Lifetime

Earnings

*Four years of college
education now costs \$6200.
The difference between
four years of college
and four years of high school
is worth \$178,000 in
lifetime earnings.*

FACTORS THAT DETERMINE the level of a worker's income are numerous and varied. Among other things, however, the amount of education received and the ability possessed play by far the largest roles in determining the income of many workers. Income in this sense is a part of the economic returns resulting from the investment in education and training. There is some evidence that income tends to increase with education. Income surveys of the U. S. Bureau of the Census, for instance, show that individuals with a high level of education can expect to earn much more income than those with less.

In 1958, the median annual income of male college graduates (\$6374) was \$1826 higher than the income of those who graduated from high school (\$4548). Men who graduated from high school in turn received \$1334 more than men with eight years of elementary education. Similarly, for women, the median income of college graduates in 1958 was \$2903. This was much higher than that received by high-school graduates (\$2036), and those not going beyond elementary school (\$909). It follows from these data that education is directly related to income.

The preceding analysis was based on the income data for one year. The total income earned in a *lifetime* would provide a more valuable basis for comparing earnings of persons with different amounts of education. Miller, in his study, "Annual and Lifetime Income in Relation to Education: 1939-1959" (*American Economic Review*, December 1960, p. 962-86), estimated lifetime

earnings of individuals with different levels of education. He used as the basis for his calculations the recurring data of annual income surveys conducted by the Bureau of the Census. Miller came to the conclusion that for men the completion of an additional level of schooling is closely associated with an increase in lifetime income. Table 1 illustrates this information.

In 1958, for instance, an individual who graduated from high school could receive \$75,862 more lifetime income (age 18 to death) than the one who had only elementary-school education. The difference between the expected life earnings of high-school and college graduates was more striking. In 1958 an expected lifetime income of a college graduate was \$435,242 as compared with \$257,557 for a high-school graduate. On the basis of these data, then, one may conclude that, on the average, four years of college education would yield a return equivalent to \$177,685 in lifetime income.

The preceding discussion clearly shows that education has an important influence on lifetime income expectancy of the working force. Statistics from the Bureau of the Census reveal a marked increase in the percents of persons with higher levels of schooling. In large measure as a result of this upward trend in the nation's educational attainment, the average annual income of individuals also rose considerably.

Nevertheless, there are good reasons for believing that many persons still do not receive as much education as they should. This is particularly true for nonwhites and the rural farm population. There still exist wide disparities in the educational attainment of different groups within the population. In 1958, according to the Bureau of the Census, the average number of school years completed was much higher for white men (11.1 years) than for nonwhites (8.2 years). The median level of educational attainment of rural farm men was only 8.7 years, as compared with 11.2 years for the city men.

In order to improve the potential earnings of the general population, it is necessary, therefore, to provide more educational and training programs for the underprivileged groups. It is always possible that a good education will promote the growth of skills and abilities of individuals and therefore open up new opportunities for increasing their incomes. This is important not only for improving the economic productivity of the individual, but also for promoting the welfare of our society.

An analysis of lifetime income trends from 1939 to 1958 affords further evidence of the strong influence of education on earnings. Increases of lifetime income since 1939 have been significant for all groups with the exception of those having less than eight years of schooling. As evident from the table, the better educated groups have made greater relative gains in expected lifetime income over the past two decades. The incomes of college graduates from age 25 to age 64 rose \$262,382, or 251 percent, from 1939 to 1958, compared with \$148,104, or 220 percent, for high-school graduates over the same period.

These relative gains in income over the years may be expressed in another way. In 1946, for example, college graduates could expect to earn (from age 25 to age 64) only 48 percent (\$168,983/\$114,023) more than high-school graduates. Twelve years later, however, the differential rose to 70 percent (\$366,990/\$215,487), reflecting a greater relative income gain for the college group. The differential of lifetime earnings between elementary- and high-school graduates increased in favor of the latter from 35 percent in 1946 to 44 percent in 1958, showing a sharp increase in the earnings of high-school graduates over the period.

Based on: U. S. Department of Commerce, Bureau of the Census. *Income of Families and Persons in the United States: 1958*. Current Population Reports, Consumer Income, Series P-60, No. 33. Washington, D. C.: the Bureau, January 15, 1960. Tables 26 and 27.
