IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in arbitration brought by Henry J. Aguilar, claimant, against Oscar Mayer Company, self-insured employer, defendant, to recover benefits under the Iowa Workers' Compensation Act for a condition allegedly arising out of and in the course of his employment. It came on for hearing on July 11, 1984 at the Bicentennial Building in Davenport, Iowa. It was considered fully submitted at that time.

The industrial commissioner's file shows a first report of injury received July 18, 1983.

At the time of hearing the parties stipulated to the rate in the event of an award of $268.94.

Defendant's counsel provided information regarding the payment of medical expenses as well as the payment of group benefits totaling $6,330.23.

The record in this matter consists of the testimony of claimant, Vernon Keller, joint exhibit 1, claimant's answers to interrogatories; joint exhibit 2, a report from John E. Sinning, Jr., M.D., dated April 23, 1984; joint exhibit 3, reports from Robert W. Milas, M.D.; joint exhibit 4, a series of medical reports from J. A. deBlois, D.O., and Dr. Milas; joint exhibit 5, defendant's answers to interrogatories; joint exhibit 6, reports from Dr. Milas; joint exhibit 7, a series of medical documents; joint exhibit 8, the deposition of claimant; and joint exhibit 9, the deposition of Dr. Milas.

ISSUES

The issues in this matter are whether or not there is a causal relationship between claimant's injury and any disability he now may suffer and whether or not claimant is entitled to a running award of temporary total or healing period benefits.

STATEMENT OF THE CASE

Claimant's testimony is taken from that given at the time of hearing, that contained in his deposition and that provided in his answers to interrogatories.

Thirty-six year old right-handed married claimant, father of three children and a high school graduate with training in lathe and drill operation, served in Vietnam in heavy artillery. When he was discharged from the service, he spent a brief time doing foundry work shifting weights and laboring in the core room with lifting of up to eighty pounds before beginning work for defendant in November of 1970.

His first work for defendant was stacking loin boxes weighing from 90 to 100 pounds. He then sorted pork butts by size and placed them in boxes. This work entailed some record keeping. He next bagged blend which meant that he rolled 200-300 pound barrels of mixing meat to an area and then took away meat in 75 pound bags. He moved to the ham boning department where he started as a trucker with a duty of bringing in the product and dumping it on a table. After a year he became a chisel boner shanking the ham and taking out the body bone on chunks of meat weighing from 18 to 40 pounds. Later he worked on Iowa B hams which necessitated his taking off the skin and fat and taking out the bone. Iowa B hams was his work for seven to nine years. He kept no records doing this work and he supervised no other persons.

Claimant reported having minor nicks and cuts and smashed fingers. In 1973 or 1974 he had a motorcycle accident. He was not wearing a helmet and came off the cycle on his head. He was knocked out and had stitches over his eye. He was hospitalized for about a week and then released to return to work. He denied any trouble with his back, arms or neck resulting from this incident. He also denied any trouble with his neck or shoulder before June of 1982.

Claimant recalled that in June of 1982 he developed pain in his left arm and shoulder and cramping in his arm and chest as he worked at constant pulling with his left hand and constant cutting with his right hand. His head was in a down position and his arms were at shoulder height. He went to first aid to see a doctor. The doctor was concerned with some locking in claimant's little finger. Claimant was dissatisfied with his treatment and went to Dr. deBlois who sent him to Dr. Beaty who sent him to Dr. Milas.

The latter physician was first seen in August of 1982. He took x-rays and prescribed home traction which claimant undertook three times a day for a half hour for two weeks. Claimant returned to work on August 30, 1982. He was able to do his work on the Iowa hams for a time, but then he had a recurrence of symptoms with his arms becoming tired and hurting. A burning sensation started up his arm and into his shoulder. He had a numbness in his fingers as if they were asleep. He saw Dr. Milas in December. Home traction was tried again and then he was sent to the hospital for therapy which included the use of traction and hot packs. He was released for work with a ten to twenty pound limitation.

At work he was placed on the line where he did only a certain portion of the ham as opposed to doing the entire ham as he had done once. He was able to do the work. Eventually Dr. Milas removed the restriction.

Claimant began defatting which was to remove all the fat from the meat with a wizard knife without cutting any meat. The rate for this job was 15 hams per hour. He worked, but he claimed he hurt. He redeveloped symptoms for which he used Ben Gay and wrapped his arms in gauze.

On approximately May 25, 1983 claimant experienced a muscle spasm in his chest which made him think he was having a heart attack. He had pain in both arms. He went to the hospital. He had electromyography, a myelogram and a CT scan all of which were normal.

He was released to return to work with restrictions. He took the restrictions from Dr. Milas to the plant where he was laid off. He understood his restrictions to be "[n]ot very many repeating motions and nothing to lift over twenty pounds." He was told that there were too many people on the sick list for him to be given a job. He applied for unemployment which meant he had to seek work which he tried to find in grocery stores and machine shops, but he was not able to find work within his restrictions. He drew unemployment until March of 1984.

Claimant explained that when he told Dr. Milas what he did, he was telling the doctor about the work of the whole line. He said that Dr. Sinning gave him the same sort of exam he had received from Dr. Milas in about fifteen minutes.

Claimant acknowledged having been a weight lifter for three or four years seven years ago. He now lifts weights occasionally. He listed his present complaints as loss of strength, a twitching in his forearm, upper arm, chest and face and a burning sensation. Claimant thought his condition was about the same as in June of 1983. He does housework and cares for his children.

Claimant agreed that he had received sick leave pay and that his medical expenses had been covered.

Vernon Keller, safety and security manager and administrator for workers' compensation for defendant, testified to familiarity with the ham boning procedure which he said was as claimant described it. He stated that Dr. Sinning had been to the plant to see the ham boning operation.

The witness said that shutting down the slaughtering operation, competition and general economic conditions resulted in layoffs of a number of workers at the plant. He acknowledged that there are jobs within the plant which comport with claimant's restrictions, but he pointed out that claimant is kept from a job by his low seniority and provisions of the labor management agreement. He reported that the company expects to be able to place claimant on a job soon.

Keller stated that claimant's medical expenses have been paid as well as sickness and accident benefits. He contended that the company's position has always been that claimant's condition is non-occupational and non-compensable.

Records from defendant show claimant worked in department 20 trimming and boning hams from October 1, 1979 until he was laid off on March 26, 1982. He was recalled on April 5, 1982. From May 21, 1982 to August 30 he was on a leave of absence. He was laid off on December 17, 1982 and recalled on January 17, 1983.

Answers to interrogatories indicate claimant was paid sick leave from May 24, 1982 to August 29, 1982; from December 13, 1982 to January 9, 1983; and from May 31, 1983 to July 8, 1983.

A report from J. A. deBlois, D.O., dated June 2, 1982 reports that claimant first saw him on May 17, 1982 for a strain, sprain and bursitis of both shoulders. He indicated that claimant's condition was due to neither an accident nor an occupational injury. He found claimant unable to work beginning on May 24, 1982 to a date unknown.

Richard Beaty, D.O., treated claimant for a stenosing tenosynovitis of the left middle finger. He, too, found claimant's condition connected to neither an accident nor an occupational injury. He determined claimant was unable to work from June 17, 1982 to a date unknown, but apparently at least through August 13, 1982.

In his letter dated June 17, 1982, in addition to his impression of stenosing tenosynovitis of the left middle finger, he listed possible C5-6 radiculopathy and possible biceps tendonitis of the left shoulder. A release of the trigger finger was performed on June 21, 1982. Feldene was prescribed.

In July claimant was tried on exercises, warm soaks and home cervical traction. On July 23, 1982 Dr. Beaty noted claimant's having intermittent symptoms and his belief that claimant's muscle mass was causing the problem with thoracic outlet-type symptoms. Claimant was referred to Dr. Milas.

Claimant was receiving chiropractic adjustments when he was seen on November 19, 1982. Dr. Beaty suggested these continue as they seem to be of more benefits than other treatments claimant had received.

Robert J. Chesser, M.D., saw claimant on June 30, 1982 and took a history of left shoulder and upper trapezius pain for one year with episodes of numbness into the left fourth and fifth fingers developing in the past six weeks. Claimant's symptoms were aggravated by lifting and quick movement of the arms. Cervical motion was full. There was pain in the left cervical paraspinals and upper trapezius with no specific radiating symptoms. The left biceps reflex was reduced. Pinprick sensation also was reduced in the C5 distribution on the left.

Electromyography and nerve conduction were normal. The doctor suggested a cervical spine series and a trial of cervical traction. Because of claimant's size, there were some technical problems with the nerve conduction studies.

Claimant was reevaluated on December 20, 1982 at which time he reported a decrease in symptoms until a month before when he started having increasing pain in the left upper trapezius and left shoulder particularly with repetitive use. Claimant also complained of headaches and some migration of his symptoms to the right side. Electromyography and nerve conduction were normal. A myelogram was suggested. Dr. Chesser reported his evaluation of claimant in a letter dated June 20, 1983 in which he mentioned claimant's persistently diminished left biceps reflex. Claimant complained of pain with use of his arm, weakness in the left shoulder, spasms across the upper chest and into the left arm. His cervical range of motion was full. There was pain in the left cervical paraspinal region with right and left lateral bending. There was diffuse weakness in the left upper extremity. The left biceps reflex was diminished. There was reduced sensation in his thumb, index and middle fingers of the left hand.

Electromyography was normal. Nerve conduction studies also were normal. The doctor suggested a CT scan and myelography.

Claimant was hospitalized on December 28, 1982 with left shoulder complaints. X-rays showed mild degenerative osteo-arthritic changes. Claimant was treated with bed rest and cervical traction as well as physical therapy. By the time of his discharge he was demonstrating excellent strength in his left deltoid and left biceps. Claimant was released to return to work without restrictions on January 10, 1983. The discharge diagnosis was left C5 radiculopathy.

Claimant was admitted to the hospital on June 28, 1983 after reporting recurrent cervical discomfort in May. The left biceps was diminished. Claimant was treated conservatively with some decrease in his symptoms; but as he was unable to return to work, he was hospitalized for testing. Mild weakness of the left deltoid and left biceps persisted. The left biceps jerk was diminished.

Claimant was seen in the emergency room on May 11, 1983 with complaints of a muscle spasm across the chest and numbness in both arms. Claimant appears to have told the doctor that he wished workers' compensation because of the worsening of his condition. He was released with a diagnosis of neuromuscular chest wall pain.

A myelogram showed what seemed to be a defect at T7-T8. The cervical area evidenced no defects. A CT scan was normal and claimant was released for return to work on July 5, 1983. The discharge diagnosis was a left C-5 radiculopathy.

Claimant mentioned during his hospitalization his need to change jobs.

Robert W. Milas, M.D., board certified neurosurgeon, first saw claimant on August 6, 1982 on referral from Dr. Beaty. Claimant was complaining of left cervical discomfort with radiation into his upper extremity which started six weeks prior to his visit. Subsequently, the doctor learned that claimant boned hams at a rate between 100 and 200 per hour doing repetitive work utilizing his upper extremities. The doctor had no record of discussing claimant's occupation with him at the time of his first visit. On that first examination the doctor's impression was that claimant had a left C-6 radiculopathy. Later he felt that the radiculopathy might be at C-5. Claimant was to return to work on August 30, 1982.

Dr. Milas testified that his diagnosis was made by examining the strength in claimant's upper extremities, his reflexes and pain pattern. On claimant's initial visit his reflexes were symmetrical. Later the biceps jerk was diminished on the left.

Claimant was seen for follow-up on December 13, 1982 at which time he spoke of cervical discomfort which radiated into his left shoulder and upper extremity with weakness in the left deltoid muscle. Claimant was kept off work beginning on December 13, 1982.

Claimant had a decrease in symptoms when he was seen on February 14, 1983 after he changed jobs. Improvement in strength in the left deltoid and in the left biceps muscles was found.

Claimant returned in May of 1983. Dr. Milas diagnosed a C5 radiculopathy and kept claimant off work for physical therapy.

In a letter of May 18, 1983 Dr. Milas recorded claimant's belief that his symptoms were related to the demands of his work. The doctor wrote: "Certainly degenerative osteoarthritic changes may, if not caused by certain physical activities, certainly be exacerbated by such activity." Then he wrote: "Patient is to investigate the work related basis for his complaints."

Claimant was seen on June 23, 1983 at which time he said his symptoms had decreased, but he was unable to engage in physical activity without recurrence of symptoms. Claimant was hospitalized.

On July 13, 1983 claimant was released to return to work with no lifting over twenty pounds and no repetitive motion of the upper extremities. Those restrictions were to remain in force for three months.

Claimant was seen in follow-up on October 11, 1983 at which time he complained of intermittent burning discomfort in the left cervical area with radiation to the left upper extremity. Claimant had improvement in his strength on the left and Dr. Milas found strength symmetrical. The left biceps reflex remained absent. The doctor wrote: "I do feel that chronologically the patient's aggravation of his problem appears to be related to the type of work he does and hence there is a strong probability that returning to that occupation may indeed lead to further permanent damage."

Claimant had electromyography and nerve conduction studies as well as a CT scan and myelogram. He was treated with rest, physical therapy and cervical traction.

Dr. Milas agreed that body habitus or weight lifting could predispose a person to radiculopathy. The doctor was unaware of whether claimant was left or right handed.

Dr. Milas was asked about a portion of his January 24, 1984 report:

> Q. "Hence, there does not appear to be any permanent disability at this time." Then you go on that, "It would be foolhardy for him to return to his former occupation." Then in your next report where Cook evidently asked you to be more specific or to explain that, you state in the last paragraph of your January 24th report, "Although I am unable at this point in time to quantitate objectively the percentage of permanent partial impairment of the whole man as described in the A.M.A. Guide to Valuations [sic] of Permanent Impairment, I feel that Mr. Aguilar is not able to return to his previous employment as a meat cutter and under that description is, in effect, 100 percent disabled from engaging in his previous employment." I understand that to mean that it is 100 percent wrong for him to go back to his hamboning, but under the A.M.A. rating tables which rate functional disability, you can't find any percentage of permanent disability?
>
> A. That's correct. (Milas dep., p. 17; l. 19-25; p. 18; l. 1-13)

The doctor agreed that there were other types of work of a light or sedentary nature claimant could do. He felt it would be a mistake for claimant to go back to his previous job and risk "permanent impairment." He suggested retraining for claimant.

The neurosurgeon understood that claimant worked between his episodes of pain. Regarding causation, he said:

> Q. And is it your opinion that working aggravated or contributed to the cause of the radiculopathy?
>
> A. I can only relate what Mr. Aguilar relates to me, and he told me that his work environment precipitated his discomfort.
>
> Q. So within a reasonable degree of medical certainty, could you say that the work contributed to the radiculopathy or caused it?
>
> A. I can say that it is a possible cause. (Milas dep., p. 23 ll. 14-23)

The doctor's letter of December 7, 1983 attributes claimant's two episodes to the work required by claimant's employment as a meat cutter.

John E. Sinning, Jr., M.D., orthopedic surgeon, examined claimant on April 19, 1984 and reviewed records from Drs. Milas and Chesser. He understood that claimant worked as a ham boner who experienced a triggering left middle finger which was treated. Both prior and subsequent to that surgery, claimant had a aching in his left forearm.

On examination, Dr. Sinning found a full range of motion in

the neck with all muscles strong and no evidence of muscle irritability or spasm on palpation of the neck. Claimant's complaint of pain on tilting and rotating his neck were inconsistent and not reproducible. Claimant's left arm was slightly smaller than the right. There was a vague absence in sensation to pinprick which did not conform to an anatomical distribution. X-rays showed spurring around C-5 and 6 but no narrowing. The doctor compared films from August 9, 1982 and June 1983 and found no difference. Overall, x-rays were thought to show minor signs of cervical hypertrophic osteoarthritis and degenerative disc disease.

Dr. Sinning's diagnosis was osteoarthritis of the cervical spine of a minor degree and cervical degenerative disc disease which were not related to nor aggravated by claimant's work. He thought that what claimant was experiencing were flare-ups of cervical root irritation "as a part of a cervical disc problem." He did not think claimant had an impairment of function.

APPLICABLE LAW AND ANALYSIS

The issues in this matter according to the prehearing order are whether there is a causal relationship between the alleged injury and the disability; whether claimant is entitled to benefits for temporary/healing/permanent partial disability; 85.27; and rate, credit. On May 14, 1984 claimant filed a request for admissions which included the following: "That the Claimant was injured in the course and scope of his employment on or about June, 1982" and "[t]hat the injury resulted from the continuous and repetitive motions associated with Claimant's former work as a ham boner." Those requests were denied by defendant. At the time of hearing, however, clarification of issues by the undersigned leaves only those of causal connection and claimant's entitlement to temporary total or to healing period benefits.

The claimant has the burden of proving by a preponderance of the evidence that his injury is the cause of his disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

Claimant testified that in June of 1982 he developed pain in his left arm and shoulder and cramping in his arm and chest. He was treated with traction. Claimant was given a ten to twenty pound weight limitation which later was removed. Claimant redeveloped symptoms and then had an episode of chest pain which resulted in the imposition of new restrictions and in his being placed on layoff.

Claimant first saw Dr. deBlois who kept him off work but assigned his condition neither to an accident nor to an occupational injury. His diagnosis was strain, sprain and bursitis of both shoulders.

Dr. Beaty saw claimant shortly after he saw Dr. deBlois, concluded that claimant's condition was attributable neither to an accident nor to an occupational injury, kept claimant off work and diagnosed a stenosing tenosynovitis of the left middle finger. A possible C5-6 radiculopathy and possible biceps tendonitis of the left shoulder was suspected. Nothing in the reports and records connects claimant's condition to his work other than claimant's own statement that his shoulder starts to hurt from job activities. At one point in claimant's care Dr. Beaty attributed claimant's problems to his muscle mass.

Dr. Chesser did electromyographies and nerve conduction studies on June 30, 1982; December 20, 1982; and June 20, 1983 all of which were normal. Dr. Chesser does not give an opinion on causation.

Dr. Sinning, who evaluated claimant, had the advantage of reviewing records from both Drs. Milas and Chesser. Dr. Sinning examined claimant, reviewed his x-rays and took x-rays himself. He made diagnoses of osteoarthritis of the cervical spine and of cervical degenerative disc disease of a minor degree. The doctor specificaly said that "the cervical arthritis and degenerative disc disease are not related to Mr. Aguilar's work and further it is my opinion that his work does not aggravate that condition."

The sole support for claimant's claim is found in the evidence from Dr. Milas. On claimant's first visit he complained of intermittent left cervical discomfort with radiation into the left upper extremity beginning six weeks before with no history of trauma or heavy lifting. Dr. Milas made note of claimant's feeling "that his symptoms may indeed be related to the physical demands placed on him at his place of employment" and seemingly suggested that claimant should "investiage [sic] the work related basis for his complaints." Dr. Milas' reports indicate that one change in claimant's work resulted in improvement. A period on light duty resulted in no change.

A letter of October 12, 1983 contains this statement: "I do feel that chronologically the patient's aggravation of his problem appears to be related to the type of work he does and hence there is a strong probability that returning to that occupation may indeed lead to further permanent damage." Following claimant's myelogram he was advised "not to perform repetitive activities with the upper extremities for fear of aggravating his left C5 radiculopathy." Dr. Milas agreed that body habitus or weight lifting would predispose claimant to radiculopathy.

An award of benefits cannot stand on a showing of a mere possibility of causal connection between the injury and the claimant's employment. An award can be sustained if the causal connection is not only possible, but fairly probable. Nellis v. Quealy, 237 Iowa 507, 21 N.W.2d 584 (1946). Questions of causal connection are essentially within the domain of expert testimony. Bradshaw, 251 Iowa 375, 101 N.W.2d 167. However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish., 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

The weight of Dr. Milas' testimony is diminished by his understanding of claimant's work which he thought included boning hams at the rate of 100 to 200 hams per hour. Claimant testified at hearing that he personally would do about fourteen or fifteen an hour. The doctor's deposition testimony regarding causation relied heavily on what claimant told him; i.e., he testified: "I can only relate what Mr. Aguilar relates to me, and he told me that his work environment precipitated his discomfort." When the doctor was asked if he could say the work contributed to the radiculopathy with a reasonable degree of medical certainty he said, "I can say that it is a possible cause."

Claimant's burden is a preponderance of the evidence which means the greater weight of the evidence; i.e., the evidence of superior influence or efficacy. Bauer v. Ravell, 219 Iowa 1212, 260 N.W. 39 (1935). Claimant seeks a running award. The evidence in this matter does not allow claimant to preponderate on the issue of whether or not his continuing disability is causally related to his employment.

FINDINGS OF FACT

That claimant is thirty-six (36) years of age.

That claimant is a high school graduate.

That claimant began work for defendant in November of 1970.

That claimant had a motorcycle accident in 1973 or 1974 in which he landed on his head and had stitches over his eye.

That claimant has been a weight lifter.

That in June of 1982 claimant developed pain in his left arm and shoulder and cramping in his arm and chest.

That in June 1982 claimant was diagnosed as having a stenosing tenosynovitis of the left middle finger.

That claimant was treated with traction.

That claimant was given a ten to twenty pound weight limitation which was later removed.

That claimant was laid off after an episode of chest pain in May of 1983.

That claimant drew unemployment until March of 1984.

That claimant continues to complain of loss of strength; of a twitching in his forearm, upper arm, chest and face and of a burning sensation.

That electromyography and nerve conductions studies were normal in June 1982, December 1982 and June 1983.

That a left C5 radiculopathy was diagnosed in early 1983.

That claimant had a normal CT scan in mid-1983.

That a myelogram of June 29, 1983 showed what seemed to be a defect at T7-T8.

That in July of 1983 claimant was released to return to work with no lifting over twenty pounds and no repetitive motion of the upper extremities.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has failed to establish by a preponderance of the evidence a causal relationship between his work and any disability which he now suffers.

ORDER

THEREFORE, IT IS ORDERED:

That claimant take nothing from these proceedings.

That defendant pay costs pursuant to Industrial Commisioner Rule 500-4.33.

Signed and filed this 11 day of August, 1984.

IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is proceeding in arbitration brought by Tom Aiello, claimant, against Alcoa, self-insured employer, defendant, to recover benefits under the Iowa Workers' Compensation Act for an alleged injury arising out of and in the course of his employment on February 25, 1983. It came on for hearing on July 9, 1984 at the Bicentennial Building in Davenport, Iowa. It was considered fully submitted with the receipt of additional wage information on July 12, 1984.

The industrial commissioner's file contains a first report of injury received November 28, 1983.

At the time of hearing the parties stipulated to time off work from February 25, 1983 to September 3, 1983.

The record in this matter consists of the testimony of claimant, Richard Kimball, Larry Delf and David Behensmeyer; claimant's exhibit 1, company medical records; claimant's exhibit 2, records from a hospitalization of February 28, 1983; claimant's exhibit 3, records from a hospital admission of April 19, 1983; claimant's exhibit 4, records from defendant's medical department; claimant's exhibit 5, a letter from Richard T. Beaty, D.O., dated February 7, 1984; defendant's exhibit 1, a report from Dr. Beaty dated September 16, 1983; defendant's exhibit 2, a report from Dr. Beaty dated May 31, 1983; defendant's exhibit 3, a hospital record dated April 20, 1983; defendant's exhibit 4, a letter from Dr. Beaty dated March 4, 1983; defendant's exhibit 5, an x-ray report dated March 1, 1983; defendant's exhibit 6, a report dated February 7, 1983 from Vijay Verma, M.D., dated February 7, 1983; defendant's exhibit 7, a report from M. J. Aden, M.D., dated December 16, 1982; defendant's exhibit 8, a report from Lloyd England, D.O., dated September 28, 1981; defendant's exhibit 9, defendant's medical records; defendant's exhibit 10, an applicaton for group benefits; defendant's exhibit 11, an application for benefits; defendant's exhibit 12, a letter from claimant dated March 2, 1984; defendant's exhibit 13, a record of disability payments; deputy commissioner's exhibit 1, a listing of wage amounts; and deputy commissioner's exhibit 2, additional wage information. The parties filed briefs which were helpful to the undersigned.

ISSUES

The issues in this matter are whether or not claimant's injury arose out of and in the course of his employment; whether or not there is a causal relationship between claimant's injury and any disability he now may suffer; whether or not claimant is entitled to healing period and permanent partial disability benefits; and the rate of compensation in the event of an award. Defendant has raised the affirmative defense of notice.

STATEMENT OF THE CASE

Fifty-one year old married claimant testified to a twelfth grade education and to commencing work for defendant employer on January 28, 1952 in the remelt department where he worked as a laborer. In 1961 he moved to the roll shop where he undertook three and a half years of training to be come a grinder. This training is his only special training. He drove a school bus part time for fourteen years. He also has done transfer for a truck rental firm. His last work at that was three to five years ago. In April of 1983 he commenced a trucking business with two trucks hauling general freight. He has done no driving himself and subsequently lost one truck. His son drives the truck that remains.

Claimant recalled the circumstances surrounding his injury as follows: He was working the 11:00 p.m. to 7:00 a.m. shift. He was working on the number one 28 inch grinder. The safety hook was missing to attach the hoist to change the guard which needed to be removed to change the wheel. His back was not any worse than normal on this day. He did the setup on the grinder. He carried four gibs. He removed and lowered the wheel guard which he understood weighed 79 pounds. He had extreme pain and was unable to stand up. This pain was more severe than he had been experiencing. He went to his supervisor Behensmeyer whom he told his back was hurting and asked for a pass to the medical department.

When he got to the medical department he thought that he had said he was changing a guard when his back started to hurt. On his way home he stopped at the hospital where he told of lifting. He possibly received a shot there. Next he went to Dr. Beaty who admitted him for a myelogram and then on April 20, 1983 performed surgery. He was released to return to work on September 3, 1983 with a 35 pound weight restriction as well as limitation on prolonged standing and sitting and excessive bending or twisting.

He reported to defendant, but there was no work available with those restrictions. He has not worked since his injury. He thought that he could drive a school bus for three or four hours a day or do light factory work if there was no standing for prolonged periods. He indicated that the union president is trying to get him back to work with defendant. Claimant admitted that he might have, because of pride, told Delf he would not take a lower paying job; however, he has reconsidered his position. It was his contention that under union rules he could not get out of the department.

Claimant acknowledged having a 60 pound weight restriction in January of 1982. He recalled having been off work for sixteen weeks including ten weeks of vacation and being hospitalized for x-rays in September 1981 after having his back go out while he was lying down. In early February of 1983 he was examined by Dr. Verma and had a CT scan after having a previous CT scan in December of 1982.

Claimant has collected group benefits which he will draw until February 1985. He asserted that under the plan he cannot look for work or his benefits will be stopped. As a reason for seeking sickness and accident benefits, claimant said he could not wait the time necessary to draw compensation and that sickness and accident benefits are easy to get. Also, if he had sought workers' compensation, he would not have obtained sickness and accident benefits. Claimant testified that what happened to him was not by his definition an accident. He stated that he learned of the concept of aggravation from his nephew. He consulted a lawyer around early October of 1983. In addition to the group benefits, he had car payments made through a disability policy with the credit union. He has not made any other claim for workers' compensation and he has never drawn benefits. He agreed that prior to February 25, 1983 he knew the difference between sickness and accident and compensation.

Claimant stated that he and Delf, the workers' compensation supervisor, had a discussion on May 16, 1983 in which he asked for compensation benefits and which resulted in inquiry being made of Dr. Beaty. Claimant claimed that he told Delf at this time about his back and his claim for compensation which Delf said he would review. In addition to this meeting in Delf's office, they had other discussions by phone and at some time discussed the weight of the wheel guard. He filed further claim for sickness and accident after his discussion with Delf.

Claimant acknowledged knowing that he would need back

surgery sooner or later; however, no surgery was scheduled on February 25, 1983.

As to his present complaints, he listed mild back pain brought on by activity which can be controlled with aspirin, trouble with prolonged standing and pain in the area of his incision with stooping. He is not bothered by walking, bending or twisting; he is most comfortable sitting; and he can drive three to four hours. He can lift, but he will have pain for several days.

In addition to his back problems, claimant is troubled by hypoglycemia and tachacardyia. Besides his back surgery he has had operations for a pilonidal cyst, hernia, hemorrhoids, gall bladder, a gastric resection and two carpal tunnel releases.

Claimant admitted that before February 25, 1983 he neither asked for nor received any assistance with his work. Neither did he complain about equipment. However, he alleged that he had told the supervisor he was unable to handle the work when he was written up for missing work. He further asserted that he pleaded he could not handle the heavy work. He knew the wheel guard was over his limit, but he was used to doing his work himself.

He said that as he has thirty years in, he is eligible for retirement. After two years on sickness and accident the company must find a place for him or he is out.

Richard Kimball, a roll grinder and roll shop committeeman who has worked for defendant for twenty-nine years and who was working with claimant on the eleven to seven shift on February 25, 1983 testified to seeing claimant when they punched in and to knowing claimant was operating a twenty-eight inch grinder which was the same sort of work he was doing himself. He did not recollect claimant's commenting about his physical condition that night. He then spoke to claimant ten or fifteen minutes into the shift. He was aware that claimant did not finish the shift and did not come back to work after that date. As he remembered, claimant complained after lifting off the wheel guard, a lift he did not actually see claimant perform. He did not talk to claimant, but he noticed claimant limped and saw him go to the medical department.

The witness said routine aspects of the grinder's job would be to make setups and change wheels. In order to change a wheel, the wheel guard cover which he estimated weighed from 80 to 100 pounds with the lighter weight applicable when it was free from oil or residue had to be removed. The guard had a hook so that an overhead gib boom could be used to lift it off. This weight might be lifted once or twice a night. The cover was placed in a trough several feet below floor level, and therefore it was necessary to bend and to stoop. Some grinders could be lifting gibs weighing twenty-five to thirty pounds.

He explained the procedure for obtaining a pass for the medical department as going through the supervisor.

The witness testified there was no hook to use with the jib boom on grinder number 1.

He remembered no conversations with Behensmeyer that night, but he said they had spoken of claimant's situation subsequently. He had not talked with Delf.

He indicated an awareness that claimant had problems. He knew that claimant was off work in late 1982 and into 1983 but he did not know it was because of his back. He also knew claimant had a fifty pound weight limitation, but he did not know of claimant's asking for help.

David Behensmeyer, a twenty-one year employee and roll shop foreman, said his responsibility is to coordinate the work and to supervise the people in the shop.

He remembered the events of February 25, 1983 as follows: His shift started at midnight. Claimant was in shortly thereafter. He seemed agitated. He asked for a medical pass, but he did not say why he wanted one. Claimant did not tell him of a work-related incident. He did not remember claimant's limping. He first learned claimant was claiming a work incident after claimant's meeting with Delf.

The witness said that he was certain there was a hoist over grinder 1 on February 25, 1983. He reported that most of his female workers used the hoist while his male workers manhandled the wheel guard. He believed that even if the hook or handle on the wheel guard had been missing, a sling arrangement could have been made to use the hoist. Claimant did not complain of the missing hook.

Behensmeyer recalled that claimant was moved to his building because there had been some trouble in the foil mill area and it was felt that claimant needed closer supervision. He was placed in the main shop when he came back after being on a medical leave.

It was the opinion of the witness that claimant did not like the work in the main shop and he did complain of the heavier work which was in reality more a difference in size rather than a difference in weight. He claimed that running a grinder is the lightest work in the machine shop. He reported that claimant often limped and complained of various problems. He knew of claimant's back trouble.

Larry Delf, who testified in both claimant's and defendant's cases and who was the safety and health supervisor as well as the supervisor of workers' compensation, recalled the circumstances of his meeting with claimant on May 16, 1983: They met in his office for a discussion and went to the medical department where they talked to Dr. Costa. That discussion provoked a letter from Dr. Costa to Dr. Beaty. Claimant told him of the incident on February 25, 1983. He had the guard weighed and he thought the weight was 84 pounds.

The witness stated that prior to that meeting claimant had not made any claim to his knowledge of a work-related injury. He had no requests from claimant that equipment be weighed. Neither did he know of complaints by claimant that he was handling weights in excess of his limitation. He was not cognizant of claimant's complaining of a lack of a safe and healthy work environment.

Delf explained that there is one main roll shop with three satellite shops. Grinding work is essentially the same in all, but there is variety in the materials and equipment. It was his recollection that claimant was sent to the main shop for closer supervision and that claimant resisted being there. He had no personal knowledge as to whether or not the hook was on the wheel guard on February 25, 1983, but he said the hoist was there and the hook was there on May 16, 1983. He acknowledged that employees do not always use the hoist. He did not have information that claimant was complaining of the weights or of the work prior to May 16, 1983.

Delf testified that claimant told him he would not go to a lesser paying job. He agreed that claimant is a proud person.

The witness discussed with Robert Burns claimant's letter of March 2, 1984. He said that he first learned of claimant's dissatisfaction on May 16, 1983 and told Burns about it at that time.

Restrictions come from medical personnel with a copy to him, a copy to the supervisor and a copy to the employee. The employee was told to remind the supervisor of the restrictions in the event the supervisor should forget. In the alternative, an employee with a restriction could seek help from a coemployee.

A letter from claimant to Robert Burns dated March 2, 1984 was offered in evidence.

On March 4, 1983 claimant filed a claim for accident and sickness benefits. He did not complete the portion relating to an accident nor did he answer the question: "Were you at work when the accident happened?" The form states: "This form is not a claim for workers' compensation. The portion completed by Dr. Beaty includes a diagnosis of spinal stenosis and a "no" in response to the question "Did this sickness or injury arise out of patient's employment?"

A similar form is dated May 27, 1983. Attached to that form is a bill from Dr. Beaty indicating claimant's symptoms were recurrent and not work related.

An exhibit shows the payment of 75 weeks and 3 days of accident and sickness benefits at a rate of $291 weekly.

A form to obtain credit union benefits was signed by claimant on October 19, 1983 which gives back surgery as the cause of disability and November of 1982 as the time the condition first appeared. Claimant reported being hospitalized four times between November of 1982 and January of 1983.

Medical department records record back trouble in 1956, 1957, 1960, 1961 and 1964. X-rays in 1957 showed a narrowing in the fourth lumbar vertebra on the left which was thought to be congenital. X-rays in 1961 showed a slight wedging of L2 anteriorly and minimal degenerative disc disease with slight herniation of L4-L5 into L4 on the right.

Records from periodic health checks show acknowledgement of back pain in 1981. During a period of that year, claimant underwent chiropractic care on a daily basis for back pain and pain into the legs.

On January 7, 1983 claimant carried a weight limitation of fifty pounds which was a ten pound reduction from that imposed in 1982.

A note in the medical department records of February 4, 1983 indicates claimant was taking Feldene for his back with complaints of muscle spasm into the right leg. Claimant on that date was restricted to lifting fifty pounds.

A statement from Charles Cunningham, D.O., records his treatment with medication, heat and adjustments of claimant from September 21, 1981 to October 15, 1981 for an acute lumbosacral strain and osteoarthritis of the lumbar spine. Claimant was given a weight limitation of thirty-five pounds.

An x-ray report of September 24, 1981 records an impression of moderate osteoarthritis and a thinning of the disc between L2 and L3.

R. H. Wood, D.C., reports his treating claimant from October 19, 1981 to January 6, 1982 for chronic recurrent lumbosacral strain/sprain with associated myofibrositis and radicular leg pain. He assigned a sixty pound weight limitation.

Records from defendant show claimant was seen in the medical department at nine minutes after midnight on February 25, 1983 complaining of severe lumbar pain which prevented his standing straight. He told of back pain for the past few days and of going to an orthopedist for a pinched nerve. He also announced the possibility of surgery.

Claimant went to the hospital emergency room on February 25, 1983 and gave a history of back problems with his current complaint of pain going down his legs. He claimed no new symptoms. More specifically, his primary complaint was of pain over the lateral aspect of both legs with numbness into the buttocks region. Claimant complained that he aggravated his back while lifting at work.

A note of February 28, 1983 records Behensmeyer's calling the hospital and learning that claimant was there with a bad back.

Eugene Collins, M.D., saw claimant in consultation on February 28, 1983 and took a history of low back pain spanning several years with a flareup in November of 1982. Dr. Collins' impression was spinal stenosis at L4-5 and to a lesser degree at L3-4 with probable intermittent claudication.

X-ray views of the lumbar spine on March 1, 1983 showed extensive osteoarthritis. A lumbar myelogram was interpreted by Charles R. Porter, D.O., as revealing stenosis or narrowing of the spinal canal at L3-4 and L4-5 which was "probably secondary to spondylosis (osteoarthritis)." On March 3, 1983 a Depo-medrol epidural injection was tried.

On April 20, 1983 claimant underwent a bilateral laminectomy at L3/4 after being admitted the preceding day with a chief complaint of pain in both legs. The diagnosis for claimant's condition was spinal stenosis at L3/4. X-rays of the lumbar spine post-surgery showed extensive hypertrophic arthritis.

Dr. Beaty summarized his treatment of claimant in a letter dated February 7, 1984. In that letter the doctor states that he first saw claimant in December of 1982. Claimant had a history of low back and left leg pain and told of a specific incident in November of 1982.

Computerized tomography of the lumbar spine was done on December 16, 1982 which showed probable spinal canal stenosis at L4. Claimant had physiotherapy during this time. M. J. Aden, M.D. expressed an impression of probable spinal canal stenosis at L4.

After some conservative treatment and a Depo-medrol epidural injection, claimant was returned to work on January 10, 1983 with restrictions against lifting in excess of fifty pounds. Dr. Beaty at that time felt that if claimant's condition worsened he would have to be readmitted to the hospital for myelography and a neurosurgical consultation for possible decompression of the spinal stenosis.

Vijay Verma, M.D., examined claimant on February 7, 1983 and took a history of back pain beginning at Thanksgiving when claimant was doing some work. Nerve conduction studies were done in both the upper and lower extremities. Electrodiagnostic study showed muscle membrane instability in the L4-L5 paraspinals. There was no evidence of definite right L3 to S1 radiculopathy.

Following an electromyography in February, the doctor observed that muscle membrane instability at the L4-5 paraspinal might be "secondary to the spinal stenosis as well as hypoglycemia episodes."

The essence of Dr. Beaty's opinion is contained in the following paragraph:

> With regards to the specific asked in your letter, I do not believe that Mr. Aiello would have been able to work indefinitely with a 50 lb. restriction without undergoing a decompression laminectomy, however if the injury as related on February 24, 1983 of lifting 80 lbs. is true, this probably aggravated the patient's low back condition and precipitated the decompression surgery of April 20, 1983. I believe that he did have spinal stenosis which was aggravated by heavy lifting, bending and repetitive twisting activities at work for which he underwent decompression surgery on 4-20-83. The patient has done quite well but I do not believe that he will ever be able to return to a heavy lifting, repetitive, bending, twisting or prolonged periods of standing job activity. I would limit his weight to approximately 35 lbs. This will be permanent. Mr. Aiello was kept off work for his back from February 25, 1983 until October 3, 1983 although some of this obviously was not due to his back in total. I believe that he probably could have returned to work a month earlier had he not had the carpal tunnel releases. The patient has not returned to work because of the restrictions that have been placed on him which I believe to be permanent. These are no lifting over 35 lbs., no repetitive bending, twisting or prolonged periods of standing.

Dr. Beaty rated claimant's permanent partial disability at ten percent.

On September 16, 1983 Dr. Beaty completed a form on which he assessed claimant's ability to stand and to sit at eight hours daily, his ability to walk at five hours and his ability to drive at three. He thought claimant could occasionally lift and carry up to fifty pounds as well as occasionally bend, climb, crawl, squat and reach. He found claimant suited to either light or to sedentary work and possibly to medium work.

Medical department notes from September 27, 1983 show claimant's refusal to return to the main roll shop and indicate claimant's desire to go back to the foil mill. On September 29, 1983 it appears that the doctor visited the shop and determined claimant could not perform work in the roll shop with his restrictions. Apparently a later adjustment was made in the restrictions, but Dr. Costa, after consulting with the superintendent, continued to find the work inappropriate.

APPLICABLE LAW AND ANALYSIS

The first issue to be determined is whether or not claimant's injury arose out of and in the course of his employment. In order to receive compensation for an injury, an employee must establish that the injury arose out of and in the course of employment. Both conditions must exist. Crowe v. DeSoto Consolidated School District, 246 Iowa 402, 68 N.W.2d 63 (1955).

In the course of relates to time, place and circumstances of the injury. An injury occurs in the course of the employment when it is within a period of employment at a place where the employee may be performing duties and while he is fulfilling those duties or engaged in doing something incidental thereto. McClure v. Union County, 188 N.W.2d 283, 286 (Iowa 1971).

In addition to establishing that an injury occurred in the course of employment, the claimant must also establish the injury arose out of employment. An injury "arises out of" the employment when a causal connection between the conditions under which the work was performed and the resulting injury followed as a natural incident of the work. Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

Our supreme court has stated many times that a claimant may recover for a work connected aggravation of a preexisting condition. Almquist v. Shenandoah Nurseries, 218 Iowa 724, 254 N.W. 35 (1934). See also Auxier v. Woodward State Hosp. Sch., 266 N.W.2d 139 (Iowa 1978); Gosek v. Garmer and Stiles Co., 158 N.W.2d 731 (Iowa 1968); Barz v. Oler, 257 Iowa 508, 133 N.W.2d 704 (1965); Olson v. Goodyear Service Stores, 255 Iowa 1112, 125 N.W.2d 251 (1963); Yeager v. Firestone Tire & Rubber Co., 253 Iowa 369, 112 N.W.2d 299 (1961); Ziegler v. United States Gypsum Co., 252 Iowa 613, 106 N.W.2d 591 (1960).

Claimant, who had a fifty pound weight restriction, testified that on February 25, 1983 he was lifting and lowering a wheel guard which was described as weighing between 79 and 84 pounds. He said that he had extreme and severe pain which caused him to go to the medical department.

Records from the medical department show that claimant was indeed seen in that department with back pain and an inability to straighten. He said at that time that he had been having back pain for the past few days and had been going to an orthopedist who had suggested to him the possibility of surgery.

Richard Kimball, although not seeing claimant lift the wheel guard, had observed the claimant limping and had seen him go to the medical department after the start of their shift.

Claimant went directly from work to the hospital where he complained that he aggravated his back with lifting at work.

On March 4, 1983 claimant filed for accident and sickness benefits. Claimant explained that he could not wait for compensation, that getting accident and sickness benefits is easy, and that if he claimed a compensable injury he would have been unable to receive accident and sickness benefits.

Defendants make note of Dr. Beaty's referring to an accident of February 24, 1983 rather than February 25. The Iowa Supreme Court has declared the selection of an injury date unimportant in a case where evidence showed that another date, only a few days off from the date given in claimant's application, was the date of injury. Yeager, 253 Iowa 369, 373-74, 112 N.W.2d 299, 301 (1961). Claimant's injury occurred around midnight. The minimal discrepancy is unimportant.

The record supports a conclusion that claimant suffered an injury arising out of and in the course of his employment on February 25, 1983 which aggravated his preexisting condition.

Defendant has raised the affirmative defense notice. The Iowa Supreme Court in Reddick v. Grand Union Tea Co., 230 Iowa 108, 296 N.W. 800 (1941) set forth the rule for dealing with affirmative defenses. The opinion of the court in Reddick provided that once claimant sustains the burden of showing that an injury arose out of and in the course of employment, claimant prevails unless defendant can prove by a preponderance of the evidence an affirmative defense.

In DeLong v. Iowa State Highway Commission, 229 Iowa 700, 295 N.W. 91 (1940) the court recognized the industrial commissioner's treatment of notice. The commissioner, quoted in DeLong at 702-03, 92, wrote:

that while the weight of the evidence is not entirely free from doubt, much of which may be due to lapse of time...we are of the opinion claimant sustained the burden of proof in that respect, but in this the question upon whom the burden of proof may rest is not free from doubt. We are constrained to believe that want of such notice is an affirmative defense and if that be true the burden of proof would rest upon the defendant.

The Iowa Supreme Court most recently dealt with notice in Robinson v. Department of Transportation, 296 N.W.2d 809, 811 (Iowa 1980) as follows:

> If the actual knowledge requirement were satisfied without any information that the injury might be work-connected, it should not be necessary to allege the injury was work-connected when giving the st-tutory notice. In fact, however, it is necessary to allege the injury was work-connected when giving notice. It logically follows that the actual knowledge alternative is not satisfied unless the employer has information putting him on notice that the injury may be work-related.
>
> The purpose of section 85.23 is to alert the employer to the possibility of a claim so that an investigation of the facts can be made while the information is fresh. See Knipe v. Skelgas Co., 229 Iowa 740, 748, 294 N.W. 880, 884 (1941). In view of this purpose, it is reasonable to believe the actual knowledge alternative must include information that the injury might be work-connected.

This is the meaning which has been given the actual knowledge requirement under similar statutes in other jurisdictions. See, e.g., Bollerer v. Elenberger, 50 N.J. 428, 432, 236 A.2d 138, 140 (1967) ("The test is whether a reasonably conscientious employer had grounds to suspect the possibility of a potential compensation claim."). The principle is stated in 3 A. Larson, Workmen's Compensation § 78.31(a), at 15-39 to 15-44 (1976):

> It is not enough, however, that the employer through his representatives, be aware [of claimant's malady]. There must in addition be some knowledge of accompanying facts connecting the injury or illness with the employment, and indicating to a reasonably conscientious manager that the case might involve a potential compensation claim.
>
> We hold that this principle applies to the actual knowledge provision of section 85.23.

Prior to February 25, 1983 claimant had a lifting restriction. On the evening of his injury he went to his supervisor for a pass to the medical department. He recalled saying his back was hurting, but he did not testify that he told Behensmeyer that he hurt it on the job. The medical department notes record a complaint of severe lumbar pain, but contain no notation of a cause for pain. Claimant thought he said that he was changing the guard.

Employer records show that claimant did indeed meet with Delf and someone from the medical department on May 16, 1983 and that claimant's entitlement to workers' compensation was a subject at that meeting. Behensmeyer testified that he first learned that claimant was making a claim for workers' compensation after claimant's meeting with Delf. Defendant's affirmative defense of notice fails.

The claimant has the burden of proving by a preponderance of the evidence that the injury of February 25, 1983 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

An award of benefits cannot stand on a showing of a mere possibility of causal connection between the injury and the claimant's employment. An award can be sustained if the causal connection is not only possible, but fairly probable. Nellis v. Quealy, 237 Iowa 507, 21 N.W.2d 584 (1946). Questions of causal connection are essentially within the domain of expert testimony. Bradshaw, 251 Iowa 375, 101 N.W.2d 167. However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W 867. See also Musselman, 261 Iowa 352, 154 N.W.2d 128.

While a claimant is not entitled to compensation for the results of a preexisting injury or disease, the mere existence at the time of a subsequent injury is not a defense. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756, 760-761 (1956). If the claimant had a preexisting condition or disability that is aggravated, accelerated, worsened or lighted up so that it results in disability, claimant is entitled to recover. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812, 815 (1962). When an aggravation occurs in the performance of an employer's work and a causal connection is established, claimant may recover to the extent of the impairment. Ziegler, 252 Iowa 613, 620, 106 N.W.2d 591 (1961).

Claimant has a long history of back problems with recorded trouble beginning in 1956. X-rays in 1957 were thought to show a congenital narrowing in the fourth lumbar vertebra. X-rays in 1961 showed a slight wedging of L2 anteriorly and minimal degenerati.e disc disease with slight herniation at L4-L5 into L4 on the right.

For a portion of 1981 claimant underwent daily chiropractic care for pain in his back and legs. Dr. Cunningham diagnosed claimant's condition as acute lumbosacral strain and osteoarthritis of the lumbar spine. X-rays showed moderate osteoarthritis and a thinning of the disc between L2 and L3.

Claimant's diagnosis in early 1982 was chronic recurrent lumbosacral strain/sprain with associated myofibrositis and radicular leg pain. He was given a sixty pound weight restriction.

Dr. Beaty began treating claimant in December of 1982 after an incident in late November in which claimant had immediate back pain. Claimant was diagnosed as having spinal stenosis at L3 and L4 and treated with Cortisone injections and a TENS unit. His weight restiction was lowered to fifty pounds. Claimant began taking Feldene. A CT scan showed probable spinal canal stenosis at L4. Claimant was returned to work, but the possibility of decompression was raised. Dr. Verma also took a history of pain beginning at Thanksgiving.

When claimant was seen on February 4, 1983 he reported he was working with a fifty pound weight restriction and doing well. In reality he was not working because of glucose intolerance and reactive hypoglycemia and was released for return on February 7.

Although no early 1983 office notes or reports from Dr. Beaty were offered, a claim for accident and sickness benefits completed by the doctor on March 9, 1983 shows claimant was treated for spinal stenosis which did not arise out of claimant's employment. A similar form with an attached physician's statement dated May 19, 1983 again denies the work-relatedness of claimant's spinal stenosis and of the decompression laminectomy.

A myelogram in March of 1983 showed stenosis at L3-4 and L4-5 which was thought secondary to osteoarthritis. On April 20, 1983 claimant underwent a decompessive bilateral laminectomy at L3-4.

The statement contained in Dr. Beaty's letter of February 7, 1984 is sufficient to establish a causal relationship between an injury of February 25, 1983 which aggravated claimant's pre-existing condition and precipitated his surgery. Claimant will be awarded benefits for the time period to which the parties stipulated--February 25, 1983 to September 3, 1983.

However, as defendant quite properly points out there is no evidence to causally connect Dr. Beaty's impairment rating to the Februa.y 25, 1983 injury. Such evidence is necessary in light of claimant's extensive preexisting condition and the form claimant's surgery took. Claimant had spinal stenosis and a decompressive laminectomy was carried out. No permanent partial disability will be awarded.

The remaining issue is that of rate. The parties agreed to a marital status of married with two exemptions. They were unable to agree on the weeks prior to claimant's injury which should be used to determine the rate.

Iowa Code section 85.36 is the section of the law which deals with rate. The first unnumbered paragraph of section 85.36 mandates a determination of earnings to which an employee "would have been entitled had he worked the customary hours for the full pay period in which he was injured..." Defendant makes note of a portion of 85.36 which refers to "the last completed period of thirteen consecutive calendar weeks immediately preceding the injury." That language speaks of consecutive weeks but it also includes the concept of completeness. Rulings by this agency have been consistent in excluding incomplete work weeks. Lewis v. Aalf's Manufacturing Co., I Industrial Commissioner Report 206 (Appeal Decision 1980); Schotanus v. Command Hydraulics, Inc., I Industrial Commissioner Report 294 (1981).

Applying the method of computation routinely used in these matters results in average gross weekly earnings in the thirteen complete weeks prior to claimant's injury of $675.34. As a married person with two exemptions claimant is entitled to a rate of $377.15.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant is fifty-one (51) years of age.

That claimant has a high school education.

That claimant has had additional training to become a grinder.

That claimant commenced work for defendant on January 28, 1952.

That in addition to working for defendant, claimant has driven a school bus and done transfer work for a truck rental firm.

That in April of 1983 claimant began a general freight hauling bu_iness.

That one of claimant's duties on February 25, 1983 was to remove and lower a wheel guard weighing around eighty (80) pounds.

That claimant had back pain which took him first to the medical department and then to the hospital emergency room.

That claimant has not worked since February 25, 1983.

That Delf knew on May 16, 1983 that claimant was making a claim for workers' compensation.

That claimant had back complaints as early as 1957 at which time x-rays showed a narrowing in the fourth lumbar vertebra on the left.

That claimant was off work in the fall and early winter of 1981 and 1982 with a chronic recurrent lumbosacral strain/sprain with associated myofibrositis and radicular left leg pain.

That x-rays of the lumbar spine in September of 1981 demonstrated moderate osteoarthritis.

That as of January 6, 1982 claimant had a sixty (60) pound weight restriction.

That claimant was off work in December of 1982 with a diagnosis of spinal stenosis at L3 and L4.

That claimant received physiotherapy for his back in December of 1982.

That as of January 10, 1983 claimant had a fifty (50) pound weight restriction.

That claimant is married and entitled to two exemptions.

That claimant had average gross weekly earnings in the thirteen completed weeks prior to his injury of six hundred seventy-five and 34/100 dollars ($675.34).

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant had an injury arising out of and in the course of his employment on February 25, 1983.

That claimant has established entitlement to temporary total disability benefits from February 25, 1983 to September 3, 1983.

That claimant has failed to show entitlement to permanent partial disability benefits.

That the proper rate of compensation for claimant is three hundred seventy-seven and 15/100 dollars ($377.15).

That defendant has failed to establish by a preponderance of the evidence the affirmative defense notice.

ORDER

THEREFORE, IT IS ORDERED:

That defendant pay unto claimant temporary total disability benefits from February 25, 1983 to September 3, 1983 at a rate of three hundred seventy-seven and 15/100 dollars ($377.15).

That defendant pay interest pursuant to Iowa Code section 85.30.

That defendant pay costs pursuant to Industrial Commissioner Rule 500-4.33.

That defendant pay the amount due and owing in a lump sum.

That defendant file a final report in sixty (60) days.

Signed and filed this 5 day of September, 1984.

ROBERT BARNHILL, Claimant, vs. DELAVAN MANUFACTURING CO., Employer, and LIBERTY MUTUAL INSURANCE CO., Insurance Carrier, Defendants.	FILE NO. 459100 D E C I S I O N O N 85.27 B E N E F I T S

FILED
JUL 24 1984
IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding wherein benefits available under section 85.27 of the Code of Iowa for medical care and prescription medication are being sought on behalf of Robert C. Barnhill against Delavan Manufacturing Company, employer, and Liberty Mutual Insurance Company, insurance carrier.

The hearing commenced May 18, 1984 in the hearing room at the industrial commissioner's office in Des Moines, Polk County, Iowa.

Claimant appeared through his attorney John R. Ward but did not appear in person. Defendants appeared through their attorney Dorothy Kelley.

The record in this proceeding consists of the testimony of James Brackett, claimant's exhibit 1 and defendants' exhibits A through F. Upon request, official notice was taken of section 2370 of the Medicare Rules and Guides as contained within revision 3-713, of the decision in the case of Robert Barnhill v. Davis as reported at 300 N.W.2d 104 (1981) and of the prior decisions regarding this matter which were made by this agency.

ISSUES

The issues presented by the parties at the time of hearing are claimant's entitlement to benefits under section 85.27 of the Code of Iowa. Defendants contest claimant's entitlement on the grounds that the services were unauthorized and also on the grounds that the services are not for treatment of the work related injury.

REVIEW OF THE EVIDENCE

James Brackett testified that he is the claims supervisor for Liberty Mutual Insurance Company and that his duties include management of claimant's case file with Liberty Mutual. Brackett stated that since exhibit A was issued that claimant has been offered care by a board certified orthopedic physician, which care claimant has refused. Brackett also testified that exhibit D was sent to stress that care by James E. Dolan, M.D., was unauthorized. He stated that care by board certified orthopedic surgeons and psychiatrists continues to be offered to claimant. Brackett conceded that the prior decisions of the agency had required that Dr. Dolan's care be paid for by the defendants and that such decisions were issued in the intervening time between the time exhibit A was issued and exhibit D was issued. Brackett also conceded that claimant would require care from time to time, but that the defendants sought to have the care provided by specialists.

The prior decisions of this agency, namely the review-reopening decision filed April 18, 1979 and the appeal decision filed April 3, 1980, do not address the issue of whether or not care by Dr. Dolan was authorized.

It should be noted that a decision on attorney's fees filed December 9, 1982 authorizes that whatever amount, if any, which is awarded to claimant through this proceeding be paid to Arthur C. Hedberg, claimant's attorney, toward satisfaction of the fees which were awarded to Hedberg for his handling of the previous proceedings.

Claimant's exhibit 1 contains a report from James E. Dolan, M.D., dated February 1, 1983 wherein he relates charges in the total amount of $918.00 which were provided by him to the claimant between June 16, 1978 and December 10, 1982, both dates inclusive. Those charges total $918.00. The report also makes reference to charges for prescription medications in the total amount of $310.83. Dr. Dolan states that both sets of bills, those from himself and those from Drug Mart #6 are related to the October 5, 1976 injury at Delavan Corporation. He also relates that the charges are fair and reasonable for his services.

Defendants' exhibit A is a letter directed to claimant dated June 2, 1977 which indicates that care from Dr. Dolan is unauthorized. Exhibit B is copies of a petition filed by claimant in the Iowa District Court for Polk County wherein he seeks damages for emotional distress as a result of observing an injury suffered by his mother. The decision of the Iowa Supreme Court of which official notice was taken also relates to that

civil action. Exhibit C consists of answers to interrogatories given by claimant in that civil proceeding. In the same he relates stress, anxiety and loss of sleep among the complaints which he alleges as the basis for the damages he seeks in that civil action.

Claimant's exhibit D is a letter from James Brackett to Arthur Hedberg dated January 21, 1983 which states that claimant's care by Dr. Dolan is unauthorized and which also tenders psychiatr and orthopedic care by board certified physicians.

Exhibit E is a collection of records from the Veterans Administration dealing with claimant's medical care.

ANALYSIS AND APPLICABLE LAW

The employer has the right under section 85.27 of the Code of Iowa to choose the medical care which an injured worker will receive. The law imposes upon the employer a duty to monitor the care and provide care which is reasonably suited to the injury. Zimmerman v. L. L. Pelling Co., 2 Iowa Industrial Commissioner Report 462 (App. Decision 1982).

Exhibit A, a letter addressed to claimant, dated June 2, 1977 indicates that care by Dr. Dolan is no longer authorized. The exhibit does not contain a clear concise offer of medical care from any other physician although it does suggest that an orthopedic surgeon be consulted and it makes reference to Dr. Blair who the undersigned assumes to be Donald W. Blair, M.D., a local orthopedic surgeon. The subsequent decisions of the agency, namely the review-reopening decision filed April 18, 1979 and the appeal decision filed April 3, 1980 do not, however, deny payment of Dr. Dolan's bills on the basis of lack of authorization. It appears that those charges which were not made the liability of the defendants were held to be not causally connected to the injury. Defendants did not, however, give any other or further notice of lack of authorization until the letter of January 21, 1983 as shown by exhibit D. The findings of the review-reopening decision and appeal decision found that Dr. Dolan had become an advocate for claimant. Such would be somewhat inconsistent with his role as an objective provider of medical care. For this reason a change in care as directed by the defendants was not unreasonable. The change will not be held effective, however, until January 21, 1983, the date of exhibit D. The prior decisions of the agency coupled with the lack of other clear and concise evidence of notice to claimant of the lack of authorization for Dr. Dolan makes exhibit D a proper point of reference. The fact that claimant requires psychiatric care as well as orthopedic care further indicates that exhibit A is not the proper point of reference for changing the provider of medical care. Further, exhibit A purports to have been sent directly to claimant without any notice to any attorney with whom claimant may have been dealing at that time. From the file in this case it cannot be established whether or not claimant did actually have the services of an attorney on June 2, 1977. This allowance of Dr. Dolan's charges which were incurred prior to January 21, 1983 would clearly be unwarranted under the circumstances of this case.

The claimant has the burden of proving by a preponderance of the evidence that the injury of October 4, 1976 is the cause of the medical expenses on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

The employment activity must be a proximate cause of claimant's expenses but it need not be the only cause. Armstrong Tire & Rubber Company v. Kubli, Iowa App., 312 N.W.2d 60 (Iowa 1981). The evidence in this case does not contain a medical opinion which conflicts with that expressed by Dr. Dolan in exhibit 1. A close review of all the other reports and exhibits reflects a number of incidents which could reasonably be expected to result in symptoms similar to those which resulted from the 1976 injury. There is no indication, however, that the other incidents caused claimant to recover from the 1976 injury. Dr. Dolan provided services to claimant on a number of occasions which he did not relate to the injury of 1976. Independent review of his notes and the requests for medicare payment as contained in exhibit F confirm that all the charges for medication on exhibit 1 are in fact related to the 1976 injury and that all but seven of the charges are related to the 1976 injury. There is no explanation why the charge of October 31, 1979 which notes removing wax from ears is related to the injury. The problems with claimant's neck on November 21, 1979 are not shown to be related to the lower back injury which claimant sustained in 1976 or the emotional disturbances which it precipitated. The entries of March 7, 1980, April 1, 1980, July 31, 1980, August 15, 1980 and February 12, 1981 may relate to the 1976 injury; however, those entries make references to claimant falling and it appears that the primary purpose for the care rendered on those dates was the treatment of a recent fall. There is no showing in the record of this case that the 1976 injury caused claimant to suffer those falls. The total charges from Dr. Dolan for the services which are not shown to be related to the 1976 injury total $150.00.

This agency does not have jurisdiction to make a determination of whether or not any of claimant's medical expenses, which were paid under medicare, constitute an overpayment to the extent that the same are ordered paid in this proceeding.

FINDINGS OF FACT

1. Claimant is currently receiving permanent total disability compensation as the result of an injury which occurred October 4, 1976.

2. Claimant received medical care from James E. Dolan, M.D., for that 1976 injury during the period including June 16, 1978 through December 10, 1982 which resulted in total charges in the amount of $768.00.

3. Claimant's injury required that he receive prescription medication, which was provided to him at a total cost of $310.83.

4. The charges for prescription medication and those from Dr. Dolan are fair and reasonable.

5. Other intervening incidents may have played a part in claimant's need for care but such were not the only cause of that need for care.

6. Defendants had not effectively removed the authorization for claimant's care by Dr. Dolan until January 21, 1983.

CONCLUSIONS OF LAW

All medical care provided by James E. Dolan, M.D., to claimant herein which was provided before January 21, 1983 was authorized.

The charges for prescription medication in the total amount of $310.83 from Drug Mart #6 were for prescription medication used in treating the injury claimant sustained October 4, 1976.

The charges of James E. Dolan, M.D., were incurred providing reasonable medical care for the injuries claimant sustained on October 4, 1976 as shown in exhibit 1 except for those charges rendered on October 31 and November 21, 1979, April 7, March 1, July 31 and August 15, 1980, and February 12, 1981.

Defendants are liable under the provisions of section 85.27 of the Code of Iowa for claimant's expenses with Drug Mart #6 in the amount of $310.83 and for claimant's expenses incurred with James E. Dolan, M.D., in the total amount of $768.00.

ORDER

IT IS THEREFORE ORDERED that defendants pay one thousand seventy-eight and 83/100 dollars ($1,078.83) to claimant as and for reimbursement of medical expenses, the same to be paid to claimant's attorney of record in these proceedings, Arthur Hedberg, in accordance with the prior order of this agency filed December 9, 1982 in the proceedings which resolved the dispute concerning attorney fees.

IT IS FURTHER ORDERED that defendants file an activity report in twenty (20) days from the date of this decision.

Signed and filed this 24th day of July, 1984.

FIREMAN'S FUND INSURANCE,	:	
Insurance Carrier, Defendants.	:	

INTRODUCTION

This is a proceeding in review-reopening brought by the claimant, Shirley Lee Bautsch, against her employer, A. Y. McDonald Manufacturing Company, and its insurance carrier, Fireman's Fund, to recover additional benefits under the Iowa Workers' Compensation Act as a result of an injury she sustained on May 5, 1980.

The matter came on for hearing before the undersigned deputy industrial commissioner at the courthouse in Dubuque, Iowa on May 15, 1984. The record was considered fully submitted on that date.

A review of the industrial commissioner's file indicates that a first report of injury was filed May 16, 1980.

The record in this case consists of the testimony of claimant, of Art Winne and of Luke C. Faber; M.D., of claimant's exhibits A through C; and of defendants' exhibits 1 through 3.

ISSUES

The issues for resolution are:

1. Whether a causal relationship exists between claimant's injury and her alleged disability.

2. Whether claimant is entitled to permanent partial disability benefits for her original work incident.

3. Claimant's rate of weekly compensation.

A review of the industrial commissioner's file reveals that a first report of injury was filed May 16, 1980 and a memorandum of agreement June 18, 1980.

REVIEW OF THE EVIDENCE

The parties stipulated that the commencement date for any award for permanent partial disability was April 7, 1981, claimant's initial work return date.

Claimant, Shirley Lee Bautsch of 2174 River Road, Galena, Illinois, testified in her own behalf. Claimant is 4' 11'' tall and weighs 155 pounds.

Claimant was born May 9, 1943 and graduated from high school in 1961. She has had no formal training since that time. She has worked as a waitress, a nurse's aide, a housekeeper, and a factory laborer. Claimant began work with A. Y. McDonald in April 1979. Claimant worked as a packer wrapper and a Kingsbury operator. The Kingsbury operator had to put a plug into the jaws of the machine and hold the jaws in place tightly. Claimant often used a hammer to assure that the plugs were secured tightly. On her injury date, claimant was pulling on the jaws to keep the plug in tightly. She apparently needed to use her hammer. Her general foreman told her she could not use the hammer but had to close the jaws by hand, however. Claimant reports that the first time she attempted to do so she was "ok"; the second time, she experienced a sharp pain across her back into her right leg. Claimant stated she had had no low back problems nor medical treatment for low back problems before her May 5, 1980 injury date.

Claimant reported she went on her break but needed help getting up following it. She told her foreman who released her to see a doctor. She walked from the plant to the bus depot where she took a bus to her home in Galena. She saw G. J. Klein, M.D., in Hazel Green, Wisconsin that afternoon. Claimant testified she further reported her problems to her employer and the company physician, Luke C. Faber, M.D., in a telephone conference of May 14, 1980. Dr. Faber apparently asked claimant to obtain a statement of Dr. Klein that claimant's work injury was not related to an earlier injury claimant incurred while gardening at home on April 20, 1980. It appears claimant was off work until her injury date as a result of this nonwork incident. At hearing, claimant distinguished the two incidents by stating the gardening incident involved her middle back and shoulders while the work incident produced sharp pain in her lower left side below the belt line and radiating to the right.

Dr. Faber hospitalized claimant from May 15, 1980 to June 4, 1980. She received daily physical therapy and a myelogram was performed. Dr. Faber released claimant to return to work June 8, 1980. Claimant reported she did not feel she could work and asked permission to see Dr. Pearson. Claimant remained off work under Pearson's care through January 1981. Claimant returned to work January 12, 1981 and reinjured herself February 19, 1981. Claimant recited this injury produced the same pain in her low back and occurred when she pulled the jaws of the Kingsbury. Claimant saw David C. Weber, D.C., following this injury at Dr. Faber's direction.

Claimant returned to work April 8, 1981. She bid on a job on a lathe and testified this job did not bother her back so much. Claimant denied that both the Kingsbury and the lathe jobs paid equally well, but express her belief that she had a "hard time making rate" and thereby acquiring incentive pay after her work incident because of back pain. Claimant reported that before her injury her hourly wage had been 125%, but after her injury it was 100% or lower on the Kingsbury and varied from 100% to less on the lathe. Claimant worked from April 1981 to July 1982 when she broke her thumb. Claimant missed seven weeks for this injury then returned and bid for an assembly job which she described as putting saddles together.

Claimant testified concerning her work incident of October 1983. Defendants objected to this testimony on the grounds that it was not admissible if claimant's October 1983 incident resulted in a new injury or an aggravation of her previous injury. Since the evidence is relevant to the question of whether claimant's October 1983 incident was a second injury or aggravation or merely an exacerbation of the symptomology from claimant's earlier problem, defendants' objection is overruled. Claimant recited that she was working in her regular department as an assembler when a supervisor told her to go to department 14 to work on stock boxes. Claimant was then told to drive a fork truck. She stated that when she went to get up in the truck she noticed a very sharp pain in her low back. She characterized her pain as the "very same" as that experienced on May 5, 1980. Claimant later stated she "had reached up real quick" from a bent position to prevent an overhead pipe from hitting a co-worker in stock boxes. She stated she felt a little numbness then and that this occurred approximately five minutes before her great pain. Claimant was hospitalized following this incident. She reported Dr. Faber put weight restrictions on her following this incident, and that she has been unable to return to work since then for A. Y. McDonald's has no work within the restrictions.

On cross examination, claimant stated that her pain is mostly in her right leg and characterized as "wrong" an interrogatory answer which states her pain is in her left leg. Claimant admitted that following her injury she received her base pay even when she did not meet 100 percent of her wage rate. Claimant admitted she received no written warnings concerning her quantity of work following her May 1980 injury. She had received a written warning regarding the quality of her work on April 15, 1980. Claimant could not recall being laid off in summer 1981 nor could she recall whether she ever received unemployment compensation. Claimant thought her hourly rate in October 1983 was $5.59 per hour plus cost of living adjustment.

On redirect examination, claimant again characterized her April 20, 1980 nonwork incident as producing pain between the shoulder blades rather than in her low back. She reported she was given a brace which she characterized as an elastic back support on recross-examination. She also reported she was off work two weeks following this incident and that her shoulder blade pain has gone away and has never again bothered her.

Art Winne, the vice president for personnel relations at A. Y. McDonald, was called by defendants. Mr. Winne identified defendants' exhibit 3 as a summary of claimant's pay during her last 13 weeks at A. Y. McDonald. He identified exhibit 2 as a summary work history for claimant, such as is prepared routinely when workers are discharged. He testified that assemblers at the plant have a lower base pay than some other workers but often receive higher overall pay through incentive pay which he characterized as a function of how fast the human body works.

Luke Charles Faber, M.D., was called by claimant. The doctor described himself as company doctor for A. Y. McDonald. He stated he first saw claimant for her work incident May 8, 1980. He gave the following oral history:

> Well, she stated that on April 20th of 1980 she pulled muscles in her back doing yard work. She saw her family physician for two weeks and she was off for two weeks. She returned to work on 5-5 of '80. She worked for two hours. She pulled her muscles again while running Kingsburys and this involved pulling her arms laterally and twisting her back. I saw her at that time for that problem.

The doctor stated he never received a report from Dr. Klein regarding claimant's April 20, 1980 injury. He denied hospitalizing claimant in May 1980 and stated that James A. Pearson, M.D. did so. The doctor stated claimant was again hospitalized from March 12, 1981 through April 1, 1981. He recalled treating claimant during this hospitalization and said that claimant's discharge summary noted that no diagnosis of claimant's problem was made. He reported regarding this:

> She was under my care primarily, although at that time she was seen by some six or seven specialists

in various fields, including another orthopedist besides Dr. Pearson, a neurologist, a gynecologist, a urologist and an internist who all evaluated her problems and nobody could come up with a diagnosis as the cause of her pain. Therefore, she was signed out as no diagnosis made.

The doctor was questioned regarding claimant's October 18, 1983 incident. Defendants objected on the grounds recited earlier as regards claimant's testimony concerning that incident. For like reasons, the objection is overruled. The doctor recited his recorded notes reflect the following as regards that incident:

> The record states that the patient's complaint is of pain in the lower left back. The record states that the patient said she was at work today, was sent on to a different department, worked there about twenty minutes and then developed pain in the lower back, more on the left side. She has pain when she walks and sits down. The pain radiates down the back to the knee. She's on no medication but did take four aspirin at work and did not relieve the pain.
>
> She complains of a lot of pain in her left sacroiliac area at the point of tenderness, some pain in the left leg with numbness in her left leg. On forward flexion she can flex to come within eight inches of the floor but has pain on straightening back up, pain in the left side in twisting her back to the left, and on the right side she has no pain in twisting to the left side. She had pain on right side flexion and left side flexion showed no pain. She complained of numbness in the left leg and the comment was, "I will hospitalize for control of pain and symptoms in view of her past history.

The doctor stated that when claimant was hospitalized for this incident "a different kind of history came up in terms of her physical examination and history taking than in my office."

He recited the history claimant gave him on hospitalization as follows:

> The patient states that at this time while working at A. Y. McDonald's, having been given a job change, and after the job assignment Shirley informed the personnel people that if she did that job, she would probably have back pain. Sure enough, within a few hours of starting the job on that day while squatting she felt that she squatted improperly and started to have pain. As she walked away from the job, it became progressively worse.

In response to a question of claimant's counsel as to whether claimant's October 1983 incident was a new injury, an aggravation of the preexisting condition or an exacerbation of claimant's injury, the following discourse ensued:

> Yes. Well, if you remember, in that 81' hospitalization we went to a great deal of effort of trying to find out what was her pre-existing condition and we could not come to a diagnosis. She was literally discharged from the hospital with no diagnosis and we had gotten all these people involved that might explain other bizarre reasons for her pain, the urologist for kidney problems, two orthopedists because of bone problems, a gynecologist because of possible pelvic causes of pain giving her back pain, an internist for metabolic diseases and I think at that time probably an MMPI, too, which is a psychological testing.
>
> Regardless, with all of this effort, we were unable to come up with a specific diagnosis so it's very difficult for me to go back and answer your question in light of the fact that we don't have any information as to what was her pre-existing condition or situation or injury, but she comes back now with the same kind of problem with it involved with assignment to a different job that she obviously didn't want to do and she comes in with pain. I would tell you that pain -- I think her pain is real. It's a subjective sensation but I'm sure for Shirley it's real. We could not objectively find any reason for it.
>
> So she comes back in at this time and we're dealing with basically the same kind of issues and the same kind of pain. We came up with the same kind of conclusions. So to answer your question, I don't think I really can because we have no basis to put the criteria on. It certainly is a new part of her pain but it's the old pain that she had before. Is it a recurrence, I can't tell you. I really can't tell you because we don't have anything tied down before as what was the cause. Did it arise out of her work? It happened while she was working but is it due to her work, we can't tell, never been able to tie down what it is that caused her the dfficulty but she has difficulty. There's no question about that.
>
> Q. Well, then are you telling us that with any degree of medical certainty you can't really tell us whether or not she actually had a new injury, maybe she did, maybe not?
>
> A. We could never tell that she had an injury on any one of these circumstances. All she had was pain and pain is a purely subjective sensation. We could not objectively find a reason for this.

The doctor explained that the consistent thread throughout claimant's problems has been low back pain. The doctor opined that claimant does not have an injury explaining: "...after four years of observing this woman with her pain, we have never been able to demonstrate an anatomical breakdown or a demonstrable variant in her neurology or physiology or bone structure."

On cross examination, the doctor stated that obesity is a substantial contributing factor when found in a person with pain. The doctor recited that the only abnormality found on claimant's x-ray examination was a congenital condition at L4-S1 in that three nerve roots exit from her back in the same position.

Claimant's exhibit A is medical reports relative to claimant. Defendants' objections to those concerning claimant's October 18, 1983 injury are overruled. Of interest among the reports are the following: A nursing physical assessment note of March 1981 states claimant has pain in her left leg with tingling in her right leg. Later notes state claimant reports "tingling in both legs from thigh to toes." A Minnesota Multiphasic Personality Inventory profile and case summary contains the following summary of R. H. Lee, M.D.:

> Profile over almost one year's duration (test/retest) has exhibited an elevated Scale 9 - indicative of poor impulse control, high energy level & difficulty with long range goals. More hysterical qualities are apparent on the present profile.
>
> Impression: Patient is easily bored, impulsive & restless. May have difficulty persevering with conventional routine. Prone to represent conflicts in somatic symptoms. Hysterical qualities. Emotional crisis are prabably short in duration & do not markedly incapacitate her for any great length of time. She will probably have reoccurring episodes. Not depressed. Anxiety scales low. Exaggerated need for attention & excitement.

An electroneuromyographic examination report of March 13, 1981 recites that claimant has normal motor nerve conduction study and electromyographic results. It describes her pain as low back pain more left sided with a tingling into the lower left extremity but occasionally on the right side as well.

A discharge report of Luke C. Faber of June 4, 1980 notes:

> 37 year old lady who gives a history of having strained her back and shoulder while working in the garden and then returned to work following a period of several weeks off and 2 hours after returning to work complained of recurrence of her back pain.
>
> She is admitted for treatment.
>
> Under physical therapy and rest she showed gradual improvement and now claims that she has no pain whatever in her back or shoulders and is ready for discharge.
>
> She also brings up that she wants a change in the way that she does her job at home or she certainly will reinjure herself.

An April 1, 1981 discharge summary of Dr. Faber states no "diagnosis made;" recites claimant's evaluation by an orthopedist, an orthopedic surgeon, a neurologist, a gynecologist, and a urologist who found nothing within their specialities that contributed to claimant's pain and by an internist who felt claimant had a chronic pain syndrome based on compensation need. The report further states: "It is interesting in reading the nurses [sic] notes that there are numerous entries in the nurses [sic] notes, her moving with agility and without pain and then stating that when she became aware that a nurse was in the room she started to moan and complain of pain."

A report of J. S. Chapman, M.D., of March 31, 1981 recites that claimant "appears to have some of the characteristics of chronic pain syndrome with secondary gain from her back difficulty."

Defendants' objections to claimant's exhibit B and C are overruled since it appears defendants had access to and control of the exhibits before claimant received them subsequent to discovery deadline in this matter. Exhibit B is a letter report of James A. Pearson, M.D., which recites an impression of chronic lumbar strain with no evidence of permanent partial disability though claimant is not relieved of her pain. The report notes that claimant has no evidence of a ruptured lumbar disc, but that x-rays of January 17, 1984 showed a lateral deviation of the spine to the right and mild narrowing of the L5 disc.

Claimant's exhibit C is an April 24, 1984 letter report of Dr. Faber which notes:

In view of Mrs. Bautsch's long history of significant disability and inability to work because of back problems, it is felt by me that she should in no way be assigned to a job that requires lifting any weight from the floor to her waist level, or that would involve stooping, bending, or twisting. Her weight restrictions should be limited to fifteen pounds or less and the repetition of lifting should be no more than ten to fifteen times per hour at that weight level. It would be ideal if she could be on a job at which she could sit and work at waist level. If standing, that she could stand with a prop-rail, so that she can lift one leg four inches above the other and rest against the rail while working. I do believe that these restrictions should be permanent in view of the long history of disability relative to low back problems.

Defendants' exhibit 1 is medical records relative to claimant. A May 20, 1980 letter report of G. J. Klein, M.D., states that claimant injured her back doing yard work at home April 20, 1980 at 4:00 p.m., exhibited an acute posterior intercostal sprain on the right and a right trapezius muscle sprain, and that, on claimant's May 5, 1980 work return, claimant's "sprain immediately recurred when she was performing her normal job...."

A consultation note of Dr. Pearson of May 22, 1980 states claimant complains of pain in her neck, right arm, right shoulder, and back and some discomfort into the right hip and leg.

Defendants' exhibit 2 is a personnel history of claimant which recites: "DISCIPLINE: 9-18-81, W. Failure to perform required quality; 4-15-80, W. Failure to perform required quality; 10-9-79, W. K Failure to perform required quantity of work."

Defendants' exhibit 3 is a wage history of claimant which recites:

PERIOD ENDING	HOURS	GROSS AMOUNT
05-04-80	----	----
04-27	----	----
20	40.00	232.40
13	40.00	232.40
06	40.00	232.40
03-30	40.00	232.40
23	37.00	214.97
16	40.00	232.40
09	40.00	232.40
02	40.00	224.59
02-24	40.00	224.80
19	24.00	134.88
10	40.00	224.80
TOTAL	501.00	2,867.76
AVERAGE PER WEEK	38.54	5.72
7-3	40.00	224.80
1-27	40.00	224.80

APPLICABLE LAW AND ANALYSIS

Our first concern is whether a causal relationship exists between claimant's injury of May 5, 1980 and her current disability. This question also encompasses the issue of whether claimant's October 18, 1983 incident was a new injury, an aggravation of a preexisting condition or an exacerbation of her symptomology.

The claimant has the burden of proving by a preponderance of the evidence that the injury of May 5, 1980 is causally related to the disability on which she now bases her claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

Claimant does not prevail on this issue. Claimant continues to have problems but little diagnosis as to their origin or cause has been made. Dr. Chapman believes claimant suffers from chronic pain syndrome with secondary gain from her back difficulty. Dr. Faber agreed that claimant has subjective pain but explained that no physician has found any organic basis for such even after extensive testing and treatment during the course of seperate hospitalizations. Dr. Lee, in summarizing the results of claimant's MMPI, noted that claimant was "prone to represent conflicts in somatic symptoms" and had an "exaggerated need for attention and excitement." Claimant's medical history is replete with instances where claimant's difficulties apparently developed only after claimant faced an unpleasantness or a potentially confrontative situation, or saw the possibility of gaining sympathy for her plight These facts create serious questions as to whether claimant's continuing bouts of pain have any connection with her work or the work episode of May 5, 1980. They suggest that claimant's problem originates in needs within herself that are not causally connected to her May 5, 1980 work episode.

Also, disquieting is the fact that claimant cannot locate the position of the pain which she has suffered for at least four years. At hearing claimant testified her extremity pain has always been in the right leg and she so informed her attorney. She characterized as "wrong" her answers to interrogatories that state her extremity pain is predominately in her left leg. Claimant's medical records also indicate she previously described her pain as radiating into her left leg with only some tingling or numbness in the right extremity. That claimant could disremember such a salient detail of her long term physical symptomology is quite disturbing and leaves one doubtful of a physical origin of her problems in a May 5, 1980 work episode.

Equally disquieting is the medical report of Dr. Klein of May 20, 1980 in which the doctor states claimant incurred an acute posterior intercostal sprain on the right and right trapezius muscle sprain while doing yard work at home on April 20, 1980 and that claimant's "sprain immediately recurred when she was performing her normal job..." on her May 5, 1980 work return. The doctor initially treated claimant for both the April and May incidents. This report suggests that if a physical cause for claimant's problem is ever found, the cause will be traced to her nonwork injury of April 20, 1980 and not to any work event of May 5, 1980. All the above cited facts make it probable that claimant's difficulties flow from a source other than any May 5, 1980 work incident. It also appears that claimant's October 18, 1983 work incident is but another manifestation of claimant's continuing nonwork related difficulty and not a new injury or an aggravation of any injury from the May 5, 1980 event. Claimant, herself, characterized her pain on October 18, 1983 as exactly the same as that experienced May 5, 1980. Claimant had had a like work event February 19, 1981. Each followed the medical and behavior pattern of claimant's May 5, 1980 difficulty. For this reason, it cannot not be said that it is probable they are also manifestations of claimant's nonwork difficulties and not new work incidents or aggravations.

Because claimant has failed on her threshold issue, discussion of the remaining issues of benefit entitlement and rate is unnecessary.

FINDINGS OF FACT

WHEREFORE, it is found:

Claimant experienced pain in the course of her work for defendant, A. Y. McDonald, on May 5, 1980 while pulling the lever on her Kingsbury after her foreman had instructed her to not use a hammer to assist in tightening plugs.

Claimant had suffered an acute posterior intercostal sprain on the right and a right trapezius muscle sprain on April 20, 1984.

Claimant was off work on account of this injury until May 5, 1980.

Dr. Klein, who treated claimant following both incidents, reported that her sprain of April 20, 1980 immediately recurred when she was performing her normal job on May 5, 1980.

Claimant had an occurrence of pain at work on February 19, 1981 while working on the Kingsbury.

Claimant had earlier reported to Dr. Faber, the company doctor, that she would reinjure herself if her job conditions were not changed.

Claimant had an occurrence of pain at work on October 18, 1983 after she was transferred from her own department to a second department to fork lift driving.

Claimant expressed a concern that she injure herself were she to drive the fork lift previous to accepting the foreman's direction to drive the lift.

Claimant experienced great pain which she characterized as exactly the same as her pain of May 5, 1980 when she attempted to step into the fork lift.

Claimant has been evaluated by numerous different medical specialists and no organic basis for her pain has been found.

Claimant has secondary pain from her chronic problems with pain.

Claimant has an MMPI profile suggestive of a tendency to represent conflicts in somatic symptoms.

Claimant disremembered that she reported symptoms of left

rather than right leg pain to her physicians.

Claimant's pain is not causally connected to any work episode of May 5, 1980.

Claimant's pain at work on February 19, 1981 and October 18, 1983 are but manifestations of her continuing nonwork-related problem and were new injuries or aggravations of any preexisting condition.

CONCLUSIONS OF LAW

THEREFORE, it is concluded:

Claimant has not established a causal relationship between her work episode of May 5, 1980 and any disability she has.

ORDER

THEREFORE, it is ordered:

Claimant take nothing further from these proceedings.

Defendants pay costs of this action.

Signed and filed this 20th day of September, 1984.

HELEN JEAN WALLESER
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

JAMES BENI,	:	
Claimant,	:	
vs.	:	
FARMERS CO-OP,	:	FILE NO. 747511
Employer,	:	A R B I T R A T I O N
and	:	D E C I S I O N
FARMLAND MUTUAL INSURANCE,	:	
Insurance Carrier, Defendants.	:	

INTRODUCTION

This is a proceeding in arbitration brought by James Beni against Farmers Co-op Company, employer, and Farmland Mutual Insurance Company, insurance carrier. Claimant alleges that he sustained a compensable injury to his back on or about July 11, 1983 and seeks compensation for permanent partial disability and for transportation expenses in receiving medical care. The hearing commenced July 2, 1984 in the Industrial Commissioner's office in Des Moines, Iowa with Michael G. Trier, Deputy Industria Commissioner, presiding. Claimant appeared in person with his attorney David Drake and defendants appeared through Cecil Goettsch, their legal counsel. The case was considered fully submitted upon conclusion of the hearing.

The record in this proceeding consists of the testimonies of James Beni and Ray Chartier. Also admitted into evidence were claimant's exhibits 1, 2 and 3 and defendants' exhibits A, B and C.

ISSUES

The issues presented by the parties at the time of hearing are: whether claimant sustained an injury arising out of and in the course of his employment; whether there is a causal connection between the alleged injury and any disability which claimant exhibits; a determination of the nature and extent of any disability which claimant may exhibit; and a determination of claimant's entitlement to mileage for transportation expenses under section 85.27, Code of Iowa. It was stipulated by the parties that the only disability in issue is permanent partial disability and that there is no claim for temporary total disability or healing period benefits. The parties stipulated that in the event of an award claimant's rate of compensation is $190.44 per week.

REVIEW OF THE EVIDENCE

Claimant testified that he was born February 16, 1955 and is currently 29 years of age. He stated that he is married and has two children, ages three years and nine months.

Claimant testified that he graduated from Dallas Center High School in 1973 and has no further formal education or vocational training. He denied serving in the military.

Following graduation from high school claimant worked installing counter tops and kitchen cabinets which required carrying weights of as much as 80 pounds. He then worked for more than a year at City Automotive in Des Moines, Iowa as a parts-person where he performed counter sales, stocking, shipping and receiving. His next employment was with AAMCO Transmission where he worked removing and replacing transmissions, following which he worked for the Metropolitan Transit Authority in Des Moines servicing buses. He was eventually transferred to the parts department where his duties included bookkeeping, inventory control, shipping and receiving. He left due to a labor dispute at which time he was earning $6.25 per hour. Claimant also stated that he had worked doing general construction work for two different construction firms in Dallas Center, Iowa where his duties involved roofing, framing, wiring, plumbing, siding and cement work. Claimant recalled experience managing a business known as D. C. Auto in Dallas Center for approximately one year.

Claimant described his work for the defendant employer as being in the tire department where he would repair and replace tires, service cars and replace batteries. He stated that when business in his department was slow he would sometimes work at the feed mill or in the front office. Claimant testified that at the time of his injury he was earning $5.50 per hour.

Claimant testified that on July 11, 1983 he was lifting a tire and felt a pop in his back which caused excruciating pain. He stated that his knees buckled and that he fell. He stated that he finished the task he was performing and informed his supervisor. Claimant testified that he could hardly get out of bed the following morning and worked only part of the next day. He stated that he sought care from Robert L. Gustafson, D.C., a local chiropractor. Claimant recalled an incident in July, 1982 involving his back which kept him off work for a couple of days. He stated that such incident did not cause his knees to buckle, however, and that following it he got along relatively well.

Claimant denied any other previous significant back problems. Claimant testified that following the 1983 incident he returned to work but that he was unable to work and arranged with his supervisor to commence his vacation earlier than had been planned. Claimant testified that he contacted his family physician who referred him to Marshall Flapan, M.D. Claimant stated that Dr. Flapan examined him and recommended that he remain off work until August 1. He stated that Dr. Flapan recommended avoidance of excessive lifting. Claimant stated that he discussed Dr. Flapan's recommendations and impressions with Ray Chartier, particularly with regard to ways of adapting his job to fit the recommendations and his future with the Co-op.

Claimant testified that he returned to work on August 1 in the tire department with unchanged duties. He stated that he felt weaker and still had a backache at the time and that on occasion he did request assistance from other employees. Claimant stated that on that day he was called into the office by Ray Chartier where he was told that it would be best for everyone concerned if his employment were terminated. Claimant stated that he was paid for the entire month of August although he only worked until August 15, 1983. He stated that the Co-op kept his medical insurance coverage in effect through the end of September, 1983.

Claimant stated that he next worked for Pitney Bowes reading postage meters for which he earned $5.00 per hour and worked a 20 hour week. Claimant stated that the job was temporary and that when it ended in November, 1983 he found work with Gaylen Haldeman Construction, a firm with which he had been employed before beginning work for the Co-op. Claimant stated that he works as a carpenter and that he has been regularly employed since he started in November, 1983. He stated that he needs help more frequently than before and that his capacity for work is reduced. In defendants' exhibit C, at pages five through ten, claimant indicated that he has performed a variety of functions at his current employment including some digging and shoveling, finishing cement and working from a ladder.

Claimant testified that he earns $6.00 per hour in his current employment but that he does not work as many hours as he previously worked for the Co-op.

Claimant testified that he now feels different from prior to the occurrence of July, 1983 in that he is generally sore in his lower back, tires easily and is stiff when he gets up in the mornings. He stated that bending and lifting is more difficult and that he cannot carry items as he had done in the past.

Claimant testified that he would like to go to some type of schooling which would get him out of performing manual labor. Claimant denied any back problems prior to July, 1982. He

stated that he had seen Dr. Gustafson prior to July, 1983 for other problems. Claimant stated that he hurt his back on a Monday and that he thinks he saw Dr. Flapan on the following Monday. He recalled that x-rays were taken on the first visit. Claimant testified that he believed that the second visit with Dr. Flapan was mid-week and that he was released to return to work on the following Monday. He stated that the dates of July 25 and August 22, as they appear in medical records, do not seem correct and that he thinks that he called Dr. Flapan on the telephone on one occasion.

Ray Chartier testified that he has been the general manager of Farmers Co-op in Dallas Center since January, 1963. He related some problems with claimant's work and did not recall a July, 1982 back injury. He stated that claimant had vacation scheduled during July, 1983 and that he had conversations with claimant regarding his back prior to the time claimant went on vacation and also after claimant had seen Dr. Flapan. Chartier stated that it was his understanding that claimant's problem was a birth defect which heavy lifting would aggravate. He stated that the Co-op had no openings consistent with claimant's restrictions and suggested that claimant find other work. Chartier confirmed claimant's testimony regarding the termination of employment and continuation of pay and benefits. Chartier stated that claimant was not discharged due to job performance deficiencies. He also testified that he based his actions upon what claimant had told him and denied seeing any medical reports or talking with claimant's doctors. Chartier related discharging a 20 year employee who had suffered three back surgeries which involved extended absences from work totaling 26 months.

Claimant's exhibit 1 is a report from Dr. Flapan dated October 6, 1983 with progress notes attached. In the report Dr. Flapan states:

1. Final diagnosis: Symptomatic spondylolisthesis. Theis [sic] spondylolisthesis was present prior to his work related injury, but in my opinion it was aggravated by his job.

...

4. It is my opinion that Mr. Beni has sustained a permanent partial impairment as a result of his work related lifting incident of 7/11/83 in the amount of 5% of the body as a whole. This is based on his subjective findings of pain, discomfort with bending, lifting and straining and the objective findings of pre-existing spondylolisthesis.

5. I would suggest that Mr. Beni follow a regimen of guarded lifting, bending, straining and carrying to avoid reinjury to his back.

6. I have no future recommendations other than the above for treatment. The future for Mr. Beni in regards to his back may be on e [sic] which holds that of recurrent low back pain and discomfort aggravated by lifting, bending and straining. This may eventually require surgical intervention in the form of a laminectomy and lumbar fusion.

The progress notes dated July 25, 1983 include the following interpretations:

X-RAYS: Five views of his lumbosacral spine shows bilateral defects in the pars interarticularis and he has a first degree spondylolisthesis. (emphasis added)

Claimant's exhibit 2 is a report from James R. Bell, M.D., dated August 24, 1982 and states:

> In regard to your recent letter, Mr. Beni stated on 7/12/82 (according to my records) that he had had problems with similar low back difficulties over the past several years. An x-ray of the lumbosacral spine was ordered and was interpreted by Dr. Tigrani, radiologist at Northwest Hospital, as follows: "Lumbosacral spine: examination reveals evidence of defect at the pars interarticularis of L5, S1. There is no evidence of any spondylolisthesis as yet..... (emphasis added)

Claimant's exhibit 3 is a report from Peter D. Wirtz, M.D., dated April 12, 1984 in which he states:

> This patient had an x-ray at Dr. Bast's office on 7/12/82 which shows a congenital anomaly present at the time of his original injury. This congenital defect in the lumbar spine pre-existed his work injury. The injury in July, 82 and July, 83, were temporary in nature. When the healing process has completed, which is anywhere from 6-12 weeks, he has normal motion. This type of a defect will be aggravated with heavy lifting. He has not suffered any permanent impairment from his injuries in July, 82, and July, 83 which were musculoskeletal strains to these structures.

ANALYSIS AND APPLICABLE LAW

Claimant has the burden of proving by a preponderance of the evidence that he received an injury on July 11, 1983 which arose out of and in the course of his employment. McDowell v. Town of Clarksville, 241 N.W.2d 904 (Iowa 1976); Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

An employer takes an employee subject to any active or dormant health impairments, and a work connected injury which more than slightly aggravates the condition is considered to be a personal injury. Ziegler v. United States Gypsum Co., 252 Iowa 613, 620, 106 N.W.2d 591 (1960), and cases cited.

The supreme court of Iowa in Almquist v. Shenandoah Nurseries, 218 Iowa 721, 731-32, 254 N.W. 35, 38 (1934), discussed the definition of personal injury in workers' compensation cases as follows:

> While a personal injury does not include an occupational disease under the Workmen's Compensation Act, yet an injury to the health may be a personal injury. [Citations omitted.] Likewise a personal injury includes a disease resulting from an injury.... The result of changes in the human body incident to the general processes of nature do not amount to a personal injury. This must follow, even though such natural change may come about because the life has been devoted to labor and hard work. Such result of those natural changes does not constitute a personal injury even though the same brings about impairment of health or the total or partial incapacity of the functions of the human body.
>
> ....
>
> A personal injury, contemplated by the Workmen's Compensation Law, obviously means an injury to the body, the impairment of health, or a disease, not excluded by the act, which comes about, not through the natural building up and tearing down of the human body, but because of a traumatic or other hurt or damage to the health or body of an employee. [Citations omitted.] The injury to the human body here contemplated must be something, whether an accident or not, that acts extraneously to the natural processes of nature, and thereby impairs the health, overcomes, injures, interrupts, or destroys some function of the body, or otherwise damages or injures a part or all of the body.

Claimant testified to an incident from which his symptoms arose. The evidence showed that it was immediately reported and that claimant commenced his vacation early in order to recover from it. Claimant appeared and testified at hearing and the undersigned observed his demeanor and appearance. Although there appear to be some uncertainties and conflicts in the record, particularly regarding the timing of claimant's visits with Dr. Flapan and the statement of prior similar low back problems contained in exhibit 3 which were denied by claimant at hearing, claimant is found to be credible. There is ample evidence that claimant certainly had a preexisting pars interarticularis defect prior to July 11, 1983, but such had been relatively asymptomatic. In his report of October 6, 1983 Dr. Flapan opines that claimant had a preexisting spondylolisthesis which was aggravated by his work. In exhibit 3 Dr. Wirtz characterized the incident as an injury. It is therefore found and concluded that claimant did receive an injury on July 11, 1983 which arose out of and in the course of his employment. It is further found and concluded that the injury was in the nature of the aggravation of a preexisting condition.

The claimant has the burden of proving by a preponderance of the evidence that the injury of July 11, 1983 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman, 261 Iowa 352, 154 N.W.2d 128 (1967).

While a claimant is not entitled to compensation for the results of a preexisting injury or disease, the mere existence at the time of a subsequent injury is not a defense. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756, 760-761 (1956). If the claimant had a preexisting condition or disability that is aggravated, accelerated, worsened or lighted up so that it results in disability, claimant is entitled to recover. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812, 815 (1962).

Dr. Wirtz expressed the opinion that claimant's injury did

not result in permanent impairment. Dr. Flapan disagreed stating that in his opinion the injury had resulted in permanent partial impairment of 5 percent of the body as a whole. It should be noted that in exhibit 2 no evidence of spondylolisthesis was found, but that in Dr. Flapan's notes made approximately one year later a first degree spondylolisthesis was identified. It is apparent that some change had occurred between the times claimant was examined in July of 1982 and July, 1983. Such a change is inconsistent with Dr. Wirtz's opinion that claimant's injury was only temporary in nature. In view of this inconsistency, as well as the fact that Dr. Flapan was claimant's treating physician, the opinion concerning the permanency of claimant's injury which was expressed by Dr. Wirtz is rejected and the opinion of Dr. Flapan is adopted. It is therefore found and concluded that claimant sustained a 5 percent permanent partial impairment of the body as a whole as a result of the work related injury which occurred July 11, 1983.

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

In Parr v. Nash Finch Co., (Appeal decision, October 31, 1980) the Industrial Commissioner, after analyzing the decisions of McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (Iowa 1980) and Blacksmith v. All-American, Inc., 290 N.W.2d 348 (Iowa 1980), stated:

> Although the court stated that they were looking for the reduction in earning capacity it is undeniable that it was the "loss of earnings" caused by the job transfer for reasons related to the injury that the court was indicating justified a finding of "industrial disability." Therefore, if a worker is placed in a position by his employer after an injury to the body as a whole and because of the injury which results in an actual reduction in earning, it would appear this would justify an award of industrial disability. This would appear to be so even if the worker's "capacity" to earn has not been diminished.

For example, a defendant employer's refusal to give any sort of work to a claimant after he suffers his affliction may justify an award of disability. McSpadden, 288 N.W.2d 181 (Iowa 1980).

Claimant's age is such that a change to a sedentary type of employment would not be unreasonable. His education is limited to a high school diploma but claimant has expressed a desire to obtain further vocational training and there is no indication in the record that he would be unable to successfully complete further vocational training. Claimant is currently experienced in carpentry, home building and some phases of auto mechanics. He appears to have the present capability of working as an automotive parts salesperson. His functional impairment is relatively small. Claimant did, however, lose his employment as a result of his injury. Claimant's present favorable employment is the result of a sympathetic employer who has agreed to make accommodation for claimant's limitations. It is therefore found and concluded that claimant has sustained a permanent partial disability of 15 percent when the same is measured industrially.

Claimant's injury has been found to be compensable and claimant is due compensation for 104 miles of travel at the rate of $.24 per mile which computes to $24.96.

FINDINGS OF FACT

1. On July 11, 1983 claimant was a resident of the State of Iowa and was employed by Farmers Co-op Company at Dallas Center, Iowa.

2. Claimant was injured on July 11, 1983 while carrying a tire. The injury was in the nature of an aggravation of a preexisting condition in claimant's back.

3. Pursuant to the stipulations of the parties, no determination of claimant's entitlement to healing period benefits will be made.

4. Claimant's injury resulted in a permanent functional impairment of 5 percent of the body as a whole.

5. Claimant is 29 years of age and at the time of injury was married with one dependent child.

6. Claimant's rate of compensation is $190.44 per week.

7. Claimant presently suffers from continuing discomfort and soreness in his back. He tires easily and is unable to bend, lift and carry items as he did prior to the injury. His treating physician has recommended restricted activities in order to avoid a worsening of his condition which could require surgical intervention.

8. Claimant's education is limited to a high school diploma.

9. Claimant has experience in general carpentry including electrical wiring, plumbing and cement work. Claimant also has experience in the field of auto mechanics and as an automotive parts salesman.

10. Claimant appears to be of at least average intelligence, emotionally stable and well motivated.

11. Claimant's employment was terminated by his employer on the premise of avoiding further injury to claimant. Claimant's former employer employed few people, had no work which was reasonably suited to claimant's medically imposed restrictions and there is no indication that the termination of claimant's employment was made in bad faith.

12. Claimant's injury was in the nature of an aggravation of a preexisting pars interarticularis defect which resulted in a grade one spondylolisthesis. Further heavy work could be expected to result in further deterioration of claimant's back.

13. Claimant traveled 104 miles in order to obtain treatment for his injury.

CONCLUSIONS OF LAW

This agency has jurisdiction of the subject matter of this proceeding and of its parties.

On July 11, 1983 claimant sustained an injury to his back which arose out of and in the course of his employment with Farmers Co-op Company.

That injury caused claimant to become permanently partially disabled to the extent of 15 percent of total disability when measured industrially.

Claimant is entitled under section 85.27 of the Code of Iowa to compensation for 104 miles of travel which he performed in order to obtain medical care at the rate of $.24 per mile resulting in a total amount of $24.96.

The payment of claimant's entitlement to compensation for permanent partial disability should begin August 1, 1983, when claimant returned to work.

ORDER

IT IS THEREFORE ORDERED that defendants pay claimant seventy-five (75) weeks of compensation for permanent partial disability at the rate of one hundred ninety and 44/100 dollars ($190.44) per week commencing August 1, 1983. Defendants shall pay all amounts which are past due and owing in a lump sum together with interest at the rate of ten percent (10%) per annum computed from the date each such payment became due and running to the date of actual payment.

IT IS FURTHER ORDERED that defendants pay claimant twenty-four and 96/100 dollars (24.96) as reimbursement for travel expenses incurred in obtaining medical care for his injury in accordance with Iowa Code section 85.27.

IT IS FURTHER ORDERED that defendants pay the costs of this action pursuant to Industrial Commissioner Rule 500-4.33.

IT IS FURTHER ORDERED that defendants file an activity report in twenty (20) days from the date of this decision.

Signed and filed this 31st day of August, 1984.

vs.	:	A R B I T R A T I O N
W.B.M. MARINE, INC.,	:	D E C I S I O N
Employer,	:	
and	:	
HAWKEYE SECURITY INSURANCE COMPANY,	:	AUG - [illegible]
Insurance Carrier, Defendants.	:	

INTRODUCTION

This is a proceeding in arbitration brought by the claimant, James Brown, against his alleged employer, W.B.M. Marine, Inc., and its insurance carrier, Hawkeye Security Insurance Company, to recover benefits under the Iowa Workers' Compensation Act as a result of an injury he allegedly sustained August 13, 1982.

The matter came on for hearing before the undersigned deputy industrial commissioner at the municipal court room in the municipal building in Waterloo, Iowa July 13, 1984. The record was fully submitted on that date.

An examination of the industrial commissioner's file indicates no filings have been made with the industrial commissioner's office.

The record consists of the testimony of claimant and of Robert Brighton.

PRELIMINARY MATTER

At hearing, claimant orally moved for bifurcation in order that only the issue of employer-employee relationship and the affirmative defenses of casual employment and independent contractor be heard. It was established that both parties understood this matter would be bifurcated and that this proceeding would address only these issues and prepared for hearing accordingly. Therefore, no prejudice will result to defendants through bifurcation and claimant's motion is granted.

ISSUES

1. Whether claimant was an employee of W.B.M. Marine Inc. when injured. Defendants assert the affirmative defense that claimant was an independent contractor or a casual employee.

REVIEW OF THE EVDIENCE

No stipulations were made. Claimant, James P. Brown, testified in his own behalf. Claimant stated he had worked for defendant, W.B.M. Marine, for five hours on his injury date, August 13, 1982 and not previously. Claimant apparently assisted a Mike Griffin clear a vacant lot on Edwards Street in Waterloo. Claimant reported that when he and Griffin arrived at the lot, a third man was waiting there. This man apparently gave Griffin and claimant tools to use in cleaning the lot and left. Claimant assumed this man was a W.B.M. employee. Claimant testified that he attempted to roll a large log over while clearing the lot and "popped a bone" in his left shoulder blade. An ambulance transported claimant to Allen Hospital where he was apparently treated as an outpatient and released. Claimant testified he is continuing to receive treatment for his condition at University Hospitals in Iowa City. He stated his shoulder still gives him problems.

After his injury, claimant apparently went to W.B.M. headquarters and sought payment for his work. Claimant apparently spoke with Robert Brighton who paid him cash for his labor. Claimant explained he wanted cash rather than a check since he had no ID with which to cash a check.

On cross examination, claimant stated he did not know whether he was free to determine the matter in which the lot was cleaned. Claimant admitted he had only been hired to clear the lot and had not otherwise worked for W.B.M. He asserted that had he not been injured he would have "done more" for W.B.M. Claimant agreed that he was not certain the person leaving the tools was a W.B.M. employee. Claimant did not know for how long W.B.M. had hired Griffin. Claimant admitted he had never met Robert Brighton before seeking payment from W.B.M.

Claimant gave a history of work as a dishwasher and a "labor worker" with no special skills. He apparently served two years in the Mens' Reformatory. While there, he was in the infirmary two or three times as a result of a shoulder injury. Claimant stated he had hurt his shoulder before and that it was the same kind of an injury: "the shoulder would pop out of place." Claimant recited that he had previously injured his shoulder when he fell off a couch; when he fell of a porch, while lifting weights; and while fighting.

On redirect examination, claimant stated the man who left the tools, whom he assumed was from W.B.M., instructed Griffin and claimant as to what work to do on the lot. Claimant explained he initially injured his shoulder five years before the August 13 incident and that it had ached in the intervening years. On further cross examination, claimant stated that while it always ached, his shoulder had never "come out of place" before the August incident. He described its earlier condition as "stretched but not broken."

Robert Brighton, the owner of W.B.M., appeared in defendants' behalf. He stated that W.B.M. is a business which markets marine equipment. He explained that Iowa Machine and Heat Treat Corporation owns the lot which claimant and Griffin were to clean. He testified that Iowa Machine is a separate corporation from W.B.M. but does allow W.B.M. to occasionally store its products on the lot. Apparently, W.B.M. has a storage garage adjacent to the lot. The witness reported that he hired Griffin who then hired claimant. He stated Griffin was a neighborhood person who hung about W.B.M.'s offices and had sought work as a cash day laborer. Taxes were not withheld from Griffin or claimant's pay; neither was social security tax paid for them. The witness stated he was not at the lot while claimant and Griffin worked and did not control the cleaning nor the manner of cleaning the lot.

On cross examination, the witness reported that Griffin's only work for W.B.M. was to clean the lot. Griffin was also paid cash. The witness volunteered that Griffin asked his approval before hiring claimant. He stated it was his understanding that Griffin would pay claimant, but that after claimant's injury claimant came to W.B.M.'s office seeking payment and "because of his injury" W.B.M. paid him directly. The witness agreed that, though claimant was paid cash, claimant could have received a check.

APPLICABLE LAW AND ANALYSIS

Iowa Code sections 85.61(2) and section 85.61(3)(a and b) provide:

> 2. "Worker" or "employee" means a person who has entered into the employment of, or works under contract of service, express or implied, or apprenticeship, for an employer, every executive officer elected or appointed and empowered under and in accordance with the charter and bylaws of a corporation, including a person holding an official position, or standing in a representative capacity of the employer, and including officials elected or appointed by the state, counties, school districts, area education agencies, municipal corporations, or cities under any form of government, and including members of the Iowa highway safety patrol and conservation officers, except as hereinafter specified.
>
> "Worker" or "employee" includes an inmate as defined in section 85.59.
>
> 3. The following persons shall not be deemed "workers" or "employees":
>
> a. A person whose employment is purely causal and not for the purpose of the employer's trade or business except as otherwise provided in section 85.1.
>
> b. An independent contractor.

The Iowa Supreme Court stated in Nelson v. Cities Service Oil Co., 259 Iowa 1209, 1213, 146 N.W.2d 261 (1967):

> This court has consistently held it is a claimant's duty t- prove by a preponderance of the evidence he or his decedent was a workman or employee within the meaning of the law....
>
> And, if a compensation claimant establishes a prima facie case the burden is then upon defendant to go forward with the evidence and overcome or rebut the case made by claimant. He must also establish by a preponderance of the evidence any pleaded affirmative defense or bar to compensation. (Citations omitted.)

The court set forth its latest standard for determining an employer-employee relationship in Caterpillar Tractor Co. v. Shook, 313 N.W.2d 503 (Iowa 1981). The court stated in part:

> 1. The employer-employee relationship. As defined in section 85.61(2), The Code, an "employee" is a "person who has entered into the employment of, or works under contract of service... for an employer." Factors to be considered in determining whether this relationship exists are: (1) the right of selection, or to employ at will, (2) responsibility for payment of wages by the employer, (3) the right to discharge or terminate the relationship, (4) the right to control the work, and (5) identity of the employer as the authority in charge of the work or for whose benefit it is performed. The overriding issue is the intention of the parties. McClure v. Union, et al., Counties, 188 N.W.2d 285 (Iowa 1971). (Emphasis added.)

Claimant has not established by a preponderance of the evidence an employer-employee relationship. Defendant W.B.M. Marine did not select claimant for employment. The company's agent merely aquiesced in his employment by Mr. Griffin. The evidence does not establish that W.B.M. Marine was free to terminate claimant without the approval of Griffin. Likewise, the question of responsibility for payment of wages remains in dispute. Claimant states W.B.M Marine was responsible for payment of his wage. Defendants' witness maintained that Griffin was to pay claimant but refused to do so. He further maintained that W.B.M. gratuitously paid claimant following his injury. The method of payment supports defendants' position. Claimant was paid in cash. No apparent attempt was made to record that transaction. Documentation of wages paid has tax advantages for most businesses. One concludes that W.B.M. would have documented wages paid claimant had the company contractually undertaken to pay such wages.

Furthermore, there is little evidence suggesting that W.B.M. had the right to control the work being performed. Claimant testified that an unidentified man met Mr. Griffin and him at the lot, gave them tools to use, and told them what work to do on the lot. The man then left. Claimant assumed, but did not know, that this individual was an W.B.M. employee. The individual's identity was never established. However, even if he were identified as a W.B.M. employee, no intention to control the work was shown. Claimant and Griffin were left to their own devices as to how to clean the lot. No other interaction or direction from W.B.M. was shown. More importantly, no intention of further direction, or control of claimant by W.B.M. can be gleamed from the record as made. Claimant and his co-worker were free to work as they chose. W.B.M. could not be identified as the authority in charge of the work; nor could W.B.M. be identified as the entity for whose benefit it was performed. Claimant only assumed the toolbearer was a W.B.M. employee. No evidence establishing such was presented. Testimony was presented that W.B.M. did not own the lot but was allowed to use it for storage purposes. While W.B.M. arguably derives some benefit from having a cleared facility on which to store its business equipment, it remains unclear whether clearing the lot was a benefit to W.B.M. or to the lot's titleholder, Iowa Machine and Heat Treat Corporation. Claimant's charge under the law is that he preponderate on evidence establishing the factors supporting the existence of an employer-employee relationship. He has failed to do so. Because claimant has not preponderated on this issue, we need not reach the affirmative defenses asserted by defendants.

FINDINGS OF FACT

WHEREFORE, it is found:

Claimant was hired by Mike Griffin to assist Griffin in clearing a lot owned by Iowa Machine and Heat Treat Corporation and used by W.B.M. for storage.

Whether W.B.M. could terminate claimant without Griffin's approval is unclear.

Claimant and Griffin were told what work to do on the lot by an individual whom claimant assumed was from W.B.M. This individual's identity with W.B.M. was not further established.

Claimant and Griffin were given no other instruction or direction as to how to clear the lot and were left to perform the work in a matter of their own choosing.

W.B.M. did not control and did not intend to control the method of performing the work.

W.B.M. paid claimant gratuitously following his injury. W.B.M was not identified as the party responsible for paying claimant for his services. Claimant was paid in cash in an apparently undocumented transaction.

W.B.M. was not identified as the authority in charge of the work or the party for whose benefit the work was performed.

Claimant was not an employee of W.B.M. on the injury date.

CONCLUSIONS OF LAW

THEREFORE, it is concluded:

Claimant has not established that he was an employee of defendant W.B.M. on his injury date.

ORDER

THEREFORE, it is ordered:

Claimant take nothing from these proceedings.

Defendants pay costs of this action.

Signed and filed this 7th day of August, 1984.

DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

JAMES P. BURGERT, Claimant,	:	
vs.	:	File No. 606720
FUTURE FOAM, INC., Employer,	:	A P P E A L
and	:	D E C I S I O N
ARGONAUT INSURANCE COMPANIES, Insurance Carrier, Defendants.	:	

FILED
AUG 30 1984
IOWA INDUSTRIAL COMMISSIONER

Claimant appeals from a review-reopening decision in which he was awarded benefits for permanent partial disability to his right knee but denied benefits for disability related to his back. The record on appeal consists of the transcript of the review-reopening proceeding together with claimant's exhibit 1 and defendants' exhibits A through C; the pleadings contained in the record and the briefs and arguments of the parties on appeal.

ISSUE

Whether or not the disability related to claimant's back is causally related to his prior compensable knee injury.

STATEMENT OF THE CASE

Evidence germane to the issue on appeal is: twenty-six year old claimant had a prior injury to his right knee while playing football in high school in 1973. He had surgery in February of 1974 for removal of the right medial meniscus and lateral meniscus.

On September 21, 1979 while employed by defendant employer claimant received an injury when a bun of foam fell on his right knee. Claimant came under the care of Timothy C. Fitzgibbons, M.D., an orthopedic surgeon on October 2, 1979. Claimant was treated conservatively until November 2, 1979 when his knee was injected with Marcaine and Depo-Medrol and also some Xylocaine. He returned to Dr. Fitzgibbons on November 16, 1979 still having pain and an arthrogram was performed at that time. A tear of the medial meniscus was noted. On December 7, 1979 claimant underwent an arthroscopy and arthrotomy. He was noted to have multiple small tears of his medial miniscus as well as a larger tear posteriorly. Also noted when the knee was entered was some chondromalacia of the cartilage of his femoral condyles and tibial plateau. Due to the previous surgery and the chondromalacia of the claimant's knee his recovery was estimated to be somewhat slower than the normal menisectomy. The minimum of two months was estimated. Follow-up care was conducted over the next two years with claimant continuing to complain of recurrent trouble with his right knee and some swelling and catching. On January 10, 1982 another arthroscopic examination, joint debridement and irrigation and injection with Depo-Medrol and Marcaine was performed. A lateral meniscal flap tear was removed.

In February 1982 Dr. Fitzgibbons indicated that he told claimant he would have to live with his problem. He thought claimant would eventually need a total knee replacement.

Claimant testified that after he returned to work in February 1982 his lower back started to bother him after about a week. He indicated no special incident occurred. He had been walking with a limp and felt he was getting cramps in his back. In August of 1982 claimant saw Dr. Fitzgibbons with complaints of pain in his low back and right leg and some mild discomfort in the left leg. Dr. Fitzgibbons reported that claimant indicated he had been having this pain for about a month and that it had recently been getting worse. Examination disclosed decreased ankle jerk on the left and discomfort with straight leg raising on the right. Both ankle jerks were hypoactive and made assessment difficult. Dr. Fitzgibbons thought there were enough signs to warrant the thought of a possible herniated disc. The diagnosis at the time was lumbosacral strain with possible right lower extremity radiculopathy.

Claimant was hospitalized for conservative treatment but shortly after discharge complained of significant discomfort down his left leg. A lumbar myelogram was conducted on October 1, 1982 and a lumbar laminectomy was performed on October 7, 1982.

Dr. Fitzgibbons released claimant to return to work on January 10, 1983. Claimant apparently returned to work and was laid off. Dr. Fitzgibbons indicated that claimant reported to him that he had some discomfort. He saw claimant on February 11, 1983. Examination disclosed claimant still had some moderate limitation of motion due to back discomfort and some occasional numbness in his left foot but straight leg raising was negative at that time. Dr. Fitzgibbons gave a fifteen percent permanent partial disability to the body as a whole rating for the back injury.

Dr. Fitzgibbons reported on August 24, 1982:

In regard to the cause of the patient's symptoms, I suppose, the fact that he has had to favor that right knee for so long, could have put excess stresses on his low back and at least could have been a contributing cause to his back pain, but there is no way of proving that. I don't think anyone can be sure.

In a report dated September 28, 1982 Dr. Fitzgibbons reported:

We had a long discussion about the pros and cons of surgery, and the fact that we can't guarantee anything, and even with the biggest disc sometimes, if the nerve does not recover, the patients don't get better. Mr. Burgert understands and wants to proceed.

We had tentatively planned on scheduling the myelogram for next week. However, the patient also discussed, with me, the fact that unless he can relate his herniated disc symptoms and his back pain to the fact that his knee is so disabled and he has had to walk with a limp, that he will have trouble getting any coverage and have trouble with payment of the bills.

In a previous report, I noted that I felt that the fact that the patient has had to limp on the right leg, certainly was a contributing cause to his back pain, but I could not say with any certainty that it was the cause of his present symptoms exclusively.

I even told the patient that I would discuss this with some of my other colleagues, to see what their feelings were. It is pretty much my feeling and the consensus of some of the members of our office, that there is no way that any one can say with any certainty that a lower extremity problem, which causes a limp, can be the cause of a herniated disc or low back strain.

We all feel that certainly an abnormal gait, or a limp--such as Mr. Burgert has had--puts excess stresses on the back and, thus, can be the cause of development of mechanical low back pain and even the final element of disc herniation, if that occurs.

However, to again comment on the cause and affect relationship of a herniated disc, I believe that I can state that I think the fact that the patient has had disability--from his right knee injury and degenerative arthritis, which has caused him to limp and certainly put excess stresses on his back--it was a contributing cause at the least, to his back pain. If, indeed, he does turn out to have a herniated disc, I, again, feel that this could be a contributing cause to that.

Again, however, I must state that there is no way for anyone to say with absolute certainty that there is a cause and affect relationship one way or the other. In any event, it is my feeling that this patient has significant disability and has a high likelihood of a herniated disc. I certainly feel that it would be advantageous for us to do a myelogram, to see if there is some way that we can help him with surgery. I would hope that there could be some way to get some sort of coverage for his bill, so this could be arranged.

Claimant testified that he is five feet nine and one-half inches tall and weighs 267 pounds. Prior to his injury he weighed about 202 pounds. He lives at home with his parents and does some work around the house.

Claimant's mother testified that the claimant had never complained of back pain until after the last knee surgery.

A long time friend of claimant testified that he had never heard claimant complain of back problems until May 1983. Claimant had complained of left leg problems prior to that.

APPLICABLE LAW

The claimant has the burden of proving by a preponderance of the evidence that the injury of September 21, 1979 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

When a worker sustains an injury, later sustains another injury, and subsequently seeks to reopen an award predicated on the first injury, he or she must prove one of two things: (a) that the disability for which he or she seeks additional compensation was proximately caused by the first injury, or (b) that the second injury (and ensuing disability) was proximately caused by the first injury. DeShaw v. Energy Manufacturing Company, 192 N.W.2d 777, 780 (Iowa 1971).

An injury to a scheduled member which, because of after-effects (or compensatory change), creates impairment to the body as a whole entitles claimant to industrial disability. Barton v. Nevada Poultry Co., 253 Iowa 285, 110 N.W.2d 660 (1961). Dailey v. Pooley Lumber Co., 233 Iowa 758, 10 N.W.2d 569 (1943).

An injury is the producing cause; the disability, however, is the result, and it is the result which is compensated. Barton, 253 Iowa 285, 110 N.W.2d 660 Dailey, 233 Iowa 758, 10 N.W.2d 569.

ANALYSIS

That the knee injury is causally related to the employment is not in dispute. That there is a relationship between the back condition and the knee injury on the other hand is much more problematical. Reviewing the report of Dr. Fitzgibbons dated August 24, 1982 leads to the conclusion that Dr. Fitzgibbons considers the probability of nexus between the knee injury and the back injury to be speculative and conjectural. Dr. Fitzgibbons' doubt as to causal relationship was not greatly overcome after consultation with his colleagues. He indicates in his report of September 28, 1982 that he believes the back pain was contributed to by excess stresses put on his back by the limp which was caused by the injury and degenerative arthritis to his knee. He then goes on to recite that in the event a herniated disc were to be found, this could be a contributing cause to that. Dr. Fitzgibbons reiterates that there is no way to state with certainty the cause and effect relationship one way or the other. Of course certainty is not necessary but it must be an opinion that is beyond mere surmise. When the reports of Dr. Fitzgibbons are taken as a whole, they fall short in being pursuasive that claimant's back condition has the necessary nexus to the injury originally received by claimant to his knee on September 21, 1979.

FINDINGS OF FACT

1. Claimant was employed by Future Foam, Inc., on September 21, 1979.

2. Claimant hurt his right knee while working on September 21, 1979.

3. Defendants filed a memorandum of agreement on October 19, 1979.

4. The testimony indicates that claimant was paid for all time lost prior to December 31, 1981.

5. Claimant has proven by a preponderance of the evidence that the need for additional surgery was caused by the injury of September 21, 1979.

6. Claimant started missing work on January 10, 1982 and returned to work on February 16, 1982.

7. Claimant sustained permanent partial disability to his knee because of the injury of September 21, 1979.

8. Claimant proved by a preponderance of the evidence that he sustained a seven percent (7%) loss to the leg because of the injury of September 21, 1979.

9. Claimant failed to prove by a preponderance of the evidence that a lumbar disc problem was related to the September 21, 1979 injury.

10. Claimant incurred certain medical expenses which are related to the knee injury.

CONCLUSIONS OF LAW

Claimant was employed by defendant employer on September 21, 1979.

Claimant sustained an injury to his knee arising out of and in the course of his employment on September 21, 1979.

Claimant should be paid an additional five and two-sevenths (5 2/7) weeks of healing period compensation at the stipulated rate of eighty-one and 62/100 dollars ($81.62) per week.

Claimant should be paid fifteen and four-tenths (15.4) weeks of permanent partial disability compensation at the stipulated rate of eighty-one and 62/100 dollars ($81.62) per week.

Claimant should be paid the following medical expenses:

Medical Anesthesia Associates (1-11-82)	$ 273.00

Drs. Gross, Iverson, Kratochvil and Klein, P.C. (Dr. Fitzgibbons) 1,030.00

ORDER

WHEREFORE, the review-reopening decision is hereby affirmed.

THEREFORE, it is ordered:

That defendants pay unto claimant an additional five and two-sevenths (5 2/7) weeks of healing period compensation at the rate of eighty-one and 62/100 dollars ($81.62) per week.

That defendants pay unto claimant fifteen and four-tenths (15.4) weeks of permanent partial disability compensation at the rate of eighty-one and 62/100 dollars ($81.62) per week.

That defendants pay unto claimant the following medical expenses.

Medical Anesthesia Associates (1-11-82) $ 273.00
Drs. Gross, Iverson, Kratochvil and Klein, P.C. (Dr. Fitzgibbons) 1,030.00

Costs of the appeal are taxed to the appellant.

Interest on this award is to accrue pursuant to section 85.30, Code of Iowa, from the date of this decision.

Signed and filed this 30 day of August, 1984.

ROBERT C. LANDESS
INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

JAMES BURGERT,
Claimant,
vs.
FUTURE FOAM, INC.,
Employer,
and
ARGONAUT INSURANCE COMPANIES,
Insurance Carrier,
Defendants.

File No. 606720

REVIEW-REOPENING DECISION

FILED
APR 9 1984
IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This matter came on for hearing at the Pottawattamie County Courthouse in Council Bluffs, Iowa on October 4, 1983 at which time the record was closed.

A review of the commissioner's file reveals that an employers first report of injury was filed on October 3, 1979. A memorandum of agreement calling for the payment of $81.62 was filed on October 3, 1979. The record consists of the testimony of the claimant, Donna Jean Burgert, Edward Fox and Jerome Riley Eledge, Sr.; claimant's exhibit 1; and defendants' exhibits A, B and C.

ISSUES

The issues for determination are:

1) Whether there is a causal connection between the claimant's injury and his condition;

2) The nature and extent of disability; and

3) The payment of certain medical expenes.

STATEMENT OF THE EVIDENCE

Claimant, age 26, testified that he lives in Council Bluffs with his parents. He testified that he made it through the eleventh grade at school after having quit for a time. He testified that he was involved in a number of sports at school and hurt his right knee at a practice game. This resulted in surgery by Robert Klein, M.D., an Omaha orthopedist, in February 1974.

Claimant first worked for this employer after he left school. He worked for defendant for about six months before becoming employed by the Pamida warehouse. He then became employed by an excavating company as a laborer. He then became a part-time replacement through Help, Inc. for defendant and was hired on by them as a permanent employee.

Claimant testified that he injured his right knee at work on September 21, 1979. Claimant testified that he was assisting in moving foam to a saw when the foam fell on claimant's right knee. Claimant testified that he reported the injury and finished out the day despite right knee swelling. Claimant testified that he sought medical treatment after work. Claimant testified that he went to Mercy Hospital and that he was instructed to use ice water soaks and told to see a physician the following day. Claimant did not return to work on the following day.

On October 2, 1979 claimant was seen by Timothy C. Fitzgibbons, M.D., an orthopedic surgeon who practices with Dr. Klein. Dr. Fitzgibbons noted that x-rays of the right knee taken on September 21, 1979 revealed that there was some calcification along the joint line with no fracture. Physical examination by Dr. Fitzgibbons revealed that the knee didn't appear to be painful. There was full range of motion and no instability. Dr. Fitzgibbons thought that claimant had sustained a contusion of the right knee and a possible hyperextension of the knee.

Claimant returned to see Dr. Fitzgibbons on October 19, 1979. Claimant was complaining of pain and popping in his knee and also some aching down his leg. He was started on outpatient physical therapy. On November 2, 1979 claimant again saw Dr. Fitzgibbons and he injected claimant's knee with Marcaine, Depo-Medrol and Xylocaine. On November 16, 1979 he returned and was still having pain and swelling so claimant had an arthrogram performed on him. A tear of the medial meniscus was noted.

Claimant was subsequently admitted to the hospital on December 6, 1979. An arthroscopy and arthrotomy were performed. Claimant was noted to have sustained multiple small tears of his medial meniscus as well as a larger tear posteriorly. Dr. Fitzgibbons noted some chondromalacia of the cartilage of the femoral condylus and tibial plateau when the knee was entered.

Claimant was released from the hospital but continued to have considerable pain and swelling. He could hardly move his leg. On January 1, 1980 claimant was admitted to Mercy Hospital in Council Bluffs, Iowa and remained there until January 12, 1980. An extensive course of physical therapy was conducted during this hospitalization. At that time he had from minus 10 to 75 degrees of motion. Physical therapy was continued on a twice-weekly basis. Dr. Fitzgibbons saw claimant again on February 15, 1980. Dr. Fitzgibbons released claimant for light duty. Claimant had occasional swelling, but his range of motion increased.

Claimant returned to work as instructed. Dr. Fitzgibbons saw claimant again on March 14, 1980. Claimant was still having trouble. He reported some popping and catching in his knee, but did not think there was as much swelling as there was before. Dr. Fitzgibbons asparated the knee of serosanguineous fluid and injected the knee with Xylocaine, Marcaine and Depo-Medrol. Claimant was told to keep his knee active.

Claimant saw Dr. Fitzbiggons on August 1, 1980. Claimant reported that he was working. There was range of motion from -3 to 95- degrees. He had no effusion. He had minimal limp. Dr. Fitzgibbons felt claimant had reached maximum recovery and forecast permanent partial impairment.

Claimant was seen again on February 22, 1981 and claimant complained to Dr. Fitzgibbons that he was having periodic discomfort. Claimant had minimal effusion but had full range of motion. At that time a ten percent permanent partial impairment rating for the right leg was assigned. Dr. Klein had previously assigned a five percent rating for the 1974 right knee injury. Accordingly, Dr. Fitzgibbons indicated that claimant had a total impairment of twelve percent, seven percent of which could be assigned to the instant injury.

Claimant continued to see Dr. Fitzgibbons and had recurrent trouble with his right knee. The two spoke of surgical procedues again in December 1981, but surgey was not done at that time. An arthoscopic examination, joint debridement and irrigation with an injection with Depo-Medrol and Morcaine and a torn lateral medical meniscal flap was removed on January 10, 1982.

In February 1982 Dr. Fitzgibbons indicated that he told claimant he would have to live with his problem. He thought claimant would eventually need a total knee replacement.

After claimant returned to work again in February 1982 he was a saw operator, having been promoted to this position by seniority. Claimant testified that his lower back started to bother him after he had returned for about a week. Claimant indicated that no special incident happended which would have injured claimant's back. Claimant testified that he had been walking with a limp. Claimant felt he was getting cramps in his back.

Claimant told Dr. Fitzgibbons of his back problems in August 1982. Claimant was examined and was found to have a decreased ankle jerk on the left and discomfort with straight leg raising on the right. Both ankle jerks were hypoactive and made assessment difficult. Otherwise, the neurologic examination was within normal limits. However, Dr. Fitzgibbons thought there were enough signs to warrant the thought of a possible herniated disc. X-rays of the lumbar spine showed no significant bony abnormalities. The diagnosis at the time was lumbosacral strain with possible right lower extremity radiculopathy. Claimant was admitted to the hospital. The hospitalization helped claimant for a short time, but shortly after he left the hospital he began having discomfort down his left leg. A myelogram was discussed. A lumbar laminectomy was conducted on October 1, 1982. A lumbar laminectomy was conducted on October 7, 1982.

Dr. Fitzgibbons released claimant to return to work on January 10, 1983. Claimant apparently returned to work and he was laid off. Dr. Fitzgibbons indicates that claimant reported to him that he had some discomfort. Claimant saw Dr. Fitzgibbons on February 11, 1983. On examination claimant still had some moderate limitation of motion due to back discomfort. Claimant had some occasional numbness in his left foot, but straight leg raising was negative at the time. Dr. Fitzgibbons gave a fifteen percent permanent partial disability to the body as a whole for the back injury.

Dr. Fitzgibbons made periodic reports concerning claimant's condition. Of primary concern is the causation of claimant's back problems and Dr. Fitzgibbons wrote two letter with regard to the matter. In a letter dated August 24, 1982 Dr. Fitzgibbons made the following statement:

> In regard to the cause of the patient's symptoms, I suppose, the fact that he has had to favor that right knee for so long, could have put excess stresses on his low back and at least could have been a contributing cause to his back pain, but there is no way of proving that. I don't think anyone can be sure.

He than wrote a more lengthy explanation of causation on September 28, 1982. Although this excerpt is lengthy, it will show the reader the difficulty of the causation issue:

> In a previous report, I noted that I felt that the fact that the patient has had to limp on the right leg, certainly was a contributing cause to his back pain, but I could not say with any certainty that it was the cause of his present symptoms exclusively.
>
> I even told the patient that I would discuss this with some of my other colleagues, to see what their feelings were. It is pretty much my feeling and the consensus of some of the members of our office, that there is no way that any one can say with any certainty that a lower extremity problem, which causes a limp, can be the cause of a herniated disc or low back strain.
>
> We all feel that certainly an abnormal gait, or a limp--such as Mr. Burgert has had--puts excess stresses on the back and, thus, can be the cause of development of mechanical low back pain and even the final element of disc herniation, if that occurs.
>
> However, to again comment on the cause and affect (sic) relationship of a herniated disc, I believe that I can state that I think the fact that the patient has had disability--from his right knee injury and degenerative arthritis, which has caused him to limp and certainly put excess stresses on his back--it was a contributing cause at the least, to his back pain. If, indeed, he does turn out to have a herniated disc, I, again feel that this could be a contributing cause to that.
>
> Again, however, I must state that there is no way for anyone to say with absolute certainty that there is a cause and affect relationship one way or the other. In any event, it is my feeling that this patient has significant disability and has a high likelihood of a herniated disc. I certainly feel that it would be advantageous for us to do a myelogram, to see if there is some way that we can help him with surgery. I would hope that there could be some way to get some sort of coverage for his bill, so this could be arranged.

Claimant testified that he returned to work on January 10, 1983. He only worked that day. Claimant testified that the plant manager told him about two weeks later that he was fired. Claimant testified that he had not worked since January 10, 1983. He has applied for a number of jobs.

On cross-examination, claimant testified that he was five feet nine and one-half inches tall and weight 267 pounds. He used to weigh 202 pounds. Claimant lives at home and does some of the work around the house. He testified as to the job applications he has made. Claimant testified that when he went to work on January 10, 1983 there was a half schedule and that he was told that a position was not open for him. Claimant received unemployment compensation from January 1983 for a period of 36 weeks.

Donna Joann Burgert is claimant's mother. She testified that claimant never complained of back pain until after the last knee surgery.

Edward Fox is a friend of claimant and has known him for over twelve years. He testified that he never heard claimant complain of back problems until May 1983. Claimant complained of left leg problems prior to that.

Jerome Riley Eledge has been Future Foams plant manager for five years. He testified that the company used an outside agency, Help, Inc., to obtain employees on an approval basis. If an employee worked out after six months he will be hired by defendant employer as a permanent employee. He stated that claimant was eligible for rehire. He said that claimant's position had been filled by another but that claimant could be rehired by defendant through one of agencies.

On cross-examination, the witness testified that he was satisfied with claimant's performance prior to his discharge.

APPLICABLE LAW

1. Section 85.3 and 85.20, Code of Iowa, confer jurisdiction on this agency in workers' compensation matters.

2. By filing a memorandum of agreement it is established that an employer-employee relationship existed and that claimant sustained an injury arising out of and in the course of employment. Freeman v. Luppes Transport Co., 227 N.W.2d 143 (Iowa 1975). This agency cannot set this memorandum of agreement aside. Whitters and Sons, Inc. v. Karr, 180 N.W.2d 444 (Iowa 1970).

3. The claimant has the burden of proving by a preponderance of the evidence that the injury of September 21, 1979 is causally related to the disability on which now bases claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

4. However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

5. When a worker sustains an injury, later sustains another injury, and subsequently seeks to reopen an award predicated on the first injury, he or she must prove one of two things: (a) that the disability for which he or she seeks additional compensation was proximately caused by the first injury, or (b) that the second injury (and ensuing disability) was proximately caused by the first injury. DeShaw v. Energy Manufacturing Company, 192 N.W.2d 777, 780 (Iowa 1971).

6. An injury to a scheduled member which, because of after-effects (or compensatory change), creates impairment to the body as a whole entitles claimant to industrial disability. Barton v. Nevada Poultry Co., 253 Iowa 285, 110 N.W.2d 660 (1961). Dailey v. Pooley Lumber Co., 233 Iowa 758, 10 N.W.2d 569 (1943).

7. If a claimant contends he has industrial disability he has the burden of proving his injury results in an ailment extending beyond the scheduled loss. Kellogg v. Shute and Lewis Coal Co., 256 Iowa 1257, 130 N.W.2d 667 (1964).

8. In Graves v. Eagle Iron Works, 331 N.W.2d 116 (Iowa 1983), the court held that the compensation for claimant's scheduld leg injury was limited by statute to the specific impairment and not measured by industrial disability.

Section 85.34(1), Code of Iowa, provides for healing period to be paid from the date of injury until the claimant has returned to work or it is medically indicated that significant improvement from the injury is not anticipated or until the employee is capable of returning to employment substantially similar to the employment in which the employee was engaged at the time of injury, whichever occurs first.

Section 85.27, Code of Iowa, provides in part:

> The employer, for all injuries compensable under this chapter or 85A, shall furnish reasonable surgical, medical, dental, osteopathic, chiropractic, podiatric, physical rehabilitation, nursing, ambulance and hospital services and supplies therefor and shall allow reasonably necessary transportation expenses incurred for such services. The employer shall also furnish reasonable and

necessary crutches, artificial members and appliances but shall not be required to furnish more than one set of permanent prosthetic devices.

ANALYSIS

Before discussing the result in broad terms, the medical evidence must be discussed. Dr. Fitzgibbons wrote a letter on January 7, 1980 wherein he indicated that the chondromalacia was due to wear and tear secondary to previous surgery, the stress of time, and the injury. I have no difficulty in relating claimant's knee problems to the injury. There was a sufficient continuum of events to find as a fact that the knee problems and disability are related to employment.

The fighting issue in the case is the causation of the back difficulties. Claimant has not proven that the disability for which he seeks additional compensation was proximately caused by the first injury. He has made a case, however, indicating that the first injury caused the second injury. He did not prove the back injury was caused by the original September 21, 1979 knee injury since there was nearly three years' time which passed before the inception of back pain. However, the second De Shaw test allows recovery in a case such as this where a second injury is caused by a work-related injury.

I usually do not quote from medical reports as extensively as I have in this case. The sections quoted were set forth in their entirety in order that the reader who is not familiar with the case might more fully understand the problem I had with the case. The first quote from the August 24, 1982 letter uses the subjunctive mode extensively. It does give us an inkling that the doctor may be unsure of the burden of proof to be applied. Dr. Fitzgibbons uses the words "could" and "can" in conjunction with "absolute certainty." The burden is still upon the claimant to prove that he has a claim by a preponderance of the evidence. This has not been done in this case.

While I have never held to a ritualistic interpretation of the standard of proof, some adherence to the standards is necessary in order to maintain some sense of predictability. Therefore, claimant's case alleging that the back injury was cuased by the knee incident must fail. Claimant will, however, be allowed to recover for his loss to his right leg. Claimant will be awarded a seven percent loss of a leg or 15.4 weeks of permanent partial disability compensation.

As far as healing period is concerned, it is unknown what healing period is concerned, it is unknown what healing period has been paid. It is clear, however, that claimant should be paid healing period compensation, if he has not been so paid, for the period of January 10, 1982 to February 15, 1982, a period of 5 2/7 weeks. This is for the time period when claimant had his last surgery to the right knee.

Certain medical expenses have been submitted for payment. Only those related to the injury should be paid:

Medical Anesthesia Associates (1-11-82)	$ 273.00
Drs. Gross, Iverson, Kratochvil and Klein, P.C. (Dr. Fitzgibbons)	1,030.00

The last amount represents unpaid amounts for the January 1982 surgery.

FINDINGS OF FACT

1. Claimant was employed by Future Foam, Inc. on September 21, 1979.

2. Claimant hurt his right knee while working on September 21, 1979.

3. Defendants filed a memorandum of agreement on October 19, 1979.

4. The testimony indicates that claimant was paid for all time lost prior to December 31, 1981.

5. Claimant has proven by a peponderance of the evidence that the need for additional surgery was caused by the injury of September 21, 1979.

6. Claimant started missing work on January 10, 1982 and returned to work on February 16, 1982.

7. Claimant sustained permanent partial disability because of the injury of September 21, 1979.

8. Claimant proved by a preponderance of the evidence that he sustained a seven percent (7%) loss to the leg because of the injury of September 21, 1979.

9. Claimant failed to prove by a preponderance of the evidence that a lumbar disc problem was related to the September 21, 1979 injury.

10. Claimant incurred certain medical expenses which are related to the injury.

CONCLUSIONS OF LAW

1. This agency has jurisdiction over the parties and the subject matter.

2. Claimant was employed by defendant employer on September 21, 1979.

3. Claimant sustained an injury arising out of and in the course of his employment on September 21, 1979.

4. Claimant should be paid an additional five and two-sevenths (5 2/7) weeks of healing period compensation at the stipulated rate of eighty-one and 62/100 dollars ($81.62).

5. Claimant should be paid fifteen and four-tenths (15.4) weeks of permanent partial disability compensation at the stipulated rate of eighty-one and 62/100 dollars ($81.62).

6. Claimant should be paid the following medical expenses, to wit:

Medical Anesthesia Associates (1-11-82)	$ 273.00
Drs. Gross, Iverson, Kratochvil and Klein, P.C. (Dr. Fitzgibbons)	1,030.00

ORDER

IT IS THEREFORE ORDERED that defendants pay unto claimant an additional five and two-sevenths (5 2/7) weeks of healing period compensation at the rate of eighty-one and 62/100 dollars ($81.62) per week.

IT IS FURTHER ORDERED that defendants pay unto claimant fifteen and four-tenths (15.4) weeks of permanent partial disability compensation at the rate of eighty-one and 62/100 dollars ($81.62) per week.

IT IS FURTHER ORDERED that defendants pay unto claimant the following medical expenses, to wit:

Medical Anesthesia Associates (1-11-82)	$ 273.00
Drs. Gross, Iverson, Kratochvil and Klein, P.C. (Dr. Fitzgibbons)	1,030.00

Costs are taxed to defendants pursuant to Industrial Commissioner Rule 500-4.33.

Interest on this award is to accrue pursuant to Section 85.30, Code of Iowa, from the date of this decision.

Defendants are ordered to file a final report.

Signed and filed this 9th day of April, 1984.

JOSEPH M. BAUER
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

HELEN E. BURR, Claimant, vs. CRESTVIEW MANOR, Employer, and AID INSURANCE SERVICES, Insurance Carrier, Defendants.	FILE NO. 723192 A R B I T R A T I O N D E C I S I O N

INTRODUCTION

This is a proceeding in arbitration brought by the claimant, Helen E. Burr, against her employer, Crestview Manor, and its insurance carrier, Aid Insurance Services, to recover benefits under the Iowa Workers' Compensation Act as a result of an injury she sustained January 6, 1983.

This matter came on for hearing before the undersigned deputy industrial commissioner at the courthouse in Fort Dodge, Iowa June 12, 1984. The record was fully submitted on that date.

A review of the industrial commissioner's file indicates that a first report of injury was filed January 12, 1983.

The record in the case consists of the testimony of claimant, of Joseph H. Sherman, and of Alice Lynette Patch; of claimant's exhibits 1 through 13; and of defendants' exhibits A through G.

ISSUES

The issues to be resolved are:

1. Whether claimant received an injury which arose out of and in the course of her employment.

2. Whether a causal relationship exists between claimant's injury and her disability.

3. Whether claimant is entitled to benefits and the nature

and extent of any entitlement.

4. Whether claimant is entitled to payment of certain medical expenses under section 85.27.

5. Claimant's rate of weekly compensation in the event of an award.

REVIEW OF EVIDENCE

At hearing, the parties stipulated that claimant's gross weekly wage was $292.00, that she was paid on a biweekly basis, and that she was entitled to one exemption. They also stipulated that medical bills were fair and reasonable if causally related to claimant's injury.

Claimant, Helen Elizabeth Burr, testified in her own behalf. Claimant is single and is 49 years old. Claimant is a registerd nurse who has been employed at Crestview Manor for seven years. Claimant stated she received nurse's training at Drake University and Broadlawns Hospital in Des Moines in 1952-1953 and completed training through Iowa Western Community College. Claimant has been employed as a nurse since 1973. Her only other employment was as a customer service representative for Beeline Fashions. She held this position for seven years. Claimant described her injury thusly: She was seated on the side of a patient's bed while giving the patient medication, she stood up; her legs slipped, she twisted her knee, and felt severe, tearing pain. She stated she attempted to remain at work initially sitting in a wheelchair at the Manor to relieve her pain. When her condition did not improve, her supervisor referred her to Dr. Brown who subsequently referred her to Dr. Brodersen.

Claimant first saw Dr. Brodersen January 13, 1983. She reported he prescribed a mobilizer and crutches until May 1983. Claimant was unable to work during this time. The doctor also prescribed a TENS unit which claimant no longer uses. Claimant apparently had two such units, the first having been found defective after one week of use. She stated defendants did not pay for the second unit and, therefore, even though she was practically pain free while using the newer unit, an effective unit is not available to her.

Dr. Brodersen performed an arthoscope in March 1983. Claimant reported that her doctors found severe degenerative arthritis in the knee. Claimant disclosed that she had injured her knee in an auto accident in 1965. She characterized that injury as consisting of severe lacerations and partial severance of the right knee cap. Claimant asserted that before her work injury neither the effects of the auto injury nor her degenerative arthritis had hindered her work. Claimant admitted her employment application of 1977 notes she has a limp. She ascribed her limp then to the fact that her legs are of differing lengths. She stated she had walked without difficulty before her January 1983 injury. She stated she now has difficulty walking and has a limp and knows it. At hearing, it was apparent claimant walked with a slight limp.

Claimant returned to work on a two and then a three day per week schedule June 6, 1983. She reported Dr. Brodersen has only authorized her to work three days per week. She, herself, does not believe she could work more than three days per week, even though it would be financially advantageous for her to do so. She stated she must "pass pills" two times per day and must make rounds and perform prescribed treatments for patients. She is "on her feet" on the Manor's concrete floors while doing these duties and hurts when walking after she has been on her feet awhile.

Claimant relayed that her injury has curtailed her other life activities. She stated that she can no longer walk for exercise and recreation nor bowl nor bean walk as she did previous to her injury. She stated her general physical health before her injury was good and that she has gained more than 30 pounds since her injury because she cannot exercise or diet properly now. Claimant can no longer drive a straight stick car. She had to change apartments since she could not ascend and descend basement stairs to do her laundry. She has had to stay with her parents or her child at times since she could not manage alone. Claimant is now using Tylenol III or extra strength Tylenol for pain. Dr. Brodersen has told claimant to walk and exercise. She stated she trys to walk two to three blocks on her days off.

Claimant reported that her post-injury part-time status precludes her receiving health insurance, vacation time, or raises. She said she "feels like [her employers] are watching me for any mistake I make."

Claimant stated she has not been reimbursed for 680 miles of travel for medical treatment. She stated exhibit 2 evidences prescription charges for which she has not been reimbursed and that all her hospitalizations and medical bills related to treatment of her knee problem. She stated exhibit 6 evidenced Blue Cross/Blue Shield payment of her Mary Greeley Medical Center bill.

Claimant stated she experiences problems with her right hip and left heel as well as with her knee. She claimed she had not had such problems before her injury. Defendants' objection to such testimony on the grounds that the evidence indicates a scheduled injury is overruled.

On cross examination, it was established that claimant now weighs seven pounds less than she did in June 1982. Claimant explained that she lost 55 pounds between then and January 1983 following a hospitalization for a suspected heart condition. She regained 35 pounds following her injury and now weights 230 pounds. Claimant elaborated on her 1965 auto injury. She agreed she has described this injury as losing one half the right knee cap. Claimant agreed she was hospitalized for three months following this injury and then recuperated at home for four months. A wire was placed in claimant's knee cap to attach her patella to surrounding muscle. Claimant agreed that exhibit A indicates that this wire has broken in two separate places. Claimant asserted, however, that she had only had occasional knee problems between 1965 and 1983. She characterized occasional as one or two times per year. She stated she did not need prescription medication for such problems. Claimant confirmed that she had only limited range of motion in her right knee before her 1983 injury. She stated that other than her slight limp her only limitation prior to her 1983 injury was an inability to bicycle since she could not bend her knee. Claimant admitted Dr. Brodersen was not familiar with her medical history when he began treatment of her injury.

Claimant agreed her work duties now do not differ from those prior to her injury and that she has never received inpatient treatment as a result of her injury.

Defendants called Joseph H. Sherman, administrator and owner of Crestview Manor, as their first witness. The witness stated that prior to her January 1983 injury, claimant had had to use a cart for support and was often fatigued. He opined that before her injury, claimant walked with a "steady, light type of limp." He stated that before her injury, claimant had complained of knee and leg pain after walking beans; he stated her complaints of pain were more frequent than one or two times per year. The witness recalled conversing with claimant about her injury on the injury date. He reported claimant then stated that when she attempted to stand up her right leg gave out, but did not report slipping.

The witness represented that he observed the injury site on the injury date. He stated no wet spot or substance on which claimant might have slipped was apparent on the floor. On cross examination, it was established that the Manor has linoleum floor coverings. The witness agreed claimant has been a prompt and regular employee both before and after her injury. Claimant was called by defendants. Claimant agreed she described the injury honestly and accurately to Mr. Sherman on the injury date. Defendants' counsel noted that claimant's petition states claimant slipped on something on the floor on her injury date.

Alice Lynette Patch, director of nursing at the Manor, was called by defendants. This witness stated she knew claimant both at work and socially before her injury. She stated that, prior to her injury, claimant had much more difficulty walking after she had engaged in outside activities and that weather changes would increase claimant's preinjury pain. She stated claimant used nonprescription pain killers, or limped or elevated her leg when in pain prior to her January 1983 injury. She stated claimant complained of pain at least two or three times per month before her injury.

The witness was working on claimant's injury date and discussed her injury with claimant. She reported claimant denied falling, slipping, or tripping, but that claimant stated her leg "gave way" and "felt like something crossed over." On cross examination, the witness admitted she made no written report of claimant's statement on her injury date. She disclosed claimant was experiencing much pain following her injury and principally described her pain and not the injury itself. She admitted claimant never indicated she fell to the floor but agreed a fall may be a fall against something.

Defendants objected to claimant's exhibits 1 through 12 on the grounds that no causal relationship between claimant's medical problems and claimant's work injury has been established. The objections are overruled. Claimant's exhibit 1 is copies of a prescription by Dr. Brodersen of March 29, 1983 for a TENS unit for claimant for use at home and of a statement of Home Healthcare Center in the amount of $120.50 for a TENS unit. Claimant's exhibit 2 is an endorsed check of Helen E. Burr to Thompson Pharmacy in the amount of $8.50. Claimant's exhibit 3 is a statement of Home Healthcare Center in the amount of $120.50 which apparently duplicates the charges evidenced in exhibit 1. Claimant's exhibit 4 is copies of statements of Hamilton County Public Hospital in the amounts of $35.00, $111.50, and $6.25, respectively. Claimant's exhibit 5 is a statement of Mary Greeley Medical Center in the amount of $682.40. Claimant's exhibit 6 are Blue Cross/Blue Shield of Iowa explanations of health care benefits showing payments of $576.90, $63.00, and $42.50 respectively to Mary Greeley Medical Center, Pathology Department, and Radiology Department in claimant's behalf. Claimant's exhibit 7 is a Blue Cross/Blue Shield of Iowa explanation of health care benefits showing payment of $955.00 to McFarland Clinic, P.C. in claimant's behalf. Claimant's exhibit 8 is a February 2[illegible] 1984 letter of Hamilton County Public Hospital to claimant stating she is in default on her account in the amount of $117.50.

Claimant's exhibit 9 is an April 28, 1983 letter report of Mark P. Brodersen, M.D., to claimant's counsel. The letter states claimant's present condition results from her work injury, but acknowledges claimant had "some prior existing disease." Claimant's exhibit 10 is a March 29, 1983 letter report of Dr. Brodersen to claimant's counsel. In the letter, the doctor states claimant has severe degenerative arthritis of

the medial compartment as well as tears of the medial meniscus. He opines claimant's work injury aggravated her arthritis and caused a tear of the medial meniscus.

Claimant's exhibit 11 is an August 19, 1983 letter report of Dr. Brodersen to claimant's counsel which states:

> ...at the present time, the future of [claimant's] status is uncertain. If she continues to have problems with her knee and with the severity of the deterioration of her joint, it is my feeling that she may need total knee arthroplasty in the future. However, at the present time I am reluctant to advise this because of her relative youth and desire to remain physically active. It obviously is difficult to decide how much of her problem is on the basis of her injury and how much is on the basis of the underlying arthritis. At the present time it appears as though most of her present problem is related to the injury that she sustained and to some extent her underlying arthritis also plays a role. It is my feeling that in using the criteria of the American Academy of Orthopedic Surgeons, that Ms. Burr would have a 15 percent impairment of the lower extremity on the basis of her knee injury. It is my feeling that her total impairment is probably greater than this, but as a result of her knee injury I think the 15 percent figure would be reasonable.

Claimant's exhibit 12 is a December 14, 1983 letter report of Samir P Wahby, M.D., to defendants' counsel. The letter states in relevant part:

> A past history indicated that [claimant] had had a fractured patella 17 years ago for which she had an open reduction and internal fixation.
>
> On examination, [on January 25, 1983,] she had severe tenderness on the medial aspect of the right knee and medial femoral condyle. She had approximately 5 degrees of lack of extension and could not flex her knee due to severe pain.
>
> X-rays were obtained at the office at the time. They showed severe degenerative arthritis of her right knee....
>
> Examination on 10-25-83 revealed full extension and about 70 degrees of flexion with pain and tenderness over the medial and lateral joint lines, more so on the medial joint line. There was medial instability which is probably due to the narrowing of the joint line medially.
>
> The patient had gained weight. She weighs about 215 pounds. The patient was advised to lose weight and that would probably help her knee for the time being. She was also told to use the Indocin PRN for pain....
>
> The patient will still need the total knee replacement sometime in the future if her knee becomes severely painful at all times. However, for the time being if she can get by with pain medication and anti-inflammatory medication until she reaches an age that is appropriate for the proposd surgery [sic].

Claimant's exhibit 13 is the deposition of Mark Brodersen, M. The doctor noted that his impression upon initial examination of claimant was that she had both a preexisting degenerative arthritis in the knee and had suffered a sprain of the knee. The doctor observed that, on examination, claimant's knee was swollen. The ligamentous stability of the knee was normal. Claimant had marked pain on movement and her range of motion was about half the normal range of motion. The doctor stated claimant underwent arthroscopy, which he described as a means of smoothing the ends of the bone in an attempt to stimulate a healing response in the knee itself, on March 24, 1983. The doctor stated that, on arthroscopic examination, he found claimant had almost complete loss of the articular cartilage on the medial or the inner aspect of the knee. He described the condition as damage to the surface covering material on the end of the bone such that the material was eroded away and the underlying hard bone was then rubbing on hard bone. The doctor opined that this condition was attributable to claimant's surgery in 1965 and the deterioration since that time. The following dialogue transpired as regards claimant's condition and her 1983 work injury:

> Q. After going back to the surgical procedure, did you find any conditions in the performance of the surgery that were consistent with the type or caused by the type of injury she described as having occurred in January of 1983?
>
> A. It was my feeling that that injury was primarily to the soft tissues of the knee and to the ligaments and had aggravated the preexisting arthritis in the knee and I did not--I was not able to identify any of the damage as being directly caused by the injury in January of '83 as such.
>
> Q. Were you able to determine whether or not the preexisting condition had been aggravated by the injury in January of '83?
>
> A. Well, that's I think a clinical diagnosis and the findings that we had at the time of surgery would have been consistent with the chronic problem or the old injury gradually deteriorating.
>
> Q. Can you tell me so that I understand your answer whether or not the injury in January of 1983 aggravated that old injury or that old condition?
>
> A. I feel that it definitely did. The reason for that is that normally for a simple knee sprain the healing, expected healing period for that would be six weeks. And in the normal population, a person with a knee sprain should be back to work or at least have full range of motion and their knee should be essentially painless within about six to eight weeks and hers made no improvement whatsoever.

The doctor stated that he examined claimant July 5, 1983 following her work return of June 6, 1983. He described claimant's condition then thusly:

> A. She told me that indeed she had returned to work on 6-6-83, that she had worked three days a week and that she was having a fairly significant amount of pain in her knee. She had been as well using the Feldene but in addition was having to use Tylenol III, Tylenol plus codeine preparation at midday to enable herself to get through the day. And then when she would come home, that she'd have to use crutches to get around.
>
> Her knee motion at that time I felt had deteriorated. It was not as good as when she'd been seen in May and so we did reinject her knee with a steroid preparation again to try and calm things down and we talked then about the possibility of her needing more surgery and specifically discussing the possibility of a knee joint replacement.

The doctor reported that total knee replacement is not favored for persons who are still active and advised that a person under age 65 who has such surgery should not continue an occupation that involves heavy lifting or prolonged walking. The doctor opined the following as to claimant's present and future work capacity:

> Q. Doctor, what would you expect Mrs. Burr's ability to work would be given her situation as you see it now without a total knee replacement?
>
> A. I think that at the present time she is probably not going to be able to work any more than she is at the present time. She has to use a narcotic preparation in the middle of the day to be able to get through her work and I would guess that if she were to continue on as she is now, her frustration with this type of situation would probably lead her to stop working altogether unless she eventually had the knee joint replacement performed.

He stated that, on examination on October 13, 1983, claimant complained of backaches secondary to having to change her gait pattern to protect her knee. The doctor relayed the following as regards to his determination of claimant's permanent impairment:

> A. Well, this is a difficult problem. When there is a preexisting condition such as the arthritis, it's difficult to know how much the underlying disease process has to play. In my experience it is very frequent to have arthritis not be a problem until some significant traumatic event occurs and then it becomes symptomatic often on a permanent basis.
>
> Because of this and reviewing the guidelines of the American Academy of Orthopedic Surgeons, I felt that Mrs. Burr had, in the criteria that had been established, an impairment of 40 percent of the lower extremity. And I came up with a 15 percent impairment on the basis of her knee injury, of the injury itself. And I think that was sent to you in the letter.
>
> Q. Insofar as the other 25 percent, Doctor, is that or can that be described as related to the aggravation of the preexisting condition or how would you explain that?
>
> A. That would be correct.

The doctor opined that it is "almost inevitable" that claimant will need total knee replacement though this procedure should be prolonged as much as possible. Defendants' objections to the balance of testimony regarding such future medical procedure is sustained.

On cross examination, the doctor agreed that claimant's injury is limited to her right knee or leg. The doctor reported claimant had not told him she walked with a limp prior to her work injury. He expressed his agreement that a noticeable limp

is "a significant ramification of a medical condition," which desirably should be included in the patient's medical history.

Defendants' exhibit A is an x-ray report of R. W. Vogt, M.D., which states:

> RIGHT KNEE: Two views of the right knee show extensive osteoarthritic change. Wire suture is seen within the patella, therefore this osteoarthritis could have been induced by previous trauma. I do not see any acute fractures or avulsions. The suprapatellar bursa does show [sic] any distention [sic] thus I doubt that there is any large joint effusion. I have no previous films of this area with which to compare.
>
> IMPRESSION: Prominent osteoarthritic changes, no acute injury demonstrated radiographically.

Defendants' exhibit B is a surgeon's report of January 21, 1983. Defendants' exhibit C is a surgeon's report of Mark Brodersen, M.D., of January 28, 1983. Defendants' exhibit D is a surgeon's report of February 25, 1983. Each of these reports opines claimant's injury will not result in a permanent defect.

Defendants' exhibit E is a work release for claimant dated May 25, 1983 and authorizing a June 6, 1983 work return per Dr. Brodersen.

Defendants' exhibit F is a chest x-ray report of C. P. Pun, M.D. of June 14, 1982 and an Employee Health Examination Record for claimant dated June 11, 1982. The report lists claimant's height as 5'6" and her weight as 237 1/2 pounds. Defendants' exhibit G is claimant's application for employment with Crestview Manor. The application notes: "Limp because of knee Injury [sic] in Auto [sic] accident Mar [sic] 12, 1965."

APPLICABLE LAW AND ANALYSIS

First to be decided is whether claimant received an injury which arose out of and in the course of her employment.

Claimant has the burden of proving by a preponderance of the evidence that she received an injury on January 6, 1983 which arose out of and in the course of her employment. McDowell v. Town of Clarksville, 241 N.W.2d 904 (Iowa 1976); Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

An employee is entitled to compensation for any and all personal injuries which arise out of and in the course of the employment. Section 85.3(1).

The words "out of" refer to the cause or source of the injury. Crowe v. DeSoto Consol. Sch. Dist., 246 Iowa 402, 68 N.W.2d 63 (1955).

The words "in the course of" refer to the time and place and circumstances of the injury. McClure v. Union et al. Counties, 188 N.W.2d 283 (Iowa 1971); Crowe v. DeSoto Consol. Sch. Dist., 246 Iowa 402, 68 N.W.2d 63 (1955).

"An injury occurs in the course of the employment when it is within the period of employment at a place the employee may reasonably be, and while he is doing his work or something incidental to it." Cedar Rapids Comm. Sch. Dist. v. Cady, 278 N.W.2d 298 (Iowa 1979), McClure v. Union et al. Counties, 188 N.W.2d 283 (Iowa 1971), Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

The supreme court of Iowa in Almquist v. Shenandoah Nurseries, 218 Iowa 724, 731-32, 254 N.W. 35, 38 (1934), discussed the definition of personal injury in workers' compensation cases as follows:

> While a personal injury does not include an occupational disease under the Workmen's Compensation Act, yet an injury to the health may be a personal injury. [Citations omitted.] Likewise a personal injury includes a disease resulting from an injury....The result of changes in the human body incident to the general processes of nature do not amount to a personal injury. This must follow, even though such natural change may come about because the life has been devoted to labor and hard work. Such result of those natural changes does not constitute a personal injury even though the same brings about impairment of health or the total or partial incapacity of the functions of the human body.
>
> ....
>
> A personal injury, contemplated by the Workmen's Compensation Law, obviously means an injury to the body, the impairment of health, or a disease, not excluded by the act, which comes about, not through the natural building up and tearing down of the human body, but because of a traumatic or other hurt or damage to the health or body of an employee. [Citations omitted.] The injury to the human body here contemplated must be something, whether an accident or not, that acts extraneously to the natural processes of nature, and thereby impairs the health, overcomes, injures, interrupts, or destroys some function of the body, or otherwise damages or injures a part or all of the body.

Claimant explains her accident by stating she was sitting at the side of a patient's bed while administering medication. She then stood up. Her leg slipped and she twisted her knee. Both Mr. Sherman and Ms. Patch testified that claimant did not state she fell onto the floor; merely that she did not know what caused her injury. At hearing, claimant also did not state she fell to the floor. The evidence established claimant had a prior injury to her knee cap and accompanying osteoarthritis prior to her work incident. Defendants suggest claimant's trauma of January 6, 1983 arose wholly from these preexisting conditions. Claimant asserts it originated in her work activities. Larson has stated the principle governing whether an injury arises out of claimant's employment in cases of preexisting weakness or disease, thusly:

> Injuries arising out of risks or conditions personal to the claimant do not arise out of the employment unless the employment contributes to the risk or aggravates the injury. When the employee has a preexisting physical weakness or disease, this employment contribution may be found either in placing the employee in a position which aggravates the effects of a fall due to the idiopathic condition, or in precipitating the effects of the condition by strain or trauma. (Larson Workmen's Compensation Law §12:00).

This is a case where strain in the course of claimant's work duties precipitated the effects of her condition. Claimant was sitting at the side of a patient's bed administering medication, an employment duty. She stood up, which strained her already weakened leg thereby precipitating claimant's current knee injury. Thus, claimant's injury arose from her employment.

Claimant's injury clearly occurred at a time and place where claimant was performing routine work duties. Therefore, it occurred in the course of her employment. Claimant has established an injury both arising out of and in the course of her employment as a nurse at the Manor.

We next must decide whether claimant's disability is causally related to her work injury.

The claimant has the burden of proving by a preponderance of the evidence that the injury of January 6, 1983 is causally related to the disability on which she now bases her claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

While a claimant is not entitled to compensation for the results of a preexisting injury or disease, the mere existence at the time of a subsequent injury is not a defense. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756, 760-761 (1956). If the claimant had a preexisting condition or disability that is aggravated, accelerated, worsened or lighted up so that it results in disability, claimant is entitled to recover. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812, 815 (1962).

An employer takes an employee subject to any active or dormant health impairments, and a work connected injury which more than slightly aggravates the condition is considered to be a personal injury. Ziegler v. United States Gypsum Co., 252 Iowa 613, 620, 106 N.W.2d 591 (1960), and cases cited.

An employee is not entitled to recover for the results of a preexisting injury or disease, however. He can recover when aggravation of that condition creates a disability. Olson v. Goodyear Service Stores, 255 Iowa 1112, 125 N.W.2d 251 (1963); Yeager v. Firestone Tire & Rubber, Co., 253 Iowa 369, 112 N.W.2d 299 (1961); Ziegler v. United States Gypsum Co., 252 Iowa 613, 106 N.W.2d 591 (1960). See also Barz v. Oler, 257 Iowa 508, 133 N.W.2d 704 (1965); Almquist v. Shenandoah Nurseries, 218 Iowa 724, 254 N.W. 35 (1934).

Again the telling consideration in this case is whether claimant's disability results wholly from her earlier knee problem; wholly from her work injury or; at least in part from aggravation of the preexisting damage to her knee by her work injury. Dr. Brodersen offers the only expert testimony addressing this issue. In his reports and in his deposition, he consistently acknowledges claimant's preexisting problems but states her work injury produced her present reduced level of functioning. He explained his reasoning in this regard, thusly:

Q. Can you tell me so that I understand your answer whether or not the injury in January of 1983 aggravated that old injury or that old condition?

A. I feel that it definitely did. The reason for that is that normally for a simple knee sprain the healing, expected healing period for that would be six weeks. And in the normal population, a person with a knee sprain should be back to work or at least have full range of motion and their knee should be essentially painless within about six to eight weeks and hers made no improvement whatsoever.

The lay testimony presented also supports the conclusion that claimant's work injury aggravated her earlier condition thereby creating her current level of disability. Both claimant and defendants' witness' testified claimant walked with a limp throughout her employment with the Manor. Even though one side perhaps understated and the other overstated the level of difficulty previously experienced, both claimant and defendants' witnesses recalled that claimant had physical complaints relative to her damaged extremity before the January 1983 work incident. Yet claimant lived independently, moved about relatively freely, and worked a 40 hour, 5 day week prior to her work incident. Claimant, who gave no evidence of malingering, cannot do these things now. This fact, when coupled with Dr. Brodersen's expert opinion firmly establishes that claimant's current disability resulted, at least in part, from an aggravation of her preexisting injury by her work incident.

The next question to be addressed is the nature and extent of claiman 's benefit entitlement. This question has two aspects: One, whether claimant's disability relates to a body as a whole injury or a scheduled member injury; and two, the extent of claimant's disability which results from her work injury.

The right of a worker to receive compensation for injuries sustained which arose out of and in the course of employment is statutory. The statute conferring this right can also fix the amount of compensation to be paid for different specific injuries, and the employee is not entitled to compensation except as provided by the statute. Soukup v. Shores Co., 222 Iowa 272, 268 N.W. 598 (1936).

An injury to a scheduled member may, because of after effects (or compensatory change), result in permanent impairment of the body as a whole. Such impairment may in turn form the basis for a rating of industrial disability. Dailey v. Pooley Lumber Co., 233 Iowa 758, 10 N.W.2d 569 (1943). Soukup v. Shores Co., 222 Iowa 272, 268 N.W. 598 (1936).

Section 85.24(2) provides in relevant part...

...For all cases of permanent partial disability compensation shall be paid as follows:...

The loss of two-thirds of the part of a leg between the hip joint and the knee joint shall equal the loss of a leg, and the compensation therefor shall be weekly compensation during two hundred twenty weeks....

In all cases of permanent partial disability other than those hereinabove described or referred to in paragraphs "a" through "t" hereof, the compensation shall be paid during the number of weeks in relation to five hundred weeks as the disability bears to the body of the injured employee as a whole.

It it is determined that an injury has produced a disability less than that specifically described in said schedule, compensation shall be paid during the lesser number of weeks of disability determined, as will not exceed a total amount equal to the same percentage proportion of said scheduled maximum compensation.

Claimant stated she has experienced low back pain and left leg and hip pain as a result of the change in her gait following her work injury. Dr. Brodersen agreed that claimant experiences low back pain. Yet no further evidence of compensatory change was presented and Dr. Brodersen couched claimant's disability rating in terms of impairment to a scheduled member, her right lower extremity. Thus, the evidence presented is insufficient to support a finding that claimant has a body as a whole injury. Claimant's disability percentage, therefore, must be determined as a scheduled member disability and not as industrial disability.

Dr. Brodersen testified that claimant has a 40 percent impairment to her right lower extremity. He described his arrival at this figure, thusly:

Q. Doctor, have you made a determination of the percentage of permanent impairment that Mrs. Burr has at this time and if so, would you tell us what that opinion is?

A. Well, this is a difficult problem. When there is a preexisiting condition such as the arthritis, it's difficult to know how much the underlying disease process has to play. In my experience it is very frequent to have arthritis not be a problem until some significant traumatic event occurs and then it becomes symptomatic often on a permanent basis.

Because of this and reviewing the guidelines of the American Academy of Orthopedic Surgeons, I felt that Mrs. Burr had, in the criteria that had been established, an impairment of 40 percent of the lower extremity. And I came up with a 15 percent impairment on the basis of her knee injury, of the injury itself. And I think that was sent to you in the letter.

Q. Insofar as the other 25 percent, Doctor, is that or can that be described as related to the aggravation of the preexisting condition or how would you explain that?

A. That would be correct.

This impairment rating, unfortunately, does not account for the fact that claimant had some obvious limitations prior to her work injury and that these resulted from her earlier knee injury. Claimant clearly is entitled to compensation for the 15 percent impairment attributed solely to the work injury. The 25 percent impairment rating which Dr. Brodersen characterizes as related to the aggravation of claimant's preexisting condition must be discounted by the fact that, as a result of her earlier non work injury, claimant walked with a limp and had physical discomfort sufficient to require periodic treatment with pain medication prior to her work injury. Ten percent of that figure must be attributed to claimant's preexisting, disabling condition. When the remaining 15 percent is coupled with the 15 percent attributed directly to claimant's work injury, claimant is found to have a 30 percent impairment of her right lower extremity. Such impairment entitles claimant to 66 weeks of disability benefits under section 85.34(2)(0).

Claimant seeks payment of certain medical costs under section 85.27. The employer shall furnish reasonable medical care and allow reasonable transportation expenses for compensable injuries. The employer also shall furnish reasonable and necessary appliances. Claimant's injury has been found to be compensable. Therefore, claimant is entitled to be compensated for those expenses she has actually paid or is actually liable for, but not for those which her health insurance has paid. The evidence established that claimant requires a TENS unit and that defendants paid the costs of a unit which was found to be defective. While an employer is not required to furnish more than one set of permanent prosthetic devices, no such limitation applies to a treatment appliance found to be defective. Defendants, therefore, shall compensate claimant for the costs of a second working TENS unit.

Claimant's rate of weekly compensation must be decided. The parties stipulated that claimant earned a weekly gross wage of $292.00, paid on a biweekly basis and that she was entitled to one exemption. Claimant is single. Section 85.36(2) governs this issue. The applicable rate of compensation is $175.38.

PINDINGS OF FACT

WHEREFORE, it is found:

Claimant received an injury in the course of her employment with Crestview Manor on January 6, 1983 when the strain from arising from the bed on which she was seated while administering medication to a patient caused her right leg to give way and resulted in a twisting of her knee.

Claimant had injured her knee sixteen (16) years previously in an auto accident. As a result of this injury, claimant had a partially severed right knee cap and a wire support in the knee.

Claimant walked with a limp and experienced episodic pain at the time of her work injury. These conditions resulted from her earlier trauma.

Claimant had preexisting osteoarthritis when injured at work. This condition probably resulted from the 1965 trauma.

Claimant's work injury aggravated claimant's preexisting condition.

Claimant's work injury resulted in an impairment to her right lower extremity and did not result in a body as a whole injury.

Claimant sustained a fifteen (15) percent impairment to her right lower extremity as a result of her work injury. Claimant has a twenty-five (25) percent impairment of the right lower extremity as a result of the aggravation of her preexisting condition. Ten (10) percent of such impairment can be attributed to claimant's preexisting condition and not to her work injury.

Claimant has sustained a thirty (30) percent impairment of her right lower extremity as a result of her work injury.

Claimant requires a TENS unit to alleviate her pain. Defendants have refused to provide a functioning unit.

Claimant's medical costs are causally related to her January 6, 1983 work injury.

Claimant was paid five hundred eighty-four and 00/100 dollars ($584.00) on a biweekly basis. She is single and

entitled to one exemption.

Claimant's rate of weekly compensation is one hundred seventy-five and 38/100 dollars ($175.38).

CONCLUSIONS OF LAW

THEREFORE, it is concluded:

Claimant has established that she received an injury on January 6, 1983 which arose out of and in the course of her employment.

Claimant has established that her present disability is causally related to her work injury of January 6, 1983.

Claimant has established she is entitled to permanent partial disability resulting from her injury of January 6, 1983 of thirty (30) percent of the right lower extremity.

Claimant has established that she is entitled to payment of medical costs for which she has not been reimbursed by her health insurance carrier including medical travel expenses of six hundred eighty (680) miles and the costs of a functioning TENS unit.

Claimant has established that her rate of weekly compensation is one hundred seventy-five and 38/100 dollars ($175.38).

ORDER

THEREFORE, it is ordered:

Defendants pay claimant permanent partial disability benefits for sixty-six (66) weeks at the rate of one hundred seventy-five and 38/100 dollars ($175.38).

Defendants pay claimant mileage expenses totaling six hundred eighty (680) miles at the rate appropriate for the time at which the expenses were incurred.

Defendants pay claimant the following medical costs:

Thompson Pharmacy	$8.50
Home Health Center	$120.50
Hamilton County Public Hospital	$152.75

Defendants pay claimant any additional costs incurred in the acquisition of a functioning TENS unit.

Defendants pay interest pursuant to section 85.30 as amended

Defendants pay costs of this action.

Defendants file a final report when this award is paid.

Signed and filed this 7th day of August, 1984.

HELEN JEAN WALLESER
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

ILLINOIS NATIONAL,	:	
Insurance Carrier, Defendants.	:	

INTRODUCTION

These are proceedings in arbitration and review-reopening brought by the claimant, Robert L. Carroll, against his employer Blahnik Construction Co., and its insurance carrier, Liberty Mutual Insurance Co., to recover benefits under the Iowa Workers' Compensation Act as a result of an injury allegedly sustained in July 1981; and against his employer, Spencers, Inc., and its insurance carrier, Illinois National Insurance Company, to recover additional benefits under the Act as a result of an injury of October 20, 1978.

The matters came on for hearing before the undersigned deputy industrial commissioner at the juvenile court facility in Cedar Rapids, Iowa March 16, 1984. All evidence presented is considered part of the record in each matter. The record was considered fully submitted at close of hearing in file number 719104. A first report of injury was filed January 8, 1979 and a memorandum of agreement was filed November 15, 1978 in file number 522429.

A review of the industrial commissioner's file reveals that no filings have been made.

The record in this case consists of the testimony of claimant, Robert L. Carroll, of Norma Brown; and of claimant's exhibits 1 through 22; and of defendants'(Blahnik's) exhibits 1 through 5.

ISSUES

The issues for resolution in claimant's case against Spencers are:

1. Whether a causal relationship between claimant's alleged injury and his disability exists.

2. Whether claimant is entitled to benefits and the nature and extent of his entitlement.

The issues for resolution in claimant's case against Blahnik are:

1. Whether claimant received an injury which arose out of and in the course of his employment.

2. Whether a causal relationship exists between claimant's alleged injury and his disability.

3. Whether claimant is entitled to benefits and the nature and extent of his entitlement.

REVIEW OF THE EVIDENCE

Claimant, Robert L. Carroll, born May 25, 1949, completed ninth grade and has obtained a GED. Claimant served in the U. S. Marines from August 1966 to July 30, 1970. He is a veteran of the Vietnam Conflict in which he suffered an injury to his legs, knees, and ankle. Claimant did not elaborate as to the nature of such injury or the circumstances surrounding it. Since 1970 claimant has worked primarily in the construction trades and is a certified ironworker, specifically, a journeyman rodman. Claimant passed both an oral and written exam to obtain his certification. Claimant works from a union hall. Claimant testified that his work has always required considerable lifting,

bending, and climbing. Claimant recited that he began work at Spencers Inc. in September of 1977 or 1978. He testified that he was injured at Spencers on October 20, 1978. Claimant was helping construct an airport hangar. Large fiberglass sheets weighing three to four hundred pounds were part of the building materials. Generally three persons transferred each sheet. Claimant was assisting in transferring a sheet onto the hangar roof. Apparently one person stood on the roof and grabbed the sheet up and the others slid it from the ground. Claimant was a ground worker. The sheeting fell and jammed claimant's back. Claimant reports he felt a "tingling sensation" which got worse as the day progressed. Claimant states he finished his work day, went home and then lay on the floor with heat and aspirin all weekend. His back did not improve. Claimant then sought treatment at Mercy Hospital and was placed in traction for a week. He was released but apparently was later rehospitalized. A myelogram and surgery were performed. He was released to return to work at Spencer in September 1979. Claimant then worked for J J Steel and Abel House Construction before beginning work with Blahnik Construction in October 1980.

At Blahnik claimant stated he initially hauled and lifted old steel beams in a remodeling project. He described these as six to eight feet long and ten inches wide by three to four inches deep and estimated each weighed between three and four hundred pounds. Claimant resumed work for Blahnik in June 1981. He characterized his back condition then by saying he had a "few" problems and occasionally wore a back brace. He then had muscle spasm with pain radiating into his legs. He sought medical treatment and returned to work at Blahnik on a "sheeting" project. Claimant states he lifted sheets to a second worker on the scaffolding. He reports he had leg pain on the July 4th weekend. He sought medical treatment and received a muscle relaxant and a pain killer. Claimant states he tried to return to work on the following Tuesday. He continued to experience problems. Claimant reports that he told his foreman of his problems and was advised to take it easy. Claimant states he "took the lay off" for fear he would further aggravate his condition were he to continue working. Claimant states he sought work as a gas station attendant and a maintenance worker while laid off.

Claimant returned to work at Spencers in November 1981. He only worked for a day or so.

Claimant states his back got worse in December 1981 and he then experienced pain in the back of his leg. In January 1982, he was rehospitalized for traction and physical therapy. A second hospitalization followed. Claimant returned to work for Loomis Construction in April 1982, however. He worked there through much of the 1982 construction season with spot employment elsewhere when he was not working for Loomis. Claimant reports he spread bar joists having an average weight of 300 pounds during this time. He also tied rebars that he described as 30 to 40 feet long, two and one half inches thick and as considerably heavier [than the bar joists.] Claimant also worked construction in 1983. Apparently he performed work which required substantially the same body mechanics as those required in his other jobs.

Claimant described a number of nonwork injuries he has received. Claimant was involved in a two car collision in March 1973. He states that x-ray examination found no injury and that he had some muscle spasm back pain for which he took a few aspirin.

In August 1977, claimant reinjured his right forearm and fingers when his hand went through a grocery store window. Claimant states he damaged his arm muscles and was hospitalized for a few days. In September 1979, claimant broke his leg in five places playing ball. He was treated at Mercy Hospital and reports this injury "came along real good."

On cross examination by Mr. Ferris, counsel for Spencers, claimant admitted he was off work from September 1979 to January 1980 on account of his broken leg. Claimant stated that after his 1979 injury he chose jobs on which he could take it easy for the first few months but as his back improved he took those jobs available. Claimant admitted his injury at Spencers did not reduce his earnings.

On cross examination by Mr. Hoffmann counsel for Blahnik, it was established that claimant denied ever having sustained treatment for back pain or having suffered back pain or having received workers' compensation benefits on his written employment application with Blahnik. Claimant admitted never reporting his injury to his supervisor nor seeking immediate medical attention. Claimant admitted that following the sheeting incident, he simply told Blahnik he would not be in and did not explain he had received a work injury. Claimant never visited Blahnik's company doctor for his injury. It was also established that claimant's medical records reflect that he was treated for lumbar pain in September 1974. Claimant admitted he never advised Blahnik he was wearing a back brace because of his pain. Claimant admitted he volunteered for the layoff at Blahnik and was not fired. He admitted that on his work return following his Blahnik injury, he worked "at least as hard" as anyone else.

On redirect examination, claimant explained he denied having back problems and receiving compensation benefits on his Blahnik application because he was afraid he would not be with an employer that long if the employer knew of his back problems and not many jobs were offered at that time. On recross examination, it was established that claimant has worn his back brace two or three times since it was prescribed.

Blahnik called Norma L. Brown in its behalf. Ms. Brown has worked in Blahnik's payroll department for the past 13 years. She reported she was in the Blahnik office on the first work day following July 4, 1981. The witness recited that she spoke with claimant by telephone that day. She reported claimant stated he would not be at work because he had injured his back. She related that she asked claimant whether the injury was job related. She stated claimant replied that the injury was not work related but resulted from mowing his lawn. On cross examination, the witness admitted she had no notes concerning this conversation. She stated she did tell claimant's foreman that claimant would not report to work. She explained that she does not routinely record nonjob related injuries when these are reported.

Claimant appeared as a rebuttal witness. He stated that from June 1981 through the July 4, 1981 weekend his back had been relatively sore with pain radiating into his legs. He stated lifting or climbing stairs set off the pain. He did not recall the specifics of his conversation with Ms. Brown.

Counsel for all parties presented closing arguments at hearing, and these were considered in the disposition of this matter.

Claimant's exhibits 1 through 22 are various medical records relative to claimant. Claimant's exhibit 1 concerns claimant's September 1974 hospitalization. The history recites that claimant dates his persistent, severe non-relenting pain in his lumbosacral back to a rear-ended auto collison in March 1973. The lumbosacral spine did not show evidence of boney disease or injury; intravertebral disc spaces appeared intact and claimant was felt to have a chronic, acute lumbosacral strain, probably on the basis of continued strain of lifting, more on a mechanical low back pain basis with a mild right sciatica. Claimant's exhibit 2 is medical records relative to claimant's August 1977 arm and finger injury. Claimant's exhibit 3 are medical records relative to claimant's October 25, 1978 hospitalization. The history states the following:

> This is an adult white male, age 29, who was seen by me two days before admission as an out patient in the Emergency Room. complaining [sic] of pain in his right leg posteriorly, extending down to the calf and posterior aspect of the foot. He states that while working for a construction company, he was coming down a ladder, and apparently did not realize that one of the wrungs of the ladder was missing and when he attempted to put his right foot down, he went all the way to the ground and put marked pressure on his right leg and hip. He had considerable amount of discomfort, but finished out the day, and then the following morning, he had severe pain, was unable to scarcely [sic] go to the bathroom and he remained in bed all day and then on Monday morning he came to the hospital for relief and to ascertain the cause of his problem. I saw him in the Emergency Room and he was unable to sit any length of time and walking seemed to be a frightful chore. He had pain in the posterior aspect of the thigh and the popliteal area of the right knee and some in the calf. Naffsiger's sign was +1 on the right. Patrick Fabere was negative. He had no apparent nerve dificit [sic]. Refelexes were normal and the peripheral circulation seemed to be adequate. My impression at that time that he had marked muscle spasms and may have had a ruptured vein in the deep muscle of the thigh. It was advised to have a whirlpool and he left and returned the following day with an extreme amount of discomfort and his wife tells me that he was unable to even drive the car, so he was brought to the hospital for further treatment....

X-ray examination showed satisfactory alignment, minimal spurring at L-5 and slight thinning of the discs between discs L-5 and S-1. No fracture or abnormalities were identified. Claimant's discharge diagnosis was acute lumbosacral strain with possible disc syndrome at the L-5 and S-1 level.

Claimant's exhibit 4 is medical records relative to claimant's November 8, 1978 hospitalization. A lumbar laminectomy was performed with removal of a herniated intervertebral disc at the L5-S1 level on the right. Claimant's exhibit 5 is medical records relative to claimant's September 1979 ankle injury.

Claimant's exhibit 6 is medical records relative to claimant's June 15, 1981 medical treatment at the Mercy Hospital Trauma Center. The diagnosis is lumbar spine strain. The history recites that claimant has had intermittent lumbosacral pain which has responded to bedrest and also complains of a "crunching sensation" in his right hip which has been present for about one month. It states claimant canoed over the weekend but knows of no specific single injury to his spine. The observed data reports:

> Patient has limited flexion and sideways bending to pain in the buttocks area. There is no specific point tenderness down the LS spine but there is mild tenderness to palpation over the paraspinal muscle at approximately L-3, L-4. Straight leg raising tests are negative. Knee jerks and ankle jerks equal bilaterally. Normal sensation. spine [sic] reveals a thinning of the L-5 - S-1 disc

space. Xray of the R [sic] hip within normal limits.

The x-ray report states that no evidence of recent injury exists.

Claimant's exhibit 7 is medical records relative to claimant's January 20, 1982 hospital admission. The reports recite the following history:

> This adult white male, is being admitted to the hospital because of persistent low back pain, [sic] the pain seems to radiate across the entire lower back region and particularly down the left leg at the present time and very marked trigger point area in the left sciatic notch. He has been working, but up until approximately a few days ago, but this pain gets so severe that he is unable to continue with his present occupation. He has not had any real new specific single injury recently and he complains also of a crunching sensation in both right and left hips, which has been present off and on for a month. This patient has a long past medical history. He dates some of his problem clear back to March of 1973, when he was involved in a car accident and at that time, sustained what he thought was a severe neck and back injury. He was seen in the Emergency Room at St. Luke's Hospital at that time and was given muscle relaxants and reported back to work, but eventually became much more uncomfortable and was seen again by me in 1974, at which time he was admitted to the hospital and x-rays again of the back were taken, but showed no significant bony disease. He was placed in traction at that time and had intramuscular injection of Xylocaine, but no great apparent relief. He was advised at that time that he should probably have a myelogram to determine whether or not he had a disc syndrome. The patient was not receptive to this and was discharged again without further studies and given medication for relief of his pain and discomfort. He continued to have discomfort off and on and again in 1978, I saw him and insisted that he have orthopedic consultation. He was seen then by Dr. Naden and myelogram done on 11-09-78 confirmed the physical findings of herniated disc at L-5, S-1. The patient did not elect to do anything at that time, but the pain became quite severe when he was again readmitted by Dr. Naden in 1979 and a surgical procedure was done at that time and the patient had what was apparently an uncomplicated gradual improvement. In 1977, I failed to mention that he had a severe injury where he put the right arm and forearm though [sic] plate glass. HE [sic] was seen then by Dr. Naden and he had surgical procedure of this [sic] arm and forearm, of the flexor musculature under local anesthesia and this repair was very successful. After the decompression of his back, the patient seemed to get along quite well, although from time to time, coming in complaining of some discomfort, but nothing too severe until July of 1981, when he complaind quite severely of this back pain, admitted himself to the Emergency Room of the hospital and at that time, he was advised to get bedrest and given medication for pain and was to call Dr. Naden for further instructions, which he did not do. X-ray at that time was negative for any bony disease of the pelvis or right hip, but x-rays of the lower back were not done at that time. The pain is now so severe that I have told him that he has to be admitted for further observation and possible myelogram.

Claimant's exhibit 8 is medical records relative to claimant's February 18, 1982 hospital admission wherein a partial "laminoctomy" [sic] and a laminotomy were performed. The history recites:

> This 32 year old man, for the last 2-3 weeks, has been having severe cramping symptoms in his left lower extremity, quite reminiscent of a herniated disc.
>
> It is interesting that actually this started back in July, in his right leg, last year. He started developing cramping and numbness and tingling in the middle three toes of his right foot and started developing significant weakness. I checked him over at that time, followed him for a white [sic] and he denied any serious problems [sic] did not want to have anything specifically done. We just watched him along and he had good evidence of a disc, but as I said, refused to have anything done.
>
> About 3 weeks ago, he came in to see me and he was just completely decompensated. He had severe, constant cramping in his buttocks and lower extremities and continued to have the numbness now in both lower extremities. Most of his symptoms were on the left at this time. Positive straight leg raise. Definite weakness of the extensor hallucis longus in both feet and of the flexor hallucis longus on the left. He finally decided to give in and have something done. We brought him in for a myelogram. This was positive and he will have surgery on his back.

Claimant's exhibit 9 is medical notes of several physicians regarding claimant from September 24, 1974 to July 21, 1982. Claimant's exhibit 10 is a standard form surgeon's report for claimant's October 23, 1978 accident. Claimant's exhibit 11 is a letter report of D. C. Naden, M.D., to New Hampshire Insurance Group of February 1, 1979. Claimant's exhibit 12 is an April 2, 1979 letter report of Naden to the Insurance Group. Claimant's exhibit 13 is a July 19, 1979 letter report of Dr. Naden to New Hampshire Insurance Group opining claimant has a 15 percent permanent partial disability rating of the body as a whole as a result of his then current injury. Claimant's exhibit 14 is a July 30, 1979 letter report of Naden to the Insurance Group which elaborates as follows:

> This young man's permanent partial disability rating would be approximately 15 per cent [sic] whole body permanent physical impairment and loss of physical function to the whole body. This would be the result of surgical excision of the disc without a fusion but with moderate, persistent pain and stiffness aggravated by heavy lifting and necessary modification of his activities.
>
> I last saw this young man on July 19 of this year and he was getting along a little bit better than usual. He was back working and able to tolerate it better than I thought he would be able to. However, I still maintain that there is a possibility that he could run into additional problems with his disc disease, either at this level or at a different level in his lower back and that there is a possibility of further treatment. However, I should reiterate that at the present time no active treatment is necessary or recommended.

Claimant's exhibit 15 is a work release for claimant from Dr. Naden for June 6, 1979. Claimant's exhibit 16 is a letter report of Naden to John W. Bickel dated August 11, 1981. The letter states:

> The above named patient of mine has been doctoring with me for approximately six and one-half months for what I think is a new herniated disc that I do not feel is related to his previous back condition. Iam [sic] not just exactly sure if this is work incurred but I am sure that it has been work aggravated during this latter period of time.

Claimant's exhibit 17 is an attending physician's report of January 11, 1982 for claimant. The report recites claimant's history as described by claimant as problems in his lower extremity and left foot with diagnosis of possible disc on left side. The doctor reports treating claimant for a similar condition of discomfort in his back on July 23, 1981.

Claimant's exhibit 19 is a letter report of Dr. Naden to American International Adjustment Company Inc. of March 3, 1982. The letter states:

> I am not exactly sure how the above patient hurt his back but I feel that his herniated disc started in July of last year and then kind of quieted down with a re-exacerbation three weeks ago. He was taken into the hospital where a myelogram revealed a complete cutoff at the L-4,5 [sic] level bilateral.

Claimant's exhibt 20 is a letter report of Dr. Naden to Roger L. Ferris of January 20, 1983. The letter states:

> It is my feeling that Mr. Carroll's back problems that began in January of 1981 and culminated into the surgery that I did in February of 1982 was a new injury and not associated with his October 20, 1978 problem.
>
> Also, I feel that the surgery that I performed on him on the 22nd of February, 1982 was not related to his 1978 injury.

Claimant's exhibit 21 is a letter report of Naden to Thomas Reid of April 16, 1983 which states in relevant part:

> ...At the present time, I would appropriate a 20 per cent [sic] P.P.D. rating to the entire body of Mr. Carroll's functional disability status and would appropriate the insult of 50/50 to each incident associated with surgery. That is, I would appropriate a ten per cent P.P.D. rating to his October of 1978 affliction plus surgery and then another ten per cent [sic] P.P.D. rating to his whole body as a result of the more recent affliction culminating with surgery in February of 1982. The 20 per cent [sic] whole-body permanent physical impairment and loss of function to the whole body would be the result of again the surgical excision of two herniated discs without fusion, but with moderate pain and stiffness aggravated by heavy lifting and necessary modification of his activities.
> ...
>
> No one is going to be able to tell us when he developed his second herniation or disc problem. Certainly his work and activities prior to his surgery in February of 1982 were aggravating his

condition. I feel this culminated into a problem that necessitated surgery February of 1982.

Claimant's exhibit 22 is a letter report of W. J. Robt, M.D., to Liberty Mutual Insurance Company dated February 23, 1984. The report diagnoses claimant's problems as "post laminectomy residuals, minor" and states the following regarding his disability rating:

> I think he has an excellent result considering a two level involvement. I observe that he has a ten percent rating for his first laminectomy and residual from that of ten percent. I would consider the second one an additional five percent or a summary of 15 percent permanent impairment of function to the body as a whole as a result of the two level involvement.

Blahnik defendants' exhibit 1 is certain medical reports relative to claimant, all of which were included in claimant's exhibits. Blahnik defendants' exhibit 2 is an undated Blahnik Construction Company Employee Questionaire executed by claimant. Claimant has checked "no" in response to questions as to whether he ever received treatment for a back condition or back injury, as to whether he ever suffered aches or pains of the back, and as to whether he has ever received workers' compensation. Blahnik defendants' exhibit 3 is a statement executed by claimant which recites:

> I have read the Company's Employee Handbook and understand the personnel policy working rules, Safety and Health rules and regulations and emergency procedure rules and I promise to follow them while in the employe [sic] of this company.
>
> I also understand that in case I am injured, no matter how slight, while in the course of my work, I must report immediately to my supervisor.

Blahnik defendants' exhibit 4 is a Blahnik Construction Company Employee handbook. Claimant's objections to Blahnik defendants' exhibits 3 and 4 are overruled. Blahnik defendants' exhibit 5 is claimant's anwers to interrogatories propounded by Blahnik.

APPLICABLE LAW AND ANALYSIS

We shall first address claimant's claim against defendants Blahnik and Liberty Mutual.

Our first concern is whether claimant received an injury which arose out of and in the course of his employment.

Claimant has the burden of proving by a preponderance of the evidence that he received an injury on July 1981 which arose out of and in the course of his employment. McDowell v. Town of Clarksville, 241 N.W.2d 904 (Iowa 1976); Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

An employee is entitled to compensation for any and all personal injuries which arise out of and in the course of the employment. Section 85.3(1).

The injury must both arise out of and be in the course of the employment. Crowe v. DeSoto Consol. Sch. Dist., 246 Iowa 402, 68 N.W.2d 63 (1955) and cases cited at pp. 405-406 of the Iowa Report. See also Sister Mary Benedict v. St. Mary's Corp., 255 Iowa 847, 124 N.W.2d 548 (1963) and Hansen v. State of Iowa, 249 Iowa 1147, 91 N.W.2d 555 (1958).

The words "out of" refer to the cause or source of the injury. Crowe v. DeSoto Consol. Sch. Dist., 246 Iowa 402, 68 N.W.2d 63 (1955).

The words "in the course of" refer to the time and place and circumstances of the injury. McClure v. Union et al. Counties, 188 N.W.2d 283 (Iowa 1971); Crowe v. DeSoto Consol. Sch. Dist., 246 Iowa 402, 68 N.W.2d 63 (1955).

"An injury occurs in the course of the employment when it is within the period of employment at a place the employee may reasonably be, and while he is doing his work or something incidental to it." Cedar Rapids Comm. Sch. Dist. v. Cady, 278 N.W.2d 298 (Iowa 1979), McClure v. Union et al. Counties, 188 N.W.2d 283 (Iowa 1971), Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

The supreme court of Iowa in Almquist v. Shenandoah Nurseries, 218 Iowa 724, 731-32, 254 N.W. 35, 38 (1934), discussed the definition of personal injury in workers' compensation cases as follows:

> While a personal injury does not include an occupational disease under the Workmen's Compensation Act, yet an injury to the health may be a personal injury. [Citations omitted.] Likewise a personal injury includes a disease resulting from an injury....The result of changes in the human body incident to the general processes of nature do not amount to a personal injury. This must follow, even though such natural change may come about because the life has been devoted to labor and hard work. Such result of those natural changes does not constitute a personal injury even though the same brings about impairment of health or the total or partial incapacity of the functions of the human body.
>
> ....
>
> A personal injury, contemplated by the Workmen's Compensation Law, obviously means an injury to the body, the impairment of health, or a disease, not excluded by the act, which comes about, not through the natural building up and tearing down of the human body, but because of a traumatic or other hurt or damage to the health or body of an employee. [Citations omitted.] The injury to the human body here contemplated must be something, whether an accident or not, that acts extraneously to the natural processes of nature, and thereby impairs the health, overcomes, injures, interrupts, or destroys some function of the body, or otherwise damages or injures a part or all of the body.

Claimant apparently relies on his activity of lifting sheeting while working for Blahnik in 1981 as the source of his present difficulties. If claimant's problems did arise from this activity, he certainly would have an injury arising out of and in the course of his employment. Unfortunately, serious questions remain unresolved in regard to this matter. Claimant reports he first experienced leg pain on the 1981 July 4th weekend. He first missed work for his 1981 related problem on the first or day following the July 4th holiday. Claimant called Blahnik and reported he would not be at work. Defendants' witness testified claimant spoke with her when reporting his work absence. She recalled that he stated he had injured his back mowing the lawn. This witness appeared credible and, while certainly not wholly disinterested, had no apparent reason to volunteer a fabricated account of the phone incident to claimant's employer. Even if her account is rejected, however, claimant, himself, admits he did not tell his employer that his pain resulted from his work. Claimant knew company policy mandated that he report work injuries. Claimant had had a prior back problem for which he had received workers' compensation. He is an intelligent, well-spoken, apparently socially aware young man. These facts suggest claimant would have possessed the presence of mind to report his back problems were work related had a work incident occurred. Thus, the fact that claimant did not report an injury is most disconcerning and leaves serious doubts as to whether his problem arose out of and in the course of his employment.

It is granted that claimant perhaps feared that reporting a work-related condition to his employer would jeopardize his job security. Such would be understandable in one with previous back problems whose livelihood depends on the physical integrity of his body. The medical histories recorded regarding claimant's 1981 and 1982 treatment for back pain are also troubling, however. No history recites any work incident nor even makes reference to claimant's work activities in describing his condition or its onset. It is more than likely that claimant's examining physicians questioned him regarding the onset of his difficulties. Any work incident producing pain or any aggravation of preexisting pain by work activity described by claimant would certainly have been recorded. Such recordations are wholly lacking. Further, Dr. Naden, on one occasion states he is "not just exactly sure if this is work incurred" and on another occasion states: "No one is going to be able to tell us when he developed his second [1981-1982] herniation or disc problem." Claimant had no reason not to describe a work incident or the fact that his work activities produced his pain. The absence of such descriptions and Dr. Naden's uncertainty as to whether claimant's problems are work incurred, brace claimant's own failure to report his problems as work related and defendants' witness' account of a lawn mowing incident as the source of claimant's initially reported pain in creating obstacles for claimant in his task of establishing that his problems have originated in his employment. For the above cited reasons, claimant fails to preponderate on this threshold issue and his claim fails.

It is noted that even had claimant established an injury which arose out of and in the course of his employment, the insufficiency of the medical histories recorded would also seriously handicap claimant's case as to the issue of whether his current disabilities are causally related to a work injury of 1981.

The claimant has the burden of proving by a preponderance of the evidence that the injury of 1981 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa

516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

While a claimant is not entitled to compensation for the results of a preexisting injury or disease, the mere existence at the time of a subsequent injury is not a defense. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756, 760-761 (1956). If the claimant had a preexisting condition or disability chat is aggravated, accelerated, worsened or lighted up so that it results in disability, claimant is entitled to recover. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812, 815 (1962).

As noted above, the histories recited do not establish that claimant's problems result from his work. Dr. Naden opines that it cannot be established that claimant's second herniation was work incurred. Evidence of the work related nature of injury itself is necessary to establish the requisite causal connection to claimant's current disabilities. This is lacking. We grant that Dr. Naden volunteered that claimant's work activities prior to his February 1982 surgery were aggravating his condition. Certainly, the heavy work claimant continued to perform did not alleviate his symptoms and may well have elevated them. But that in itself cannot show the causal connection required under the law. Claimant has neither demonstrated a preexisting condition nor that such condition was lit up by his work activity.

We shall now address claimant's claim against Spencers and Illinois National. Claimant first seeks to establish a causal connection between his current disabilites and his verified October 20, 1978 work incident with Spencers. As noted above, the claimant has the burden of proving by a preponderance of the evidence that the injury of October 20, 1978 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

Furthermore, when a worker sustains an injury, and later sustains another injury, and subsequently seeks to reopen an award predicated on the first injury, he or she must prove one of two things: (1) that the disability for which he or she seeks additional compensation was proximately caused by the first injury, or (2) that the second injury (and ensuing disability) was proximately caused by the first injury. DeShaw v. Energy Manufacturing Company, 192 N.W.2d 777, 780 (Iowa 1971).

Claimant has failed to show either of the above. Claimant's current problems apparently originate fom his 1981 disc herniation and resultant surgery. The medical evidence presented does not suggest they grew from claimant's 1978 injury. Indeed, the medicals suggest claimant had made a most satisfactory recovery from his 1978 injury and functioned quite well until his new herniation in approximately July 1981. Thus, claimant cannot establish that his current disability was proximately caused by his 1978 injury.

Claimant also cannot demonstrate that the second injury was proximately caused by the first injury. The medical evidence belies such a showing. Dr. Naden, claimant's treating physician, expressly states the 1981 herniated disc was a new condition not related to either claimant's previous back condition or to his 1978 injury. Nothing in the expert testimony offered or otherwise refutes this conclusion. Claimant's case against Spencers Inc., therefore, fails.

FINDINGS OF FACT

WHEREFORE, it is found:

Claimant sustained an injury to his back October 20, 1978 arising out of and in the course of his employment as a steelworker with defendant, Spencers Inc.

This injury cummulated in physical findings of a herniated disc at L-5, S-1 and surgery in 1979 from which claimant apparently made a satisfactory improvement.

Claimant began to experience severe back pain in June or July 1981.

This condition cummulated in physical findings of a bilateral herniated disc at the L4-L5 level and surgery in February 1982.

Dr. Naden opines claimant's 1981 condition did not result from his 1978 injury. Dr. Naden was claimant's treating physician.

Claimant's 1981 condition was not proximately caused by his 1978 injury.

Claimant's 1981 condition developed during the time in which he was employed as a steelworker by defendant Blahnik.

Claimant's first work absence for his condition occurred on the first work day following the July 4, 1981 holiday.

Claimant did not report his condition as a work injury.

Claimant was aware that company rules required him to report all work injuries.

Claimant had a previous work-related back condition for which he received workers' compensation benefits.

Claimant is intelligent and apparently socially aware.

Claimant's medical histories of his 1981 condition describe neither a work incident which produced claimant's condition nor onset of pain with work activities.

Claimant's 1981 back condition did not arise out of and in the course of his employment with defendant, Blahnik.

CONCLUSIONS OF LAW

THEREFORE, it is concluded:

Claimant has not established that his current disability is causally related to his October 20, 1978 work injury while employed for defendant, Spencers.

Claimant has not established that his back condition which had its onset in June or July 1981 arose out of and in the course of his employment with defendant, Blahnik.

ORDER

THEREFORE, it is ordered:

Claimant take nothing further from his proceedings against defendant, Spencers.

Claimant take nothing from his proceedings against defendant, Blahnik.

Defendants Spencers and Blahnik pay the costs of these proceedings apportioning such costs equally between them.

Signed and filed this 27th day of August, 1984.

HELEN JEAN WALLESER
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

TERRY CHURCH, Claimant, vs. FORT DODGE ROOFING CO., Employer, and AETNA INSURANCE CO., Insurance Carrier, and SECOND INJURY FUND, Defendants.	FILE NO. 642717 R E V I E W - R E O P E N I N G D E C I S I O N FILED AUG 16 1984 IOWA INDUSTRIAL COMMISSIONER

This is a proceeding in review-reopening brought by Terry Church, the claimant, against Fort Dodge Roofing Company, the employer, Aetna Insurance Company, the insurance carrier, and the Second Injury Fund, defendants, to recover benefits under the Iowa Workers' Compensation Act arising from an industrial injury which occurred on July 23, 1980. This matter was heard in Sioux City, Iowa on December 7, 1983 and considered as fully submitted at the conclusion of the hearing.

The record consists of the oral testimony of the claimant, defendants' exhibit 1 consisting of various medical reports, the discovery deposition of claimant and the evidentiary deposition of John J. Dougherty, M.D. Through filings by the insurance carrier, payment to claimant of 127 weeks of healing period benefits and payment of 47 weeks of permanent partial disability benefits have been made. The parties stipulated at hearing that permanent partial disability benefits would be paid to claimant in the total amount of 52 4/7 weeks based on a 35 percent functional disability to claimant's right foot. The parties further stipulated to a weekly rate of $197.10.

There are two issues in this case: whether claimant is entitled to additional permanent partial disability; and whether claimant is entitled to second injury fund benefits.

There is sufficient credible evidence in this record to support the following statement of facts:

Claimant, age 35, is single with no dependents. He completed his formal education through the eighth grade and subsequently received a GED. Claimant has held a variety of jobs in general labor classifications prior to his employment with Fort Dodge Roofing Company including working at meat packing plants, manufacturing and foundry plants and with other roofing companies. Claimant received only on-the-job training in these jobs.

Sometime in 1973 or 1974, claimant was involved in a motor vehicle accident while riding a motorcycle. Claimant sustained a non-industrial injury to his left leg. K. M. Keane, M.D., an orthopedic surgeon, treated claimant for his injuries. In a report dated April 5, 1983, Dr. Keane stated:

> ...he had a comminuted fracture of the tibia with multiple severe abrasions over the leg. The traumatized skin had become necrotic and it was necessary to debride it and do a skin graft. He was treated in a cast for several months until the fracture had healed.....

When released from treatment by Dr. Keane, claimant ultimately went to work as a meat cutter. He then began work as a roofer with another company. For a short period he worked as a beef skinner before being employed by Fort Dodge Roofing Company.

Each of the positions claimant held subsequent to his motorcycle accident, involved standing while working for an average of eight hours per day. According to claimant he experienced pain in his left ankle and leg while working for an average of eight hours per day. According to claimant he experienced pain in his left ankle and leg while working. He favored his left leg by placing more weight and stress on his right leg and foot. During this time claimant found his left leg would get sore and ache if he used it too long.

On July 23, 1980 claimant was working as a roofer for Fort Dodge Roofing Company on a project in Oelwein, Iowa. While loading up materials at the end of the work day, claimant fell 20 to 30 feet from the roof on which he had been working. Claimant landed on both feet.

Claimant was taken to the emergency room at the Oelwein Hospital. R. S. Jaggard, M.D., treated him for an "apparent fracture metatarsals, right foot," and referred him for further treatment in Fort Dodge. (Jaggard Report 8/27/80) In Fort Dodge Paul. L. Stitt, M.D., found "severely comminuted fractures involving the forefoot of the right leg." (Stitt Report 7-26-80) He performed surgery. Due to lack of improvement in claimant's condition, Dr. Stitt referred him for further treatment to K. M. Keane, M.D., in Sioux City.

Dr. Keane admitted claimant to the hospital "with severe comminution involving the navicular cuneiforms, bases of the metatarsals and involvement of all the adjacent joints with collapse of the mid foot." (Marian Health Center, Discharge Summary Sheet 7/31/80) Dr. Keane performed further surgery on July 28, 1980.

On December 22, 1980, Dr. Keane released claimant for light work. Claimant attempted to return to work, but quit due to pain from standing.

Dr. Keane readmitted claimant to the hospital for surgery on March 24, 1981. Dr. Keane found "deformity secondary to severe multiple fracture dislocations mid tarsal and tarsal-metatarsal joints." (Marian Health Center, Discharge Summary Sheet 3/29/81) During this hospitalization, Dr. Keane removed a "large bony prominence from the dorsum of the foot...." Subsequent to surgery, claimant continued to have pain in his foot and instability in his foot and leg when walking or standing.

On November 17, 1981, Dr. Keane readmitted claimant for further surgery due to "Post-traumatic arthritis at the tarsometatarsal joints and retained fragments of fractured cuneiforms." (Marian Health Center, Surgical Report 11/18/81) On January 7, 1983 Dr. Keane released claimant "to work doing whatever he is able to do." (Keane Notes 1/7/83).

During his period of recuperation and treatment claimant's employer, Fort Dodge Roofing Company, went out of business. Upon his release, claimant has sought other employment, but without success. Since his release from Dr. Keane's treatment, claimant continues to experience pain in his right leg and instability while using it. Additionally, claimant no longer uses his right leg to support his injured left leg. Claimant experiences an aching pain in the area of his left ankle and swelling in the same area after walking or standing.

Claimant's treating physician, Dr. Keane, finds in regard to claimant's left leg a "5% permanent disability" (Keane's Notes 4/5/83) To claimant's right leg Dr. Keane finds functional disability of 30 percent and "occupational disability, for heavy work and agility for working on uneven surfaces and returning to the occupation of a roofer, to be even higher than that." (Keane Letter 6/10/83).

Defendants' examining physician, John J. Dougherty, M.D., an orthopedic surgeon, ascribes no permanent disability to claimant's left leg. He further concludes claimant's injuries from the accident of July 23, 1980 are restricted to his foot. He rates the functional disability of claimant's right foot at 35 percent.

Based on the record as a whole and as the treating physician, Dr. Keane's medical evidence is more persuasive. In regard to the left leg, Dr. Dougherty does not totally deny abnormalities. His testimony is to that extent consistent with Dr. Keane's. Further, the claimant's testimony that he began experiencing severe problems with the left leg only after he suffered the injury to his right leg in July, 1980 is undisputed. Since the record discloses no evidence of injury or treatment to his left leg after his fall in July, 1980, claimant's difficulties with his left leg most likely resulted from residual problems as opined by Dr. Keane. Dr. Keane's testimony, as treating physician, is most persuasive and is given the greater weight.

In regard to claimant's right leg, Dr. Keane's testimony places claimant's injury and disabilities at the astragalo-navicular and calcaneal-cuboid joint and at the tarsal-metatarsal joints. His testimony places the injury into the ankle and lower extremity of claimant. Dr. Dougherty also finds restricted motion of the subtalar joint. Dr. Keane's assessment is most persuasive, particularly in view of claimant's undisputed and credible testimony regarding his instability in standing and walking.

Based on the medical evidence as a whole, claimant sustained a 5 percent permanent partial disability to his left leg as a result of his motorcycle mishap in 1973. See Simbro v. Delong's Sportswear, 332 N.W.2d 886, 889 (Iowa 1983). Further, claimant has sustained a 30 percent permanent partial disability to his right leg as a result of the industrial accident of July 23, 1980.

Based upon the record as a whole, and particularly on claimant's undisputed testimony regarding his age, education, work history and earning capacity and his inability to return to his former employment, to obtain work or rehabilitation since the July 23, 1980 injury, claimant has sustained industrial disability of 65 percent. McSpadden v. Big Ben Coal Co., 288 N.W.2d 181, 192 (Iowa 1980). The record unequivocally establishes claimant was experiencing problems with his injury to his left leg prior to the industrial injury of July 23, 1980. Further, the record establishes claimant was employed throughout the time between the two injuries. On the basis of the record, 30 percent of claimant's industrial disability was caused by his second injury of July 23, 1980 and 5 percent caused by his earlier injury to his left leg. Second Injury Fund v. Mich. Coal Co., 274 N.W.2d 300, 303-04 (Iowa 1979).

WHEREFORE, after having seen and heard the witness in open hearing and after taking into account all of the credible evidence contained in the record, the following findings of fact are made:

1. That this agency has jurisdiction of the parties and of the subject matter.

2. That claimant sustained a non-compensable injury to his left leg in 1973 or 1974 in a motorcycle accident.

3. That as a result of the motorcycle accident, claimant sustained a 5 percent functional impairment to his left leg.

4. That subsequent to the injury to his left leg and up to July 23, 1980, claimant engaged in gainful employment in various general labor classifications with various employers and suffered intermittent pain in his left leg.

5. On July 23, 1980, while in the employment of and in the course of performing his duties for defendant employer, claimant fell from the roof of a building and sustained injuries to his right foot and ankle.

6. That as a result of the incident on July 23, 1980, claimant sustained a 30 percent functional impairment to his right leg.

7. That claimant is 35 years old with formal education through the eighth grade, has received a GED and has received no other training.

8. That claimant has worked only as a laborer, has been unable to return to his former employment and has been unable to obtain other permanent employment or rehabilitation, since his release from medical care on January 10, 1983.

9. That claimant has sustained an industrial disability of 65 percent.

10. That 30 percent of claimant's industrial disability was caused by his accident of July 23, 1980 and the injuries to his right leg and 5 percent was caused by the earlier injury to his left leg.

11. That claimant's weekly rate of benefits is $197.10.

12. That defendants, employer and insurance carrier, have paid to claimant 127 weeks of healing period benefits.

THEREFORE, IT IS ORDERED that defendants, beginning on February 10, 1983, shall pay to claimant permanent partial disability benefits for a total period of sixty-six (66) weeks at the weekly rate of one hundred ninety-seven and 10/100 dollars ($197.10). Defendants shall be given credit for prior payments. Defendants shall pay all accrued amounts owing in a

lump sum with accrued interest from the date due.

IT IS FURTHER ORDERED that defendant, Second Injury Fund, beginning on April 23, 1984, shall pay to claimant permanent partial disability benefits for a period of one hundred sixty-four (164) weeks at the weekly rate of one hundred ninety-seven and 10/100 dollars ($197.10) until paid. Defendant shall pay all accrued amounts owing in a lump sum with accrued interest from the date due.

Costs, as contemplated by Industrial Commissioner's Rule 500-4.33, are charged to both defendants equally who are also ordered to file a final report when due.

Signed and filed this 16 day of August, 1984.

Claimant,
vs.
IOWA VETERANS HOME,
Employer,
and
STATE OF IOWA,
Insurance Carrier,
Defendants.

File No. 715107
ARBITRATION
DECISION

FILED
SEP 27 1984
IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in arbitration brought by Ericka E. Clemens, claimant, against Iowa Veterans Home, employer, and the State of Iowa, defendants, to recover additional benefits under the Iowa Workers' Compensation Act for an alleged injury of April 21, 1981. It came on for hearing on June 5, 1984 at the office of the Iowa Industrial Commissioner in Des Moines, Iowa. It was considered fully submitted with the submission of a bill from Dr. Walker on June 28, 1984.

The industrial commissioner's file contains no filings.

At the time of hearing the parties stipulated to a rate in the event of an award of $112.18 and to the fairness of the medical expenses.

The record in this matter consists of the testimony of claimant, John Franklin Clemens and Max Norris Diggins; claimant's exhibit 1, a series of leave of absence slips; claimant's exhibit 2, a series of medical bills; claimant's exhibit 3, a performance evaluation sheet; claimant's exhibit 4, a series of reports from John R. Walker, M.D.; defendants' exhibit A, a series of medical reports; defendants' exhibit B, reports from P. L. Collins, D.C.; defendants' exhibit C, a series of medical records; defendants' exhibit D, a letter from Scott B. Neff, D.O.; and defendants' exhibit E, a series of medical reports.

ISSUES

The issues in this matter are whether or not claimant's injury arose out of and in the course of her employment; whether or not there is a causal relationship between claimant's injury and any disability she now suffers; whether or not claimant is entitled to healing period or permanent partial disability benefits; whether or not claimant is entitled to expenses under Iowa Code section 85.27. Defendants have raised the affirmative defense of notice.

STATEMENT OF THE CASE

Forty-six year old married claimant, mother of three children, graduated from high school in Germany, had no other formal education other than an eight hour class offered by her employer. Her work experience in Germany involved working in a flower shop where she cared for and sold plants and made flower arrangements. Her first work in this country was as a waitress in a bowling alley where she also acted as a short order cook, clerk, bartender and cleanup person with wages of $2.25 per hour. For three years she worked in a flower shop selling plants, making arrangements and cleaning the shop once a week. She earned $3.00 per hour.

Her work for defendant employer started in April of 1978 when she was hired to do housekeeping work. She listed her tasks as mopping floors first with a chemical and then with a wet mop, sanitizing various areas, dusting, emptying and relining trash cans, caring for furniture, moving furniture, hand scrubbing stained areas, polishing chrome, cleaning mirrors, scrubbing sinks and toilets, and replenishing paper and supplies. Many of her jobs were done on a daily basis. Her responsibility included sixteen rooms and baths, halls, a stairway, two public areas, nurse's station, nurse's office, a treatment room, a utility room, an elevator lobby and another room.

Claimant recalled the circumstances of her injury in May of 1980 as follows: She was working in an elevator lobby. She was lifting a garbage can weighing perhaps 23 pounds. She had a pulling sensation in her left shoulder. She continued to work by modifying her job. Her pain worsened. She reported to her supervisor. Pain went into her arm and she had tingling in her fingers. The next day she saw a chiropractor, Dr. Collins, who gave her ultrasound treatments and adjusted her neck. She saw him two to three times a week. He advised her to take time off from work which she did.

When she went back to work, pain in her shoulder was still present. There was tingling pain and numbness in her hands. She had trouble with her grip strength and dropped things. She tried to modify her work.

She visited her family physician, Dr. Sullivan, who gave her muscle relaxants. She stayed off work and had some relief from her pain. Dr. Sullivan referred her to Dr. Hughes who gave her Naprosyn and Motrin and kept her off work. Dr. Hughes in turn sent her to Dr. Grundberg who gave her a Cortisone shot which temporarily relieved her condition and also sent her to Mayo Clinic.

Claimant testified to an injury on April 21, 1981: She got "pretty sick." Her shoulder was acting up. The first time she experienced pain in her low back and legs. She was bothered by both mopping and doing her other work. She told her supervisor she was having back pain. Sick leave was requested.

In September she went to the Mayo Clinic where she was x-rayed and had dye injected into her shoulder. Doctors there were unable to help her.

She returned to Dr. Hughes who also was unable to help her. She went to Dr. Kitchell who did a nerve test of her shoulder which was negative. She then saw Dr. Johnson who treated her condition with heat.

Claimant denied any other injury in close proximity to either incident to which she testified, but she reported a fall hurting her tailbone some years before.

She acknowledged a rearend car accident in December of 1982. She saw Drs. Sullivan and Walker and was x-rayed. Her only treatment was aspirin. She said that her neck was stiff for a week or so. A second incident occurred in November of 1983 and resulted in a broken elbow which was surgically treated. She also had a bump on her head. She received no disability payments as a result of either accident.

In January of 1982 she changed to another work area because she thought her job might be easier. She continued to do both dry and wet mopping. She cleaned a wheelchair ramp, the recreation room, an elevator lobby, entryways and exits, and two executive rooms where doctors spent the night. She vacuumed, sanitized and dusted. Periodically, she cleaned a dining room. In the wintertime she shoveled snow.

In 1982 she was hospitalized by Dr. Walker and treated with traction, physical therapy, vitamin shots, whirlpool, heat and medication.

In June of 1982 she went on an unpaid leave status because she was sick and not able to do her tasks. Her shoulder acted up. She had trouble walking and she had numbness and tingling in her buttocks and legs. Claimant stated that the leave requests she offered into evidence were submitted because of the conditions for which she now makes claim. Because she always

was told to see the doctor each time she was off work and because she was afraid of losing her job, she gave other excuses for being off work. When she was asked about being off with a stomachache, she said that when she got really sick she became nauseated. There was some decrease in her stomach symptoms after her gallbladder surgery.

In June of 1983 her condition was bad and she was hospitalized for physical therapy, a CT scan and a myelogram which were negative. She also had gallbladder surgery.

Her employment was terminated on July 20, 1983.

Claimant asserted that she continues to have pain which is sometimes like needles and sometimes like ants crawling on a daily basis, some days worse than others. The pain is located in her neck, both shoulders, chest, ribs, groin, hips, legs, knees and feet. She occasionally has headaches. She has found no long term relief from the pain which did not change very much after she quit work. She has pain when she lies down and has difficulty getting settled at night.

She estimated that on a good day she could sit for an hour. She can stand for a half hour. She has been able to increase her walking from one block to a half mile with rest. She does exercises to limber up her spine and to strengthen her muscles. She uses a whirlpool. She lies down during the day. Her spouse takes care of most household duties, but she is able to put things in the microwave.

Claimant claimed that she has more bad days than good days and even on good days she could not work. She said that she is interested in going back to work. When she was asked how she felt about sitting at home, she responded: "In plain English, I hate it."

On cross-examination, claimant acknowledged that there was nothing different about April 21, 1981. She did not work that day. She filled out her request for leave on April 22, 1981.

Claimant reported that no surgery has been recommended for her.

Forty-eight year old John Franklin Clemens, claimant's spouse, testified that the two used to dance, go to movies, bowl, fish and hike. Now claimant is unable to do much of anything although he has observed some improvement since the first of this year.

The witness described changes in the company for which he worked which led to his taking a voluntary layoff so he could stay home to help take care of claimant and to assist her with her exercises. He reported that because claimant laid around too much and used a wheelchair, her condition deteriorated.

He commented on claimant's problems which he said were trouble holding concentration because of pain, fogginess from medication, loss of grip, difficulty staying at such things as letter writing and inability to bend. He said that claimant becomes melancholy and both of them cry. A waterbed has been of some assistance to claimant, but she moans and groans at night.

Sixty year old Max Norris Diggins, who first worked for defendant employer as a custodial leader, testified that he was moved to supervisor over twenty-three other employees in January of 1981. Claimant worked under his direct supervision until 1982. He described claimant's duties essentially as she had done.

Diggins had no recollection of April 21, 1981. He said that he knew claimant was having medical problems which he said he thought were related to her lifting the waste can. He recalled that off and on she would mention pain in her shoulder and back. He was not cognizant of a change in her complaints.

He outlined the procedure for securing a leave of absence: The employee calls in the morning. Note is made. The employee is asked what is wrong. When the employee returns to work a leave request is filled out. Accident reports are completed at the time of the accident. No accident report was filled out for an April injury. The witness denied knowledge of any complaints in other areas of the body other than those on exhibit 1.

Diggins characterized claimant as "top notch," "a very good worker," and "sincere" about her job.

Daniel J. Sullivan, M.D., treated claimant on May 19, 1980 for a muscle strain of the chest and arms.

She was next seen on July 10, 1980 with complaints of left arm pain. She was given a slip for light duty and a muscle relaxant. On July 21, 1980 claimant was given a return to work slip.

On October 30, 1981 Dr. Sullivan recommended claimant take two weeks off and thereafter he assigned her to work which would not aggravate her chronic shoulder problems.

P. L. Collins, D.C., treated claimant for a sprain of the left deltoid tendon. In a note dated June 3, 1980 Dr. Collins advised that claimant should not lift over twenty pounds nor lift things over her head. Claimant was treated with a series of chiropractic manipulations. Claimant was seen on several occasions in 1981 for left shoulder bursitis. On May 21, 1982 claimant had restricted motion in her left shoulder and moderate restriction in her left ilium.

John W. Hughes, M.D., examined claimant on August 1, 1980. At that time she complained of problems with her left arm. Shoulder motion was within normal limits. There was tenderness about the lateral epicondyle of the elbow. Stress of the extensors increased pain. Grip was satisfactory. Sensation was intact. Peripheral pulses were normal. The doctor's diagnosis was lateral epicondylitis. He advised claimant to take Clinoril. He expected her to be able to return to work in a week's time.

When claimant was seen on January 13, 1981 she spoke of pain in her left shoulder, arm and hand. She was bothered by heavy mopping when a swinging vigorous motion was required. Dr. Hughes' working diagnosis was of biceps tendinitis and/or irritation of the rotator cuff.

Dr. Hughes next saw claimant on April 9, 1981 at which time she complained of her left shoulder and arm. The doctor thought the Phalen's test might be positive. There were minimal objective findings in spite of a postive history. An EMG was normal. Claimant was referred to Mayo Clinic in July.

In a letter dated October 21, 1981 Dr. Hughes was unable to make a definitive diagnosis, to outline a treatment plan or to place limitation relating to her job.

Arnis B. Grundberg, M.D., saw claimant on March 17, 1981 at which time claimant gave a history of lifting a garbage can. She complained of pain radiating into the lateral aspect of the arm and forearm and cramping in her fingers. She denied numbness and tingling. Shoulder abduction was the same on each side. Claimant's hand was tender. Dr. Grundberg's impression was bursitis of the left shoulder. Claimant's shoulder was injected with Cortisone.

James A. Rand, M.D., orthopedic surgeon of the Mayo Clinic, reported his examination of claimant in a letter dated September 25, 1981. He took a history of claimant's lifting a garbage can. On examination of the left shoulder, she forward flexed to 180°, abducted to 180°, externally rotated to 60° and internally rotated to T8 bilaterally. She had mild weakness of the external rotators on the left with some localized tenderness over the supraspinatus tendon on the left and a questionable palpable defect. X-rays were unremarkable except for mild degenerative change in the acromioclavicular joint. A shoulder arthrogram was negative. Dr. Rand suggested claimant modify her work to avoid activities exacerbating her shoulders. His diagnosis was periarthritis of the left shoulder.

Michael J. Kitchell, M.D., saw claimant, apparently on referral from Dr. Sullivan, on November 24, 1981 at which time she told of a pull in her left shoulder in May of 1980 followed by chronic left shoulder pain radiating through the scapula, left anterior chest and down the arm. Pain was maximal along the ulnar aspect of her upper arm and forearm and radiated toward the thumb and index fingers. She also complained of weakness of her grip and arms. She was using Motrin and aspirin.

On examination, range of motion in her neck was normal. Claimant complained of pain with passive movement of the left shoulder. Reflexes were 2+ throughout both arms. There were complaints of pain with some muscle testing, but no definite significant weakness in any muscle groups. There was possible minimal weakness of the opponens pollicis and abductor pollicis brevis. There was no definite diminution to pin prick although claimant felt there was a slight decline in sensation of the left thumb.

Nerve conduction studies and an EMG were normal.

Dr. Kitchell felt that claimant's pain was musculoskeletal and he could not come up with a definite etiology. He found no neurological impairment and his only suggestion was further orthopedic consultation. He anticipated claimant would be able to return to work.

In a letter dated April 2, 1983 Dr. Kitchell reported: "As to the cause of her complaints, I can only state what she has reported to me, that her discomfort was related to an episode at work in May of 1980. It is certainly possible that she caused some muscle strain with the incident."

In a report dated January 12, 1982 Dr. Kitchell responded "no" to the question, "Will the injury result in a permanent defect?" He concluded claimant was able to resume light work on November 25, 1981.

On November 2, 1981 O. Landis Johnson, D.O., reported treating claimant's shoulder in the preceding month. He found her to be suffering from a chronic shoulder condition (periarthritis).

John R. Walker, M.D., reported his findings on examination in a letter dated May 7, 1982. Claimant told him of the lifting incident. She complained of pain in both her shoulders which was worse on the left and which radiated into both rib cages bilaterally; tingling in her arms, shoulders and hands; pain over both hips; and left knee pain. Claimant had restriction on external rotation of her shoulder, and she had pain. There was no significant atrophy. Upper extremity reflexes were physiological except the left triceps which seemed a little hyperactive at 1++. Grip strength was 80 on the right and 60 on the left. There was no deficit in sensorium. Her neck was slightly tender. Claimant

was tender over both wings of the ilium and the anterior aspect of the ilium.

X-rays showed some instability between the bodies of C3 and C4. Views of the left and right shoulder were practically identical. Dr. Walker's opinion was that claimant had a chronic sprain of her shoulder with some loss of external rotation and that "the work that this patient is doing is causing a great deal of trouble on a chronic basis." He explained: "I don't think one injury alone is responsible for everything but I think what is happening is that she is mopping from side to side with a hand mop some seven hours a day and then wiping windows." He recommended claimant be transferred to a lighter job and stop mopping altogether.

Dr. Walker saw claimant in July with complaints of pain in her right anterior abdomen. Her neck was better, but she had problems in her left anterior lateral chest. Meprobamate was started. Claimant was to be off work until August 19, 1982.

On September 10, 1982 Dr. Walker wrote: "The problem that this patient has is that she is a very well-motivated patient and followed her orders to keep working. She was doing swabbing with a mop all day long, some eight hours a day in spite of the fact that she had pain and injuries. I feel that this has caused the great chronicity of her problems and is the reason why she is not getting along well." He noted claimant's having a high pain tolerance which allowed her to work with extreme pain.

When claimant was seen in 1983, she told the doctor that all her accident of December 1982 did was stiffen her neck. Her complaints were of tingling and aching in her neck; of slight headaches every two weeks; aching in her shoulder which was worse on the left; numbness and tingling in both arms, hands, fingers and palms; a sharp constant ache of the dorsal spine starting around T7 which radiated to the left lateral abdomen and into the thighs, low back ache into the rib area; burning, tingling and aching in both legs, feet and toes and abdominal pain into the pubic area.

On examination claimant had "fairly good grip" and tenderness throughout the cervical, lumbar and dorsal spine. Dr. Walker proposed hospitalization and decided to refer claimant to a psychiatrist.

Claimant was hospitalized on May 16, 1983. She had a cholecystectomy and cholangiogram. X-rays of the lumbar spine were negative; a CT scan of L3, L4 and L5 was negative. A cervical and lumbar myelogram was negative. Discharge diagnoses included lumbosacral sprain with sciatica, cervical spine sprain, chronic myofascial sprains of the posterior chest wall and chronic cholecylitis.

When claimant saw Dr. Walker on October 14, 1983 she acknowledged some relief from her stomach problems after her cholecystectomy. She still had intercostal neuralgia and lots of aches and pains. Dr. Walker thought claimant's permanent disability might be as high as 38 percent of the body as a whole based on her subjective complaints. He wrote in a letter dated November 30, 1983: "She is certainly better than she was but I think we have just about reached maximum benefit of treatment or hospitalization for her."

On December 6, 1983 Dr. Walker wrote that claimant was not able to be gainfully employed.

In a letter dated January 12, 1984 he wrote: "The onset of the injury of course did occur in May of 1980, but because she was persistently sent back to work to do this heavy work, her problems became enlarged, chronic and more severe."

Claimant was hospitalized on December 10, 1983 after a motor vehicle accident in which she suffered multiple contusions and abrasions, a closed head injury with a contusion of her upper right forehead, a fractured dislocation of the left elbow and a contusion hematoma of the right patella. X-rays showed a posterolateral fracture dislocation of the left elbow joint and a fracture of the capetellum. An open reduction and external fixation were performed.

Earl L. Keyser, M.D., reported his findings in a letter dated August 10, 1983. There was no loss of motion in the neck, the shoulders, elbows, forearms or wrists. Sensation was intact. Reflexes were equal. Straight leg raising was accomplished to 85 percent. RA latex and sedimentation tests were normal. Dr. Keyser was unable to substantiate left-sided weakness or decreased range of motion of the back, neck or legs on the left or any other orthopedic, neurological or circulatory defect. The doctor suspected a psychological overlay.

David L. Bethel, D.O., evaluated claimant on September 20, 1983 and diagnosed no specific psychiatric disorder. She demonstrated situational depression secondary to orthopedic difficulties. He found no indication claimant was "exaggerating, misleading or distorting" her physical complaints. Dr. Bethel found indication of orthopedic problems which would make it difficult for claimant to be gainfully employed.

Scott B. Neff, D.O., reported his findings in a letter dated May 7, 1984. He took a history of the lifting incident in 1980 and of a motor vehicle accident causing a neck and muscle injury in December of 1983. Claimant complained of pain in her back at the right and left posterior superior iliac spines with decreased range of motion. Deep tendon reflexes were normal and straight leg raising was negative. Cervical motion was normal. Dr. Neff assigned a five percent disability based on claimant's subjective complaints. He did not find her diffuse musculoskeletal complaints of any definite etiology. He wrote: "In my opinion, she has no disability with reference to her neck, shoulders or back."

Dr. Neff thought claimant able to return to work, but he thought she should be restricted from heavy lifting. He estimated her healing period would have been completed in six weeks.

APPLICABLE LAW AND ANALYSIS

The first issue to be determined is whether or not claimant's injury arose out of and in the course of his employment. In order to receive compensation for an injury, an employee must establish that the injury arose out of and in the course of employment. Both conditions must exist. Crowe v. DeSoto Consolidated School District, 246 Iowa 402, 68 N.W.2d 63 (1955).

In the course of relates to time, place and circumstances of the injury. An injury occurs in the course of the employment when it is within a period of employment at a place where the employee may be performing duties and while he is fulfilling those duties or engaged in doing something incidental thereto. McClure v. Union County, 188 N.W.2d 283, 286 (Iowa 1971).

In addition to establishing that an injury occurred in the course of employment, the claimant must also establish the injury arose out of employment. An injury "arises out of" the employment when a causal connection between the conditions under which the work was performed and the resulting injury followed as a natural incident of the work. Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

The source of the problem herein is whether claimant who had a prior injury of May 19, 1980 for which defendants have admitted liability had an additional injury on April 21, 1981.

In May of 1980 claimant had what was diagnosed as a muscle strain of the chest and arms and of the left deltoid tendon. Claimant continued to complain after that date of her left arm, shoulder and hand. Her last visit to the doctor before April 21, 1981 was on April 9, 1981 at which time she saw Dr. Hughes who advised her to continue working, but to avoid some of the heavier aspects of her job. She saw Dr. Collins that same day.

Claimant's difficulty on April 21, 1981, as she testified, was that her shoulder acted up and for the first time she had pain in her back and legs. Claimant took leave for the entire day on April 21. She claimed that she told her supervisor she was having back pain.

There is no evidence of claimant's seeking medical care until July 16, 1981 at which time she saw Dr. Hughes. She complained at that time of shoulder and arm pain. She was referred to Mayo Clinic where in September of 1981 she gave a history only of the May 1980 injury and of paresthesia to all four extremities. Dr. Kitchell was seen in November of 1981 and he recorded the May 1980 incident and left shoulder and arm pain.

More than a year after the injury alleged herein claimant saw Dr. Walker. Again the May 1980 incident was reported. Claimant at this time was complaining of both shoulders, her rib cage, her hips and her left knee. Dr. Collins saw claimant later in the month noting moderate restriction of the left ilium.

At the time of her auto accident in December of 1983, claimant gave a history of a back injury in 1982 which required hospitalization and traction.

Dr. Neff who saw claimant for evaluation took a history of lifting a can cover in May of 1980 which resulted in shoulder pain.

Claimant's burden is a preponderance of the evidence. There is little in the record to support either a specific injury to her back or a cumulative injury which became disabling in April of 1981. Claimant has failed to establish an injury arising out of and in the course of her employment.

In light of the conclusion that claimant has not established an injury arising out of and in the course of her employment, it is unnecessary to examine any additional issues.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant is 46 years of age.

That claimant began work for defendant employer in April of 1978.

That claimant's duties included mopping floors, sanitizing areas, dusting, removing trash, caring for furniture, moving furniture, hand scrubbing, polishing and replenishing supplies.

That claimant had responsibilities for caring for a number of rooms and other areas.

That in May of 1980 claimant injured her left shoulder and had pain into her arm and tingling in her fingers as she lifted a garbage can.

That the incident of May of 1980 was the only incident which claimant has reported to the doctors.

That claimant complained of paresthesia to all four extremities in September of 1981.

That claimant did not make significant complaints of her back until some substantial time after April 21, 1981.

CONCLUSION OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has failed to establish by a preponderance of the evidence an injury arising out of and in the course of her employment on April 21, 1981.

ORDER

THEREFORE, IT IS ORDERED:

That claimant take nothing from these proceedings.

That defendants pay costs pursuant to Industrial Commissioner Rule 500-4.33.

Signed and filed this 27 day of September, 1984.

INTRODUCTION

This is a proceeding in review-reopening brought by Erika E. Clemens, claimant, against Iowa Veterans Home, employer, and the State of Iowa, defendants, to recover additional benefits under the Iowa Workers' Compensation Act for an injury arising out of and in the course of her employment on May 19, 1980. It came on for hearing on June 5, 1984 at the office of the Iowa Industrial Commissioner in Des Moines, Iowa. It was considered fully submitted with the submisson of a bill from Dr. Walker on June 28, 1984.

The industrial commissioner's file shows a first report of injury received October 7, 1980. A memorandum of agreement was received on October 14, 1980. A Form 2 shows payment of four weeks and one day of weekly benefits as well as medical expenses.

At the time of hearing the parties stipulated to a rate of $112.18 and to the fairness of medical expenses.

The record in this matter consists of the testimony of claimant, John Franklin Clemens, and Max Norris Diggins; claimant's exhibit 1, a series of leave of absence slips; claimant's exhibit 2, a series of medical bills; claimant's exhibit 3, a performance evaluation sheet; claimant's exhibit 4, a series of reports from John R. Walker, M.D.; defendants' exhibit A, a series of medical reports; defendants' exhibit B, reports from P. L. Collins, D.C.; defendants' exhibit C, a series of medical records; defendants' exhibit D, a letter from Scott B. Neff, D.O.; and defendants' exhibit E, a series of medical records.

ISSUES

The issues in this matter are whether or not there is a causal relationship between claimant's injury and any disability she now may suffer; whether or not claimant is entitled to further healing period or permanent partial disability benefits; and whether or not claimant is entitled to benefits under Iowa Code section 85.27.

STATEMENT OF THE CASE

Forty-six year old married claimant, mother of three children, graduated from high school in Germany, had no other formal education other than an eight hour class offered by her employer. Her work experience in Germany involved working in a flower shop where she cared for and sold plants and made flower arrangements. Her first work in this country was as a waitress in a bowling alley where she also acted as a short order cook, clerk, bartender and cleanup person with wages of $2.25 per hour. For three years she worked in a flower shop selling plants, making arrangements and cleaning the shop once a week. She earned $3.00 per hour.

Her work for defendant employer started in April of 1978 when she was hired to do housekeeping work. She listed her tasks as mopping floors first with a chemical and then with a wet mop, sanitizing various areas, dusting, emptying and relining trash cans, caring for furniture, moving furniture, hand scrubbing stained areas, polishing chrome, cleaning mirrors, scrubbing sinks and toilets, and replenishing paper and supplies. Many of her jobs were done on a daily basis. Her responsibility included sixteen rooms and baths, halls, a stairway, two public areas, nurse's station, nurse's office, a treatment room, a utility room, an elevator lobby and another room.

Claimant recalled the circumstances of her injury in May of 1980 as follows: She was working in an elevator lobby. She was lifting a garbage can weighing perhaps 23 pounds. She had a pulling sensation in her left shoulder. She continued to work by modifying her job. Her pain worsened. She reported to her supervisor. Pain went into her arm and she had tingling in her fingers. The next day she saw a chiropractor, Dr. Collins, who gave her ultrasound treatments and adjusted her neck. She saw him two to three times a week. He advised her to take time off from work which she did.

When she went back to work, pain in her shoulder was still present. There was tingling pain and numbness in her hands. She had trouble with her grip strength and dropped things. She tried to modify her work.

She visited her family physician, Dr. Sullivan, who gave her muscle relaxants. She stayed off work and had some relief from her pain. Dr. Sullivan referred her to Dr. Hughes who gave her Naprosyn and Motrin and kept her off work. Dr. Hughes in turn sent her to Dr. Grundberg who gave her a Cortisone shot which temporarily relieved her condition and also sent her to Mayo Clinic.

Claimant testified to an injury on April 21, 1981: She got "pretty sick." Her shoulder was acting up. The first time she experienced pain in her low back and legs. She was bothered by both mopping and doing her other work. She told her supervisor she was having back pain. Sick leave was requested.

In September she went to the Mayo Clinic where she was x-rayed and had dye injected into her shoulder. Doctors there were unable to help her.

She returned to Dr. Hughes who also was unable to help her. She went to Dr. Kitchell who did a nerve test of her shoulder which was negative. She then saw Dr. Johnson who treated her condition with heat.

Claimant denied any other injury in close proximity to either incident to which she testified, but she reported a fall hurting her tailbone some years before.

She acknowledged a rearend car accident in December of 1982. She saw Drs. Sullivan and Walker and was x-rayed. Her only treatment was aspirin. She said that her neck was stiff for a week or so. A second incident occurred in November of 1983 and resulted in a broken elbow which was surgically treated. She also had a bump on her head. She received no disability payments as a result of either accident.

In January of 1982 she changed to another work area because she thought her job might be easier. She continued to do both dry and wet mopping. She cleaned a wheelchair ramp, the recreation room, an elevator lobby, entryways and exits, and two executive rooms where doctors spent the night. She vacuumed, sanitized and dusted. Periodically, she cleaned a dining room. In the wintertime she shoveled snow.

In 1982 she was hospitalized by Dr. Walker and treated with traction, physical therapy, vitamin shots, whirlpool, heat and medication.

In June of 1982 she went on an unpaid leave status because she was sick and not able to do her tasks. Her shoulder acted up. She had trouble walking and she had numbness and tingling in her buttocks and legs. Claimant stated that the leave requests she offered into evidence were submitted because of the

conditions for which she now makes claim. Because she always was told to see the doctor each time she was off work and because she was afraid of losing her job, she gave other excuses for being off work. When she was asked about being off with a stomachache, she said that when she got really sick she became nauseated. There was some decrease in her stomach symptoms after her gallbladder surgery.

In June of 1983 her condition was bad and she was hospitalized for physical therapy, a CT scan and a myelogram which were negative. She also had gallbladder surgery.

Her employment was terminated on July 20, 1983.

Claimant asserted that she continues to have pain which is sometimes like needles and sometimes like ants crawling on a daily basis, some days worse than others. The pain is located in her neck, both shoulders, chest, ribs, groin, hips, legs, knees and feet. She occasionally has headaches. She has found no long term relief from the pain which did not change very much after she quit work. She has pain when she lies down and has difficulty getting settled at night.

She estimated that on a good day she could sit for an hour. She can stand for a half hour. She has been able to increase her walking from one block to a half mile with rest. She does exercises to limber up her spine and to strengthen her muscles. She uses a whirlpool. She lies down during the day. Her spouse takes care of most household duties, but she is able to put things in the microwave.

Claimant claimed that she has more bad days than good days and even on good days she could not work. She said that she is interested in going back to work. When she was asked how she felt about sitting at home, she responded: "In plain English, I hate it."

On cross-examination, claimant acknowledged that there was nothing different about April 21, 1981. She did not work that day. She filled out her request for leave on April 22, 1981.

Claimant reported that no surgery has been recommended for her.

Forty-eight year old John Franklin Clemens, claimant's spouse, testified that the two used to dance, go to movies, bowl, fish and hike. Now claimant is unable to do much of anything although he has observed some improvement since the first of this year.

The witness described changes in the company for which he worked which led to his taking a voluntary layoff so he could stay home to help take care of claimant and to assist her with her exercises. He reported that because claimant laid around too much and used a wheelchair, her condition deteriorated.

He commented on claimant's problems which he said were trouble holding concentration because of pain, fogginess from medication, loss of grip, difficulty staying at such things as letter writing and inability to bend. He said that claimant becomes melancholy and both of them cry. A waterbed has been of some assistance to claimant, but she moans and groans at night.

Sixty year old Max Norris Diggins, who first worked for defendant employer as a custodial leader, testified that he was moved to supervisor over twenty-three other employees in January of 1981. Claimant worked under his direct supervision until 1982. He described claimant's duties essentially as she had done.

Diggins had no recollection of April 21, 1981. He said that he knew claimant was having medical problems which he said he thought were related to her lifting the waste can. He recalled that off and on she would mention pain in her shoulder and back. He was not cognizant of a change in her complaints.

He outlined the procedure for securing a leave of absence: The employee calls in the morning. Note is made. The employee is asked what is wrong. When the employee returns to work a leave request is filled out. Accident reports are completed at the time of the accident. No accident report was filled out for an April injury. The witness denied knowledge of any complaints in other areas of the body other than those on exhibit 1.

Diggins characterized claimant as "top notch," "a very good worker," and "sincere" about her job.

Daniel J. Sullivan, M.D., treated claimant on May 19, 1980 for a muscle strain of the chest and arms.

She was next seen on July 10, 1980 with complaints of left arm pain. She was given a slip for light duty and a muscle relaxant. On July 21, 1980 claimant was given a return to work slip.

On October 30, 1981 Dr. Sullivan recommended claimant take two weeks off and thereafter he assigned her to work which would not aggravate her chronic shoulder problems.

P. L. Collins, D.C., treated claimant for a sprain of the left deltoid tendon. In a note dated June 3, 1980 Dr. Collins advised that claimant should not lift over twenty pounds nor lift things over her head. Claimant was treated with a series of chiropractic manipulations. Claimant was seen on several occasions in 1981 for left shoulder bursitis. On May 21, 1982 claimant had restricted motion in her left shoulder and moderate restriction in her left ilium.

John W. Hughes, M.D., examined claimant on August 1, 1980. At that time she complained of problems with her left arm. Shoulder motion was within normal limits. There was tenderness about the lateral epicondyle of the elbow. Stress of the extensors increased pain. Grip was satisfactory. Sensation was intact. Peripheral pulses were normal. The doctor's diagnosis was lateral epicondylitis. He advised claimant to take Clinoril. He expected her to be able to return to work in a week's time.

When claimant was seen on January 13, 1981 she spoke of pain in her left shoulder, arm and hand. She was bothered by heavy mopping when a swinging vigorous motion was required. Dr. Hughes' working diagnosis was of biceps tendinitis and/or irritation of the rotator cuff.

Dr. Hughes next saw claimant on April 9, 1981 at which time she complained of her left shoulder and arm. The doctor thought the Phalen's test might be positive. There were minimal objective findings in spite of a postive history. An EMG was normal. Claimant was referred to Mayo Clinic in July.

In a letter dated October 21, 1981 Dr. Hughes was unable to make a definitive diagnosis, to outline a treatment plan or to place limitation relating to her job.

Arnis B. Grundberg, M.D., saw claimant on March 17, 1981 at which time claimant gave a history of lifting a garbage can. She complained of pain radiating into the lateral aspect of the arm and forearm and cramping in her fingers. She denied numbness and tingling. Shoulder abduction was the same on each side. Claimant's hand was tender. Dr. Grundberg's impression was bursitis of the left shoulder. Claimant's shoulder was injected with Cortisone.

James A. Rand, M.D., orthopedic surgeon of the Mayo Clinic, reported his examination of claimant in a letter dated September 25, 1981. He took a history of claimant's lifting a garbage can. On examination of the left shoulder, she forward flexed to 180°, abducted to 180°, externally rotated to 60° and internally rotated to T8 bilaterally. She had mild weakness of the external rotators on the left with some localized tenderness over the supraspinatus tendon on the left and a questionable palpable defect. X-rays were unremarkable except for mild degenerative change in the acromioclavicular joint. A shoulder arthrogram was negative. Dr. Rand suggested claimant modify her work to avoid activities exacerbating her shoulders. His diagnosis was periarthritis of the left shoulder.

Michael J. Kitchell, M.D., saw claimant, apparently on referral from Dr. Sullivan, on November 24, 1981 at which time she told of a pull in her left shoulder in May of 1980 followed by chronic left shoulder pain radiating through the scapula, left anterior chest and down the arm. Pain was maximal along the ulnar aspect of her upper arm and forearm and radiated toward the thumb and index fingers. She also complained of weakness of her grip and arms. She was using Motrin and aspirin.

On examination, range of motion in her neck was normal. Claimant complained of pain with passive movement of the left shoulder. Reflexes were 2+ throughout both arms. There were complaints of pain with some muscle testing, but no definite significant weakness in any muscle groups. There was possible minimal weakness of the opponens pollicis and abductor pollicis brevis. There was no definite diminution to pin prick although claimant felt there was a slight decline in sensation of the left thumb.

Nerve conduction studies and an EMG were normal.

Dr. Kitchell felt that claimant's pain was musculoskeletal and he could not come up with a definite etiology. He found no neurological impairment and his only suggestion was further orthopedic consultation. He anticipated claimant would be able to return to work.

In a letter dated April 2, 1983 Dr. Kitchell reported: "As to the cause of her complaints, I can only state what she has reported to me, that her discomfort was related to an episode at work in May of 1980. It is certainly possible that she caused some muscle strain with the incident."

In a report dated January 12, 1982 Dr. Kitchell responded "no" to the question, "Will the injury result in a permanent defect?" He concluded claimant was able to resume light work on November 25, 1981.

On November 2, 1981 O. Landis Johnson, D.O., reported treating claimant's shoulder in the preceding month. He found her to be suffering from a chronic shoulder condition (periarthritis).

John R. Walker, M.D., reported his findings on examination in a letter dated May 7, 1982. Claimant told him of the lifting incident. She complained of pain in both her shoulders which was worse on the left and which radiated into both rib cages bilaterally; tingling in her arms, shoulders and hands; pain over both hips; and left knee pain. Claimant had restriction on external rotation of her shoulder, and she had pain. There was no significant atrophy. Upper extremity reflexes were physiological except the left triceps which seemed a little hyperactive at 1++. Grip strength was 80 on the right and 60 on the left. There was

no deficit in sensorium. Her neck was slightly tender. Claimant was tender over both wings of the ilium and the anterior aspect of the ilium.

X-rays showed some instability between the bodies of C3 and C4. Views of the left and right shoulder were practically identical. Dr. Walker's opinion was that claimant had a chronic sprain of her shoulder with some loss of external rotation and that "the work that this patient is doing is causing a great deal of trouble on a chronic basis." He explained: "I don't think one injury alone is responsible for everything but I think what is happening is that she is mopping from side to side with a hand mop some seven hours a day and then wiping windows." He recommended claimant be transferred to a lighter job and stop mopping altogether.

Dr. Walker saw claimant in July with complaints of pain in her right anterior abdomen. Her neck was better, but she had problems in her left anterior lateral chest. Meprobamate was started. Claimant was to be off work until August 19, 1982.

On September 10, 1982 Dr. Walker wrote: "The problem that this patient has is that she is a very well-motivated patient and followed her orders to keep working. She was doing swabbing with a mop all day long, some eight hours a day in spite of the fact that she had pain and injuries. I feel that this has caused the great chronicity of her problems and is the reason why she is not getting along well." He noted claimant's having a high pain tolerance which allowed her to work with extreme pain.

When claimant was seen in 1983, she told the doctor that all her accident of December 1982 did was stiffen her neck. Her complaints were of tingling and aching in her neck; of slight headaches every two weeks; aching in her shoulder which was worse on the left; numbness and tingling in both arms, hands, fingers and palms; a sharp constant ache of the dorsal spine starting around T7 which radiated to the left lateral abdomen and into the thighs, low back ache into the rib area; burning, tingling and aching in both legs, feet and toes and abdominal pain into the pubic area.

On examination claimant had "fairly good grip" and tenderness throughout the cervical, lumbar and dorsal spine. Dr. Walker proposed hospitalization and decided to refer claimant to a psychiatrist.

Claimant was hospitalized on May 16, 1983. She had a cholecystectomy and cholangiogram. X-rays of the lumbar spine were negative; a CT scan of L3, L4 and L5 was negative. A cervical and lumbar myelogram was negative. Discharge diagnoses included lumbosacral sprain with sciatica, cervical spine sprain, chronic myofascial sprains of the posterior chest wall and chronic cholecylitis.

When claimant saw Dr. Walker on October 14, 1983 she acknowledged some relief from her stomach problems after her cholecystectomy. She still had intercostal neuralgia and lots of aches and pains. Dr. Walker thought claimant's permanent disability might be as high as 38 percent of the body as a whole based on her subjective complaints. He wrote in a letter dated November 30, 1983: "She is certainly better than she was but I think we have just about reached maximum benefit of treatment or hospitalization for her."

On December 6, 1983 Dr. Walker wrote that claimant was not able to be gainfully employed.

In a letter dated January 12, 1984 he wrote: "The onset of the injury of course did occur in May of 1980, but because she was persistently sent back to work to do this heavy work, her problems became enlarged, chronic and more severe."

Claimant was hospitalized on December 10, 1983 after a motor vehicle accident in which she suffered multiple contusions and abrasions, a closed head injury with a contusion of her upper right forehead, a fractured dislocation of the left elbow and a contusion hematoma of the right patella. X-rays showed a posterolateral fracture dislocation of the left elbow joint and a fracture of the capetellum. An open reduction and external fixation were performed.

Earl L. Keyser, M.D., reported his findings in a letter dated August 10, 1983. There was no loss of motion in the neck, the shoulders, elbows, forearms or wrists. Sensation was intact. Reflexes were equal. Straight leg raising was accomplished to 85 percent. RA latex and sedimentation tests were normal. Dr. Keyser was unable to substantiate left-sided weakness or decreased range of motion of the back, neck or legs on the left or any other orthopedic, neurological or circulatory defect. The doctor suspected a psychological overlay.

David L. Bethel, D.O., evaluated claimant on September 20, 1983 and diagnosed no specific psychiatric disorder. She demonstrated situational depression secondary to orthopedic difficulties. He found no indication claimant was "exaggerating, misleading or distorting" her physical complaints. Dr. Bethel found indication of orthopedic problems which would make it difficult for claimant to be gainfully employed.

Scott F Neff, D.O., reported his findings in a letter dated May 7, 1984. He took a history of the lifting incident in 1980 and of a motor vehicle accident causing a neck and muscle injury in December of 1983. Claimant complained of pain in her back at the right and left posterior superior iliac spines with decreased range of motion. Deep tendon reflexes were normal and straight leg raising was negative. Cervical motion was normal. Dr. Neff assigned a five percent disability based on claimant's subjective complaints. He did not find her diffuse musculoskeletal complaints of any definite etiology. He wrote: "In my opinion, she has no disability with reference to her neck, shoulders or back."

Dr. Neff thought claimant able to return to work, but he thought she should be restricted from heavy lifting. He estimated her healing period would have been completed in six weeks.

APPLICABLE LAW AND ANALYSIS

The claimant has the burden of proving by a preponderance of the evidence that the injury of May 19, 1980 is causally related to the disability on which she now bases her claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

Claimant testified that at the time of her injury she had a pulling sensation in her left shoulder, pain into her arm and tingling in her fingers.

Claimant was treated on May 19, 1980 by Dr. Sullivan for a muscle strain of the chest and arms. Dr. Collins examined claimant on May 23, 1980 and treated her for a sprain of her left deltoid tendon. He restricted claimant's lifting and placed her on two weeks of light duty. Dr. Hughes saw claimant on August 1, 1980, diagnosed lateral epicondylitis based on tenderness in the elbow area and anticipated claimant's return to work in a week. When claimant was seen on January 13, 1981, she continued to complain of tenderness over the lateral epicondylar area as well as her left shoulder, arm and hand. Claimant's diagnosis was changed to biceps tendinitis and/or irritation of the rotator cuff. Dr. Collins treated claimant for left shoulder bursitis. Dr. Grundberg diagnosed bursitis of the left shoulder. On April 9, 1981 claimant was advised by Dr. Hughes to continue her work, but to avoid some of the heavier portions.

Claimant alleges an additional injury on April 21, 1981. In a companion decision no injury was found at that time.

Dr. Rand examined claimant in September of 1981 and diagnosed periarthritis of the shoulder. About two months later, claimant was seen by Dr. Kitchell who found no neurological impairment and who believed claimant's complaints were musculoskeletal in origin. Dr. Johnson agreed with Dr. Rand's diagnosis of periarthritis.

When claimant saw Dr. Walker, apparently in May of 1982 and about a month prior to her taking a leave of absence from work, she had pain in both rib cages, both shoulders, both hips and her left knee. She had tingling in her shoulders, arms and hands.

Drs. Keyser and Bethel examined claimant in relation to her social security claim. Dr. Keyser was unable to substantiate an orthopedic, neurological or circulatory defect. Dr. Bethel found no specific psychiatric disorder, but he thought claimant demonstrated situational depression secondary to orthopedic problems.

Dr. Neff could not attribute claimant's complaints to any definite etiology.

Claimant's case is a perplexing and a close one on the issue of causation. Her condition worsened after her injury. Her complaints increased. Objective evidence of impairment is scant. Electromyography in April of 1981 was normal. X-rays in September of 1981 showed mild degenerative changes in the acromioclavicular joint. An arthrogram of the shoulder at the same time was normal. Nerve conduction studies and electromyography were normal in November of 1981. In May of 1983 claimant had negative x-rays and a CT scan of the lumbar spine and a negative lumbar and cervical myelogram. Rheumatoid arthritis, latex and sedimentation tests were normal in August of that year.

Dr. Kitchell expressed a possibility that claimant's work episode of 1980 caused a muscle strain. Dr. Walker believed that claimant's work was causing chronic trouble with her shoulder. He summed up his assessment of the case by saying: "The onset of the injury of course did occur in May of 1980, but because she was persistently sent back to work to do this heavy work, her problem became enlarged, chronic and more severe."

It is only dealing with the record as a whole which allows claimant to preponderate. That overview of the record makes Dr. Walker's theory of causation fit. Claimant was doing hard work in terms of lots of physical movement. Her duties required her to bend, twist, lift, reach and stretch. Claimant was characterized by Diggins as "top notch," "a very good worker," and "sincere" about her job. Doctors consistently suggested that claimant modify her work and she testified that she did do that to the extent possible. She continued to work following her May 19, 1980 injury making adjustments she could make and maintaining at least into May of 1982 her own high standards. Dr. Bethel who performed a psychiatric evaluation found no psychiatric impairment.

Claimant has established by a preponderance of the evidence a causal relationship between her injury and her present disability.

The next issue to be considered is claimant's entitlement to weekly benefits.

Dr. Sullivan purposed that claimant do work which would not aggravate her chronic shoulder problem. Dr. Rand made a similar suggestion, but he did not think claimant's injury would result in a permanent defect. Dr. Walker agreed that claimant's work should be adjusted.

Dr. Walker thought claimant's permanent disability might be as high as 38 percent. Dr. Neff gave claimant a five percent "disability" based on subjective muscle complaints. In light of all the negative testing in this matter, the undersigned does not feel that claimant's impairment is as high as 38 percent; however, claimant has some functional impairment and she has restriction on her work activity. Therefore, she has some permanent partial disability to her body as a whole. Claimant's symptoms initially were in her shoulder. Subsequently her symptoms have been more diffuse. Impairment of the shoulder is disability to the body as a whole. Alm v. Morris Barick Cattle Co., 240 Iowa 1174, 38 N.W.2d 161 (1949); Nazarenus v. Oscar Mayer & Co., II Iowa Industrial Commissioner Report 281 (Appeal Decision 1981); Godwin v. Hicklin G.M. Power, II Iowa Industrial Commissioner Report 170 (Appeal Decision 1981).

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

The industrial commissioner has stated on many occasions:

> Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 125 N.W.2d 251 (1963). Barton v. Nevada Poultry, 253 Iowa 285, 110 N.W.2d 660 (1961).
>
> A finding of impairment to the body as a whole found by a medical evaluator does not equate to industrial disability. This is so as impairment and disability are not identical terms. Degree of industrial disability can in fact be much different than the degree of impairment because in the first instance reference is to loss of earning capacity and in the later to anatomical or functional abnormality or loss. Although loss of function is to be considered and disability can rarely be found without it, it is not so that an industrial disability is proportionally related to a degree of impairment of bodily function.
>
> Factors considered in determining industrial disability include the employee's medical condition prior to the injury, after the injury, and present condition; the situs of the injury, its severity and the length of healing period; the work experience of the employee prior to the injury, after the injury and potential for rehabilitation; the employee's qualifications intellectually, emotionally and physically; earnings prior and subsequent to the injury; and age, education, motivation, and functional impairment as a result of the injury and inability because of the injury to engage in employment for which the employee is fitted. Loss of earnings caused by a job transfer for reasons related to the injury is also relevant. These are matters which the finder of fact considers collectively in arriving at the determination of the degree of industrial disability.
>
> There are no weighting guidelines that are indicated for each of the factors to be considered. There are no guidelines which give, for example, age a weighted value of ten percent of total, education a value of fifteen percent of total, motivation - five percent; work experience - thirty percent, etc. Neither is a rating of functional impairment entitled to whatever the degree of impairment that is found to be conclusive that it directly correlates to that degree of industrial disability to the body as a whole. In other words, there are no formulae which can be applied and then added up to determine the degree of industrial disability. It therefore becomes necessary for the deputy or commissioner to draw upon prior experience, general and specialized knowledge to make the finding with regard to degree of industrial disability.

See Birmingham v. Firestone Tire & Rubber Company, II Iowa Industrial Commissioner Report 39 (1981); Enstrom v. Iowa Public Services Company, II Iowa Industrial Commissioner Report 142 (1981); Webb v. Lovejoy Construction Co., II Iowa Industrial Commissioner Report 430 (1981).

Claimant seemingly was in good health before her injury. She had a fall which injured her tailbone prior to May of 1980. She has had two car accidents since her injury, one of which resulted in a posterolateral fracture dislocation of the left elbow and a fracture of the capetellum. Claimant continues to complain of pain in her neck, shoulders, chest, ribs, groin, hips, legs, knees and feet. Claimant's condition was diagnosed at Mayo Clinic as periarthritis or inflammation surrounding joints.

Claimant has more than 15 years of work life ahead of her. She was educated in Germany. Her potential for vocational rehabilitation has not been explored. Claimant's work experience has included some of a lighter nature. As has been discussed above, claimant's work for defendant employer, although not involving lifting heavy weights, was very physically demanding and of the sort which aggravated her complaints. Work in a flower shop seems to be something claimant could do. She might also perform some of the same type of work she did in the bowling alley. She has not been up to looking for work. She testified that she hated staying at home.

Claimant's spouse took a voluntary layoff to stay home and care for her. His solicitousness may lessen to some degree claimant's motivation to get back to work.

Claimant worked for nearly two years after her injury. Her subsequent healing period has been substantial. Claimant has not had surgical intervention.

Based on the Iowa case law, the discussion in this section of the decision and the findings of fact set out below, it is determined that claimant has a permanent partial industrial disability of 15 percent related to her injury of May 19, 1980.

Claimant has been paid healing period benefits from July 11, 1980 through August 8, 1980.

Iowa Code section 85.34(1) provides:

> If an employee has suffered a personal injury causing permanent partial disability for which compensation is payable as provided in subsection 2 of this section, the employer shall pay to the employee compensation for a healing period, as provided in section 85.37, beginning on the date of injury, and until the employee has returned to work or it is medically indicated that significant improvement from the injury is not anticipated or until the employee is medically capable of returning to employment substantially similar to the employment in which the employee was engaged at the time of injury, whichever occurs first.

A request for a leave of absence shows claimant was off work because of her shoulder from July 11, 1980 through August 10, 1980. Dr. Johnson saw and treated claimant for her shoulder condition and kept her off work in October and November of 1981. Request for leave shows she took sick leave for her shoulder problems from October 22, 1981 through October 30, 1981; from November 2, 1981 through November 13, 1981; from November 19, 1981 through November 25, 1981 and from December 15, 1981 through December 19, 1981. Dr. Sullivan also recommended claimant be off work for some of this period. Dr. Walker kept claimant off work from July 2, 1982 through August 18, 1982. When he saw her on that date, he decided she should be off for an additional six months. No evidence of Dr. Walker's subsequent treatment is given until May of 1983 when claimant claimed to be worse, but in reality had little change in physical findings.

Healing period is terminated at the first of three events. Claimant has not returned to work. Neither is she medically capable of returning to substantially similar employment. The remaining time for termination is indication that significant medical improvement is not anticipated. In spite of Dr. Walker's statement that claimant was unable to be gainfully employed in December of 1983, his opinion the month before was that claimant had reached maximum benefit from treatment. Overall, Dr. Walker's impression in August of 1982 that claimant should be off another six months seems the most reasonable. See Hebensperger v. Motorola Communications and Electronics, Inc., II Iowa Industrial Commissioner Report 187 (Appeal Decision 1981) (Dist. Ct. Appeal Remanded for Settlement). Claimant's healing period will run as set out above with an additional time from August 18, 1982 through February 18, 1983. Healing period will be awarded for claimant's time in the hospital in May of 1983.

The remaining issue is claimant's entitlement to benefits under Iowa Code section 85.27 which provides in pertinent part:

> The employer, for all injuries compensable under this chapter or chapter 85A, shall furnish reasonable surgical, medical, dental, oseteopathic, chiropractic, podiatric, physical rehabilitation, nursing, ambulance and hospital services and supplies therefor and shall allow reasonably necessary transportation expenses incurred for such services. The employer shall also furnish reasonable and necessary crutches, artifical members and appliances but shall not be required to furnish more than one set of permanent prosthetic devices.
>
> For purposes of this section, the employer is obliged to furnish reasonable services and supplies to treat an injured employee, and has the right to choose the care. The treatment must be offered

> promptly and be reasonably suited to treat the injury without undue inconvenience to the employee. If the employee has reason to be dissatisfied with the care offered, he should communicate the basis of such dissatisfaction to the employer, in writing if requested, following which the employer and the employee may agree to alternate care reasonably suited to treat the injury. If the employer and employee cannot agree on such alternate care, the commissioner may, upon application and reasonable proofs of the necessity therefor, allow and order other care. In an emergency, the employee may choose his care at the employer's expense, provided the employer or his agent cannot be reached immediately.

As established by statute, defendants have the obligation to furnish claimant care and to select that care. Little evidence was offered regarding the issue of authorization.

Claimant initially saw Dr. Sullivan and at about the same time went to Dr. Collins. Dr. Sullivan sent claimant to Dr. Hughes who referred her to Dr. Grundberg and to the Mayo Clinic. Dr. Sullivan also directed claimant to Dr. Kitchell. The manner in which claimant found her way to Dr. Walker is unclear, but no findings of an absence of authorization can be made.

Claimant has the burden of proving her medical expenses are causally related to her injury of May 19, 1980. Insufficient evidence was offered relating to claimant's hospitalization at St. Francis Hospital to award any payment. Numerous prescription expenses were offered, but no testimony relating to those was given. Those from the Medicine Store, however, do contain sufficient information to allow awarding those costs.

Claimant's hospitalization in May of 1983 was for a cholecystectomy and cholangiogram as well as testing for her back. The bill submitted does not allow for apportionment of any of those charges and none will be allowed.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant is a credible witness.

That claimant is 46 years of age.

That claimant graduated from high school in Germany.

That claimant's work experience has been in flower shops and doing various jobs in a bowling alley.

That claimant began work for defendant employer in April of 1978.

That claimant's employment was terminated on July 20, 1983 after she went on unpaid leave status.

That claimant's duties for defendant employer included mopping floors, sanitizing areas, dusting, removing trash, caring for furniture, moving furniture, hand scrubbing, polishing and replenishing supplies.

That claimant's work required bending, twisting, lifting, reaching and stretching.

That claimant was a very good, conscientous worker.

That claimant had responsibility for caring for a number of rooms and other areas. That in May of 1980 claimant injured her left shoulder and had pain into her arms and tingling into her fingers as she lifted a garbage can.

That claimant continues to complain of pain in her neck, shoulders, chest, ribs, groin, biceps, legs, knees and feet.

That claimant had no injury arising out of and in the course of her employment on April 21, 1981.

That Drs. Rand, Walker and Neff suggested claimant modify her work activities.

That claimant had an auto accident in December of 1982.

That in May of 1983 claimant had a cholecystectomy and cholangiogram.

That claimant was involved in a car accident in December of 1983 which resulted in a posterolateral fracture dislocation of the left elbow and fracture of the capetellum.

That claimant has some functional impairment as a result of her injury.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has established by a preponderance of the evidence that her injury of May 19, 1980 is the cause of the disability on which she now bases her claim.

That claimant has established entitlement to healing period benefits and permanent partial industrial disability of fifteen (15) percent.

That claimant has established entitlement to expenses under Iowa Code section 85.27.

ORDER

THEREFORE, IT IS ORDERED:

That defendants pay unto claimant healing period benefits at the rate of one hundred twelve and 18/100 dollars ($112.18) for the following periods: July 11, 1980 through August 10, 1980; October 22, 1981 through October 30, 1981; November 2, 1981 through November 13, 1981; November 19, 1981 through November 25, 1981; December 15, 1981 through December 19, 1981; July 2, 1982 through February 18, 1983; and May 17, 1983 through May 30, 1983.

That defendants be allowed credit for amounts previously paid.

That defendants pay unto claimant seventy-five (75) weeks of permanent partial disability benefits at a rate of one hundred twelve and 18/100 dollars ($112.18) with payment to commence on February 19, 1983.

That defendants pay amounts due and owing in a lump sum.

That defendants pay interest pursuant to Iowa Code section 85.30.

That defendants pay the following medical expenses:

McFarland Clinic P.C.	$ 271.00
Medicine Store	67.86
John R. Walker, M.D.	1,879.00

That defendants pay costs pursuant to Industrial Commissioner Rule 500-4.33.

That defendants file an activity report with the payment of this award.

Signed and filed this 27 day of September, 1984.

Judith Ann Higgs
JUDITH ANN HIGGS
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

BETTY COLEMAN, Claimant, vs. COLEMAN INDUSTRIAL CLEANING, Employer, and LIBERTY MUTUAL INSURANCE COMPANY, Insurance Carrier, Defendants.	FILE NO. 622172 R E V I E W - R E O P E N I N G D E C I S I O N FILED JUL 6 1984 IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in review-reopening brought by Betty Coleman against Coleman Industrial Cleaning, employer, and Liberty Mutual Insurance Company, insurance carrier.

Claimant seeks further benefits as a result of the injury which occurred on January 7, 1980. Claimant's rate of compensation is $55.24 per week as established by the stipulation of the parties and the memorandum of agreement filed in this proceeding on February 12, 1980.

The hearing commenced April 13, 1984 in the Pottawattamie County Courthouse at Council Bluffs, Iowa with Michael G. Trier, Deputy Industrial Commissioner, presiding. Claimant appeared in person with her attorney Robert Laubenthal. Defendants appeared through their attorney of record James E. Thorn. The case was completed and fully submitted upon conclusion of the hearing on April 13, 1984.

The record in this proceeding consists of the testimonies of Betty Coleman, Thomas Coleman, Ronald Coleman and Virginia Coleman. Claimant introduced exhibits 1, 2 and 3. Defendants introduced exhibits 101a-g and 102 through 122 except that during the course of the hearing it was determined that what had been marked as exhibit 119 was not one of claimant's medical records and the same was withdrawn.

ISSUES

The issues presented by the parties at the time of hearing are whether there is a causal connection between the injury claimant sustained on January 7, 1980 and her present condition. In the event a causal connection is found to exist the issues involve a determination of the nature and extent of any disability which may be related to that injury. Defendants also raised as a defense to certain medical expenses that the same were not related to the injury and were not authorized. It was stipulated that the medical expenses in question were fair and reasonable with regard to the services which were actually rendered.

REVIEW OF THE EVIDENCE

Betty Coleman testified that she is 60 years of age and married to Thomas Coleman. She related that all of her children are independent adults. She related that her husband is disabled as a result of a heart attack which occurred December 4, 1981.

Claimant testified that she completed the tenth grade in school and had no further formal education or vocational training. She stated that she married at the age of 18 and initially worked approximately 20 years at a chicken restaurant called Rose's Lodge. She performed a variety of duties there including cooking, washing kitchen utensils, making salads and taking telephone orders.

Claimant stated that she worked as a cashier at a Red Barn restaurant which she described as a fast food establishment which served chicken and hamburgers.

Claimant related working at the Beefland Packing House for a short time. Her duties there included picking meat off a conveyor, wrapping it and carrying it to a location where it was sealed in plastic. She stated that the pieces she handled weighed in the range of 10 to 15 pounds.

Claimant stated that after she left Beefland she may have possibly returned for a short time to work in the Red Barn restaurant.

Claimant stated that she was a full time housewife from approximately 1975 through 1979 when she commenced working for her son's cleaning business.

Claimant stated that she began working for her son in approximately 1979. She stated that the business had three workers and that the general nature of the work was to clean offices. The activities performed were vacuuming carpets, emptying waste baskets, cleaning restrooms, dusting desks and cleaning tile floors. She stated that there were several customers, all of which were located in the Pacesetter Building in Omaha, Nebraska.

Claimant stated that on January 7, 1980 she fell coming downstairs in the Pacesetter Building, landed on a cement floor and was knocked unconscious. Claimant stated that she had tripped over a tear in the carpet and fell down three or four stairs landing on her stomach. She stated that a co-worker, Claudia Thompson, was with her and that her daughter-in-law, Virginia Coleman, was also in the building. Claimant stated that she was transported by rescue squad to Bergen Mercy Hospital where she was examined and released.

Claimant stated that on the following day she contacted Anthony R. Pantano, M.D., who had her admitted to Lutheran Medical Center. Claimant stated that upon admission she felt terrible, could not get out of bed and required help to move due to severe back pain. She stated that when discharged she spent most of her time at home in bed for quite a while and that she "did not feel very good".

Claimant stated that she was hospitalized again in the fall of 1980 under Dr. Pantano. While there she stated that she was placed in traction, received physical therapy and medication. She felt better at the time of discharge. She stated that Dr. Pantano told her that she had a slipped disc.

Claimant testified that she presently spends a lot of time in bed watching TV. She stated that she has an electric bed similar to a hospital bed which can raise her head and feet. She stated that her husband vacuums and does the dishes at home. She stated that she sometimes cooks and dusts, but that her husband makes the beds. She stated that she no longer does any yard work or painting about the home. Claimant testified that her pain varies and is sometimes worse than others. She stated that the pain has remained in the same location since her fall. She stated that it hurts when she moves or walks and that it helps if she takes it easy. Bending and reaching cause pain and she does not feel that she can stand on her feet for any significant length of time. Claimant related that it helps if she takes it easy and that she does not have any pain if she is lying in bed. She stated that it causes pain if she sits in a living room chair. She stated that she takes medicine daily and that her medications include Darvocet, Tylenol and bufferin. She reported that she does not have neckaches but that she continues to have tension headaches.

Claimant testified that she has not gone back to work since the injury and that her son has not offered to take her back. She thinks she could possibly still dust but was uncertain. She feels that she is too old to go back to school and that she is also limited in employability because she has high blood pressure and cannot sit in a straight chair. She feels that her ability to stand without causing pain would prohibit her from working as a cashier.

Claimant related a very extensive history of medical care which has included a hysterectomy, removal of tumors on her breast, hernia repair, removal of a fractured coccyx and a carpal tunnel release. She related having chronic stomach problems, headaches and emotional disturbances for which she received medical care and treatment. She related that she slipped without falling at Beefland and strained her back for which she received compensation benefits. She also related being involved in an auto accident while going to work while working for a former employer.

Claimant stated that she had no problem doing her work at Beefland prior to the time she was injured there and that she had completely recovered from that injury when she began working for her son. At the time she commenced work for her son she could do all of her housework, lift, drive the car and perform general yard work. She stated that she felt no pain from the injury she sustained at Beefland. She stated that she had no physical problems when she started working for her son and that she would not have gone to work for him if her back had not been all right.

Claimant stated that a woman identified as Mrs. Turner from Liberty Mutual Insurance Company visited her at her home and in the hospital. She related that Mrs. Turner had sent her to Dr. Pantano and also to A. P. Manahan, M.D. She stated that she also saw other doctors and that Mrs. Turner knew she was doing so. She related that Richard P. Murphy, M.D., was brought into her case by Dr. Pantano.

She stated that Dr. Manahan did not provide any relief for her back pain. She recalled receiving a TENS unit which she did not feel was particularly effective.

Claimant identified exhibit 1 as the charges for the period of hospitalization incurred when she was hospitalized over Christmas, 1980 and exhibit 2 has the charges arising from the time Dr. Murphy was called to consult on her case. Claimant stated that she ceased physical therapy because the exercises increased her pain.

Claimant stated that she felt that the back pain increased her emotional disturbances but that she is not seeking payment from defendants related to her depression or emotional disturbance.

Claimant acknowledged that her present complaints were similar to those which she had following her injury at Beefland.

Thomas Coleman testified that he is claimant's husband of 42 years. He stated that prior to the injury at the Pacesetter Building she could do the housework, vacuum, rake the yard, do the washing and most of the cooking. He stated that since the fall his work around the home has doubled. He stated that claimant is tired and hurting and that he presumes that the problem is her back because she lays down frequently.

Ronald Coleman testified that he is claimant's son and that he is self-employed doing business as Coleman Industrial Cleaning. He stated that the business involves janitorial work and general cleaning in office buildings. He started the business in 1979 after working for his father-in-law for approximately five years in a similar business.

He stated that he was called to the hospital on the night of January 7, 1980 and that at the time of her release, claimant walked from the hospital with assistance.

Ronald Coleman stated that he has refused to allow his mother to return to work because he is afraid she will hurt herself.

He stated that he has had limited contact with his parents since the injury but that when he has seen his mother since, he has observed no difference in her walking or other movements when comparing the same with the way she moved prior to the fall. He stated that he is not well acquainted with claimant's medical history but that he knows that she has had several periods of hospitalization. He stated that she was not complaining of back pain prior to the time of the fall and that he does not dispute his father's testimony concerning claimant's complaints and activities.

Virginia Coleman testified that she is claimant's daughter-in-law and is married to Ronald Coleman. She confirmed claimant's work activities at the Pacesetter Building and stated that claimant's primary activity was emptying trash baskets but that on occasion she would have performed all of the functions. She related that she had an argument with claimant over a raise and time off shortly before claimant fell and that they were both angry.

Virginia Coleman related that the other employee notified her that claimant had fallen and, when she went to the location, she found claimant lying on a concrete floor which also had glass and metal shavings on it. She related that she saw no cuts and rode in the ambulance to the hospital where claimant was examined and released. She stated that claimant was upset about being released and about being told at the hospital they could not find anything wrong.

The witness stated that claimant appears the same now as she did before the fall, but that she does not dispute her father-in-law's testimony. She agreed that she had little contact with her mother-in-law since the fall.

Claimant's exhibit 3 is an emergency department record from Bergen Mercy Hospital of claimant's visit to the emergency room January 7, 1980. An x-ray report interpreted by Gerard J. Kelly, M.D., relates a scoliosis possibly due to muscle spasm and narrowing of the L5-S1 interspace. No other significant abnormality or evidence of recent traumatic bone or joint change was identified. The record shows claimant to have been discharged with a diagnosis of low back strain.

Exhibit 101(b) contains a discharge summary from Immanuel Medical Center in Omaha, Nebraska signed by Ronald C. Bell, M.D., which indicates that claimant was hospitalized from December 16 through 27, 1973 and was diagnosed as having an acute lumbar strain for which she received traction which improved her symptoms. A consultation report of James W. Dinsmore, M.D., dated December 20, 1973 contains the following:

> She has had some intermittent low back pain for some years now. About 5-6 days ago, she had an acute episode of low back pain, with some numbness into both legs. She was unable to be up and about and sitting considerably bothers her. Lying down does relieve her some. Coughing, sneezing, bending and lifting all seem to aggravate. No actual leg pain. It has not gotten better....

The physical examination he performed showed marked back spasm, positive straight leg raising bilaterally and no neurological deficit.

A radiology report dated December 22, 1973 interpreted by W. Benton Copple, M.D., shows well aligned vertebral bodies with normal intervertebral disc spaces, no spondylolisthesis and an overall impression of a normal lumbosacral spine.

Exhibit 101(d) is a deposition of Ronald C. Bell, M.D., taken March 6, 1975. At page 31 of the deposition he indicated that when claimant was hospitalized in December, 1973, she was suffering severe incapacitating back pain. He stated that it was of the nature that claimant was unable to move, could not get out of bed or carry on her daily functions. He related that she needed help in going to and from the bathroom due to her back pain.

Exhibit 101(e) is a deposition of James W. Dinsmore, M.D., an orthopedic surgeon, taken March 7, 1975. At page 12 of the deposition he indicates that in February or April of 1974, he estimated that claimant had a permanent partial disability of between five and ten percent of the lumbar spine and body as a whole. At page 16 of the deposition, Dr. Dinsmore relates that in 1969 he had given claimant a disability rating of 10 percent of the lumbar spine or body as a whole following removal of the

Exhibit 101(f) is a transcript of a hearing in proceedings entitled Betty Jane Coleman, claimant, vs. American Beef Packers, Inc., employer, and the St. Paul Companies, insurance carrier, such hearing having been conducted November 20, 1974. Commencing on page 17 at line 22 claimant stated:

> A. Well, I can't-- Like I said, I can't pick up my--one of my grandchildren if they come to me, and I can't stand on my feet for long periods of time. I go--like I take naps and go to bed quite often, and there has been sometimes when I've bent down just to do something on the floor, and I couldn't go to my sister's funeral. The pain is so bad everytime you take a step you just couldn't do it.

Continuing on page 18 at line 10 the record relates:

> Q. Are you able to do all your household chores now, or do you have to have some help?
>
> A. Well, I do most of them unless I have to lift something or move something heavy. I don't do anything like that.
>
> Q. Do you feel that you will be able to be employed at this time?
>
> A. I don't think so. I don't think I could stand on my feet for even like a four hour part-time job.
>
> Q. In other words, four hours on your feet is too much?
>
> A. Mm-hm (Yes).
>
> Q. What happens if you stand on your feet like four hours, how does it effect you in anyway [sic]?
>
> A. Well, I get-- It's back in here, in this place, it gets-- I get pain.
>
> Q. In your low back?
>
> A. Mm-hm (Yes)....

Continuing on pages 19 and 20 claimant indicated that raking the lawn caused discomfort and that she was unable to lift her grandchildren, two of which were two years old, one of which was one year old and the other was two months old. She felt that they were too heavy for her to lift.

Exhibit 101(g) is a copy of a review-reopening decision filed April 23, 1975 involving claimant's injury that occurred on December 14, 1973 at her employment with Beefland. The record reflects that claimant was awarded 17 1/2 percent permanent partial disability of the body as a whole in the proceeding attributable to an injury to her low back.

Exhibit 102 is a report of Edward M. Schima, M.D., dated February 2, 1979. The complaints noted include a constant headache and neck pain. The observations included what was termed a "blunted affect and mild stare". An EEG showed some moderate abnormalities. The clinical impression included depression.

Exhibit 103 relates to the diagnosis of carpal tunnel syndrome.

Exhibit 104 relates an examination of the claimant performed January 8, 1980 following the injury in question. The initial impressions noted are of a cerebral concussion and a lumbosacral strain.

Exhibit 105 consists of records from claimant's hospitalization at Lutheran Medical Center from January 8 through 29, 1980. The initial impressions on admission were that claimant has a cerebral concussion and a lumbosacral strain. While hospitalized claimant underwent duodenoscopy. A CT brain scan was normal and x-ray of claimant's lumbar spine was termed to be unremarkable. The final diagnosis added a hiatal hernia, hypertrophic gastritis of the cardia and fibrotic pyloric sphincter to those initially noted.

Exhibit 107 is a report from Timothy C. Fitzgibbons, M.D., dated March 31, 1980 wherein he relates evaluating claimant on March 6, 1980. His impression was that claimant had a resolving lumbosacral strain.

Exhibit 109 is a report from Dr. Pantano dated June 12, 1980 which indicates that claimant was able to resume regular work on February 4, 1980, that normal recovery had not been delayed, that the injury would not result in permanent defect and would not require further treatment.

Exhibit 110 is a report from Dr. Fitzgibbons dated June 12, 1980 which relates that on May 8, 1980 he felt that claimant was depressed, that her problem was unchanged and simply that of a back strain and that he felt that she could not go to work. The report also relates that he saw claimant April 22, 1980 and, at that time, felt that she should return to work in a couple of weeks.

Exhibit 111 is a report from Antonio P. Manahan, M.D., dated July 11, 1980 with additional notes dated August 15, 1980. He notes claimant's complaints of pain radiating into the right leg and occasionally in the left side. Following examination, his impression was a chronic low back pain secondary to lumbosacral strain and poor posture. He arranged physical therapy. On August 15, 1980 her complaints had not been resolved and a TENS unit had been applied with limited success. He stated that he felt that claimant was not ready to return to work at that time.

Exhibit 113 is a note from Dr. Manahan dated October 17, 1980. In it he opines that claimant has a five percent disability, that she cannot go back to the work of cleaning which she previously performed and that she needs vocational rehabilitation.

Exhibit 114 contains records from claimant's hospitalization which began December 22, 1980. The complaints noted at time of admission were pain in the left low back with radiation down the left leg but which sometimes is present in both legs. On examination decreased sensation on the dorsal aspect of the left foot was noted and straight leg raising was negative in the sitting position. Claimant also had complaints of gastric disturbance. An x-ray report dated December 29, 1980 showed a normal lumbar spine with well maintained discovertebral joint spaces. An EMG including claimant's lower extremities and paraspinal muscles at the L3-4, L4-5 and L5-S1 levels all produced results within normal limits. A skeletal scintiphoto series produced normal results.

In exhibit 115 Dr. Pantano states that following the December, 1980 hospitalization the final diagnosis was a herniated lumbar disc which decision was made in consultation with Richard Murphy, M.D.

Exhibit 116 consists of approximately 162 pages of records and reports dealing with claimant's hospitalization at Mercy Hospital in Council Bluffs commencing March 30, 1981 and running through May 1, 1981. The discharge summary notes a dismissal diagnosis of major depression, vascular headaches, low back pain, marital maladjustment and tinia inguium. The ninth page of the exhibit is a consultation report from Dr. B. Rassekh dated April 1, 1981. Part of the history in the report states: "She states the pain started in 1-1981 [sic], while at work when she fell and had back pain since then. Has had occasional back pain since but nothing like present episodes. No radicular pain although she states at times the pain will go numb." Examination revealed no muscle spasm. His impression was that claimant was suffering from disc disease and not a herniated disc. The exhibit relates that the primary purpose of the hospitalization was an emotional disturbance.

Exhibit 117 is a report from Dr. Pantano dated June 12, 1981. It states:

Mrs. Coleman was admitted to the hospital December 22, 1980 primarily because of severe pain in her back radiating down her leg and a final diagnosis after x-rays and electromyelogram was made of "herniated lumbar disc." This was omitted from the discharge summary and I apologize.

Mrs. Coleman was again hospitalized May 29, 1981 because of severe pain in her back, radiating down the legs. She was diagnosed as "positive disc syndrome." The patient was treated symptomatically with routine care and traction and was discharged from the hospital June 8, 1981.

Exhibit 118 consists of approximately 113 pages of medical records and reports dealing with claimant's admission to Mercy Hospital in Council Bluffs on July 24, 1981 and running until her discharge on August 20, 1981. The discharge summary relates a major depressive disorder, marital discord and a hiatal hernia.

Exhibit 120 is a note from Dr. Manahan dated November 29, 1983 in which he states that claimant has achieved maximum recovery. The report relates that claimant stated that she had not used the TENS unit for the last year and that she had been hospitalized a year previously for her back condition.

Exhibit 121 is the deposition of Anthony R. Pantano, M.D., taken August 18, 1983. On page 9 the doctor indicates that he felt claimant had a possible herniated disc. He related the same to her restricted motion, tenderness over the lumbosacral area, positive straight leg raising test and weakness of the extenditure of her toes and complaints of severe pain radiating down her back to her toes. He related that he called in Dr. Murphy, an orthopedic specialist, for purposes of consultation. At page 21 of the deposition he indicated that to his acknowledge claimant had not experienced low back pain prior to January, 1980 and that such was based upon reports from other physicians. On page 13 of the deposition he expresses his opinion concerning the cause of claimant's complaints of back pain as follows: "...It is m personal opinion that this is definitely correlated with the history of Dr. Hertzler's that this patient slipped and fell and injured her back at work and also had a possibility of a brain concussion."

Exhibit 122 is claimant's deposition taken April 25, 1983 which is generally consistent with her testimony at hearing.

APPLICABLE LAW

A memorandum of agreement conclusively establishes an employer-employee relationship and the occurrence of an injury arising out of and in the course of employment. Trenhaile v. Quaker Oats Company, 228 Iowa 711, 292 N.W. 799 (1940). It does not establish the nature or extent of disability. Freeman v. Luppes Transport Co., 227 N.W.2d 143 (Iowa 1975). Claimant must prove by a preponderance of the evidence the causal connection between the employment incident or activity and the injury upon which her claim is based. A possibility is insufficient, a probability is necessary. Holmes v. Bruce Motor Freight, Inc., 215 N.W.2d 296, 297 (Iowa 1974). Whether a disability has a direct causal connection with the claimant's employment is essentially within the domain of expert testimony. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867, 870 (1965).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

While a claimant is not entitled to compensation for the results of a preexisting injury or disease, the mere existence at the time of a subsequent injury is not a defense. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756, 760-761 (1956). If the claimant had a preexisting condition or disability that is aggravated, accelerated, worsened or lighted up so that it results in disability, claimant is entitled to recover. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812, 815 (1962).

When an aggravation occurs in the performance of an employer's work and a causal connection is established, claimant may recover to the extent of the impairment. Ziegler v. United States Gypsum Co., 252 Iowa 613, 620, 106 N.W.2d 591, 595 (1960).

If claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

A defendant employer's refusal to give any sort of work to a claimant after he suffers his affliction may justify an award of disability. McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (Iowa 1980).

Section 85.27 of the Code of Iowa places upon an employer the duty to furnish reasonable medical care for an injured worker, the right to select the care and the duty to monitor the care. Zimmerman v. L. L. Pelling Company, 2 Iowa Industrial Commissioner Reports 462 (Appeal Decision 1982).

ANALYSIS

Claimant is a resident of the State of Iowa. The employer's business address is located in the State of Iowa. From the evidence in the record it appears that all of claimant's work was performed in the State of Nebraska in the Pacesetter Building. Under the provisions of section 85.71(1) this agency has jurisdiction of the subject matter of this proceeding and its parties.

There appears from the record no reason to doubt that the accident happened with claimant tripping and falling as was described at hearing. The result of that fall is the principal issue in this case. The medical evidence introduced comes from a number of sources and the only concensus of opinion is that claimant was suffering from low back pain. Dr. Pantano related the pain to the fall and such is not contradicted by any other opinion evidenced in the record. Such a result could reasonably be expected to follow from a fall. The onset of symptoms was immediate and it is found and concluded that the fall is a proximate cause of claimant's low back pain.

The only impairment rating in the record of this case is that of Dr. Manahan in exhibit 120 where it is indicated that on October 17, 1980 he found claimant to have a five percent disability. Such is likewise uncontradicted by any other competent medical opinion evidenced in the record. It does not appear, however, that claimant had previous lower back complaints which she related to any injury which occurred December 14, 1973. It also appears that he was unaware that Dr. Dinsmore had previously found claimant to have a disability, as a result of that prior injury, in the range of five to ten percent. It also appears that Dr. Manahan was unaware that in 1967 Dr. Dinsmore had found claimant to have a ten percent permanent partial disability as a result of an industrial injury to her coccyx. When the records of the two proceedings are compared, claimant's present complaints are similar to the complaints which she previously related to the 1973 injury. It seems reasonable that the surgical removal of claimant's fractured coccyx would resolve the pain which it had caused. It is also reasonable to assume that if claimant did, in fact, sustain a back injury in 1973, that the passage of time would cause the symptoms to subside. Such assumptions are consistent with claimant's testimony that she was feeling good at the time she commenced work for her son's business. In view of the fact that a permanent disability rating was imposed by her physicians shortly after the 1973 injury, one would not expect, however, for her to have been totally asymptomatic. A further complicating factor is that the concensus of x-ray reports reveal nothing which indicates any injury to claimant's spine. Only the report taken at Bergen Mercy Hospital on January 7, 1980 shows narrowing at the L5-S1 interspace. Such would be consistent with a herniated disc or some other injury. All the subsequent reports indicate a normal spine with normal interspaces. Claimant has shown a positive result in straight leg raising tests on some occasions early after the injury, but such appears to have resolved with the passage of time. The reports, except for the observations made by Dr. Pantano in his deposition, failed to conduct any other clinical objective basis for claimant's continuing complaints.

Dr. Pantano related in his deposition and in one or more reports that Dr. Murphy had diagnosed a herniated disc. There is no final discharge summary or report from Dr. Murphy which indicates such. Such was entered as an admitting diagnosis on exhibit 114 at the time of claimant's December 1980 period of hospitalization but the tests which were performed during that period of hospitalization provided no confirmation of a herniated disc.

A further complicating factor in the case is claimant's emotional disturbances and the manner in which they relate to her relationship with her husband and children. It would not be entirely incredible if some part of her complaints were a result of an unrealized desire for attention, appreciation, sympathy or even revenge.

Even though Dr. Pantano opined that claimant had a herniated disc, his language was somewhat equivocal. The facts upon which he purported to base that opinion are not corroborated by the evidence in the case. It should be further noted that his opinion was based upon the assumption that claimant had been asymptomatic prior to her fall in January, 1980. His opinion concerning a herniated disc conflicts with those expressed by Drs. Hertzler, Fitzgibbons, Manahan and Rassekh. The lack of objective clinical findings and the concensus of medical opinion against a herniated disc will, in this case, result in a finding contrary to that of the primary treating physician. Under the

record made, claimant's injuries from the January 7, 1980 fall are not shown to include a herniated disc.

It should be noted that, until claimant began working for her son's business, she had not been employed for any significant amount of time, if at all, after she sustained her injury in 1973. This is some indication that she was either suffering residual effects from that injury or that she had decided to cease being employed outside the home. The work she performed for her son was part-time in nature. She has not sought to return to other employment since the 1980 injury. Her subjective complaints would seem to severely limit her ability to return to gainful employment, but those complaints are greatly disproportionate to the objective clinical findings from the numerous medical tests and procedures. Claimant's education is limited. At her present age she is near the age of normal retirement and beyond the age at which one would normally expect a person to begin a new career.

When all the foregoing factors are considered, it appears that claimant's present industrial disability is in the range of 25 percent of the body as a whole. It also appears that claimant has already been paid a total of 25 percent permanent partial industrial disability when the award in the previous case and the amount already paid by defendants is combined. Claimant was admittedly less symptomatic immediately prior to this most recent injury than she was at the time of her previous award. Such would normally be expected to occur and the fact that claimant may have had an increased susceptibility to further injury following the 1973 injury are matters which properly would have been within the contemplation of the deputy at the time the disability arising from the 1973 injury was determined. It is therefore found that claimant has received all compensation for permanent partial disability to which she is entitled.

Claimant has not returned to work and the termination of her healing period must be measured by the point at which further significant improvement from the injury was not anticipated. The point at which a disability rating is imposed is sometimes used to determine the point of maximum significant improvement. As shown in exhibit 113, Dr. Manahan imposed a disability rating of five percent on October 17, 1980. His notes in exhibit 120 from his examination of claimant on November 9, 1983 indicates that he feels the claimant had, by that time, achieved the maximum recovery. Claimant's symptoms were such that she was hospitalized on December 22, 1980 where she remained until discharged January 13, 1981. She was still complaining of her back and admitted to Mercy Hospital in Council Bluffs on March 30, 1981 and while there she received treatment for her back, although such was not the major reason for her hospitalization. The records of claimant's hospitalization commencing July 24, 1981 make no reference to back complaints at that time. There is also no treatment shown in those records for any back pain or condition in her back. According to claimant's testimony her condition improved little at any time since the fall. The ninth page of exhibit 116 indicates that there was a fareup of her back pain at approximately the time she was admitted to Mercy Hospital in Council Bluffs on March 30, 1981. Under such a record it will be determined that claimant reached the point of maximum significant medical improvement from the injury on May 1, 1981, the day she was last discharged from any hospitalization which included treatment for her back continuing, although somewhat sparadic improvement is noted up to that date. There is nothing in the record to indicate that her condition improved after May 1, 1981. That date of discharge also amounts to what is substantially the end of claimant seeking medical care for her back. In view of the nature of her condition it will also be found, medical opinions to the contrary notwithstanding, that her healing period ran continuously from the date of injury until May 1, 1981, a period of 68 weeks four days.

It is clear from the record Dr. Pantano was an authorized treating physician. When he chose to call upon Dr. Murphy for consultation, such impliedly authorizes care by Dr. Murphy. His charges in the amount of $370.00 were incurred for care of claimant's back and are the responsibility of the defendants.

Exhibit 1 relates to claimant's admission to Lutheran Medical Center on December 22, 1980. While so hospitalized claimant was subjected to certain tests and procedures which were not related to her back. They were, however, part of a series of diagnostic tests used to determine the full nature and extent of whatever injuries she had sustained in the fall. Some of the tests excluded some possible causes of claimant's complaints which would not be related to a fall. That testing allowed the diagnosis concerning her back to be more certain does not render those tests unnecessary or unreasonable. It should be noted that they were arranged under the directions of Dr. Pantano, an authorized treating physician. There are, nevertheless, four charges on exhibit 1 which cannot be related to the injury of July 7, 1980. They are the electrocardiogram posted February 24, 1980 in the amount of $40.00, the x-ray of the gall bladder posted February 29, 1980 in the amount of $65.00, the CT scan of the pancreas posted December 30, 1980 in the amount of $326.00 and the echography of the gall bladder posted December 30, 1980 in the amount of $59.00. All other charges on exhibit 1, which total $4,438.25 are found to be the responsibility of the defendants under the provisions of section 85.27 of the Code of Iowa.

FINDINGS OF FACT

1. Claimant is a 60 year old married resident of the State of Iowa.

2. On January 7, 1980 claimant was an employee of Coleman Industrial Cleaning, a business which has its business offices in the State of Iowa.

3. On January 7, 1980 claimant, while cleaning the Pacesetter Building in Omaha, Nebraska as part of the work for her employer, tripped on carpet and fell down a short flight of three or four stairs landing on a cement floor.

4. Claimant completed the tenth grade in school and has no further formal education or vocational training.

5. Claimant's work experience is generally limited to domestic work in the nature of cooking and cleaning, but she also has a limited amount of experience of packaging meat in a packing house and in working as a cashier at a fast food restaurant.

6. Claimant's rate of compensation is $55.24 per week.

7. In 1973 claimant sustained an injury which resulted in a permanent partial functional impairment centered in her low back of five to ten percent of the body as a whole. That injury was in the nature of a lumbosacral strain and was accompanied by symptoms similar to those which followed from the injury claimant sustained January 7, 1980. She was awarded 17 1/2 percent permanent partial disability as a result of that 1973 injury.

8. By the time claimant commenced working for Coleman Industrial Cleaning in 1979, the discomfort related to the 1973 injury had substantially reduced.

9. Following the 1973 injury claimant performed little, if any, work beyond the work in and around her home until the time she commenced employment with Coleman Industrial Cleaning.

10. In the fall which claimant suffered on January 7, 1980 her injuries included a lumbosacral strain. There exists a possibility that she may have suffered a herniated disc, but such cannot be confirmed.

11. On October 17, 1980 claimant had a five percent functional impairment of the body as a whole attributable to the condition of her lumbar spine.

12. Claimant suffers continuing discomfort in her lumbar spine as a result of the injury.

13. Claimant's complaints exceed any objective clinical findings regarding her injury.

14. Claimant reached the point of maximum significant medical improvement from the injury on May 1, 1981.

15. Claimant's emotional disturbances have not been shown to be related to the injury of January 7, 1980.

16. The services of Richard P. Murphy, M.D., were called upon by Dr. Pantano, the authorized treating physician for claimant's injury.

17. Of the charges from Lutheran Medical Center, as shown on claimant's exhibit 1, $4,438.25 were for care related to the injury. Charges totaling $490.00 were for medical care of claimant's unrelated gastric problems.

18. Defendants have paid claimant 50 5/7 weeks of healing period benefits and 37 1/2 weeks of compensation for permanent partial disability which relates to a disability of 7 1/2 percent of the body as a whole.

CONCLUSIONS OF LAW

Where claimant is a resident of the State of Iowa and defendant employer maintains its business office in the State of Iowa this agency has jurisdiction of the subject matter and parties of this proceeding, even though the injury occurred in the State of Nebraska and all of claimant's work was performed in the State of Nebraska.

The injury claimant sustained arising out of and in the course of her employment on January 7, 1980 was a proximate cause of the disability which she presently exhibits.

Claimant's total present disability, when measured in industrial terms, is 25 percent of the body as a whole.

The injury claimant sustained was an aggravation of her preexisting back injury and condition and that the extent to which her disability increased as a result of the injury of January 7, 1980 is 7 1/2 percent of the body as a whole when the same is measured industrially and consideration given to her preexisting disability of 17 1/2 percent.

Claimant's healing period commenced January 8, 1980 and ended May 1, 1981 resulting in a total of 68 4/7 weeks.

The services of Richard P. Murphy, M.D., were obtained at the request of Anthony R. Pantano, M.D., the authorized treating physician and Dr. Murphy's charges in the amount of $370.00 are the responsibility of the defendants under section 85.27 of the Code of Iowa.

All of the charges from Lutheran Medical Center incurred as a result of claimant's hospitalization which began December 22, 1980 were authorized by Dr. Pantano and related to care for the

injury claimant sustained January 7, 1980, except charges relating to her gastric disturbance which total the sum of $490.00, leaving defendants responsible for the remainder of the charges which total $4,438.25.

ORDER

IT IS THEREFORE ORDERED that defendants pay claimant sixty-eight and four-sevenths (68 4/7) weeks of healing period compensation at the rate of fifty-five and 24/100 dollars ($55.24) per week commencing January 8, 1980.

IT IS FURTHER ORDERED that defendants pay claimant thirty-seven and one-half (37 1/2) weeks of compensation for permanent partial disability at the rate of fifty-five and 24/100 dollars ($55.24) commencing May 2, 1981.

IT IS FURTHER ORDERED that defendants receive credit for all amounts of compensation for healing period and permanent partial disability previously paid which results in defendants currently owing claimant seventeen and six-sevenths (17 6/7) weeks of compensation at the rate of fifty-five and 24/100 dollars ($55.24) per week if the payments shown on the final report dated June 23, 1983 are correct.

IT IS FURTHER ORDERED that defendants pay the amount due and owing in a lump sum together with interest thereon in accordance with section 85.30 of the Code of Iowa.

IT IS FURTHER ORDERED that defendants pay the cost of this action pursuant to Industrial Commissioner Rule 500-4.33.

IT IS FURTHER ORDERED that defendants file a final report within twenty (20) days from the date of this decision.

Signed and filed this 6th day of June, 1984.

Insurance Carrier, Defendants.	:	

INTRODUCTION

This is a proceeding in review-reopening brought by Robert E. Dettman, claimant, against Quad City Construction Company, employer, and Liberty Mutual Insurance Company, insurance carrier, defendants, to recover additional benefits under the Iowa Workers' Compensation Act for an injury arising out of and in the course of his employment on November 10, 1981. It came on for hearing on June 26, 1984 at the Bicentennial Building in Davenport, Iowa. It was considered fully submitted at that time.

The industrial commissioner's file shows a first report of injury received November 16, 1981. At the time of hearing defendants' counsel indicated healing period benefits were paid from November 11, 1981 through November 1, 1983. Eleven and five-sevenths weeks of permanent partial disability benefits also have been paid.

The parties stipulated to a rate in the event of an award of $312.28.

The record in this matter consists of the testimony of claimant; claimant's exhibit 1, a letter from Richard L. Anderson, M.D., dated May 16, 1984; claimant's exhibit 2, a surgeon's report dated November 16, 1981; claimant's exhibit 3, a letter from W. B. Hofmann, M.D., dated March 19, 1982; claimant's exhibit 4, a letter from John M. Syverud, M.D., dated March 31, 1982; claimant's exhibit 5, a letter from Dr. Syverud dated June 28, 1982; claimant's exhibit 6, a letter from Dr. Anderson dated February 24, 1983; claimant's exhibit 7, a letter from Dr. Anderson dated June 16, 1983; claimant's exhibit 8, a letter from Dr. Anderson dated October 21, 1983; claimant's exhibit 9, a surgeon's report dated August 22, 1983; claimant's exhibit 10, a letter from William E. Scott, M.D., dated August 9, 1983; claimant's exhibit 11, a letter from Dr. Anderson dated June 13, 1983; claimant's exhibit 12, a note from Dr. Hofmann dated May 26, 1982; claimant's exhibit 13, a letter from Dr. Anderson dated December 27, 1982; claimant's exhibit 14, a letter from Dr. Anderson dated October 1, 1982; claimant's exhibit 15, a letter from Dr. Anderson dated February 18, 1983; claimant's exhibit 16, doctor's notes; claimant's exhibit 17, a medical record from the University of Iowa Hospitals from May 12, 1983; claimant's exhibit 18, hospital records from the University of Iowa Hospitals and Clinics; defendants' exhibit A, a letter from Scott H. Pressman, M.D., dated November 21, 1983; defendants' exhibit B, a letter from Dr. Scott dated January 16, 1984; and defendants' exhibit C, a letter from Dr. Scott dated April 18, 1984.

ISSUE

The issue in this matter is whether or not claimant is entitled to further healing period or permanent partial disability benefits.

STATEMENT OF THE CASE

Fifty-eight year old married claimant commenced work for defendant employer as a cement truck driver in heavy road work five years before his injury. He recalled the circumstances surrounding his injury on November 10, 1981 as follows: He was driving a full loaded cement truck when it turned over. He was taken to the hospital where he was treated for a punctured lung, cracked ribs and cuts to the right side of his face, particularly in the area of his right eye. He was treated by a plastic surgeon.

Eventually, he was transferred to Iowa City for further surgery. He was having double vision. Initially, his bottom eyelid was tightened and his upper eyelid was raised. Post-surgery there was no improvement in the double vision, but his general vision improved a bit.

In October of 1983 Dr. Scott operated on the left eye to correct the double vision. Claimant was seen briefly for follow-up on November 1, 1983. He was not asked to read an eye chart. He had double vision which did get better with time and continued to improve for up to six or eight weeks after November 1.

Additional outpatient surgery was done in March of 1984 to raise his right eyelid. This operation helped his vision.

Between the surgeries his vision was improving but he continued to have irritation. He was unable to work because his eye was irritated and red.

As to present problems, claimant said that he continues to have double vision, redness and irritation. He uses prescription ointment which eases a pain he described as feeling as if someone is throwing sand in his eyes. Artificial tears also are used in the evening as his tear ducts have been cut. Ointment, which results in a blur of his vision, is applied as often as four to five times a day if he is outside. Irritation results from wind, sun, dust and dirt. Dust and dirt must be removed immediately. Dark glasses provide some protection, but do not entirely prevent irritation. His right eye will not close as tightly or open as wide as the left. He claims less mobility in the eye as well. He places heavier reliance on his left eye.

Medication costs average $25 every two weeks.

Claimant denied trouble with his eyes before the accident. In addition to problems with his eyes, claimant has scarring in the area of his eye, nose, mouth and forehead. He testified that the scarred area feels as though it has been deadened with Novocain.

Claimant attempted to return to work and was able to drive a truck for eight hours one day and six the next. Then he decided he could not handle working. On the day of hearing he drove from Tipton to Davenport. He claimed that he never drives for more than one hour.

Doctor's notes show claimant was seen on November 11, 1981 with a severe trauma to the periorbital tissues with a traumatic myriasis of the right eye. A surgeon's report indicates multiple severe facial lacerations, multiple rib fractures, abrasions and contusions of chest, blunt chest trauma, and a right hemithorax.

Claimant's visual acuity on November 30, 1981 was 20/60 on the right and 20/30 on the left.

William B. Hofmann, M.D., ophthalmologist, reported claimant's visual acuity on February 25, 1982 as 20/30- on the right and 20/25- on the left. On May 26, 1982 the doctor wrote that claimant was unable to see out of his right eye because of a ptosis of the right upper lid.

J. M. Syverud, M.D., saw claimant on February 25, 1982 at which time claimant had residual edema of the right periorbital

region, ptosis of the upper eyelid, and nearly complete paralysis of the obicularis oculi. Scars to the upper lip, nose, cheek and forehead were not expected to cause any functional disability.

When claimant was seen on May 13, 1982 motor control was returning to the forehead and obicularis.

Dr. Hofmann referred claimant to the University of Iowa. Examination there showed claimant's medial and lateral canthus were displaced inferiorly and the ptosis of the right eye remained. Claimant's visual acuity was 20/40 on the right and 20/15 on the left. Claimant had diplopia in all fields except down where he was ortho. Impressions were multiple scars, lateral canthal malposition and lower lid ectropion, ptosis and redundant scarred tissues of the right eyelid, strabismus, blockage of the lower canalicular system, infraorbital anesthesia, right globe ptosis, a right enophthalmos and right brow ptosis.

Claimant was to be scheduled for a levator advancement of the right upper lid, right lateral canthoplasty and debulking of the upper lid.

A tarsal strip procedure, levator advancement and upper lid reconstruction with blepharoplasty were done on December 13, 1982.

Claimant was seen by neuro-ophthalmology on January 25, 1983. A traumatic mydriasis was seen. Claimant's visual acuity without correction was 20/60 on the right and 20/30+3 on the left. With refraction his vision was 20/40 on the right and 20/20 on the left.

Claimant returned on May 12, 1983 at which time his vision was 20/40+1 on the right and 20/25-1 on the left. Diplopia was unchanged. Tear function was decreased on the right. Claimant had mild exposure keratitis on the inferior cornea.

In a letter dated June 13, 1983 Dr. Anderson expressed doubt that claimant could return to commercial truck driving requiring binocular single vision.

William E. Scott, M.D., reported seeing claimant on June 24, 1983 at which time his vision with correction was 20/50 on the right and 25/15 in the left. Claimant's right eye was lower than the left.

In a letter dated October 21, 1983, Dr. Anderson suggested that claimant could wear a patch over his affected eye to block out his double vision.

H. Pressman, M.D., reported Dr. Scott's surgery in October as a left inferior oblique recission of 10 mm. and a left superior rectus recission of 3.5 mm. On November 1, 1983 claimant's vision was 20/50 and 20/20 without correction. He had single binocular vision on down, up and left gaze with a small amount of right hypotropia in the primary position. Double vision remained in right gaze and primary position. No restrictions were placed on claimant's working abilities.

On March 28, 1984 claimant underwent a levator advancement of the right upper lid for ptosis. The right lower lid was raised as well. After surgery claimant's lid fissure on the right was 9 mm; on the left 13 mm. A drop of the left eyelid was suggested to make claimant look more symmetrical. Dr. Anderson proposed in a letter dated May 16, 1984 that claimant would have to use artificial tears and ointment on a permanent basis. The doctor noted continued irritation of the right eye, loss of tear production due to injury to the lacrimal gland and tear producing structures in the eyelid, a failure of the lid to open and close completely and decreased eye movement.

Dr. Scott's letter of April 18, 1984 states that claimant has sustained no permanent impairment.

APPLICABLE LAW AND ANALYSIS

The first issue to be discussed is claimant's entitlement to further healing period benefits. He has been paid healing period from November 11, 1981 through November 1, 1983. Claimant requests that additional time be allowed after his October 1983 surgery.

In his letter of August 9, 1983 Dr. Scott explained that claimant's surgery had been booked for October 27, 1983 with postoperative visits at one and three weeks with later visits spaced further apart. Dr. Pressman's letter of November 21, 1983 written in Dr. Scott's behalf reports claimant's still having double vision in right gaze and primary position when he was seen on November 1, 1983. Dr. Pressman wrote: "This should get better in time." Dr. Scott's letter of January 16, 1984 indicates claimant's healing is stable at that point. Claimant's own testimony was that he improved for an additional six to eight weeks. Dr. Pressman's letter of November 21, 1983 anticipated further healing period. Dr. Scott's letter of January 16, 1984 concludes healing is accomplished. Claimant will be awarded a seven week healing period from October 27, 1983. Healing period will be concluded on December 15, 1983.

There is nothing in the record which shows claimant to be entitled to further healing period relating to his most recent outpatient surgery.

The next issue to be addressed is claimant's entitlement to permanent partial disability benefits.

Iowa Code section 85.34(2)(p) provides: "For the loss of an eye, weekly compensation during one hundred forty weeks." Iowa Code section 85.34(2)(t) states:

> For permanent disfigurement of the face or head which shall impair the future usefulness and earnings of the employee in his occupation at the time of receiving the injury, weekly compensation, for such period as may be determined by the industrial commissioner according to the severity of the disfigurement, but not to exceed one hundred fifty weeks.

The right of a worker to receive compensation for injuries sustained which arose out of and in the course of employment is statutory. The statute conferring this right can also fix the amount of compensation to be paid for different specific injuries, and the employee is not entitled to compensation except as provided by the statute. Soukup v. Shores Co., 222 Iowa 272, 268 N.W. 598 (1936).

That a worker sustaining one of the injuries for which specific compensation is provided under the statute might, because of such injury, be unable to resume employment and because of his lack of education or experience or physical strength or ability, might be unable to obtain other employment, does not entitle him to be classed as totally and permanently disabled. Id. at 278, 268 N.W. 598.

Where the result of an injury causes the loss of a foot, or eye, etc., the loss, together with its ensuing natural results upon the body, is a permanent partial disability and is entitled only to the prescribed compensation. Barton v. Nevada Poultry Co., 253 Iowa 285, 290, 110 N.W.2d 660 (1961). The schedule fixed by the legislature includes compensation for resulting reduced capacity to labor and earning power. Schell v. Central Engineering Co., 232 Iowa 424, 425, 4 N.W.2d 339 (1942). The claimant has the burden of showing that his ailment extends beyond the scheduled loss. Kellogg v. Shute and Lewis Coal Co., 256 Iowa 1257, 130 N.W.2d 667 (1964).

Larson in 2 Workmen's Compensation, §58 at 10-28 (Desk ed. 1976) discusses the nature of scheduled benefits and points out that "payments are not dependent on actual wage loss" and that they are not "an erratic deviation from the underlying principle of compensation law--that benefits relate to loss of earning capacity and not to physical injury as such." The theory, according to Larson, is unchanged with the only difference being that "the effect on earning capacity is a conclusively presumed one, instead of a specifically proved one based on the individual's actual wage-loss experience."

The Iowa Supreme Court recently has reaffirmed the concept of scheduled member injuries in Graves v. Eagle Iron Works, 331 N.W.2d 116 (Iowa 1983).

The matter of claimant's entitlement to any benefits under 85.34(2)(t) will be considered first. Dr. Syverud anticipated no functional disability attributable to scarring. Claimant testified to loss of sensation in the scarred area. He made no claim of difficulty caused by such things as heat or cold. Claimant's scarring is extensive, but it is not at all repulsive. The statute speaks of impairment of future usefulness and earnings in the occupation at the time of injury. No impairment of claimant's usefulness and earnings as a construction truck driver can be found attributable to his scarring.

On the other hand, claimant does have permanent impairment to his eye. None of his physicians have provided a specific numerical assessment, but that does not prohibit an award in a case such as this. Kostohryz v. Lake Center Industries, III Iowa Industrial Commissioner Report 161 (1982).

Claimant denied trouble with his eye prior to his accident. He had a severe traumatic injury. His healing period has been long. He continues to be troubled by some remaining double vision. He uses ointment and artificial tears. He has irritation, an inablilty to close his right eye as tightly or open it as wide as his left and a loss of mobility.

Dr. Scott finds no impairment to claimant's eye. Dr. Scott saw claimant and did surgery to correct his double vision. His surgery, according to claimant, did go a long way toward correcting the diplopia and perhaps claimant has no impairment from the condition for which Dr. Scott saw him.

Dr. Anderson treated claimant's condition in a more general way. His most recent letter points to several persistent problems which must be endured by claimant. He will require artificial tears and ointment on a permanent basis. He has recurrent irritation of his eye. His tear producing system and his drainage system have been damaged. He has decreased eye movement. His right eye will not open and close in the same matter as the left. His fissure on the right is 9 mm. as opposed to 13 mm. on the left.

Claimant is found to have an impairment to his right eye of forty percent which entitles him to fifty-six weeks of permanent partial disability benefits.

WHEREFORE, IT IS FOUND:

That claimant was employed as a cement truck driver in heavy road work for five years prior to November 10, 1981.

That claimant was injured on November 10, 1981 when he had an accident with a cement truck.

That as a result of his accident claimant had multiple severe facial lacerations, multiple rib fractures, abrasions and contusions of the chest, blunt chest trauma and a right hemithorax

That following claimant's accident he had decreased visual acuity, diplopia, a ptosis of the right upper lid, paralysis of the obicularis oculi, enophthalmos and blockage of his lower tear ducts.

That claimant had corrective surgery on December 13, 1982.

That claimant had surgery by Dr. Scott to align his eyes and to decrease his double vision.

That claimant had a third surgery on March 25, 1984.

That claimant's injury has resulted in permanent impairment to his eyes.

That claimant has numbness in the scarred area of his face.

That claimant's scarring does not impair his future usefulness and earnings as a truck driver in heavy road work.

That claimant continues to have double vision, redness, pain, loss of mobility and irritation with his right eye.

That claimant continues to use ointment and artificial tears.

That the ointment causes blurring of claimant's vision.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has established entitlement to additional healing period benefits.

That claimant has established entitlement to fifty-six (56) weeks of permanent partial disability based on a forty percent (40%) impairment to his right eye.

ORDER

THEREFORE, IT IS ORDERED:

That defendants pay unto claimant additional healing period benefits from November 1, 1983 to December 15, 1983.

That defendants pay unto claimant permanent partial disability benefits for fifty-six (56) weeks at a rate of three hundred twelve and 28/100 dollars ($312.28) commencing on December 16, 1983.

That defendants be given credit for amounts previously paid.

That defendants pay interest pursuant to Iowa Code section 85.30.

That defendants pay costs pursuant to Industrial Commissioner Rule 500-4.33.

That defendants file a final report when this award is paid.

Signed and filed this 6 day of July, 1984.

FILED
AUG 21 1984
IOWA INDUSTRIAL COMMISSIONER

By order of the industrial commissioner filed January 17, 1984 the undersigned deputy industrial commissioner has been appointed under the provisions of §86.3, Code of Iowa, to issue the final agency decision on appeal in this matter.

Defendant appeals from an adverse review-reopening decision.

The record consists of the transcript; the deposition of Robert P. Dinapoli, M.D.; claimant's exhibits 1 through 33 plus certain exhibits which were transmitted with Mr. Roberts' letter of September 30, 1983 to the hearing deputy, all of which evidence was considered in reaching this final agency decision. The last-referred to evidence consists of an admission summary sheet and enclosures of August 27, 1974; a discharge summary and attachments of December 26, 1974; an admission-summary sheet and enclosures of October 22, 1976; an admission-summary sheet of November 7, 1977; an outpatient and emergency record of July 25, 1978; an admission-summary sheet of July 25, 1978; an admission-summary sheet of January 20, 1979; an outpatient and emergency record of January 31, 1979; an admission-summary sheet of July 2, 1979; and a report of Thomas R. Karlowski, M.D., dated April 11, 1983.

The outcome of this final agency decision will be the same as that reached in the review-reopening decision.

ISSUES

The review-reopening decision granted benefits for permanent and total disability under §85.34(3) unto claimant at the rate of $207.38.

Although the issues on appeal are stated by neither party in their briefs, those issues are taken to be (1) whether or not there is a causal relationship between the injury and claimant's alleged disability, and if so (2) the extent of that disability.

EVIDENCE PRESENTED

The review-reopening decision contained a very thorough review of the facts. Those facts, of course, were interpreted in that decision to mean that there did indeed exist a causal relationship between the injury and the disability and that the disability was permanent and total. Briefly, the evidence showed claimant sustained an electrical shock while at a machine at work. Although defendant filed a memorandum of agreement, it questions the fact that the shock ever occurred, and suggests that claimant's problem (extensive tremors) came from being struck by lightning in 1974. Although all of the evidence was considered by the original hearing deputy, some of it which was not summarized in the review-reopening decision will be discussed here. Defendant argues in its brief that the accident may not have occurred as claimant states (an electric shock). Also, defendant argues that claimant's condition (severe tremors) preexisted the injury. The matters summarized below have been abstracted in light of those arguments as well as others by defendant.

A hospital admission-summary of August 27, 1974 shows claimant was treated for right arm pain and disability secondary to a lightning strike. Claimant was discharged as improved. There was no indication of any tremors. A discharge summary of December 26, 1974 shows claimant had been admitted for syncopal (temporary loss of consciousness) episodes, peripheral neuropathy, and a traumatized external auditory canal. There was no mention of any tremors. Claimant responded well to symptomatic care and was released. An admission-summary of July 22, 1976 showed claimant had acute liver dysfunction and acute hepititis. The extremities showed a full range of motion without tenderness or deformity.

An admission-summary of November 7, 1977 shows claimant was admitted for an acute back strain and responded well to symptomatic care. There was no remark concerning the extremities. An outpatient record of July 25, 1978 shows claimant was treated for a scalp laceration. Then, claimant was admitted to the hospital for that injury which was finally diagnosed as a cerebral concussion. He was discharged as improved, and an examination of the extremities showed a full range of motion without tenderness or deformity.

An admission-summary of January 20, 1979 showed a diagnosis of a back strain and that claimant was discharged as improved. The examination of the extremities showed "[f]ull range of motion of the extremities; actively on the upper extremities and passively on the lower extremities." An outpatient record of January 31, 1979 shows claimant was treated for an acute back

strain. On July 2, 1979, claimant was admitted to the hospital, and the admission-summary showed he had a hematemesis (vomiting material containing blood) and external otitis (inflammation of the ear). He responded well to symptomatic care and was discharged. The examination of the extremities showed a full range of motion without pain.

Finally, claimant was examined by Thomas R. Karlowski, M.D., an internist, who stated in part as follows:

> After reviewing all of these documents and also being informed; that is, co-workers date the onset of his tremor to the late 1960s and to the fact that he has been, because of these tremors, handicapped job for 15 years preceding the onset of his electrical shock accident and because of these tremors not able to use a knife even before the onset of his accident.
>
> If this indeed has been the case, one would seriously have to question whether his disability was caused by his electrical shock that he received while working at Rath and seriously entertain the notion brought up by Dr. Denoply [sic] that this was caused by Parkinsinism [sic] which had its onset much before the electrical shock.

APPLICABLE LAW

The applicable law recited in the review-reopening decision is sufficient and is adopted herein.

ANALYSIS

As the review-reopening decision showed, there can be no dispute but that claimant received a rather severe electrical shock: Claimant himself, as well as eye witnesses, testified to the shock, and he was treated for electrical shock. Also, there is no evidence to the contrary. Therefore, it is concluded that claimant's injury indeed was caused by electrical shock.

Further, there is very little doubt that the cause of claimant's present condition is related to the shock. Defendant claims claimant had preexisting tremors, but the lay evidence in that regard is meager. Also, the extensive medical evidence available to the undersigned deputy industrial commissioner shows that no such tremors appeared to have been medically observed prior to December 10, 1979. One concludes, therefore, that there is a causal connection between the electrical shock and claimant's tremors.

Defendant also claims that claimant's credibility is undermined by his refusal to admit his drinking problems. It is true that the hospital records made at the time of claimant's admittance because of the injury, show a significant history of alcohol abuse. Although claimant's persistent denials of excessive drinking might lower his credibility somewhat, the loss of credibility seems trivial when compared to his obvious injury-related problems, the retailing of which are not really in question. Therefore, it is concluded that claimant's refusal to admit alcohol abuse really plays no part in the outcome of this case.

Otherwise, the analysis found in the review-reopening decision is sufficient and is adopted herein. Likewise, the findings of fact, conclusion of law and order are adopted herein.

FINDINGS OF FACT

That on December 10, 1979 the claimant was an employee of Rath Packing Company.

That on December 10, 1979 the claimant sustained a severe electrical shock which both arose out of and in the course of his employment at Rath Packing Company.

That the claimant has not worked since December 10, 1979.

That prior to the date of injury the claimant experienced an extremely mild occasional shaking of his upper extremities.

That prior to December 10, 1979 the claimant was consistently able to perform his work functions for the employer without restriction or disability.

That claimant has been employed by the Rath Packing Company since 1956.

That claimant has been a productive individual for Rath Packing Company since that date.

That immediately after sustaining the electrical shock claimant experienced an onset of upper extremity tremors bilaterally from which he has continued to suffer from the date of hearing.

That there exists a causal relationship between the electrical shock and the onset of the tremors.

That the claimant has not worked since the date of injury.

That the claimant is permanently and totally disabled.

CONCLUSION OF LAW

That the claimant has sustained his burden of proof and has established a causal relationship between the injury of December 10, 1979 and the resulting disability.

ORDER

THEREFORE, IT IS ORDERED that the employer shall pay unto claimant disability benefits at the stipulated rate of two hundred seven and 38/100 dollars ($207.38) from the date of injury, December 10, 1979, during the period of the employee's disability as that term is contemplated under section 85.34(3) of the Code.

That the employer is given credit for all benefits previously paid.

That the employer shall reimburse the claimant for mileage charges for one thousand four hundred forty-four (1,444) miles at twenty-two cents ($.22) per mile, for a total of three hundred seventeen and 68/100 dollars ($317.68).

That interest shall accrue from November 3, 1983 pursuant to the terms of section 85.30 of the Code.

That the costs of this action are taxed to the defendant pursuant to Industrial Commissioner Rule 500-4.33.

That the employer shall file an activity report upon payment of this award.

Signed and filed this 21st day of August, 1984.

IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in review-reopening brought by Richard Dewald, the claimant, against his employer, Rath Packing Company, a self-insured employer, to recover additional benefits under the Iowa Workers' Compensation Act as a result of an injury he sustained on December 10, 1979.

This matter came on for hearing before the undersigned deputy industrial commissioner at the Black Hawk County Courthouse in Waterloo, Iowa on April 12, 1983. The record was considered fully submitted on August 23, 1983.

An examination of the industrial commissioner's file indicates that a first report of injury was filed on December 14, 1979. A memorandum of agreement was filed on December 21, 1979. A Form 2A on file indicates the amount of compensation benefits paid to the claimant.

The record in this case consists of the testimony of Tom Eldridge, Lawrence Fenner, Irvin Weber, Richard Dewald, Arlene Patava, Robert Bergman, Dave Sturm, Tom Dewald, Delores Dewald, Duane Raymaker, Orville Kroenecke, Floyd Cox, Lawrence Franzen; the depositions of Robert P. Dinapoli, M.D., Robert L. Downie, M.D., Ronald R. Roth, M.D., Ezio Panegos, M.D., Jesse C. Yap, M.D.; and claimant's exhibits 1 through 33.

ISSUES

The issues to be resolved in this proceeding are whether there exists a causal relationship between the injury and the resulting disability, as well as the extent of that disability. There is no issue of healing period.

REVIEW OF THE EVIDENCE

At the time of hearing the parties stipulated that the applicable rate in the event of an award is $207.38. Additionally, the parties stipulated that any medical bills involved in this proceeding are fair and reasonable.

Tom Eldridge, a Rath employee for 31 years, testified on behalf of the claimant in this proceeding. He has known the claimant for ten or fifteen years. He worked in close proximity with the claimant on December 10, 1979, the date of injury in this proceeding.

On the date of injury claimant was cutting skin off of fat backs. This witness indicated that this work requires the use of the hands.

This witness has observed the claimant post-injury and has observed the continuous shaking of his hands and arms. Mr. Eldridge indicated that the claimant did not have this disorder prior to the date of injury.

This witness recited the facts surrounding the claimant's injury. From his testimony it appears on December 10, 1979 a piece of machinery in the vicinity of the claimant stopped functioning. As the particular machine in question was being replaced and a new one installed meat product began falling off the conveyor line. Mr. Dewald climbed up to move a shute so that the product would not go on the floor, and during this process he was electrocuted. Immediately upon electrocution, this witness observed that the claimant's arms were shaking very badly. Claimant was taken by stretcher to the company nurse. The nurse requested that some of claimant's clothing be removed so that she could determine if he had been burned. This witness indicated that it took two employees to remove the claimant's clothing because he was shaking so badly. This witness has observed the claimant post-injury and indicated that his arms are probably shaking worse now than they were on the date of injury. This witness is of the opinion that claimant could not go back to his former type of employment.

This witness acknowledged on cross-examination that he was aware that claimant drank. He acknowledged that two or three days a week the claimant would smell as if he had been drinking beer. This witness, however, was not aware that claimant had a drinking problem.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

Lawrence Fenner, of Jessup, Iowa, testified in these proceedings on behalf of the claimant. Mr. Fenner is a farmer and barber by trade. The claimant is one of his barbering customers and has been so for 23 years. As a consequence, he has had the opportunity to visit with the claimant and see him at least once a month over that period of time. This witness indicated that prior to the date of injury the claimant's hands and arms did not shake.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

Irvin Weber, a Rath Packing Company employee since 1979, testified on behalf of the claimant. He is acquainted with the claimant through their working relationship. Claimant broke this witness in on the pork cut trim job. This witness had the opportunity to work with claimant for a week and to observe him during that period of time. This witness indicated that prior to the date of injury, the claimant's hands and arms did not shake.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

The claimant, Richard Dewald, testified in these proceedings. Mr. Dewald is 52 years of age, married, and the father of four children. He is a resident of Jessup, Iowa.

The testimony reveals that he has a high school education but no special training in any given field.

His employment history indicated that post-high school he has worked as a mechanic and served two years in the armed forces. This witness began his employment relationship with Rath Packing in 1956. The testimony reveals that he has performed a variety of jobs for Rath Packing. Many of these positions required the claimant to use various knives. This witness testified at length concerning the requirements of keeping up with the production line. He indicated that he never had any difficulty keeping up with the conveyor.

Claimant recited the facts of the injury which occurred December 10, 1979. He confirmed earlier testimony that certain machinery was being changed and in the process the claimant climbed up to move a shute and received an electrical jolt. Claimant indicated that he received "a long jolt."

Mr. Dewald indicated that prior to the date of injury he did not have any tremors. He did not have any shaking of his arms or hands. He also confirmed that prior to the date of injury other employees had received shocks off the machinery in question.

Claimant's present complaints include continuous headaches and continuous shaking of his arms and hands. He has also noted a continuous ringing in his ears. He has a loss of grip strength bilaterally. This witness confirmed that he only wears boots now as he is unable to tie his shoes. It takes a long time, according to him, to get dressed because of the tremors in his arms and hands. He has difficulty writing. He notes difficulty in eating. He has also experienced difficulty in sleeping.

He confirmed that his hands and arms do not stop shaking. He is presently on medication and under the care of Dr. Roth.

The testimony indicated that prior to the date of injury the claimant was also able to do certain electrical work and small engine repair. He has also held a variety of other part-time jobs. Post-injury, he has attempted to do small engine repair but has been unable to do so because of the tremors. He also cannot do the plumbing and electrical work he did before.

This witness confirmed that in 1974 he was struck by lightning while leaving work. His right arm became paralyzed for a two week period, but the paralysis then dissipated. Mr. Dewald indicated that he fully recovered from this incident and was able to go back to his work doing his regular job. There were no tremors or shaking as a consequence.

Mr. Dewald denied that he was ever in a detoxification center. He also denied that he ever was told that he was an alcoholic. The claimant also denied that prior to the date of injury he was ever sent home for drinking. He further denied that he ever missed any work due to alcohol.

This witness has not tried to secure a position after the date of injury. He is not aware of anyone who would want to hire him.

On cross-examination, this witness indicated that he is only a social drinker. He again denied ever being detoxified and was not in a hospital for detoxification. He further denied that he has cirrhosis of the liver. He denied that anyone has advised him not to drink, and he denied giving history to a physician of alcoholism.

This witness confirmed that he has not worked since December 1979. He indicated that post-injury his morale has improved. He has been able to face his problems. He denied having any hand or arm tremors prior to the date of injury.

This witness was transferred off the kill floor because of an inability to do the work. He indicated that he was moved from the kill floor so that a woman might be put in his job. He denied being removed from that position because of shaking.

Mr. Dewald denied telling any physician that he was not examined at the Mayo Clinic. On redirect examination, he indicated that he was never advised in June 1980 that he was released to return to work. He indicated that since the date of injury the employer never contacted him in regard to a job. He indicated that he is unable to control his shaking.

The claimant undertook a demonstration of attempting to put his finger on his nose, and it is very evident that his tremors both in the arms and in the hands are indeed severe.

Arlene Patava, a Rath employee, testified in these proceedings on behalf of the claimant. This witness worked in the same department as the claimant. She confirmed the facts of the incident under discussion. She confirmed that claimant was observed by her lying on the floor on his back with his arms shaking badly after the electrocution. This witness worked with the claimant two years prior to the date of injury and confirmed that he did not shake prior to the date of the incident. She indicated that claimant could not have done the job he was performing for the employer if he was experiencing tremors. She has never known the claimant to come to work intoxicated and indicated that he never missed any work.

This witness indicated that in the job claimant was performing the individual must keep up with the conveyor line. She indicated that the work takes steady hands. She reiterated that the claimant has always been able to do this job.

On cross-examination, this witness indicated that she has never observed the claimant as though he had been drinking.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

Robert Bergman, a John Deere employee, testified on behalf of the claimant. This witness indicated that he has known the claimant for 25 years. He had been in the claimant's home on many occasions. He has had the opportunity to observe the claimant working on cars and engines prior to the date of injury. This witness indicated that prior to the incident, December 10, 1979, the claimant's hands and arms did not shake. He had no problem gripping. This witness denied that he ever saw the claimant intoxicated.

On cross-examination, this witness denied that claimant is an alcoholic. He does not know if claimant has ever been detoxified.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

Dave Sturm, a resident of Jessup, Iowa, testified on behalf of the claimant. This individual is married to the claimant's

daughter. He has known the claimant since at least 1977 and has seen him on a regular basis since that date. He indicated that claimant did not shake prior to the date of injury. This witness indicated that prior to the date of injury the claimant was always fixing or tinkering with some mechanical device at home. He indicated that the claimant had no problems in gripping. He denied seeing the claimant intoxicated at any time, although has seen him take an occasional beer. Post-injury, this witness has been in the claimant's home and has observed him. He confirmed that the claimant has a loss of grip and shakes on a continuous basis.

On cross-examination, this witness indicated that he did not know if claimant had been hospitalized for detoxification or alcoholism.

Tom Dewald testified in these proceedings. Prior to the date of injury this witness saw the claimant three or four times per week. He confirmed that the claimant did not shake in his hands or arms. Post-injury, he confirmed that the claimant shakes continually and is unable to use his hands. He confirmed the difficulties the claimant has in eating and dressing himself.

On cross-examination, this witness conceded that he was never aware that claimant had been treated for alcoholism or various alcohol-related difficulties.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

Delores Dewald, the claimant's spouse of 32 years, testified on his behalf. She indicated that prior to the date of injury the claimant was in good physical condition. She further advised that the claimant was never told that he was an alcoholic. She denied that claimant ever missed work because of drinking.

She noted that prior to the date of injury the claimant did not have shaking or tremors. Post-injury, she re-confirmed that claimant has continuous tremors as well as headaches, and is unable to do virtually any activity. This witness indicated that the claimant is dependent upon her to drive him to various places. She re-confirmed that the tremors last 24 hours a day and prohibit claimant from sleeping soundly. She reaffirmed that he is on medication.

On cross-examination, this witness reiterated that she did not advise the physicians the claimant was an alcoholic. She denied that he was ever hospitalized for alcoholism.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

Duane Raymaker testified in these proceedings on behalf of the defense. He is 55 years of age and is a supervisor at the Rath Packing Company. He has been supervisor since 1967 and with Rath since 1954.

On the date of injury this witness was the general supervisor. He had no specific involvement with the claimant on that date. He confirmed that he has known the claimant for a long period of time and admitted that claimant once worked for him on the second shift. This witness indicated that the work claimant performed was usually of a lighter nature because of his short stature. This witness thought that the claimant drank occasionally and thought that he might have seen evidence of this in claimant's work. Prior to the date of injury claimant appeared very nervous according to this witness. He indicated that claimant shook somewhat. He conceded, however, that claimant shakes far worse today.

On cross-examination, this witness conceded that when claimant worked under this witness' supervision he was able to perform his job. He confirmed that claimant was never sent home for drinking or for not performing his work properly. He reiterated that the claimant's prior nervous condition is not as bad as his present situation.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

Orval Kroneneke testified in these proceedings. Mr. Kroneneke is 48 years of age and has spent the last 29 years in the employ of Rath Packing. Six years ago he was promoted to the position of foreman in the sanitation and eventually in the hog cut area. This witness confirmed that the claimant worked under his supervision in the hog cut area prior to the date of injury. This witness indicated that the claimant did light work in the hog cut area. Some of the jobs the claimant performed were handicap jobs. This witness indicated that the fat back job the claimant was performing on the date of injury was considered light work.

This witness indicated that on a couple of occasions he smelled beer or liquor on the claimant. This witness also indicated that prior to the date of injury he noticed the claimant's hands trembled on occasion. This witness felt that this trembling, however, was probably caused from the claimant's drinking. He conceded, however, that this trembling did not affect the claimant's work. This witness did not avoid putting claimant on various jobs because of the shaking. He re-confirmed that the claimant was able to do light work. He further confirmed that the claimant did not shake on a continuous basis.

On cross-examination, this witness conceded that the claimant was never classified as a handicapped worker. He further confirmed that the claimant was never suspended for drinking, nor was he sent home for being inebriated. He confirmed that the employer never recalled the claimant to work. He also conceded that in the claimant's present condition he would not be able to do the fat back trim job.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

Floyd Cox, an employee of Rath Packing for 29 years, testified on behalf of the defense. He has been the supervisor of the hog kill since 1971. He has known the claimant for 20 years. The record reveals that the claimant has worked for this witness in two areas of the plant. At one point in time claimant tried to break into a new job and had to prove his abilities to do the work. This witness indicated that the claimant was unable to do the work because his hands trembled so badly that he could not hold the knife.

On cross-examination, this witness conceded that the claimant did not shake as badly then as he does today.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

Lawrence Franzen, a supervisor at Rath Packing since 1974, testified on behalf of the defense. He has known the claimant since 1955 and on the date of injury was claimant's supervisor. This witness has seen claimant on a daily basis and confirmed the claimant's description of the job he was performing.

This witness indicated that claimant had been assigned to various jobs but was unable to perform them because of his shaking. Specifically, the claimant was unable to trim jowls and use a knife in the process. This witness conceded that jowl trimming requires precision cut. Claimant was subsequently transferred to the fat back cut area, which does not require the precision. This witness observed the claimant shaking while doing the fat back job. He is unable to state whether the claimant is shaking more or less now. This witness has also smelled liquor on the claimant.

On cross-examination, this witness conceded that claimant had never been sent home because of the drinking.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

Ezio Panegos, M.D., an anesthesiologist, with an interest in chronic pain, was deposed in conjunction with this case. Dr. Panegos first examined the claimant on February 9, 1981.

Claimant had been referred to him by Dr. Piburn. On the initial examination, claimant complained of severe headaches. This witness indicated that after the examination, "I soon realized that the headache was derived by continuous tremor of his upper extremities, which generated muscle spasm on the cervical region, thus resulting in continuous headache." After the initial examination a diagnosis of "tremor affecting the upper extremities following electrocution with muscle spasm of the cervical spine, resulting in tension headache." Treatment was undertaken but any success from the treatment was limited. This physician's involvement in the case was discontinued as of February 16, 1981, as he felt he had done all that he could do to help the claimant. This physician expressed the opinion that the electrical shock in question caused the condition for which he treated claimant. He is of the opinion that as of the last examination he conducted of the claimant, Mr. Dewald is totally disabled.

On cross-examination, this witness confirmed that he has had some experience in treating people with alcoholism. He confirmed that he has seen alcoholic tremors but not comparable or duplicated in the signs he observed of Mr. Dewald. It appears that this physician may be unsure of precisely what event caused the claimant's present problems, that is, to say whether it was the electrical shock or the fact that he landed on the cement floor on his head. This physician is not aware of precisely what head injuries may have been sustained. He indicated that he would defer to those physicians who examined and evaluated claimant with regard to the head situation. This witness is familiar with the fact that claimant had been struck with lightning. He again refers to those medical practitioners who treated claimant at the time of this incident with respect to any damage that had been done.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

Donald R. Roth, M.D., testified in these proceedings. He is specialized in the area of family practice and initially treated the claimant on February 16, 1981. This physician continued to treat claimant for a period of time. He then referred him to the department of neurology in Iowa City. He confirmed that claimant was examined in Iowa City in August 1981. His understanding of the Iowa City diagnosis is that claimant suffered an electrical shock which was followed by the development of bilateral upper extremity tremors. Based on the reports that this physician has seen, he has concluded that the claimant has "some sort of brain injury after an electrical shock which has led to tremors." This physician is of the opinion the claimant is totally disabled as a consequence of his tremors. This witness has treated people with Parkinson's disease and indicated the claimant does not exhibit the classic symptoms of a person

suffering from that malady.

On cross-examination, this physician conceded that he assumed that Mr. Dewald did not have tremors prior to the date of injury. If tremors were present prior to the date of the accident, he would assume that there may be another cause involved. He further indicated that if tremors followed the lightning strike, it may indicate that that injury is the cause of them. This witness conceded that alcoholics may also suffer from tremors. He indicated, however, that the tremors observed in the claimant are greater than would normally be expected. He conceded, however, that alcoholism could be a contributing factor in the severity of the tremors. This witness did not treat the claimant for alcoholism problems. He indicated, however, that if the history reflects the claimant has advanced liver disease it is an indication that he has a severe problem with alcoholism. This witness is unaware of the length of time that the electrical charge went through claimant or the severity of the charge. Also, this witness was not advised that the claimant had been struck by lightning on a previous occasion.

The balance of this witness' examination has been reviewed and considered in the final disposition of this case.

Robert L. Downie, M.D., testified in these proceedings. He is a specialist in internal medicine and employed in the emergency room of Allen Hospital. His first contact with the claimant was on December 13, 1979. Dr. Downie examined the claimant. The specific complaints at this time were neck pain and tremors. This physician expressed the opinion the electrical shock that claimant sustained caused neurological damage, which he feels is probably permanent in nature and which has lead to the tremors and his inability to work in his occupation. This witness continued to treat the claimant through December 30, 1980. He indicated that the claimant's condition has remained basically the same.

On cross-examination, it appears that this witness is aware that claimant exhibited some evidence of tremor prior to the date of injury. He confirmed that the extent of damage precipitated by an electrical shock has a connection with the amount of voltage and the length of exposure. This physician examined the claimant and indicated that there was no evidence of any kind of alcohol withdrawl as a precipitating cause of the claimant's problems. This physician noted that if the claimant had any form of preexisting tremor they clearly do not affect his ability to work. He also acknowledged that if the claimant had tremors before the date of injury they may not be the same type of tremors that he has now. The physician was then asked to assume that the claimant was just marginally able to perform his job immediately before the incident in question and that his hands shook so badly that he could hardly hold a knife. The physician indicated that he had not been led to believe that the claimant's tremors had been that severe prior to the date of injury. If they had been severe he notes that the electrical shock could make them worse or perhaps the claimant was no worse. This physician confirmed that it is the tremors which are primarily disabling the claimant at this time. This physician conducted a liver function test when he examined the claimant and that test revealed that the liver was functioning normally.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

Robert P. Dinapoli, M.D., testified in these proceedings. He is a board certified specialist in neurology and is practicing at St. Mary's Hospital in Rochester, Minnesota. He is also an assistant professor of neurology at the Mayo Medical School. This witness confirmed that he initially examined claimant on November 20, 1980 and diagnosed the claimant's problem as "Parkinsonism or Parkinson's disease." This witness described Parkinson's disease as "a disease of the central nervous system in which the patient loses fine motor control, develops a shaking tremor and experiences other changes of his motor system." All of these symptoms were observed in the claimant. This witness indicated that he sees people with Parkinson's disease on a regular basis, and in total has seen hundreds of people with this disease. He indicated that Parkinson's disease does not come on suddenly. It could, however, develop over a matter of days or weeks. This witness is aware that on the date of injury the claimant received an electrical shock and that he had to be forcibly removed from the machine in order to cut the current. This witness is aware claimant was struck by lightning on a previous occasion. This witness is aware of articles depicting a relationship between the onset of Parkinson's disease and an electrical shock injury. This physician indicated, however, that individuals who have experienced this onset receive severe electrical injuries which rendered them unconscious or comatose for a period of days, weeks or months. Based on the information available to his physician, he is of the opinion that the claimant's Parkinson's disease bears no relationship to his electrical injury in connection with his work or the lightning injury previously noted. This physician indicated there is no possible way a person could receive a shock and within a few seconds, or perhaps minutes, develop any symptoms of Parkinson's disease. He conceded that a history of alcoholism could be significant in that alcoholism will produce its own neurological sequelae. However, he does not see any connection between Parkinson's disease and alcohol.

This witness confirmed that he only examined the claimant on one occasion. He gave him some medication during the course of this examination and felt that the tremors were somewhat subsiding as a result of the medication. This physician concluded that the claimant had Parkinson's disease and that the electrical shock at work temporarily aggravated the situation. It appears from the cross-examination of this witness that many classic signs of Parkinson's disease were present in the claimant.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

Jesse C. Yap, M.D., testified in these proceedings. He is a specialist in the field of neurosurgery and particularly stereotaxy, which is a branch of neurosurgery and deals with the treatment of movement disorders, intractable pain, epilepsy, tumors, and cerebral palsy. This witness examined the claimant on April 28, 1981. The claimant's complaint on that date was tremors. An examination was conducted. It appears from the testimony that this physician has treated many thousands of people with Parkinson's disease. He indicated that the claimant's condition did not reveal any of the classics of Parkinson's disease. After examination of the claimant, this physician reached a diagnosis of "bilateral basal ganglia injury, associated with electrocution." The prognosis for this claimant, according to the physician, is that the condition will become permanent. Some surgery was discussed in order to rectify the situations but none has been carried out. It is hoped that the surgery might diminish the tremors but there are clear risks associated with the procedure. This physician expresses the opinion that claimant's tremors are probably secondary to the electrocution.

The balance of this witness' testimony has been reviewed and considered in the final disposition of this case.

The discharge summary from Schoitz Memorial Hospital, contained as part of plaintiff's exhibit 2 and completed by Dr. Downie, indicates:

> Basically his major problem has now been the continued tremor of his hands and shaking and some light headedness and headache and muscle pains over the back. It is felt that most of these are a spin-off of some neurologic damage done at the time of the DC voltage with nerve damage and in addition, the possibility of this superimposed upon some alcoholic neuropathy which may have been subacute until this voltage problem occurred.

The balance of the exhibits offered in conjunction with this case have been reviewed and considered in the final disposition of this matter.

APPLICABLE LAW

The supreme court of Iowa in Almquist v. Shenandoah Nurseries, 218 Iowa 724, 254 N.W. 35 (1934) at 731-32, discussed the definition of personal injury in workers' compensation cases as follows:

> While a personal injury does not include an occupational disease under the Workmen's Compensation Act, yet an injury to the health may be a personal injury. [Citations omitted.] Likewise a personal injury includes a disease resulting from an injury....The result of changes in the human body incident to the general processes of nature do not amount to a personal injury. This must follow, even though such natural change may come about because the life has been devoted to labor and hard work. Such result of those natural changes does not constitute a personal injury even though the same brings about impairment of health or the total or partial incapacity of the functions of the human body.
>
> ....
>
> A personal injury, contemplated by the Workmen's Compensation Law, obviously means an injury to the body, the impairment of health, or a disease, not excluded by the act, which comes about, not through the natural building up and tearing down of the human body, but because of a traumatic or other hurt or damage to the health or body of an employee. [Citations omitted.] The injury to the human body here contemplated must be something, whether an accident or not, that acts extraneously to the natural processes of nature, and thereby impairs the health, overcomes, injures, interrupts, or destroys some function of the body, or otherwise damages or injures a part or all of the body.

The claimant has the burden of proving by a preponderance of the evidence that the injury of December 10, 1979 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However,

the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128.

While a claimant is not entitled to compensation for the results of a preexisting injury or disease, the mere existence at the time of a subsequent injury is not a defense. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756, (1956). If the claimant had a preexisting condition or disability that is aggravated, accelerated, worsened or lighted up so that it results in disability, claimant is entitled to recover. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812, (1962).

When an aggravation occurs in the performance of an employer's work and a causal connection is established, claimant may recover to the extent of the impairment. Ziegler v. United States Gypsum Co., 252 Iowa 613, 620, 106 N.W.2d 591, (1960).

The Iowa Supreme Court cites, apparently with approval, the C.J.S. statement that the aggravation should be material if it is to be compensable. Yeager v. Firestone Tire & Rubber Co., 253 Iowa 369, 112 N.W.2d 299 (1961); 100 C.J.S. Workmen's Compensation §555(17)a.

Our supreme court has stated many times that a claimant may recover for a work connected aggravation of a preexisting condition. Almquist v. Shenandoah Nurseries, 218 Iowa 724, 254 N.W. 35 (1934). See also Auxier v. Woodward State Hosp. Sch., 266 N.W.2d 139 (Iowa 1978); Gosek v. Garmer and Stiles Co., 158 N.W.2d 731 (Iowa 1968); Barz v. Oler, 257 Iowa 508, 133 N.W.2d 704 (1965); Olson v. Goodyear Service Stores, 255 Iowa 1112, 125 N.W.2d 251 (1963); Yeager, 253 Iowa 369, 112 N.W.2d 299; Ziegler, 252 Iowa 613, 106 N.W.2d 591.

An employer takes an employee subject to any active or dormant health impairments, and a work connected injury which more than slightly aggravates the condition is considered to be a personal injury. Id. at 620 and cases cited.

An injury is the producing cause; the disability, however, is the result, and it is the result which is compensated. Barton v. Nevada Poultry Co., 253 Iowa 285, 110 N.W.2d 660 (1961); Dailey v. Pooley Lumber Co., 233 Iowa 758, 10 N.W.2d 569 (1943).

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson, 255 Iowa 1112, 1121, 125 N.W.2d 251.

ANALYSIS

It is undisputed that on the date of injury, December 10, 1979, the claimant was an employee of the defendant herein, Rath Packing. The commissioner's official record also reflects that a memorandum of agreement was filed in conjunction with this case. By that unilateral act the employer acknowledges that on the aforementioned date of injury, the claimant sustained a personal injury which both arose out of and in the course of his employment with them.

As recited in the issues section of this opinion, the issues to be resolved include causation and the extent of claimant's disability. In the final analysis, the causation issue is critical.

The record in this case reveals that the claimant has been a long time employee of Rath Packing. It appears that he commenced his employment relationship in 1956. The record establishes that this individual has performed a wide variety of functions for the employer.

It appears from the record that the claimant, due to his slight stature, may have been placed on what could be best described as light duty positions as compared with other jobs in the plant. The record is clear, however, that the position that claimant was filling on the date of injury required him to keep pace with the production line and required him to use a knife with some degree of speed and accuracy. The record would also reveal that the claimant also appears to have been doing an acceptable job in conjunction with the performance of his work. The record would also reflect that over the history of the claimant's employment relationship, he has been a good and productive employee. The argument that claimant was for some reason performing a handicap or light duty job has not swayed the undersigned in the final analysis of this case. The fact remains that on the December 10, 1979 the claimant was performing a work function for Rath Packing that if claimant did not perform someone else would be required to perform.

There has been additional testimony offered from this record concerning claimant's drinking and its possible effect on his present condition. The testimony is at variance concerning the severity of tremors that claimant may have experienced prior to the date of this injury. One witness indicated that he could not determine if claimant was shaking more or less at the date of hearing than he was prior to the date of injury. Based on the description of the work the claimant was performing on the date of injury, and based upon this witness' observation of the claimant at the time of hearing, the opinion of the undersigned is that this witness' testimony is without credibility and is rejected in total. It is the opinion of the undersigned that the claimant would not be able to hold a knife or use a knife with the tremors he was experiencing on the date of hearing.

The record taken as a whole leaves the undersigned to believe that the claimant may have had a mild non-debilitating tremor prior to the date of injury. The extent of this tremor is mild to almost nonexistent. The claimant's friends and family, who have observed him on a day-to-day basis, bolster this opinion. The fact also remains that the tremors must not have been too severe if they existed at all, because the employer permitted the claimant to work with a sharp knife cutting fat backs on the date of injury.

The medical testimony is at variance in this case. Some of the medical data indicates that the claimant suffers from Parkinson's disease. Other medical testimony indicates that there is a relationship between the electrical shock and the claimant's tremors. Dr. Downie indicates in his notes, contained as part of plaintiff's exhibit 2, that his impressions include:

> Trembling and shakiness with mild cerebellar signs probably due to DC voltage, primarily however with the weakness, ataxia and tremulousness in the upper extremities, probably due to nerve damage at the time of the electric shock, perhaps superimposed on an alcoholic neuropathy.

Four of the physicians who testified in this proceeding appeared to the undersigned to be basically consistent in their opinions that there exists a causal relationship between the electrical jolt which claimant received in the course of his employment and the tremors from which he now suffers. Particularly important in this connection is the testimony of co-workers that observed claimant immediately after the electrical shock and who stated that the tremors came on immediately. One witness testified difficulty in removing claimant's clothing immediately post-injury because of the tremors that he was experiencing.

The close proximity between the electrocution and the onset of the symptoms which claimant now suffers is very persuasive in the undersigned's mind.

Dr. Robert Dinapoli testified at length concerning the fact that he believes claimant has Parkinson's disease. He testified that the onset of Parkinson's disease is a gradual process. If the onset of Parkinson's disease is a gradual process, the undersigned is concerned how the claimant can go from a point of being able to do his job with knife in hand to being in a position where he is suffering gross tremors in the course of a few seconds.

The claimant was closely observed by the undersigned at the time of trial. He is found to be credible in his testimony. The undersigned closely observed the claimant's condition and noted that hands, arms and upper extremities bilaterally are in a constant state of uncontrollable motion.

The record establishes that the claimant is a high school graduate, having completed that course of education in 1949. He has had some jobs as a mechanic, but basically has been involved in the meat packing business since 1956. He has worked at a variety of jobs at Rath Packing during the course of his employment. Based upon this deputy's experience, and the numerous cases that have been tried and decided that involved the meat packing industry, the undersigned is of the opinion that claimant would never be able to return to that form of employment.

Taking into consideration the entire record as a whole, and after examining all of the testimony and considering all of the medical depositions and exhibits, the undersigned is of the opinion that the claimant is permanently and totally disabled as a direct consequence of the electrocution which occurred on December 10, 1979.

FINDINGS OF FACT

That on December 10, 1979 the claimant was an employee of Rath Packing Company.

That on December 10, 1979 the claimant sustained a severe electrical shock which both arose out of and in the course of his employment at Rath Packing Company.

That the claimant has not worked since December 10, 1979.

That prior to the date of injury the claimant experienced an extremely mild occasional shaking of his upper extremities.

That prior to December 10, 1979 the claimant was consistently able to perform his work functions for the employer without

restriction or disability.

That claimant has been employed by the Rath Packing Company since 1956.

That claimant has been a productive individual for Rath Packing Company since that date.

That immediately after sustaining the electrical shock claimant experienced an onset of upper extremity tremors bilaterally from which he has continued to suffer from the date of hearing.

That there exists a causal relationship between the electrical shock and the onset of the tremors.

That the claimant has not worked since the date of injury.

That the claimant is permanently and totally disabled.

CONCLUSIONS OF LAW

That the claimant has sustained his burden of proof and has established a causal relationship between the injury of December 10, 1979 and the resulting disability.

ORDER

THEREFORE, IT IS ORDERED that the employer shall pay unto claimant disability benefits at the stipulated rate of two hundred seven dollars and 38/100 dollars ($207.38) from the date of injury, December 10, 1979, during the period of the employee's disability as that term is contemplated under section 85.34(3) of the Code.

That the employer is given credit for all benefits previously paid.

That the employer shall reimburse the claimant for mileage charges for one thousand four hundred forty-four (1,444) miles at twenty-two cents (.22) per mile, for a total of three hundred seventeen and 68/100 dollrs ($317.68).

That interest shall accrue from the date of this decision pursuant to the terms of section 85.30 of the Code.

That the costs of this action are taxed to the defendant pursuant to Industrial Commissioner Rule 500-4.33.

That the employer shall file a final report upon payment of this award.

Signed and filed this 3 day of November, 1983.

INTRODUCTION

This matter came on for hearing at the Juvenile Court Facility in Cedar Rapids, Iowa on November 18, 1983, when the record was closed.

A review of the commissioner's file reveals that an employers first report of injury was filed on February 4, 1980 along with a memorandum of agreement calling for the payment of $251.87 in weekly compensation. A final report was also filed February 4, 1980 indicating that claimant had been paid seven weeks of temporary total disability compensation representing the period of October 5, 1979 through November 22, 1979.

The record consists of the testimony of the claimant, Craig Levetzow, and Mike Gantt; claimant's exhibits 1 through 12; defendants' exhibits A through E; and an additional exhibit (medical bill) filed November 24, 1983 (filed as exhibit 10A).

ISSUES

The issues for resolution are:

1) Whether there is a causal connection between the injury and the disability;

2) The nature and extent of disability; and

3) Whether certain medical expenses were incurred as a result of injury.

STATEMENT OF THE EVIDENCE

Claimant, presently age 40, was employed by defendant employer in October 1979. He testified that he first became employed by Ruan at Buffalo, Iowa in 1976. At that time he was employed to haul ready-mix around the midwest. Sometimes the cement was bagged and unloaded by hand.

Claimant testified that his prior employment consisted of the army, a glass company and a bread company. When claimant was in the army he drove a semi and obtained a GED. When claimant was discharged, he became employed by Pittsburgh Plate Glass as a laborer. He was employed by Pittsburgh Plate Glass for three and one-half years before taking a job for a bakery as a laborer and straight truck driver. Claimant then became employed by defendant.

Claimant testified that he was injured on October 3, 1979. Claimant was unhooking a "hot" line and slipped and fell after losing his footing. He fell on the platform behind the truck, having fallen three or four feet. Claimant had grabbed a rack on the way down. Claimant testified that he hung by his right arm. His back struck the truck and his shoulder popped.

Claimant went ahead and finished the loading process and told the dispatcher that he was going home and that he hurt himself. Claimant started missing time.

Claimant saw William F. Holmberg, D.C., of Rock Island, on October 8, 1979, at which time he was complaining of lower back pain and extension of the pain into the right leg. Claimant also was complaining of neck pain and periodic headaches. Examination revealed a rigidity of the lumbar spine musculature, primarily on the right. Claimant had normal ankle jerk reflexes, left and right subjective pain and a positive right straight leg raising test. X-rays showed a slight lumbar spine curve and some narrowing of the disc space at L-5 and S-1. Diagnoses at that time was myofascial strain and sprain of the cervical and lumbar spine with neuromuscular spasm and right sciatica. Claimant continued to see Dr. Holmberg through November 12, 1979.

The record indicates that claimant returned to work on November 23, 1979 (see final report). Claimant testified that he had not injured his neck, back and shoulder prior to or subsequent to the injury. He testified that he did hurt his right hand after the injury and that he had some hemorrhoid trouble. Claimant testified that in October 1972 his lower back and shoulder started to ache. Claimant testified that the pain became worse and worse. Claimant last worked October 21, 1982.

Claimant returned to Dr. Holmberg for treatment. Dr. Holmberg's notes indicate that claimant had not recovered from the injury of 1979 and had gotten progressively worse. Examination on October 22, 1982 revealed normal achilles reflexes, pain on right straight leg raising, and pain on flexion and extension of the lumbar spine. X-rays showed little change from those taken three years earlier. Claimant was treated for about two weeks by Dr. Holmberg. Diagnoses were chronic and recurrent myofascial strain and sprain of the cervical and lumbar spine with neuromuscular sprain and right sciatica.

Claimant testified that he went to see William D. Reinwein, M.D., a Moline orthopedist, on November 3, 1982. Orthopedic and neurological examination revealed considerable paravertebral muscle spasm in the lumbar area. The movement of the lumbar area, active and passive, was markedly restricted due to generalized tenderness and pain on motion. Considerable impairment was noted at the L5-L4 level as well as L5-S1 where there was complete rigidity. There was sharp pain on deep palpation over the superior spine on the right, sciatic notch and sciatic points on the thigh and leg. Straight leg raising sign was 2+ at 45° on the right. Lasegue sign was positive at 60° on the right and was negative on the left. Naftziger was positive on the right with considerable exacerbation of pain and evidence of marked hamstring spasms. The achilles reflex was depressed on the right side and there was weakness of the extensor hallucis longus on the right with sensory change noted at L5 dermatome of the right leg.

Claimant was hospitalized and a myelogram was performed on November 8, 1982 which revealed a bulging disc at L5-L4 level. Further conservative management consisted of epidural injections and blocks of the facet joints as well as phonophoresis of the lumbar area. On December 1, 1982 a CT scan confirmed the bulging at the L4-L5 level combined with the stenosis at that level especially on the right side. At the time it was noted that conservative management had not relieved the symptoms. Accordingly, on January 13, 1983, a L5-L4 laminectomy was carried out and decompression of the hypertrophy of the facets, ligimentum flavum and the laminae of L5 and L4 was performed. A large hern.a at L5 and L4 with partial extrusion of the disc at that level was noted. The exposure of the intervertebral space at L5-L4 revealed a large traumatic type of rupture and a discectomy was conducted. A complete anterior decompression was effected and combined with a foraminotomy at L5-S1 level. Claimant was released from the hospital on January 22, 1983.

Dr. Reinwein released claimant to return to work in July 1983 after having assigned a 35 pound weight limitation and a 20 percent permanent impairment. However, claimant did not return to work. Claimant testified that he had had a physical examination by the company physician and was told not to return to work.

Claimant testified that he has returned to part-time employment where his wife works. The work is at a pool sales outlet. Claimant indicates that he has made deliveries of equipment, including diving boards. Claimant testified that he was involved in the winterizing of pools. He was required to lift five gallons of antifreeze and load a pickup.

At the time of hearing, claimant indicated that he had neck and shoudler problems. Additionally, he testified that his lower back gives him problems when he drives, bends or twists. Claimant testified that he has difficulty in driving 80 to 90 miles in a company pickup. Claimant testified that when he went to visit his father in St. Louis, he experienced discomfort in his hips after the trip. He testified that bending and twisting cause problems. He testified that he has to rest for ten minutes or so after having worked 45 minutes. Claimant stated that he has trouble lifting the pool antifreeze since the quantity weighs 40 to 45 pounds. Claimant stated that at this point his shoulder and right lower back really hurts. He stated that he had to stop and relax. Claimant testified that he is able to walk a distance of four or five blocks before his hips tighten up. He testified that he can stand for only 45 minutes. Claimant stated that his recreational activities of hunting and dancing have been affected. Claimant indicated that he had numbness in his right ring and little fingers.

On cross-examination, claimant indicated that he had the same complaints after his return to work in December 1979, but that he worked full time, even up to 60 to 70 hours per week. Claimant's wages with defendant characteristically were lesser in the winter months due to a seasonal slowdown. Claimant testified that after he returned to work in 1979 he missed about 60 days of work over a period of three years. Claimant stated that he did not recall mentioning his physical ailments to anyone because he kept these matters to himself. Claimant testified that his back gave him some problems every day. Claimant indicated that he had hemorrhoid problems in January 1982 and was off about twelve weeks. Claimant also admitted having taken thirteen weeks off in July 1982 after cutting his foot.

Claimant indicated his employer at the pool repair place was just trying to help him out. He stated that there had been no work for the three weeks prior to the hearing. Claimant showed some enthusiasm for a prospective venture into a spa business.

Craig Levetzow has been the dispatcher at Ruan Transport since March 1983. He had nearly daily contact with the claimant. He recalled that claimant complained of hurting his hand on a spoke of a steering wheel in 1980. Claimant also had complaints in August through October 1982 which were limited to his eyes. No back or shoulder complaints were made. The witness testified that on at least six occasions during 1982 claimant was off and none of the calls indicated a sore back.

Mike Gantt has been terminal manager for defendant. He stated that claimant last worked for the defendant on October 20, 1982. The witness testified that in the period from August 1982 to October 1982 the only complaints he heard from claimant were referrable to his eyes. The first indication of back problems was a back complaint made on October 25, 1982 when the witness overheard claimant say to another driver that he was off because of a compensable injury. The witness investigated and claimant said it was an old injury.

The witness testified that claimant was a good worker but difficulty was sometimes experienced in getting claimant to work extended hours. The witness testified that claimant was sent to the doctor on July 7, 1983 and an ICC card was not issued. No follow-up examination was made at the time of hearing.

The physicians in this case indicated that the claimant's later difficulties in 1982 are related to the injury in question. Dr. Holmberg indicates that the services which he rendered in October and November 1982 were related to the injury of 1979. Dr. Reinwein makes the statement that claimant's problems were causally related to the injury of October 1979.

Claimant was examined by F. Dale Wilson, M.D., on August 16, 1983. Physical examination showed that claimant did not limp and that his posture was satisfactory excepting a protruding abdomen. He could stand on either leg and walk on his toes and heels. He could squat and recover without pain. He could kneel on both heels. He noted that there was an operation scar. The sciatic notch was negative. Pressure on the sciatic nerve was negative on the inside of either thigh. Dr. Wilson performed detailed range of motion tests. Dr. Wilson indicated that claimant had sustained a strain of the right shoulder and a ruptured L4-L5 disc. Dr. Wilson attributed a permanent partial disability of 12 percent of the body as a whole to the shoulder and 15 percent of the body as a whole to the back.

On June 17, 1983, claimant was seen by Robert J. Chesser, M.D. Physical examination showed symmetrical reflexes at the knees and ankles. There was no ankle clonus or Babinksi sign noted. Sensation demonstrated reduction of pinprick sensation in the right foot but no specific distribution. Sensation above the foot was normal. Strength of the extensor hallucis longus is symmetrical from a short sitting position. He could fully extend his knees and dorsiflex his ankles and feel pain in the right posterior aspect of the right knee, but show no specific low back or hip pain. Straight leg raising on the right produced symptoms of hamstring tightness. Fabre's maneuver was full and asymptomatic. On both sides lumbar mobility demonstrated no leg length discrepancy. There was no evidence of a list or muscle spasm. Dr. Chesser reviewed the CT scan and the myelogram taken in late 1982. No abnormalities were noted. He then made the following statement:

> At this time, I feel that the patient can return to work early in July. I feel he can return to work as a truck driver but would strongly recommend that he obtain an air cushion seat for his truck. I also feel that he will require a weight restriction in the form of a 30-35 lb. weight limit and no repetitive bending. I have also encouraged him to follow through with the home exercise program. In regards to impairment, I feel he would have a 15 to 20 per cent whole man impairment; this, however is based on subjective responses rather than to any objective loss on examination.

APPLICABLE LAW

1. Sections 85.3 and 85.20, Code of Iowa, confer jurisdiction on this agency in workers' compensation cases.

2. By filing a memorandum of agreement it is established that an employer-employee relationship existed and that claimant sustained an injury arising out of and in the course of employment. Freeman v. Luppes Transport Co., 227 N.W.2d 143 (Iowa 1975). This agency cannot set this memorandum of agreement aside. Whitters & Sons, Inc. v. Karr, 180 N.W.2d 444 (Iowa 1970).

3. The claimant has the burden of proving by a preponderance of the evidence that the injury of October 3, 1979 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

4. Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

5. Section 85.27, Code of Iowa, provides for medical care for injured workers. The employer, being so obliged, has the right to chose the care.

ANALYSIS

Based on the foregoing principles, it will first be found that claimant sustained an injury arising out of and in the course of his employment on October 3, 1979. A memorandum of agreement was filed and the law in this regard is clear.

The question of causal connection has been addressed by the medical personnel in this case. Both physicians give us the necessary causal connection to find that the problems which claimant had in 1982 were related to the injury in 1979. Although the time between the injury and the resultant surgery was of some length, the physicians were nonetheless adament in the conviction that the injury and subsequent disability were related. No evidence was presented to indicate any other cause for the 1982 disability, although a sceptic might hazard a guess. For this reason, it will be found that claimant sustained his burden of proof that the injury of October 3, 1979 caused the 1982 surgery to take place.

The next item which must be discussed is the claimant's claim for medical benefits. The record indicates that the instant action was commenced at about the time claimant was having his problems in late 1982. Claimant and the employer were both represented by able counsel at time. Although this action is captioned as being a review-reopening, it is more in the nature of an arbitration proceeding since defendants are denying that any payments of compensation or medical benefits are related to the injury. In order for the assertion of nonauthorized medical to succeed, one must offer care, and presumably, accept compensability. Since no such offer was advanced, claimant's medical expenses must be paid.

Claimant has sustained permanent partial disability to the body as a whole because of the October 3, 1979 injury. Claimant is 41 years of age and has a high school education with a GED. His prior employment has been as a truck driver. This has been his primary means of supporting himself and his family. Claimant's testimony indicates to us that he cannot drive long distances. The lifting impositions found upon him since his surgery preclude him from a necessary function of the job--loading and unloading, even if done rarely. Claimant has shown excellent motivation and eagerness to return to work. Claimant has sustained a major back sugery. Considering the elements of industrial disability, it is found that claimant is disabled to the extent of 35 percent of the body as a whole.

Section 85.34(1), Code of Iowa, provides that a healing period be paid in cases of permanent disability from the date of injury until claimant has either returned to work or reached maximum medical recuperation. The record indicates that claimant reached maximum medical recuperation on July 6, 1983 when Dr. Reinwein

assessed permanent partial impairment. Claimant will be awarded an additional 37 weeks of healing period compensation at the appropriate rate.

FINDINGS OF FACT

1. Claimant was employed by Ruan Transport Company on October 3, 1979.

2. Claimant sustained a back injury while working on October 3, 1979.

3. Defendants filed a memorandum of agreement concerning an October 3, 1979 injury.

4. Claimant was paid seven (7) weeks of compensation for the November 3, 1979 injury at the rate of two hundred fifty-one and 87/100 dollars ($251.87).

5. Claimant started having back problems again in 1982.

6. The 1982 back difficulties were causally related to the 1979 injury.

7. Claimant started missing work for back pain on October 22, 1982.

8. Claimant reached maximum medical recuperation on July 6, 1983.

9. Claimant sustained permanent partial disability to the extent of thirty-five percent (35%) of the body as a whole because of the October 3, 1979 injury.

10. Claimant incurred necessary medical expenses because of the injury.

CONCLUSIONS OF LAW

1. This agency has jurisdiction of the parties and the subject matter.

2. The claimant was employed by defendant employer on October 3, 1979.

3. Claimant sustained an injury arising out of and in the course of his employment on October 3, 1979.

4. Defendants will be ordered to pay unto claimant an additional thirty-seven (37) weeks of healing period compensation at the rate of two hundred fifty-one and 87/100 dollars ($251.87) per week.

5. Defendants will be ordered to pay unto claimant one hundred seventy-five (175) weeks of permanent partial disability compensation at the rate of two hundred fifty-one and 87/100 dollars ($251.87) per week.

6. Defendants will be ordered to pay the following medical expenses:

Moline Public Hospital (11/7/82 - 11/9/82)	$ 655.65
Moline Public Hospital (12/1/82 - CT scan)	330.00
Moline Public Hospital (1/13/83 - 1/22/83)	3,054.90
William D. Reinwein, M.D.	4,775.00
Moline Radiology Associates	103.25
Anesthesiology (H. S. Hwang)	285.00
William F. Holmberg, D.C.	168.00

ORDER

IT IS THEREFORE ORDERED that defendants pay unto claimant an additional thirty-seven (37) weeks of healing period compensation at the rate of two hundred fifty-one and 87/100 dollars ($251.87) per week.

IT IS FURTHER ORDERED that defendants pay unto claimant one hundred seventy-five (175) weeks of permanent partial disability compensation at the rate of two hundred fifty-one and 87/100 dollars ($251.87) per week.

IT IS FURTHER ORDERED that defendants pay unto claimant the following medical expenses, to wit:

Moline Public Hospital (11/7/82 - 11/9/82)	$ 655.65
Moline Public Hospital (12/1/82 - CT scan)	330.00
Moline Public Hospital (1/13/83 - 1/22/83)	3,054.90
William D. Reinwein, M.D.	4,775.00
Moline Radiology Associates	103.25
Anesthesiology (H. S. Hwang)	285.00
William F. Holmberg, D.C.	168.00

Costs of this action are taxed to defendants pursuant to Industrial Commissioner Rule 500-4.33.

Defendants are to file a final report upon payment of this award.

Interest is to accrue on this award pursuant to section 85.30, Code of Iowa, from the date of this decision.

Signed and filed this 27th day of July, 1984.

Joseph M. Bauer
JOSEPH M. BAUER
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

RUSSELL L. PILIP, Claimant, vs. CEDAR GLASS, INC., Employer, and AETNA INSURANCE COMPANY and TRAVELERS INSURANCE COMPANY, Insurance Carriers, Defendants.	File No. 721819 A R B I T R A T I O N D E C I S I O N

FILED
JUL 27 1984
IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in arbitration brought by Russell L. Filip, claimant, against Cedar Glass, Inc., employer, and Aetna Insurance Company and Travelers Insurance Company, insurance carriers, defendants, to recover benefits under the Iowa Workers' Compensation Act for an alleged condition arising out of and in the course of his employment. It came on for hearing on November 9, 1983 at the Juvenile Court Facility in Cedar Rapids, Iowa. It was considered fully submitted at that time.

The industrial commissioner's file contains a first report of injury received December 23, 1982, and a Form 2 received in March of 1983 from Travelers indicating weekly benefits are not being paid pending investigation.

At the time of hearing the parties stipulated to a rate in the event of an award of $184.90. Time off work was one week. Defendants stipulated to the fairness of medical expenses but not to the necessity.

The record in this matter consists of the testimony of claimant, Patricia Ann Filip, Donald Dearborn, and Steven Ovel; claimant's exhibit 1, a series of medical records; claimant's exhibit 2, the deposition of Jo Lynn M. Glanzer, M.D., claimant's exhibit 3, medical expenses; claimant's exhibit 4, mileage expenses; claimant's exhibit 5, a bill of costs; claimant's exhibit 6, 1981 tax returns; claimant's exhibit 7, 1982 tax

returns; claimant's exhibit 8, various labels; claimant's exhibit 9, documents from the personnel file; claimant's exhibit 10, wage information; claimant's exhibit 12, an employee handbook; claimant's exhibit 13, portions of the safety inspection manual; claimant's exhibit 14, a nontoxic particle mask box; claimant's exhibit 15, a particle mask; claimant's exhibit 16, a chemical cartridge; claimant's exhibit 17, a shirt worn by claimant; claimant's exhibit 18, pants worn by claimant; claimant's exhibit 19, a drawing of the plant; Travelers' exhibit A, an affidavit from Shelby Swain; Travelers' exhibit A1, wage information; Travelers' exhibit D, a mask; Aetna's exhibit A, an affidavit from Diane Dooley. Defendants' objection to claimant's exhibit 11 is sustained. The parties submitted briefs.

ISSUES

The issues in this matter are whether or not claimant's condition arose out of and in the course of his employment; whether or not there is a causal relationship between claimant's injury and any disability he now may suffer; whether or not claimant is entitled to healing period and permanent partial disability benefits; and whether or not the provisions of section 86.13 have been triggered. Travelers has raised issues under Iowa Code sections 85.26 and 85.23.

STATEMENT OF THE CASE

Twenty-five year old claimant testified that he was last employed by defendant employer on August 31, 1983 at which time he voluntarily terminated his employment for health reasons and to return to college to obtain a degree possibly in business. He has some prior college work heading for a major in criminal justice.

Claimant recalled that before starting work for defendant employer in mid March of 1979 he had worked in a supermarket as a cook and later "deli" manager, had been a restaurant trainee and had served a short time as hotel cook. When he went to work for defendant employer he planned to work his way into a management position.

Several months after he commenced work, he became a gel coat operator. He remembered being told by Dearborn, the plant manager, that he could wear either of two masks he wished to wear. He admitted being told by Dearborn to wear the mask at all times, but he understood it was because failure to wear the mask looks bad to customers coming through rather than because of any health hazard. He did not recollect being reprimanded for wearing the mask on the top of his head. He said that he knew both the nature and the danger of the chemicals with which he worked. He started out wearing the particle mask, but he found it uncomfortable and stopped wearing it for a couple of months.

Claimant reported that he saw Dr. Glanzer in September and talked to Dearborn a couple of weeks thereafter. He agreed that Dr. Glanzer told him not to go back to the plant. He testified that he asked for a transfer and was moved to general labor. He testified both that he thought he sprayed at most a month after seeing Dr. Glanzer and that his last job gel coating was done at the end of October or beginning of November. He was told by Dr. Glanzer to wear the NIOSH mask which Dearborn bought after October. Claimant assumed the NIOSH mask did more filtering, but he thought it uncomfortable, hot and steamy. He was instructed when he went in with a work release to wear the mask in the plant.

In January of 1983 he went back to wearing the particle mask when he was in the production area. He said that it was at this time that trouble with communicating occurred. Some of his symptoms decreased; and all subsided to a certain extent, but he continued to have residuals even though he was not spraying.

Claimant asserted that he was told by Dr. Glanzer to take a week off.

He called Dearborn and asked about being compensated. This call occurred when he came back from vacation. Claimant understood from Dearborn that the insurance company did not think claimant had a health problem and that claimant had not been wearing his mask. Claimant insisted he was informed that he had an attitude problem.

Claimant recalled a steady decline in his health evidenced by headaches, dizziness, numbness in his arm and nausea which prevented his eating lunch. The latter condition came on within six months after he started to spray paint. He had congestion in his nose which became an actual steady drip as time went by. Numbness occurred as early as 1981. He discovered a pattern to his symptoms in that he felt better on weekends and was then able to eat lunch.

Claimant noticed some increased sensitivity to certain materials and more specifically to paint and to acrylic floor wax. He claimed that prior to his chemical exposure at defendant employer he had no such reactions.

Claimant testified to a good work relationship with Dearborn who he said was easy to get along with, but whom he perceived as less than totally truthful. He could not remember any specific incidents of dishonesty at work; however, he recalled Dearborn's saying he had lied to an employee before and would lie again.

Claimant agreed that no doctor had placed any restriction on his ability to get a job in the future and that he could do a management job in an area without fumes. He had not applied for other jobs, but he said that his condition has not restricted his making job applications.

Claimant asserted that he was warned about wearing his mask on one occasion and after that he used the mask as directed.

Twenty-four year old Patricia Ann Filip, claimant's spouse of six years, testified that claimant was in fine health when he commenced work for defendant employer. Eventually, he developed headaches, nausea, dizziness and lethargy. These signs and symptoms were first evident to her a couple of years ago, but in time they worsened. She noted claimant's inability to do things and to get up and get going. His symptoms diminished when he was not at work.

Filip reported that at first she attempted to launder claimant's clothes daily. Finally, he just kept on wearing them until they wore out. His outer clothes were left at work. She recalled an odor on claimant's hair, person and underclothes and a taste when she kissed him.

The witness said that her husband complained about his working conditions and that she had told him he should leave his employment. She stated that claimant's health was a contributing factor in his decision to return to college.

Fifty-six year old Donald Dearborn, plant mananger for defendant since January of 1977, testified that claimant came to work in the lowest job classification and was promoted on the basis of his job performance. He recalled that claimant went to gel coating at his own request.

Dearborn described gel coating as follows: There is one gel coater who works at a high skill level. Gel coating is a part of the production and inspection area. The booth is three-sided and approximately 12 by 12 with a nine foot ceiling. A 36 inch exhaust fan exhausts outside. Filter banks two or three feet high and eleven feet long contain filters that are left for a week. The material utilized gives off an odor which he himself did not find offensive. Gel coaters were instructed in their duties by the plant supervisor. He stated that a minimal amount of gel spray would escape as long as the filter bank and fan are operating.

Dearborn reported that persons are told when they are hired that protective equipment will be furnished on request. There is no safety officer or committee within the company, but safety is discussed at morning meetings. A handbook makes no mention of hazards encountered or protective devices to be utilized. A poster in the production area refers to the catalyst used.

The plant manager testified that the gel coat operator could wear a particle mask if he wanted to and that use of the mask would be in compliance with company rules. He assumed that claimant knew the types of masks available.

Dearborn characterized claimant as a very good employee who took an interest in his work, who approached it with enthusiasm and who wanted to advance to a management position some day.

Although claimant was given no written reprimand, he was warned not to wear his particle mask in a certain position or on top of his head on at least a half dozen different times. Dearborn believed that claimant did not use one of the masks available to him because it would restrict his speaking and his sight.

No citations for violations had been issued against the company by any government agency.

Dearborn indicated that he was never informed of any injury to claimant, but that he first became alerted to claimant's condition about the time he received a communication from Dr. Glanzer. He knew claimant was going to a physician for respiratory problems, however, he did not know the condition for which claimant sought treatment was work-related. He did not observe any decrease in claimant's work activity up to the time of the doctor's report. Claimant's time and attendance records from July 1, 1982 to September 1, 1983, according to the witness, showed no time missed due to illness. He said that claimant worked during January of 1983 with the exception of a vacation.

Dearborn did not know who had talked to Paul McCoy, insurance agent, to tell him of claimant's claimed injury. He acknowledged that two other employees had problems with the components of the gel coat.

The witness thought claimant was not removed from gel coating until January of 1983, but he was unable to verify that opinion. He said that claimant's pay as a gel coater was higher. He thought that at least by December 2, 1982 claimant was receiving less pay and he indicated that it was possible claimant stopped gel coating in October or November.

Dearborn also discussed conditions in the production area. He thought wearing of a particle mask would be protection. He said no mask rule was in effect in that area and that generally with some exceptions masks were not worn in that department.

The witness said that employees are asked about allergies and told what the company manufactures. He did not observe claimant's having any difficultes after November 1, 1983 and he had not criticized claimant for physical ability.

A letter from the toxological and labeling supervisor dated August 31, 1983 provides information regarding coatings. Symptoms of chronic exposure include a metallic taste, loss of appetite, indigestion, nausea, vomiting, constipation, abdominal cramps, sleeplessness, weakness and dermatitis. Special protective information states: "When used in restricted ventilation areas, wear NIOSH approved chemical/mechanical filters designed to remove a combination of particulate, gas and vapor. When used in confined areas, wear NIOSH approved air supplied respirators or hoods. Use NIOSH approved respirators when flame cutting, welding and hazing material coated with this product."

Thirty-five year old Steven Ovel, who was president of defendant employer from 1977 until it was sold, testified to being involved with the company on an almost daily basis. He said that he knew claimant and had observed him working, but that Dearborn was the only employee under his direct supervision and that he wished to observe the chain of command.

Ovel described claimant as an employee with no attitude problem who performed the technical aspects of his job to the best of his ability. He claimed that he insisted gun operators wear facial protection. Although claimant at times wore his mask appropriately, he had at other times seen it on top of claimant's head. On those occasions he would mention the offensive conduct to Dearborn.

The witness indicated that in establishing the policy for wearing facial protection the insurance carrier and the manufacturers' associations working with these kinds of materials had been consulted. When a safety manual was obtained there was an attempt to relate the information to their plant, and the manufacturers were contacted for more information. The company concluded full facial protection was not mandatory and that a particulate mask would be adequate.

Ovel said the company had a disciplinary policy whereby written warnings are given and placed in the employee's personnel file. The witness said that he did not learn claimant was claiming employment-related respiratory problems until recently.

The label from Thermacure indicates it is fifty percent methyl ethyl ketone peroxide in dimethyl phthalate. The label warns contact and inhalation should be avoided.

The container for the nontoxic particle mask contains this warning: "This product is not designed for use as protection against asbestos, silica, or cotton dust or any other toxic dusts, fumes, mists, gases and vapors. NOT FOR USE IN SPRAY PAINT OPERATION."

Jo Lynn Marie Glanzer, M.D., first saw claimant on July 15, 1981 at which time he was complaining of numbness and of tingling in his right arm and chest. The numbness was in the medial aspect of the arm. The tingling was present in the fingers and was worse in the posterior aspect of the chest. It came anteriorly to the pectoral area. Examination of the upper extremities revealed some weakness in the adductus of the right little finger. Claimant gave a history of numbness in his arm and pain in his chest as he operated a sprayer at work the preceding Monday. The numbness increased at night. Claimant was diagnosed as having a brachial plexus neuritis. The doctor gave viral infection as the most common cause and chemical exposures as a possible cause the neuritis. In claimant's case she believed the cause was viral.

Claimant returned on September 27, 1982, a Monday, and told of being ill for a week with a stuffy head and nasal drainage. He said he had been spraying methyl ethyl ketone peroxide. Although he was wearing a particle mask some of the material was getting through to cover his teeth. Claimant did not complain of numbness and tingling at this visit. The physician thought claimant had sinusitis which he treated with Penicillin. She said that the most common cause of sinusitis would be bacterial or viral infection. Dr. Glanzer called the Iowa Health Department to attempt to gain information about methyl ethyl ketone peroxide.

She learned that the chemical could irritate the nasal passages and throat or cause headaches or neuritis. After gaining this information she recommended claimant use a breathing apparatus. She observed that the manufacturers recommended a NIOSH approved vapor or particle respirator for vapors and dust. The doctor had reviewed labels from products claimant was using and she noted that the catalyst he used contained methyl ethyl ketone peroxide in a fifty percent concentration. She did not think the gel coat material contained the substance.

Claimant was seen on Monday, October 18, 1982. Dr. Glanzer discussed the results of her physical exam:

> I questioned an allergy to the material that he was spraying at work causing nasal stuffiness and a red throat. I then discussed it with Dr. Greenblatt who is an allergist, and he stated that we really couldn't test for this type of allergy.
>
> It seemed to be just a cause and effect type of thing. If Russ got better on the weekends, he was probably suffering these symptoms from exposure to the ch mical. His other systems -- excuse me, his other symptoms consisted of dizziness, numbness and tingling in his arms which I thought might be some toxicity from these fumes. (Glanzen dep., p. 14 11. 6-17)

Her diagnoses were possible allergic rhinitis and possible chemical toxicity. Blood tests were done which were within normal limits. The physician said that the neuritis could be caused by a viral illness or a disease such as multiple sclerosis. Claimant returned Tuesday, December 24, 1982 with complaints of a stuffy nose, bad headache, sore throat, extreme fatigue and difficulty breathing. He reported to Dr. Glanzer that he had been off spray painting about three weeks, but that there were persons spraying in his work area.

Claimant was referred to Dr. Greenblatt who found edema and erythema in the nasal mucosa, pharynx and tonsillary pillar. Dr. Greenblatt felt claimant had an irritation as opposed to an allergy.

When claimant continued to have symptoms in January, he was permanently restricted from spraying. Claimant was last seen by the doctor on August 19, 1983 at which time he was having pain in the posterior aspect of his left upper chest area. The pain was diagnosed as a muscle spasm which was unrelated to claimant's other problems.

Dr. Glanzer was of the opinion "that the chemicals that he [claimant] was spraying containing organic peroxide and methyl ethyl ketone were causing irritation to his nose and throat, causing the throat to be sore, probably causing headaches." She acknowledged the possibility that claimant's symptoms were unrelated to his work conditions or environment. She thought that claimant's time off work in December was related to the irritation, but there was no indication in the records that she had kept h.m off. She did not believe that claimant's condition is permanent; however, she said that claimant "may develop irritation of his nose and throat at concentrations less than what other people might notice irritation in the future." But she denied there would be a cumulative effect. She assigned no disability. However, she was questioned:

> In your opinion, based upon reasonable medical probability, will Mr. Filip be able to work around chemicals of the type and specifically the irritants that you have identified here and expressed an opinion in regard to? Will he be able to work around that material in the future?
>
> A. No, I don't think so.
>
> Q. At any time in his life?
>
> A. I don't feel that he could. (Glanzer dep., p. 46 11. 3-11)

She anticipated claimant's developing the same symptoms whenever he was exposed to organic solvents.

Dr. Glanzer thought that claimant was spray painting methyl ethyl ketone, but she had no description of the particle mask he was wearing or the manner in which he wore it.

The physician said that it is not possible to test for toxicity of fumes although lead could be ruled out as a cause. She stated that there are no tests or examinations to definitely relate claimant's symptoms of fatigue and headaches to the chemicals. She noted that Dr. Greenblatt ruled out a number of allergies as a source of the irritation, swelling and redness in claimant's throat and nose.

No examination or testing was done after claimant had been away from his employment. She did not think that claimant's use of the NIOSH mask would necessarily decrease his symptoms as the odor or vapor or fumes could come through the mask and be irritating even if the particulate matter was not getting through. A certificate for return to work or school from Dr. Glanzer reports claimant's inability to work from January 3, 1983 to January 10, 1983.

Jerald J. Greenblatt, M.D., saw claimant on January 10, 1983 with complaints of irritation of the nose, a full head, fatigue and tingling in the arms. The doctor understood that claimant worked with fiberglas, a catalyst and gel coat. Claimant's exposure occurred from April 1977 to October 18, 1982. Claimant said that the area had an exhaust fan and that he used mask. Neither his peripheral blood smear nor his nasal smear showed eosenophils. Pulmonary function studies were 92 percent of normal. Based on a negative family history, skin tests and laboratory data, the doctor was unable to find an allergy. Claimant's symptomatology at work which lessened when he was at home, on weekends or on vacation suggested a response to irritants.

Diane Dooley, claims supervisor for Aetna Insurance Company, signed a affidavit swearing that Aetna had a policy for Cedar Glass from October 2, 1982 through October 2, 1983. H. Shelby Swain, claims supervisor for Travelers Insurance Company, swore that his company provided coverage from March 1, 1982 to October 2, 1982.

An employee handbook from Bremen Glass, Inc., was offered in evidence. Claimant signed that he had received the book on July 15, 1982. In a section on safety employees are admonished to report hazards or unsafe conditions to supervisors, to report injuries immediately and to wear safety equipment in compliance with posted departmental rules.

APPLICABLE LAW AND ANALYSIS

Defendant Travelers asserts that claimant's claim is barred by Iowa Code section 85.26 which provides in part:

> An original proceeding for benefits under this chapter or chapter 85A, 85B, or 86, shall not be maintained in any contested case unless the proceeding is commenced within two years from the date of the occurrence of the injury for which benefits are claimed or, if weekly compensation benefits are paid under section 86.13, within three years from the date of the last payment of weekly compensation benefits.

In Orr v. Lewis Central School District, 298 N.W.2d 256, 261 (Iowa 1980) the supreme court held: "The limitation period under section 85.26, The Code 1975, began to run when the employee discovered or in the exercise of reasonable diligence should have discovered the nature, seriousness and probable compensable character of the 'injury causing...death or disability for which benefits [were] claimed.'"

Claimant's petition was filed on March 8, 1983. Although he had symptoms before July 15, 1981, he did not seek medical treatment until that time at which his primary complaint was of numbness and tingling in his right arm and chest. Dr. Glanzer diagnosed a viral neuritis. It was not until claimant's next appointmen' on September 27, 1982 that Dr. Glanzer began to investigate the chemicals with which claimant was working and to attribute claimant's symptomatology to his work. This deputy commissioner finds that it was not until after claimant sought medical treatment in September of 1982 that he was aware of the nature, seriousness and probable compensable character of his injury. His petition was filed well within the statute of limitations.

Defendant Travelers claims that claimant's petition did not assert a claim under chapter 85A and that assertion is correct. However, pretrial notes, this deputy's notes and the notice of assignment for hearing all contain reference to 85A. The issue of occupational disease is thus a proper one. Therefore, it must be determined whether or not claimant has an injury under chapter 85 or an occupational disease under chapter 85A which arose out of and in the course of his employment.

The Iowa Workers' Compensation Act makes a clear distinction between an injury and an occupational disease. Iowa Code section 85.61(5)(b) proclaims that injury or personal injury "shall not include and occupational disease as defined in §85A.8." Section 85A.14 presents the opposite side: "No compensation shall be payable under this chapter for any condition of physical or mental ill-being, disability, disablement, or death for which compensation is recoverable on account of injury under this workers' compensation law."

In McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (1980) the Iowa Supreme Court at 190 stated that "to prove causation of an occupational disease, the claimant need only meet the two basic requirements imposed by the statutory definition of occupational disease, given in section 85A.8." That section provides:

> Occupational diseases shall be only those diseases which arise out of and in the course of the employee's employment. Such diseases shall have a direct causal connection with the employment and must have followed as a natural incident thereto from injurious exposure occasioned by the naure of the employment. Such disease must be incidental to the character of the business, occupation process in which the employee was employed and not independent of the employment. Such disease need not have been foreseen or expected but after its contraction it must appear to have had its origin in a risk connected with the employment and to have resulted from that source as an incident and rational consequence. A disease which follows from a hazard to which an employee has or would have been equally exposed outside of said occupation is not compensable as an occupational disease.

In further explanation of section 85A.8, the opinion in McSpadden, said: "First, the disease must be causally related to the exposure to harmful conditions of the field of employment. ...Secondly, those harmful conditions must be more prevalent in the employment concerned than in everyday life or in other occupations."

Claimant testified to the use of various chemical products. Items of clothing offered in evidence at the time of hearing show that his clothes became covered with materials he was spraying. Ovell, president of the company, claimed that he insisted that spray gun operators wear facial protection. Medical evidence also is supportive of claimant's claim. It is apparent that claimant was exposed to harmful conditions in the form of various chemicals in his employment with defendant employer. These chemicals were more prevalent in claimant's employment than outside his occupation. Claimant has established an occupational disease arising out of and in the course of his employment.

Defendant Travelers had raised the affirmative defense of notice. Notice provisions in Iowa Code section 85A.18 make reference to the notice section in chapter 85. The Iowa Supreme Court in Reddick v. Grand Union Tea Co., 230 Iowa 108, 296 N.W. 800 (1941) set forth the rule for dealing with affirmative defenses. The opinion of the court in Reddick provided that once claimant sustains the burden of showing that an injury arose out of and in the course of employment, claimant prevails unless defendant can prove by a preponderance of the evidence an affirmative defense.

In DeLong v. Iowa State Highway Commission, 229 Iowa 700, 295 N.W. 91 (1940) the court recognized the industrial commissioner's treatment of notice. The commissioner, quoted in DeLong at 702-03, 92, wrote:

> that while the weight of the evidence is not entirely free from doubt, much of which may be due to lapse of time...we are of the opinion claimant sustained the burden of proof in that respect, but in this the question upon whom the burden of proof may rest is not free from doubt. We are constrained to believe that want of such notice is an affirmative defense and if that be true the burden of proof would rest upon the defendant.

The Iowa Supreme Court most recently dealt with notice in Robinson v. Department of Transportation, 296 N.W.2d 809, 811 (Iowa 1980) as follows:

> If the actual knowledge requirement were satisfied without any information that the injury might be work-connected, it should not be necessary to allege the injury was work-connected when giving the statutory notice. In fact, however, it is necessary to allege the injury was work-connected when giving notice. It logically follows that the actual knowledge alternative is not satisfied unless the employer has information putting him on notice that the injury may be work-related.
>
> The purpose of section 85.23 is to alert the employer to the possibility of a claim so that an investigation of the facts can be made while the information is fresh. See Knipe v. Skelgas Co., 229 Iowa 740, 748, 294 N.W. 880, 884 (1941). In view of this purpose, it is reasonable to believe the actual knowledge alternative must include information that the injury might be work-connected.
>
> This is the meaning which has been given the actual knowledge requirement under similar statutes in other jurisdictions. See, e.g., Bollerer v. Elenberger, 50 N.J. 428, 432, 236 A.2d 138, 140 (1967) ("The test is whether a reasonably conscientious employer had grounds to suspect the possibility of a potential compensation claim."). The principle is stated in 3 A. Larson, Workmen's Compensation § 78.31(a), at 15-39 to 15-44 (1976):
>
> > It is not enough, however, that the employer through his representatives, be aware [of claimant's malady]. There must in addition be some knowledge of accompanying facts connecting the injury or illness with the employment, and indicating to a reasonably conscientious manager that the case might involve a potential compensation claim.
>
> We hold that this principle applies to the actual knowledge provision of section 85.23.

Although there is mention of written notice given in section 85A.18, when that section is read with 85.23 it is apparent that the written notice requirement of section 85A.18 does not eliminate the possibility of satisfying the notice requirement by a showing that the employer had actual knowledge.

It previously has been found that claimant first became aware of the nature, seriousness and probable compensable nature of his disease in September 1982. The time frames in this case are not very clear; however, assuming that claimant had ninety days after September 27, 1982, the date on which he saw Dr. Glanzer, claimant would have had until Christmas day 1982 to give notice. Claimant and Dearborn seemingly had continuing discussions regarding claimant's moving to a different job, his using a mask and the ordering of the new mask. Dearborn acknowledged awareness of claimant's having respiratory problems, but he indicated he was unaware claimant's condition was work related. Even so, this deputy commissioner believes that Dearborn had information which would alert a reasonably conscientious manager to the potential of a compensation claim. The affirmative defense of notice fails.

The next question to be considered is whether or not claimant is entitled to weekly benefits as a result of his disease. The claimant has the burden of proving by a preponderance of the evidence that his occupational disease is a cause of disablement for which he makes claim.

The claimant has the burden of proving by a preponderance of the evidence that his condition is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

sort of endurance work. He may be able to use the extremity as an assisting extremity, but this may be several months to one year or more for full return to work status with the extremity.

Frank I. Russo, M.D., in a report dated March 5, 1979 stated:

I saw this 55-year-old gentleman today at your request. He relates suffering an injury to his right upper extremity August 7, 1978 when apparently his right arm and hand became briefly caught in a machine and according to description caused a sudden jerking and twisting motion to the right upper extremity which apparently was in a position of complete extension in the elbow and abduction to 90° or so at the shoulder at the time of the injury. He apparently noticed marked discomfort immediately after the injury, sought some medical attention and was apparently hospitalized for a period of a few days. He subsequently persisted in having complaints of discomfort over the right shoulder which is exacerbated by any movement or activity. Attempts were made to return him to work in October or so, but apparently he tolerated this for only about 3 days. He has been under the care of Dr. M.N. Fulton, an orthopedic surgeon in Muscatine, Iowa, has received physical therapy consisting of the use of ultrasound and cortisone in an ultrasound-medium base f r "phonophoresis". [sic] He has not had any direct injection into the right shoulder girdle musculature. Apparently this gentleman developed increasing amounts of parethesias in the ulnar distribution, particularly after attempting to return to work during the fall. This apparently was investigated at Iowa City but as far as I can determine in questioning the patient, the only tests being performed at that time were nerve conduction studies with no accompanying needle electromyographic examination, at least not insofar as the patient could recollect, and I do not have any reports of this study, with the exception of Dr. Fulton's notes stating that there was evidence of slowing across the elbow, suggesting tardy ulnar palsy. The last note which I have from Dr. Fulton states that this gentleman has a full range of motion in the shoulder, although he does have some diffuse discomfort in the shoulder joint upon palpation. This gentleman has had some mild relief with the use of TNS, which he has been using for the last couple of months, but apparenntly has had some difficulty with dermatitis developing from the electrogel and/or the electrodes themselves. This gentleman denies any neck pain as such. He apparently is shortly to be resumed on some physical treatments, the exact nature of which he is uncertain. On questioning he denies any active exercise program ever being initiated for his right upper extremity.

EXAMINATION: This gentleman reveals a well developed white male who does not appear to be in acute distress. Examination of his neck reveals a normal range of motion in all planes. There is a question of some mild decrease in muscle mass of the right shoulder girdle musculature and the supra and infraspinatous areas, as well as in the deltoid. I could not get this gentleman either actively or passively to demonstrate a full range of motion in the right shoulder. He complained bitterly of pain and resisted abduction beyond about 90°. I was able to achieve about 130° of flexion, normal adduction and about 30° of extension at the shoulder. This gentleman complains rather diffusely on palpation of the bicipital tendon area, the area of the deltoid insertion, and the rotator cuff muscles posteriorly. There does not appear to be any gross muscular atrophy in the remainder of the right upper extremity. On manual muscle testing, however, it was very difficult for me to get accurate assessment of strength in the right upper extremity with relative weakness noted rather diffusely in the entire right arm vs. the left with the exception of the right hand, where there was no significant evidence of any ulnar weakness noted despite reports of ulnar entrapment neuropathy. Deep tendon reflexes at the biceps, triceps, and brachioradialis are physiological and symmetrical. Sensory examination reveals a diffuse subjective decrease to pin-prick sensation throughout the entire right upper extremity vs. the left, slightly more intense in the distal ulnar distribution. There is no evidence of any swelling or significant temperature change between the two upper extremities.

IMPRESSION: Chronic right shoulder pain with significant discrepancies in range of motion noted on my attempts at examining this gentleman today and on previous examinations by Dr. Fulton, with significantly less range of motion noted today, possibly because of some hesitancy on the part of the patient to demonstrate a complete range of motion during my exam. Rule out possible brachial plexus stretch injury. Rule out significant psychophysiological overlay.

RECOMMENDATIONS: At the present time I feel it is virtually impossible for me to make any sort of a permanency rating, as I don't feel I can make an objective and accurate measurement of this gentleman's range of motion and some of the other basic functions which I would have to test in order to rate him. As I did note, there does appear to be some discrepancy in the range of motion which he demonstrates for me today and that which Dr. Fulton has noted. I am somewhat concerned about the possibilities of this gentleman having a mild brachial plexus injury with some mild relative atrophy noted in the right shoulder girdle musculature which could well be from disuse or which could represent a neurological problem. As far as I can ascertain from the patient, it does not sound like he had a complete EMG exam at the time of his electrodiagnostic studies and I would strongly recommend that such an exam be performed, whether by myself or at the patient's preference at Iowa City. I also, however, feel that this gentleman should probably have a thorough psychological evaluation to be certain at this point whether there is any conversion or any psychophysiological overlay and if these two work-ups are negative, I would suggest that this gentleman be placed on a very vigorous supervised exercise program for the right shoulder to try to remobilize it.

In the clinical notes of a Dr. Harris and a Dr. Lehmann dated November 6, 1980 it was stated:

The patient is being seen for Social Security disability examination. The patient is a 57 year old white male who on 8/7/78 caught his left arm in a machine which he states malfunctioned and the arm was thrown into ABduction [sic] and external rotation. The patient has not worked since that time and was employed as a machinist for Tool and Dye. He denies any previous problems of shoulder pain or neck pain and denies any previous x-rays having been obtained. The patient has been followed in the Orthopaedic Clinics at the University of Iowa under the care of Dr. Albright for what was initially felt to be a right frozen shoulder. He has had the full gamut of treatments, including Tolectin and Aspirin [sic] which helped some, exercises which increased soreness, neuroprobe which did not change his pain, TNS which helped him somewhat which he used 4 hours a day until he had blistering under the pads, phonophoesis with no effect, manipulation under anesthesia, 10/5/79, and ganglion block in July of 1980 which did not change his pain. The patient states that he has a constant aching in the anterior right shoulder, right shoulder, right pectoral area, right side of his neck and right posterior scapular area as well as aching over the right anterior brachium and right lateral antero-brachial area. The patient states that his aching is made worse with lifting and he can maximum lift 10 to 15 lbs. He states that he has a constant numbness over the ulnar 3 digits of the right hand and on the ulnar side of his distal forearm, dorsally. He states that the numbness is constant in nature and does not change from day to night as no change in its intensity. Because of the aching in his right shoulder, the patient states that he can sleep for a maximum of 3 hours. The past medical history is remarkable for abdominal pain of undetermined etiology, requiring inhospital evaluation in August of 1980. He has a history of analfistulas and has had an appendectomy.

Physical examination - range of motion right over left, external rotation 35-35, internal rotation to billfold area to near the tip of the scapula. ABduction [sic] 75°-180°; flexion 90-160°; with attempted passive range of motion of the shoulder the patient voluntarily resists. There is no crepitation felt on either passive or active range of motion. He has diffused tenderness in multiple areas about the right shoulder including the biceps tendon corcoid process, deltoid bursa and posterior shoulder joint. He has no measurable atrophy, being 29 cm in circumference, bilaterally, 16 cm above the cephaled portion of the . [sic] The patient had an inconsistent 2point examination of the right hand. Initially, he had 5mm 2point over the medium distribution including the radial half of the ring and ulnar half of the long finger, but after testing the small digit, which was greater than 30mm 2point, he began to manifest a 30mm 2point discrimination over the radial side of the ring and over the ulnar side of the long. He has 2point greater than 30mm consistently on the ulnar half of the ring finger. The patient had some mild weakness which was possibly voluntar of the right intrinsics. There was no intrinsic atrophy, per se. The patient had some objective weakness of the flexor carpalmaris on the right. All other motor groups were +5 and symmetric including flexor carpi radialis, wrist extensors, finger flexors, finger extensors, biceps, triceps, pronator, supinator and deltoid. The bicep and

tricep reflexes were +2 and symmetric. Dull vs. sharp discrimination was intact in all dermotomes except on the ulnar side of the right forearm and the lateral posterior right brachium. It was of note, however, that the patient's dull vs. sharp was inconsistent in the other areas, at times being normal and at other times being abnormal. The patient's deep tendon reflexes, biceps, triceps, brachial radialis and pronator were +2 and symmetric, bilaterally. The patient had full range of motion of the neck without discomfort.

Previous x-rays taken at the University of Iowa were reviewed. A c-spine was normal, right [sic] plain films normal, right shoulder arthrogram was interpreted as normal.

ASSESSMENT - periarthritis of right shoulder with some evidence of right ulnar neuropathy.

DISCUSSION - [sic] the patient was seen and examined with Dr. Lehmann. The patient has been out of work for more than 2 years. Because of his age we would expect the patient to have a poor potential for work rehabilitation and would expect him to have some difficulty for being employable.

Joseph A. Buckwalter, M.D., who testified by way of deposition stated that he is an orthopedic surgeon and is an associate professor of orthopedic surgery. Dr. Buckwalter indicated he saw claimant on June 3, 1982 and that his findings were essentially the same as all of the previous physicians. Dr. Buckwalter disclosed that the doctors had exhausted the treatments that could help claimant. Dr. Buckwalter opined that claimant's condition was permanent.

APPLICABLE LAW

If a claimant contends he has industrial disability he has the burden of proving his injury results in an ailment extending beyond the scheduled loss. Kellogg v. Shute and Lewis Coal Co., 256 Iowa 1257, 130 N.W.2d 667 (1964).

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

A finding of impairment to the body as a whole found by a medical evaluator does not equate to industrial disability. This is so as impairment and disability are not identical terms. Degree of industrial disability can in fact be much different than the degree of impairment because in the first instance reference is to loss of earning capacity and in the later to anatomical or functional abnormality or loss. Although loss of function is to be considered and disability can rarely be found without it, it is not so that an industrial disability is proportionally related to a degree of impairment of bodily function.

Factors considered in determining industrial disability include the employee's medical condition prior to the injury, after the injury, and present condition; the situs of the injury, its severity and the length of healing period; the work experience of the employee prior to the injury, after the injury and potential for rehabilitation; the employee's qualifications intellectually, emotionally and physically; earnings prior and subsequent to the injury; and age, education, motivation, and functional impairment as a result of the injury and inability because of the injury to engage in employment for which the employee is fitted. Loss of earnings caused by a job transfer for reasons related to the injury is also relevant. These are matters which the finder of fact considers collectively in arriving at the determination of the degree of industrial disability.

There are no weighting guidelines that are indicated for each of the factors to be considered. There are no guidelines which give, for example, age a weighted value of ten percent of total, education a value of fifteen percent of total, motivation - five percent; work experience - thirty percent, etc. Neither is a rating of functional impairment entitled to whatever the degree of impairment that is found to be conclusive that it directly correlates to that degree of industrial disability to the body as a whole. In other words, there are no formulae which can be applied and then added up to determine the degree of industrial disability. It therefore becomes necessary for the deputy or commissioner to draw upon prior experience, general and specialized knowledge to make the finding with regard to degree of industrial disability. See Birmingham v. Firestone Tire & Rubber Company, II Iowa Industrial Commissioner Report 39 (1981); Enstrom v. Iowa Public Services Company, II Iowa Industrial Commissioner Report 142 (1981); Webb v. Lovejoy Construction Co., II Iowa Industrial Commissioner Report 430 (1981).

In Parr v. Nash Finch Co., (Appeal decision, October 31, 1980) the Industrial Commissioner, after analyzing the decisions of McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (Iowa 1980) and Blacksmith v. All-American, Inc., 290 N.W.2d 348 (Iowa 1980), stated:

> Although the court stated that they were looking for the reduction in earning capacity it is undeniable that it was the "loss of earnings" caused by the job transfer for reasons related to the injury that the court was indicating justified a finding of "industrial disability." Therefore, if a worker is placed in a position by his employer after an injury to the body as a whole and because of the injury which results in an actual reduction in earning, it would appear this would justify an award of industrial disability. This would appear to be so even if the worker's "capacity" to earn has not been diminished.

For example, a defendant employer's refusal to give any sort of work to a claimant after he suffers his affliction may justify an award of disability. McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (Iowa 1980).

Similarly, a claimant's inability to find other suitable work after making bona fide efforts to find such work may indicate that relief would be granted. McSpadden v. Big Ben Coal Co., supra.

ANALYSIS

As indicated previously the question presented to the undersigned for consideration is the extent of claimant's permanent partial disability.

Dr. Fulton rated claimant's functional impairment at 20 percent of the whole arm. Dr. Fulton's report does not state that this rating was a a rating of impairment to the body as a whole. However, it is clear to the undersigned that claimant's impairment went beyond the schedule into the body as a whole and was not limited to the scheduled member.

Functional impairment is only one of the factors in determining a persons's industrial disability. Claimant is 59 years old and is a high school graduate, and has also had training in mechanics. Claimant has operated a dairy farm, worked as a mechanic and salesman, managed bowling alleys and pro shops. Claimant has experience as a grinder and finisher, tool and die machinist and a productions inspector. At the time of his injury claimant worked as a machinist and was operating a hand operated vertical turret lathe. Although claimant may not be able to return to the position he held at the time of his injury because of restricted movement it would appear he could return to other positions which he has held in the past.

Defendant terminated claimant's employment because of his injury and restrictions. This is exactly the type of case where the holding in Blacksmith applies. Claimant has had an actual reduction in his earnings as a result of that termination. This termination greatly increases the impact that this injury has on claimant's life.

Claimant appeared well motivated. Claimant has attempted other work since his injury. The undersigned does note that claimant does have transferable skills which would help him in other areas of employment, but claimant has limited the scope of his employment endeavors. Claimant has managerial skills and sales skills, it would not appear from the record that claimant has made any attempt to find work in those areas. It is determined that claimant has an industrial disability of 30 percent as a result of his injury on August 7, 1978.

FINDINGS OF FACT AND CONCLUSIONS OF LAW

WHEREFORE, based on the evidence presented and the principles of law previously stated, the following findings of fact and conclusions of law are made:

FINDING 1. As a result of his injury on August 7, 1978 claimant has a functional impairment of twenty percent (20%) of his whole arm.

FINDING 2. Claimant's impairment goes beyond the upper extremity into the body as a whole.

FINDING 3. Claimant is fifty-nine (59) years old.

FINDING 4. Claimant is a high school graduate and had some training as a mechanic.

FINDING 5. Claimant has experience operating a dairy farm.

FINDING 6. Claimant has worked as a mechanic and car salesman.

FINDING 7. Claimant has managed bowling alleys and pro shops.

FINDING 8. Claimant has experience as a grinder and finisher.

FINDING 9. Claimant has worked as a tool and die machinist.

FINDING 10. Defendant terminated claimant as a result of his injury and restrictions.

FINDING 11. Claimant is well motivated.

FINDING 12. Claimant has transferable skills in both management and sales.

FINDING 13. Claimant has limited the area of his employment search.

CONCLUSION A. Claimant has an industrial disablity of thirty percent (30%) as a result of his injury.

THEREFORE, defendants are to pay unto claimant an additional fifty (50) weeks of permanent partial disability benefits at a rate of one hundred ninety-three and 81/100 dollars (193.81) per week.

Defendants pay cost of this action.

Defendants pay interest on date of award.

Defendants shall file a final report upon payment of this award.

Signed and filed this 30th day of July, 1984.

DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

EDWARD A. GONZALES,	:	
Claimant,	:	File No. 750438
vs.	:	A R B I T R A T I O N
CENTURY SIDING CO., INC.,	:	D E C I S I O N
Employer, Defendant.	:	FILED

JUL 30 1984

INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in arbitration brought by Edward A. Gonzales, claimant, against Century Siding Co., Inc., employer, defendant, to recover benefits under the Iowa Workers' Compensation Act for an alleged injury arising out of and in the course of his employment on June 29, 1982. It came on for hearing on July 13, 1983 at the Bicentennial Building in Davenport, Iowa. It was considered fully submitted with the filing of additional medical expenses on July 25, 1984.

The industrial commissioner's file contains no first report of injury or memorandum of agreement.

The record in this matter consists of the testimony of claimant; claimant's exhibit 1, income tax forms and a statement from claimant; claimant's exhibit 2, a computer printout of medical expenses; and claimant's exhibit 3, various medical records.

ISSUES

Claimant's petition was filed on December 29, 1983 with a proof of service on January 5, 1984. A motion for default was filed on February 24, 1984. That motion was sustained by order of a deputy industrial commissioner filed March 12, 1984. Another deputy commissioner closed the record to further activity or evidence by defendant on April 12, 1984. At the time of hearing no one from defendant appeared nor anyone for it.

Rulings and decisions of the agency have held that the entry of a default resolves all aspects of liability against defendant. Sherwood v. Collins Radio Co., 33 Biennial Report of the Industrial Commissioner 66 (1978).

The issues in this matter are whether or not there is a causal relationship between claimant's disability and his injury of June 29, 1982 which would entitle him to permanent total disability benefits and whether or not claimant is entitled to benefits under Iowa Code section 85.27.

STATEMENT OF THE CASE

Forty-seven year old married claimant, father of seven children with four dependent children at the time of his accident, testified to a tenth grade education with no additional training. His first work out of high school was in a gas station. He spent three years as a marine infantryman. When he got out of the service he delivered dresses for a dress shop. Thereafter, he commenced a series of jobs involving essentially carpentry work doing such things as putting up awnings, storm windows and siding.

Claimant recalled that in March of 1982 he was hired by Rich Davis, the owner of defendant, to put up siding. At that time he was working for another company which recommended his hiring to Davis who called him and arranged to meet him at the job site. Claimant was to be paid on a weekly basis for the application of siding in hundred foot amounts. No taxes were withheld. Materials were supplied by defendant who set hours, controlled the work, and visited the job site each day or every two or three days. Claimant ordered materials as they were needed and billed them to defendant. Claimant was of the opinion that he could be moved from job to job or fired by defendant at will.

Claimant said that he specifically asked defendant about insurance coverage and he was told that insurance was carried. His spouse was told at the time of his hospitalization that there was insurance coverage.

Claimant remembered the circumstances of his injury of June 29, 1982 as follows: It was 11:15 in the morning. He went up a ladder to work on a wall. The ladder shifted. Scaffolding fell and he fell thirty feet. He was taken to the hospital where he remained until mid-September.

Claimant stated that as a result of that injury he had paralysis beginning at T-11. He has no bowel or bladder control.

He reported having physical rehabilitation in Rock Island, Chicago and Rochester. He was going to commence some rehabilitation with the state of Iowa, including getting his GED, but a hospitalization intervened.

Claimant said that he has had a total of ten hospitalizations since his injury spanning sixteen months' time. He continues to see Dr. Verma on a monthly basis and to visit the Mayo Clinic every five or six weeks. He has therapy three times each week with sessions lasting forty-five minutes each. He also has two learn-to-swim classes each week.

Claimant listed his present problems as an inability to walk, constant pain for which he takes Darvon, muscle spasms in his feet, bladder infections treated with Bactrim, swelling in his feet for which Lasix has been prescribed, a burning sensation in his legs, and blood clots. He also takes Valium. He sleeps in a hospital bed with his feet elevated. He has special socks and Ted hose. He avoids bed sores by doing pushups in his chair and by using special cushions.

A statement attached to claimant's tax returns indicates he started work on May 17, 1982. On May 27, 1982 he was paid $1,000; on June 16, 1982 he was paid $1,000; and on July 14, 1982 he was given $950.

A discharge summary regarding claimant's hospitalization at the time of his injury on June 29, 1982 reports claimant's having a fractured dislocation of T-10 and T-11 with an unstable spine and paraplegia. Claimant had a thoracic decompression laminectomy at T-11 with posterior wiring at T-9, T-10, T-12 and L1; a Harrington rod fixation and a spinal fusion with bone graft.

During his hospitalization, claimant was started on a bowel program and taught to catheterize himself. He was treated for depression which cleared. He developed a complete occlusion of the right posterior tibial vein for which anticoagulents were prescribed. Claimant was placed on daily outpatient physical therapy at the time of his discharge.

Claimant has a history of pulmonary fibrosis.

Vijay Verma, M.D., reports claimant's admission to a Chicago hospital for nine weeks of treatment which the claimant told him provided no benefit. Claimant was scheduled to resume rehabilitation with his bilateral lower extremity braces.

Dr. Verma reported claimant's having surgery apparently in early 1984 to remove Harrington rods. Claimant was started on a reconditioning program which consisted of therapy three times each week.

A computer printout shows medical expenses for claimant totaling $282,398.95.

APPLICABLE LAW AND ANALYSIS

The claimant has the burden of proving by a preponderance of the evidence that the injury of June 29, 1982 is causally

related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

The medical evidence supports the conclusion that claimant's current disability is causally related to his injury of June 29, 1982.

Claimant's seeks permanent total disability and such an award is seen as appropriate at this time. Claimant is reaching a difficult age in terms of employability. He is nearing a time when retraining is unlikely, but he still has a number of work years ahead before his retirement. His education is limited and thus far his pursuit of a GED has been hindered by his medical treatment. His work experience also has been limited primarily to carpentry work. It may be that he can put those carpentry skills to work, but his doing so will have to be in a much different capacity from that in which he was working before. In all likelihood, he will need professional rehabilitative assistance to do so.

Claimant's injury was a severe one. He is for the most part confined to his wheelchair. He has been hospitalized for sixteen of the twenty-four months since his injury. His present schedule of therapy would not allow him to perform a regular eight hour a day, five day a week job.

Claimant has incurred medical expenses as a result of his injury and those expenses will be awarded pursuant to Iowa Code section 85.27.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant is forty-seven (47) years of age.

That claimant is married and had four dependent children at the time of his injury.

That claimant has a tenth grade education with no additional training.

That claimant served in the marines as an infantryman.

That the major portion of claimant's work experience has been as a carpenter.

That claimant was employed by defendant to apply siding.

That claimant received two thousand, nine hundred fifty dollars ($2,950.00) from defendant for six weeks' work.

That on June 29, 1982 claimant fell from a scaffold at his job site.

That claimant underwent a thoracic decompression laminectomy at T-11 with posterior wiring at T-9, T-10, T-12 and L1; a Harrington Rod fixation and a spinal fusion with graft from the iliac crest.

That claimant has a paralysis which has rendered him unable to walk.

That claimant has been hospitalized for sixteen (16) of the twenty-four (24) months since his injury.

That claimant is troubled by pain, muscle spasm, bladder infections and blood clots.

That claimant is receiving physical rehabilitation.

That because of his medical condition, claimant has been unable to pursue vocational rehabilitation.

That claimant takes various medication.

That claimant has incurred numerous medical expenses.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has established by a preponderance of the evidence a causal connection between his injury of June 29, 1982 and his present disability.

That claimant has established by a preponderance of the evidence entitlement to permanent total disability.

That claimant has established entitlement to benefits under Iowa Code section 85.27.

ORDER

THEREFORE, IT IS ORDERED:

That defendant pay unto claimant permanent total disability benefits during the period of his disability at a rate of two hundred ninety-four and 18/100 dollars ($294.18).

That defendant pay the accrued amount in a lump sum.

That defendant pay medical expenses as set out in claimant's exhibit 2 which total two hundred eighty-two thousand, three hundred ninety-eight and 95/100 dollars ($282,398.95).

That defendant pay interest pursuant to Iowa Code section 85.30.

That defendant pay costs pursuant to Industrial Commissioner Rule 500-4.33.

That defendant file periodic reports as required by the agency.

Signed and filed this 30 day of July, 1984.

Judith Ann Higgs
JUDITH ANN HIGGS
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

LORRAINE S. GONZALES, Claimant, vs. GLENWOOD STATE HOSPITAL-SCHOOL, Employer, and STATE OF IOWA, Insurance Carrier, Defendants.	:	File No. 660503 A P P E A L D E C I S I O N

FILED
JUL 19 1984
IOWA INDUSTRIAL COMMISSIONER

By order of the industrial commissioner filed April 20, 1984 the undersigned deputy industrial commissioner has been appointed under the provisions of §86.3, Code of Iowa, to issue the final agency decision on appeal in this matter. Claimant appeals from an adverse arbitration decision.

The record on appeal consists of the transcript; claimant's exhibits 1 through 93, inclusive; and defendants' exhibits A though G, all of which evidence was considered in reaching this final agency decision.

The outcome of this final agency decision will be the same as that reached in the arbitration decision.

ISSUES

The arbitration decision found that claimant hurt her knee at work on January 31, 1979 but that she did not prove any resulting disability and therefore no right to any compensation benefits.

Claimant argues that she hurt her back on that date and that compensation ought to be awarded for the back injury. Claimant states the issues on appeal:

I. The decision of the Deputy Industrial Commissioner is abusive of his discretion unsupported by substantial evidence in the record made before the Deputy Commissioner when the record is viewed as a whole and is unreasonable, arbitrary and capricious

and can only be characterized by being termed in [sic] abuse of discretion and the opinion is clearly an unwarranted exercise of discretion.

II. The Deputy Commissioner errored [sic] in failing to follow the Iowa Rules of Evidence, in particular, Rule 703 and 705.

III. Claimant has sustained its [sic] burden of proving by a preponderance of the evidence that she received an injury on January 31, 1979, which arose out of and in the course of her employment which is causally related to the disability on which she now bases her claim and the evidence supports a probability rather than a possibility as couched in the terms of the arbitration decision.

EVIDENCE PRESENTED

On Jauary 31, 1979, while in the employ of the Glennwood State Hospital-School, claimant fell in a driveway on the employer's property. On February 12, 1979 she sought treatment of her left knee by her personal physician, Fred A. Hansen, M.D. In May of 1979, she complained of back difficulties. In June 1980 she was referred to an orthopedic surgeon, Ronald K. Miller, M.D., where she was treated for problems with the quadriceps muscles above the knees. She continued to have difficulties with her legs and low back and eventually in 1982 had a laminectomy at L3-L4.

Dr. Hansen testified by deposition that, prior to February 1979, he had treated claimant for routine matters, one of which included an injury to the left knee of 1978, an injury which occurred at the Glenwood State Hospital-School. He further testified:

> Q. On that occasion that you gave her a knee brace [February 12, 1979] for her left knee, did she indicate pain in her back?
>
> A. I think that came shortly after that. On the 14th of May, 1979, we had an X-ray of her back. Something in her back gave her problems and pain on movement. And she said this happened on the 12th of May--12th of May of 1979. (Hansen dep., p. 7 ll. 6-12)

With respect to exactly when claimant's back pain started Dr. Hansen testified: "Q. Prior to May of 1979 had Mrs. Gonzales had any complaints of back problems or back pain? A. No. I think those all came later. Yeah. 12th of February on to May. It began bothering her apparently the first time at the end of May." (Hansen dep., p. 9 ll. 4-8)

In a hospital admission of May 29, 1982, Dr. Hansen stated:

> HISTORY OF PRESENT ILLNESS: The patient has had a chronic backache for sometime. Yesterday and the night before, she had a severe back pain in the left low lumbar area. She was up to the bathroom at 0500, sneezed and immediately had a severe pain in the central lower back. The patient was practically screaming. The patient was brought to the hospital by the Emergency Unit where a hypo of Demerol gave some relief. The pain was in the lower back and radiated down to both legs, especially the anterior side.
>
> PAST HISTORY: In January of 1979, the patient fell on the ice at the Glenwood State School and injuried [sic] her back and left knee. She is now involved in a settlement with the State School at Glenwood. She had had no prior back troubles or leg troubles prior to the injury.

Claimant was also seen by Ronald K. Miller, M.D., a qualified orthopedic surgeon, who testified:

> We initially saw her on 6-12-1980 at the request of Doctor Fred Hansen in Red Oak. She was seen through the Red Oak Orthopedic Clinic, at Montgomery County Memorial Hospital. I have a notation there: 23-year old Glenwood State Hospital employee who apparently slipped and fell approximately one year ago; since that time has been having continued difficulty; on examining her we noted that she had tight hamstrings bilaterally; had minimal back problems or symptoms and we felt that her difficulty at that time seemed to be primarily peripheral. She, in addition, had been having numbness and tingling on the dorsum of her left foot; could be compatible with an L4, 5 disc or root irritation. (Miller dep., p. 4 ll. 1-14)

With respect to exactly why he was consulted, Dr. Miller stated:

> The main thing that we were seeing her for was the weakness and the complaints in her legs. And in going back to this first time that we saw her, we were suspicious that there could have been something going on in her back and certainly wanted to rule that out. And that was one of the reasons why we had Doctor Gill see her in the hospital. And he really didn't come up with much of anything from a neurological standpoint. (Miller dep., pp. 9-10 ll. 23-25 and 1-6)

With respect to the weakness in claimant's legs, Dr. Miller testified:

> The only thing that it [Cybex testing] told us was that she had quite a bit of weakness in the quads and in somebody who is having some knee problems, they can get a lot of quadriceps atrophy. And they can get a lot of quadriceps weakness. And we felt that perhaps at that point that she hadn't been using her leg and had just developed disuse atrophy in the quadriceps musculature. Although that's -- were impressed with the amount of quadriceps weakness she had, much, much more so than you might expect from just a simple knee injury. (Miller dep., p. 11 ll. 7-16)

With respect to the causal relationship, Dr. Miller stated:

> Q. Doctor, Mrs Gonzales has had a laminectomy on -- she underwent a lumbar myelography, which showed a ruptured lumbar disc at L3, 4 on the left and subsequently on September 29th, 1982, underwent a lumbar laminectomy and removal of this disc. Doctor was that -- in your opinion, was a ruptured disc at L3, L4, apparent, in you opinion, on your last examination of Mrs Gonzales?
>
> A. If she had a disc, that level sort of surprises me. I know that when we initially saw her, I had a notation there L4, 5 disc, a root irritation. So, no. (Miller dep., pp. 14-15 ll. 20-25 and 1-4)

Also with respect to causal relationship, Dr. Miller testified:

> Q. Doctor, other than the hamstring weakness that you described and the pain that Mrs Gonzales had in her knee area, were there any other clues or findings that might suggest a ruptured disc at L3, L4 on your examination of Mrs Gonzales?
>
> A. No. Nothing that I was very very impressed with. (Miller dep., p. 16 ll. 4-9)

James W. Dinsmore, M.D., a qualified orthopedic surgeon, saw claimant on October 2, 1981 with reference to her knee injury. At that time, she did not complain to that doctor about back pain. (Dep., 5) With respect to claimant's knee problem, Dr. Dinsmore testified: "Yes. It was my feeling that the patient primarily had symptoms from disuse, what we call disuse atrophy of the musculature as indicated by the three-quarter inch atrophy of the quadriceps muscle above the knee joint." (Dinsmore dep., p. 6 ll. 17-21) Again with respect to a connection between claimant's work incident and the back condition, Dr. Dinsmore testified: "Q. In your opinion was her knee problem that she came in with, was that at all connected in your opinion to any kind of a back injury? A. Well, I didn't find anything and she didn't relate anything in regard to her back." (Dinsmore dep., pp. 8-9 ll. 21-25 and 1)

Alan H. Fruin, M.D., a qualified neurosurgeon, first saw claimant on September 20, 1982. A myelogram showed a ruptured lumbar disc at the L3-4 level, left, and Dr. Fruin did a lumbar laminectomy on September 29, 1982. (Dep., 5) With respect to causal relationship, Dr. Fruin testified:

> Well, she indicated that--when I first saw her on 9/20/1982, before she was admitted to the hospital, that she had had back and left leg pain for approximately three years. She dated all of this to an episode in 1979, in which she fell and injured herself and had leg pain and back pain of varying degrees on a persistent basis since that time.
>
> Her history of this back and leg pain following a fall was, of course, compatible with the final diagnosis of a ruptured lumbar disc at L3-4 on the left. (Fruin dep., p. 6 ll. 11-22)
>
> ....
>
> Q. And what is that opinion?
>
> A. That it was. (Fruin dep., p. 8 ll. 2-3)

Dr. Fruin qualified the causal connection as follows:

> I think--yes, I think it's unusual for someone to have pain of the degree that she had for three years before a diagnosis was made. But--I think it's a little unusual for someone to go that long without having a diagnosis made, yes. (Fruin dep., p. 21 ll. 1-5)
>
> ....
>
> Well, I am--I am constrained by the information that I get from the patient. She says that she fell, you know, when she was at work at the Glenwood State Hospital and had pain in her leg ever since that fall. So I have to say that that fall is the likely source of her ruptured lumbar disc. (Fruin dep., p. 27 ll. 14-19)

APPLICABLE LAW

Claimant has the burden to show that the health impairment was probably caused by her work; possible cause is not sufficient. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955); Ford v. Goode, 240 Iowa 1219, 38 N.W.2d 158 (1949); Almquist v. Shenandoah Nurseries, Inc., 218 Iowa 724, 254 N.W. 35 (1934).

Matters of causal relationship are essentially within the realm of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960). "The incident or activity need not be the sole proximate cause, if the injury is directly traceable to it." Holmes v. Bruce Motor Freight, Inc., 215 N.W.2d 296, 297 (Iowa 1974); Langford v. Kellar Excavating & Grading, Inc., 191 N.W.2d 667 (Iowa 1971). "A cause is proximate if it is a substantial factor in bringing about the result." Blacksmith v. All-American, Inc., 290 N.W.2d 348, 354 (Iowa 1980).

In the case where an expert's opinion based upon an incomplete history, that opinion is not necessarily binding on the commissioner. Musselman v. Central Tele. Co., 261 Iowa 352, 154 N.W.2d 128 (1967). See also Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965).

ANALYSIS

Claimant's arguments I and III are couched in terms which pertain to a judicial review of an industrial commissioner's decision. The case here is, of course, de novo, and those arguments will be taken to pertain to the question of causal relationship between the injury and the back problem. The arbitration decision stated three reasons why such causal relationship was not present, and those are adopted and repeated here:

> 1) Claimant had no back complaints during several of her visits to the doctors. These complaints were not addressed with any significance to the doctors performing the intestinal bypass.
>
> 2) There was a significant time lapse between the date of injury in late January 1979 and claimant's visit to Dr. Hansen in May 1979.
>
> 3) There was a significant length of time between the traumatic incident and the diagnosis of back pathology. Even though one might conclude that Dr. Miller supports causation, it is important to note that he notes that the L3,4 nerve is a "mixed" nerve, thus, indicating that claimant must have sensory and motor loss in order to support recovery.

Actually, only Dr. Fruin's opinion directly tied the injury to the necessity for the surgery, and that opinion was qualified by the fact that it was based upon the history given by claimant. There was no showing that Dr. Fruin had the advantage of the history given to Dr. Hansen originally, which did not include a back problem. Also, nowhere in the record is there an opinion concerning the severe sneezing incident described by Dr. Hansen.

Dr. Miller's testimony could be taken to support a causal relationship between a back injury and a herniated disc at L4-5; however, he testified that he was surprised that the herniation was one level above and he really did not support a causal relationship argument in favor of claimant.

The other medical testimony, that by Dr. Hansen and by Dr. Dinsmore, did not support a causal relationship.

Taking all of the evidence together, then, the record is insufficient to show that the incident of January 31, 1979 was a substantial factor and caused the subsequent need for surgery and the disability which followed.

With respect to claimant's second argument, the Iowa Industrial Commissioner is under the Administrative Procedure Act and is not obliged to follow the Iowa Rules of Evidence as cited. In this connection and elsewhere in her arguments, claimant states that the testimony of Dr. Hansen should be disregarded because that gentleman is an octogenerian. One can only state that the doctor's testimony appears to be quite clear and concise, clearer in fact than much medical testimony by younger doctors.

Claimant, therefore, has shown no entitlement to benefits for a back injury, and has shown no permanent disability to the knee as a result of the incident of January 31, 1979.

The findings of fact, conclusions of law and order of the arbitration decision are adopted below.

FINDINGS OF FACT

1. Claimant was employed as a child development worker at the Glenwood State Hospital-School on January 31, 1979.

2. Claimant fell in the parking lot at her employer's premises on January 31, 1979.

3. Claimant's injury of January 31, 1979 resulted in claimant being treated for her left knee in February 1979.

4. Claimant first expressed complaints regarding back pain to Dr. Hansen in May 1979.

5. Claimant had an intestinal bypass in August 1979.

6. The bypass surgery was not related to the injury.

7. Claimant had surgery to her back in 1982.

8. The effects of the January 31, 1979 injury were confined to the left leg. It is not permanent.

9. Claimant failed to prove by a preponderance of the evidence that the back surgery and any resulting permanency was related to the injury of January 31, 1979.

10. Claimant did not lose three days of work because of the injury.

CONCLUSIONS OF LAW

1. This agency has jurisdiction of the parties and the subject matter.

2. Claimant was employed by Glenwood State Hospital-School on January 31, 1979.

3. Claimant sustained an injury arising out of and in the course of her employment on January 31, 1979.

4. Claimant is not entitled to permanent partial disability compensation because of the January 31, 1979 injury.

5. Claimant lost insufficient time to entitle her to temporary total disability compensation.

ORDER

IT IS THEREFORE ORDERED that claimant take nothing from these proceedings.

Costs are taxed to defendants.

Signed and filed this 19th day of July, 1984.

Barry Moranville

BARRY MORANVILLE
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE INDUSTRIAL COMMISSIONER

LORRAINE S. GONZALES, Claimant, vs. GLENWOOD STATE HOSPITAL-SCHOOL, Employer, and STATE OF IOWA, Insurance Carrier, Defendants.	:	File No. 660503 A R B I T R A T I O N D E C I S I O N

FILED
JAN 13 1984
IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This matter came on for hearing at the Pottawattamie County Courthouse in Council Bluffs on August 5, 1983 at which time the case was closed.

A review of the commissioner's file reveals that an employers first report of injury was filed on August 5, 1983. The record consists of the testimony of the claimant, Cheryl Clark, Edwardo Gonzales and Lloyd Morstad; claimant's exhibits 1 through 93; and defendants' exhibits A through G.

ISSUES

The issues for resolution are:

1) Whether claimant sustained an injury arising out of and in the course of employment;

2) Whether there is a causal connection between claimant's alleged injury and the condition;

3) The nature and extent of disability; and

4) Whether claimant is entitled to benefits pursuant to the penalty provisions of section 86.13, Code of Iowa.

STATEMENT OF THE EVIDENCE

Claimant was employed by the Glenwood State Hospital School on January 31, 1979 as a child development worker. She testified that she fell in the driveway on her employer's premises while reporting to work. Claimant fell on her left side. She lay there for a while and went to the nurse's station. She saw her family physician, Fred A. Hansen, on February 12, 1979. Treatment at this time was focused on the left knee and claimant was given a hinged knee brace. X-rays were taken and were negative. Claimant's complaints of pain continued and claimant saw Dr. Hansen again on May 12, 1979. X-rays of the lumbar spine were taken at this time and were negative. Dr. Hansen again saw claimant on May 16, 1979 and May 29, 1979. On May 16, 1979 claimant was reported to have sustained a back strain. On May 29, 1979 claimant reported malaise. Dr. Hansen's records indicate that claimant indicated that her back had improved. At this time claimant reported that she had hurt her right ankle. Claimant lost about a week of work because of this. A first report, memorandum of agreement and Form 5 were filed.

In August 1979 claimant weighed about 273 pounds. Claimant was admitted to the St. Joseph Hospital in Omaha, Nebraska on August 19, 1979 for a ileojujunal bypass. The surgeon was Claude H. Organ, M.D.

Upon her release from the hospital at the end of August 1979 claimant was terminated on September 8, 1979. Defendants' exhibit C indicates that claimant's resignation was voluntary.

On March 17, 1980 claimant saw Dr. Hansen for "chronic distress" of the left thigh. On June 12, 1980 claimant was examined by R.K. Miller, M.D., a Council Bluffs orthopedist. Dr. Hansen referred claimant to Dr. Miller. Examination revealed tight hamstrings bilaterally and "minimal" back problems. Claimant's difficulty appeared to be primarily peripheral. She had numbness and tingling on the dorsum of her left foot. Dr. Miller thought a neurological evaluation was in order. X-rays of the lumbar spine, left hip and left knee were negative.

Claimant was admitted to Jennie Edmundson Memorial Hospital in Council Bluffs on June 21, 1980 for complete studies. The admitting physician was Maurice P. Margules, M.D. During the first night claimant received a phone call from home and she had to be discharged from the hospital at about 3:00 a.m. on June 22, 1980 because her mother had a health problem.

In July 1980 claimant returned to work as a bus driver. She was paid $600 per month and she worked 40 to 50 hours per week. She was laid off because of a funding cutoff. Her other employments since the injury include self-employment selling home interior items. She testified that she could not handle this because the lifting involved hurting her back. Claimant then worked in a nursing home on the night shift for about three weeks. She was paid $3.35 per hour. She testified that she quit because her back hurt. She also worked about three weeks at Union Carbide and wrapped batteries. She drove a bus again. She watched an elderly lady at home at night.

Dr. Miller caused claimant to be admitted to the Jennie Edmundson Memorial Hospital in Council Bluffs on November 27, 1980. Claimant's chief complaint was left knee pain and weakness. Claimant reported that her left knee had given out about Novembe. 23, 1980. Claimant injured her right shoulder when she fell. Claimant was admitted. X-rays and Cybex testing were performed on the left knee. The discharge diagnosis was a small tear in the left medial meniscus, with weakness in the left quadriceps musculature. Claimant was discharged from the hospital on December 1, 1980.

Claimant was examined by James W. Dinsmore, M.D., an Omaha orthopedist. He noted that claimant was able to stand straight. She had full extension of the knee in standing. She had varicose veins which were prominent on the left side. She had mild "varicosities" on the right. She had full motion of the left knee. She would not squat all the way on the knee. However, passively the knee would fully flex and did not hurt when forced. She had a negative twist sign for medical and lateral compartment pathology. The ligaments were intact. She had no swelling. She had three quarters of an inch atrophy of the quadriceps when measured four inches above the patella. She had a little discomfort in patella manipulation. She had some discomfort with pressure over the medial joint but also had some on the lateral side.

X-rays of the left knee showed a rather marked osteoporosis. Dr. Dinsmore felt that claimant's primary problem was "disuse atrophy" at the left knee. Dr. Dinsmore did not have a definite diagnosis. The only disability he could see was the atrophy which he thought could be eliminated with exercise.

Dr. Hansen caused claimant to be admitted to the hospital in Red Oak on May 29, 1982. The admitting history indicates that claimant had severe back pain in the left lower lumbar area. Claimant had sneezed and immediately had severe pain in the central lower back. Dr. Hansen diagnosed claimant's condition as a lumbar disc syndrome. Claimant was released from the hospital on June 2, 1982.

Claimant was admitted to St. Joseph Hospital on June 17, 1982 for evaluation of back pain which was described as achy. It involved claimant's low back and radiated down her left leg. Claimant's treating physician was Dr. Organ. Lab work was compatible to claimant's bypass. X-rays of the thoracic spine showed no fractures and only minimal degenerative changes. The lumbar spine showed a mild scoliosis with convexity to the left. Disc spaces were normal. Claimant's back pain was not felt to be related to the bypass. Claimant was discharged on June 30, 1982.

Claimant was given a company physical at Land O Lakes in Oakland (exhibit 5). Claimant was admitted to St. Joseph's Hospital in Omaha, Nebraska on September 21, 1982. The hospitalization was for the purpose of evaluation and treatment of back and left leg pain. Claimant's treating physician was Alan H. Fruin, M.D., Chairman of the Department of Surgery and Chief of the Division of Neurological Surgery at Creighton University. Following her admission to the hospital she underwent lumbar myelography, which showed a ruptured lumbar disc at L3-4 on the left. On September 29, 1982 Dr. Fruin performed a laminectomy and removal of this disc. At that time her left leg pain was relieved. Claimant was discharged from the hospital on October 7, 1982.

Claimant then sought out the services of vocational rehabilitation and immediate medical referral was made. Lloyd Morstad was the vocational rehabilitation counselor. He testified at the hearing that there was a possibility for claimant to start her own floral design business. However, he did note certain drawbacks in claimant's ability to deal with numbers. Also included in negative factors in claimant's lack of employability was the fact that claimant's skills were limited by living in a small rural community.

Claimant had problems falling during the winter of 1982-1983. In February 1983 claimant was admitted to the hospital in Red Oak after falling flat on her back on the ice. She was brought to the hospital by emergency unit and was treated by Dr. Hansen. X-rays showed postoperative changes in the lower lumbar spine from the laminectomy. There was mild scoliosis involving the L5-S1 apophysial joints. There was minimal anterior ragging of the vertebral body of T12 (this was new since the 1979 x-rays). Claimant was treated with traction and physical therapy and released after five days.

Cheryl Clark testified that she saw claimant fall on the day in question. Her description of the incident was that claimant landed on her knees. She recalled that claimant earned the nickname "crip" following the incident. She testified that claimant was not a complainer prior to the fall and that claimant had become somewhat depressed thereafter.

Edwardo Gonzales, claimant's husband, testified that claimant still complains of pain and that claimant has sought employment on a more or less continuous basis.

As far as causation is concerned, we have the benefit of many medical depositions and reports. Dr. Hansen is claimant's family physician and treated her both before and after the incident in question. He explained the mechanics of the disc problem in this case as follows:

By Ms. Post:

Q. At the time that you examined Mrs. Gonzales in February of '79, were her complaints of pain or symptoms characteristic or compatible with a diagnosis of a ruptured disk in L-3 and L-4?

A. No. No. This developed over a period of time. It's a long process as a rule. I would be surprised if she developed lumbar disk overnight with an injury unless she had dislocation of the vertebrae, which is a very serious injury.

Q. Are you saying, Doctor, that the ruptured disk at L-3, L-4, does not correspond directly to a single injury date or that--

A. No. I say that the only injury to her back that I knew of was the one that we mentioned in February of '79. And there was a series of events that very slowly developed over a period of eight or nine years. Let's see. Be about four or five years, wouldn't it? There is an almost orderly fashion to these things development [sic]. A disk is a soft tissue which does not show in the X-ray, as I mentioned. And as the vertebrae gradually-- If the disk is ruptured, it's a gradual process of compression and pressing in on the spinal cord, which causes the pain. So I say orderly and about the usual picture, I would think. The time element, as I say, would be all right for the history of an injury followed eventually by a laminectomy.

Dr. Hansen acknowledged that claimant did not complaint of back problems until 1979.

Dr. Miller examined claimant on June 12, 1980 and originally thought claimant's back problems were referrable to the L4-L5 level. An arthorgram was performed on the knee. He last saw claimant on February 18, 1981 and Dr. Miller reported that his chief complaint was with claimant's legs. He stated that the Cybex testing showed weakness in the left leg. He testified that claimant's knee problems were caused by the fall (deposition p. 12, ll. 23, 24). He testified as follows in regard to causation:

By Ms. Post:

Q. Doctor, Mrs Gonzales has had a laminectomy on -- she underwent a lumbar myelography, which showed a ruptured lumbar disc at L3, 4 on the left and subsequently on September 29th, 1982, underwent a lumbar laminectomy and removal of this disc. Doctor was there -- in my opinion, was a ruptured disc at L3, L4, apparent, in your opinion, on your last examination of Mrs. Gonzales?

A. If she had a disc, that level sort of surprises me. I know that when we initially saw her, I had a notation there L4, 5 disc, a root irritation. So, no. The only thing that would suggest a lumbar disc would be the amount of hamstring spasm, and you certainly get hamstring spasm and hamstring tightness with a disc. People with a disc can present with just basically a lot of leg pain and sometimes very little back pain. Doctor Gill had seen her when she was in the hospital and certainly if she had an acute disc at that time I would have thought that he would have picked it up or at least suggested EMG's or possibly a myelogram at that time. So he apparently wasn't that impressed with the physical findings at the time of his examination.

Q. With the condition such as Mrs Gonzales displayed on September 29th, 1982, with a ruptured disc, would that become increasingly -- would the pain in her knee and back areas become increasingly more significant with time?

A. With a lumbar disc?

Q. Yes.

A. Yes, it could. Certainly.

He went on to state that he would have expected to find something neurological (sensory or motor). Dr. Miller went on to address the causal connection question further:

By Mr. Gee:

Q. Am I to understand that, I am a little bit confused here, if Lorraine in the fall that she had related through her history, if she had in fact ruptured the lumbar disc at L3, 4, would that condition be consistent with the tightening or the weakness of the hamstrings and/or the quadriceps atrophy that you found?

A. It could be yes. But again you would expect to find other physical findings other than that. For example, if you had, say, ruptured an L3, 4 disc and that would give you the quadriceps weakness. A disc certainly can give you hamstring spasm. It can give you hamstring tightness. But in addition to that you would normally expect to find other things as well. Not just that per se. I guess it would depend upon how big the disc is; whether it is a central disc; whether it is a lateral disc; I presume since she was having so much trouble with her left leg it is more lateralized than central.

Q. Would there always be these other symptoms that you are talking about?

A. You normally would expect to find it, yes, but not always. But I would guess that most of the time you would expect to find it. And particularly after things have gone on for a year and one half or maybe even two years; certainly in that time frame I would expect to find more things showing up.

He thought claimant's knee problem could be consistent with an injury to the medial meniscus or the synovitis. On redirect examination, Dr. Miller indicated that one of the hallmarks of L3, L4 pathology was a tendency toward buckling of the quads. However, he also indicated that there should also be a sensory loss since the nerve involved is "mixed."

Dr. Dinsmore saw claimant on October 2, 1981. Claimant did not complain of back pain. A summary of his examination follows:

Q. On the date of your last examination, did you recommend any treatment?

A. Yes. It was my feeling that the patient primarily had symptoms from disuse, what we call disuse atrophy of the musculature as indicated by the three-quarter inch atrophy of the quadriceps muscle above the knee joint. The x-rays also showed a rather marked degree of osteoporosis and I told her that some of this osteoporosis could be secondary to her bypass surgery, but I felt probably some of it was just due to not using the knee sufficiently. She did have a definite weakness of the quadriceps muscle and she had a distinct lack of any good physical findings to suggest any intra-articular problems such as a torn cartilage or arthritis or anything such as that.

I suggested that she lift weights and try to re-establish the more normal musculature of the thigh. We discussed the possibility of--oh, we discussed that Dr. Miller had done an arthrogram and that he thought that she might have a torn cartilage and I told her I'd be very happy to review the arthrogram films if she would bring them in for me to look at. I never did see them.

We discussed the possibility of arthroscopic examination and I told her that normally when the examination doesn't show anything to suggest a problem that we normally wouldn't find anything. And I did tell her that this does entail hospitalization, anesthetic and all that which is a major diagnostic procedure if you don't find anything. I couldn't recommend an arthroscopic exam at that time.

He testified that some of claimant's knee problem may have been related to her weight and that claimant "had a distinct lack of any significant findings" other than the wasting of a quadriceps muscle. However, claimant did complain that the knee pain radiated up into the thigh and to the back (p. 16).

Dr. Fruin performed back surgery on claimant and testified as to causal connection:

By Mr. Stephens:

Q. With respect to her complaints of a fall on January 31, 1979, which the Industrial Commissioner has an injury report in his file concerning, do you have an opinion, based upon a reasonable degree of medical and surgical certainty as to whether or not the condition of the Claimant found by you was caused by her fall upon the parking lot at the Glenwood State School on January 31 of 1979?

A. Yes.

Q. And what is that opinion?

A. That it was.

He rated claimant's disability as 15 percent of the body as a whole. He recommended a continuing weight restriction of twenty pounds. He testified that claimant's numbness remains but that claimant's pain has left. He testified that claimant reached maximum recovery in December 1982. He thought it was unusual for someone to have pain of the degree to which claimant complained for three years before a diagnosis was made. Dr. Fruin made the following statement with regrad to causation:

BY MS. POST:

Q. Doctor, I just have a couple more questions.

Is it your opinion that a cause of Mrs. Gonzales' ruptured disc was the trauma, but is it your opinion that it was necessarily the trauma in 1979?

A. Well, I am--I am constrained by the information that I get from the patient. She says that she fell, you know, when she was at work at the Glenwood State Hospital and had pain in her leg ever since that fall. So I have to say that that fall is the likely source of her ruptured lumbar disc.

APPLICABLE LAW

Section 85.3 and 85.20, Code of Iowa, confer jurisdiction upon this agency in workers' compensation cases.

An employee is entitled to compensation for any and all personal injuries which arise out of and in the course of the employment. Section 85.3(1).

Claimant has the burden of proving by a preponderance of the evidence that she received an injury on January 31, 1979 which arose out of and in the course of her employment. McDowell v. Town of Clarksville, 241 N.W.2d 904 (Iowa 1976); Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

The claimant has the burden of proving by a preponderance of the evidence that the injury of January 31, 1979 is causally related to the disability on which she now bases her claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

ANALYSIS

Based on the principles enunciated, it is found that claimant failed to sustain her burden of proof that her back injury was caused by her work. It is specifically found that claimant was injured on the job January 31, 1979. Further, the evidence indicates that that injury was confined to the left knee. The reasons why I feel that the back injury is not related to the injury are:

1) Claimant had no back complaints during several of her

visits to the doctors. These complaints were not addressed with any significance to the doctors performing the intestinal bypass.

2) There was a significant time lapse between the date of injury in late January 1979 and claimant's visit to Dr. Hansen in May 1979.

3) There was a significant length of time between the traumatic incident and the diagnosis of back pathology. Even though one might conclude that Dr. Miller supports causation, it is important to note that he notes that the L3,4 nerve is a "mixed" nerve, thus, indicating that claimant must have sensory and motor loss in order to support recovery.

There is no evidence of record to indicate that any permanent impairment rating has been given regarding the knee. The record indicates that claimant's knee injury is temporary and that claimant lost insufficient time to entitle her to temporary total disability compensation.

FINDINGS OF FACT

1. Claimant was employed as a child development worker at the Glenwood State Hospital School on January 31, 1979.

2. Claimant fell in the parking lot at her employer's premises on January 31, 1979.

3. Claimant's injury of January 31, 1979 resulted in claimant being treated for her left knee in February 1979.

4. Claimant first expressed complaints regarding back pain to Dr. Hansen in May 1979.

5. Claimant had an intestinal bypass in August 1979.

6. The bypass surgery was not related to the injury.

7. Claimant had surgery to her back in 1982.

8. The effects of the January 31, 1979 injury were confined to the left leg. It is not permanent.

9. Claimant failed to prove by a prepondernance of the evidence that the back surgery and any resulting permanency was related to the injury of January 31, 1979.

10. Claimant did not lose three days of work because of the injury.

CONCLUSIONS OF LAW

1. This agency has jurisdiction of the parties and the subject matter.

2. Claimant was employed by Glenwood State Hospital School on January 31, 1979.

3. Claimant sustained an injury arising out of and in the course of her employment on January 31, 1979.

4. Claimant is not entitled to permanent partial disability compensation because of the January 31, 1979 injury.

5. Claimant lost insufficient time to entitle her to temporary total disability compensation.

ORDER

IT IS THEREFORE ORDERED that claimant take nothing from these proceedings.

Costs are taxed to defendants.

Signed and filed this 13th day of January, 1984.

JOSEPH M. BAUER
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

JAMES HANSEN,	:	
Claimant,	:	File No. 614511
vs.	:	
HUGHES STEEL ERECTION CO.,	:	R E V I E W -
Employer,	:	R E O P E N I N G
and	:	D E C I S I O N
LIBERTY MUTUAL INSURANCE COMPANY,	:	
Insurance Carrier, Defendants.	:	

This matter came on for hearing at the Woodbury County Courthouse in Sioux City on November 30, 1983. The case was fully submitted at that time.

A review of the commissioner's file reveals that an employer's first report of injury was filed August 31, 1979. A memorandum of agreement calling for the payment of $271.38 in weekly compensation was filed September 18, 1979. A final report was filed October 23, 1979 indicating claimant had been paid six weeks of compensation.

The record consists of the testimony of the claimant, Kathleen Hansen, James Hughes, Loren Larsen, and Clarence Peterson; claimant's exhibits A through G; and defendants' exhibits 1, 2 and 3.

ISSUES

The issues for resolution are:

1. Whether there is a causal connection between the injury and the disability; and

2. the extent of permanent disability.

STATEMENT OF THE EVIDENCE

Claimant, age 35, was employed by defendant employer on July 20, 1979. Claimant was a crane operator and testified that he had worked for defendant off and on since 1972. Claimant's duties included the operation, maintenance and transportation of a crane. On July 20, 1979, claimant was driving the crane over a railroad crossing when the rear of the crane was struck by a train. Claimant testified that he was stiff and sore immediately following the injury. Claimant testified that he had good health prior to the injury. He had no prior complaints of back pain. He had a burn injury earlier. He testified that just prior to the injury, he had successfully completed a FAA physical. Claimant continued to work. Claimant testified that his physical condition became worse and worse, and that he started missing work on about July 30, 1979. Claimant sought treatment from Allen W. Bronson, D.C., of Jefferson, South Dakota on July 30, 1979. Claimant was complaining of neck pain, tightness in the neck, pain between the shoulders and in the chest, headaches, blurred vision, sleeping difficulties, mid-back pain, and low back pain. Physical and neurological examination was conducted. Pain and tenderness were elicited on palpation at the occiput especially on the right, C-2 and 3 right and left; at C-7 and T-1 left and right. There was marked tenderness on palpation throughout the lumbar spine and especially over L-5 and S-1 right and left. Reflexes appeared normal. X-rays of the cervical spine were negative for recent fracture, dislocation or marked osteopathology. The cervical x-ray showed a marked reversal of the cervical lordotic curve. X-rays of the lumbar spine indicated that Ferguson's perpendicular was anterior to the base sacrum and Ferguson's angle was increased to 49 degrees. Dr. Bronson diagnosed claimant's condition as a traumatic strain of the cervical spine complicated by residual muscle spasm, myogascitis, radicualgia and occiptial neuralgia. He also diagnosed claimant as having a traumatic strain of the lumbar spine complicated by residual muscle spasm and myofascitis. Claimant underwent chiropractic treatments for a period of time. Dr. Bronson indicated that claimant was totally disabled from the time of the accident until October 8, 1979.

Claimant testified that he returned to work on October 7, 1979. He also testified that the relief from Dr. Bronson's treatment was only temporary and that he had a great deal of difficulty when he returned to work. Claimant indicated that he had difficulty in repositioning the crane after it was moved. He testified that the various maneuvers required in placing the outriggers caused a lot of difficulty. Claimant testified that he had difficulty in performing his maintenance duties. In September 1979, claimant had seen Vernon G. Helt, M.D., of Sioux City. Claimant was given Tolectin and Norflex. Claimant only saw Dr. Helt twice. Claimant testified that in April 1980, he was examined by John J. Dougherty, M.D., a Des Moines orthopedist. Claimant stated that he went on his own to see Dr. Dougherty. Dr. Dougherty diagnosed claimant's condition as possible cervical strain, dorsal lumbar sprain superimposed upon a mild scoliosis

in the dorsal spine and a slight increased upper dorsal kyphosis and an increased lumbar lordosis, with questionable early narrowing of the L-5/S-1 disc space. Claimant was advised to do flexion and extension exercises and given a prescription for pain medication. Claimant was to report back to Dr. Dougherty two weeks later but did not do so. Claimant testified that he kept up treatment with Dr. Bronson. In January 1981 claimant commenced treatment with G. L. Taper, D.C. Claimant had treatments from Dr. Tapper for about a year and was diagnosed as having vertebrogenic radiculitis of the cervical spine. Claimant stated that his reason for ceasing treatment with Dr. Tapper was that he had no money to pay the bills. Claimant testified that he was given backrubs by his wife. Claimant states that he has limited himself in his car racing activities and in activities involving his children.

Claimant then testified that he had an eleventh grade education and had received a GED. He worked for a farmer, worked part-time in a blacksmith shop and was a yardman at the stockyards. He also spent some time working in a warehouse where he filled orders. He worked out of the operating engineers hall and became a journeyman. Claimant testified that he was laid off periodically.

The record indicates that claimant saw Dr. Dougherty again in December 1982. Claimant stated that he was not working at the time. Claimant could walk on his toes and his heels. His forward bending was normal. Claimant's neck was tender to a minimal degree over the trapezius. However, motion of the neck was good. X-rays were taken and showed degenerative changes in the mid dorsal area, disc narrowing at L-5/S-1, and some lumbosacral scoliosis. He did not think claimant had any permanent disability. He diagnosed claimant's condition as follows:

> 1. Apparent previous possible dorsal sprain, superimposed upon an increased kyphosis and lordosis, with what appears to be probably an old epiphysitis in the dorsal spine, questionable slight early narrowing of L-5/S-1 with periodic bouts of pain, which radiate up into apparently the neck and with headaches, possible facet type pain in the dorsal spine.
>
> 2. A list to the right with a long scoliosis to the right in the dorsal lumbar spine which appears different than before, etiology of this (?). Neurologically I think he is sound.

On cross-examination it was revealed that when claimant was seeking treatment from Dr. Helt he was originally seeking treatment for a uninary infection. Claimant indicated that after the injury he continued to work. He testified that his union card is suspended for nonpayment of dues. He testified that he can operate any type of construction equipment. He is involved in car racing and sells parts. He owns his own welder.

The last report of Dr. Bronson indicates as follows:

CURRENT IMPRESSION

> Based on the radiographic findings, it is apparent that Mr. James Hansen suffered a rather severe traumatic insult to the cervical spine resulting in a strain/sprain complex of the supportive soft tissues. As a consequence of this injury, there is a moderate cervical hypermobility, alteration in the area of stress and strain, and early Joint of Luschka Arthrosis between C-6 & C-7. Therefore, it must be assumed that the cervical spine is experiencing some degree of instability.
>
> Dr. Bronson set permanent disability at five percent of the body as a whole.

Claimant's wife, Kathleen Hansen, testified that prior to the injury claimant was involved in a number of avocational pursuits, including racing, Little League, bike riding, and bowling. She also testified that claimant helps less with household chores than before. She testified that the roundtrip distance to Dr. Bronson's office is 40 miles (41 trips); 12 miles for Dr. Tapper's (15 trips); and 20 miles for Dr. Dougherty (3 trips).

James Hughes is the sole owner of Hughes Steel Erection Company. He testified that his wife works in the office. The business involves the hiring of crane workers to assist in iron work. The witness testified that claimant had been an employee for some time. Following the injury, the claimant continued to work even though the crane which he was operating had been damaged. When the crane was fixed claimant worked on it. The witness testified that claimant related back difficulties attributable to an infection. The witness indicated that he thought claimant was doing well in 1979 and 1980 because he voiced no complaints. The witness testified that when work was slack, claimant did maintenance. He observed claimant through August 15, 1981 and noted that claimant did not appear to have any physical problems. The witness testified that claimant came in to see him on August 15, 1981 expressing interest as to whether work would be available. The witness testified that he thought claimant was seeking or had obtained employment elsewhere. The witness testified that he told claimant to keep in touch if things didn't work out. He then obtained another operator. The witness testified that a number of other crane operators were employed and that claimant came back in June 1982 and was employed for a short period of time before being laid off again. A lengthy discussion of the people working in 1982 indicates that claimant was laid off in July 1982 and that claimant has not been replaced. The witness had no complaint about the claimant's work.

Loren Larsen was employed as a construction company estimator for another construction company at the time of hearing. From July 1979 to May 1982, he was employed by defendant. At that time he carried a card as an iron worker. The witness testified that claimant always had ability as a crane operator and that he never heard claimant complain of pain. He testified that he recalled the circumstances of claimant's departure in August 1981. Claimant stated that he was going to look elsewhere for employment. The witness testified that he worked closely with the claimant.

Clarence Peterson is the job foreman and indicated that he was a working foreman. He had a conversation with claimant whereby claimant stated that he was going to quit to better himself.

APPLICABLE LAW

1. Sections 85.3 and 85.20, Code of Iowa, confer jurisdiction on this agency in workers' compensation matters.

2. By filing a memorandum of agreement it is established that an employer-employee relationship existed and that claimant sustained an injury arising out of and in the course of employment. Freeman v. Luppes Transport Co., 227 N.W.2d 143 (Iowa 1975). This agency cannot set this memorandum of agreement aside. Whitters & Sons, Inc. v. Karr, 180 N.W.2d 444 (Iowa 1970).

3. The claimant has the burden of proving by a preponderance of the evidence that the injury of July 20, 1979 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

4. Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d

ANALYSIS

Based on the foregoing principles, it is found that claimant has established his claim to additional compensation. Claimant has proven by a preponderance of the evidence that he sustained a permanent partial disability because of the July 20, 1979 injury. Although the lay evidence would have us believe that claimant's ability to work inferred his lack of disability, the record shows a long and steady course of treatments during the period after claimant had returned to work. This constant return for treatment shows me that the claimant had some problems for a sufficient period of time to call the condition permanent.

Although one might consider the factors of industrial disability to justify a substantial award in this case, one must look at the fact that claimant worked for a sufficient period of time after he returned to work in order to reach an award that is fair to the parties. Claimant's departure from his employment in 1981 and 1982 do not appear to be related to the injury. Considering this together with the other elements of industrial disability, it will be found that claimant sustained a permanent partial disability to the body as a whole of five percent.

FINDINGS OF FACT

1. Claimant was employed by Hughes Steel Erection Company on July 20, 1979.

2. Claimant was involved in a collision with a train on July 20, 1979.

3. At the time he was driving equipment being used by Hughes Steel Erection Company in furtherance of its business.

4. Defendants filed a memorandum of agreement regarding a July 20, 1979 injury.

5. Claimant hurt his back because of the injury on July 20, 1979.

6. The injury of July 20, 1979 caused permanent partial disability to the body as a whole.

7. Claimant's permanent partial disability to the body as a whole is five percent.

8. Claimant incurred 1880 miles in seeking medical/chiropractic treatment.

1. This agency has jurisdiction of the parties and the subject matter.

2. Claimant was employed by defendant-employer on July 20, 1979.

3. Claimant sustained an injury arising out of and in the course of employment on July 20, 1979.

4. Defendants will be ordered to pay unto claimant 25 weeks of permanent partial disability compensation at the stipulated rate of $271.38 per week.

5. Defendants will be ordered to pay unto claimant $451.20 in reimbursement for travel expenses.

ORDER

IT IS THEREFORE ORDERED that defendants pay unto claimant twenty-five (25) weeks of permanent partial disability compensation at the rate of two hundred seventy-one and 38/100 dollars ($271.38) per week.

IT IS FURTHER ORDERED that defendants reimburse claimant four hundred fifty-one and 20/100 dollars ($451.20) for mileage expense.

Costs are taxed to the defendants.

Interest is to accrue on this award pursuant to section 85.30, Code of Iowa, from the date of this decision.

Defendants are to file a final report upon payment of this award.

Signed and filed this 2nd day of August, 1984.

FILED
AUG 13 1984
IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in arbitration brought by Albert J. Hartl, Sr., against Quaker Oats, employer, and Ideal Mutual Insurance Company, insurance carrier, for benefits as a result of an injury on April 22, 1982. On July 19, 1983 this case was heard by the undersigned. This case was considered fully submitted upon completion of the hearing.

The record consists of the testimony of claimant and David Kennedy Norton; claimant's exhibits 1 through 3; defendants' exhibits A through E; and the deposition of Dennis Purcell.

ISSUES

The issues presented by the parties at the time of the prehearing and the hearing are whether claimant received an injury arising out of and in the course of his employment; whether there is a causal relationship between the alleged injury and the disability on which he is now basing his claim; and the extent of temporary total, healing period and permanent partial disability benefits he is entitled to; section 86.13; and section 85.38(2).

FACTS PRESENTED

Claimant who is a machine operator in the packaging department in instant oats testified that his job required him to run and maintain three lines of machines. Claimant stated he had to lift cases and rolls of paper as well as move pallets and dump barrels of waste product. Claimant testified that on April 22, 1982 he went to help his boss move a dust collector that had fallen over and felt pain in his lower back. Claimant indicated he told his boss he had pain and may have injured his back. Claimant testified that he completed his shift but had increased problems when going home. Claimant disclosed that the following day he was seen by a plant physician, given pain pills, and worked the rest of the day. Claimant was later placed in the hospital and two myelograms were performed. Later claimant had surgery. After being released by his physician, claimant returned to work at the same job he held at the time of his injury. Claimant stated he didn't do all of the lifting he did prior to the injury. Claimant indicated he still has pain most of the time which is aggravated by standing on the cement floor. Claimant stated that in the 70's he had some chiropractic treatment but hadn't seen a chiropractor for a year prior to the injury. On cross-examination claimant revealed he holds the top job in his area.

David Kennedy Norton testified that he works for defendant employer as manager of labor relations and indicated that prior to April of 1982 claimant was a highly regarded employee and an expert in the instant oats area. Mr. Norton stated that claimant has had no performance problems since the injury.

Dennis Purcell, who testified by way of deposition, stated he is a supervisor for defendant employer and that claimant worked under him. Mr. Purcell indicated that claimant's job requires lifting of cases of product weighing between 15 - 20 pounds. Mr. Purcell disclosed that he was moving a dust collector with claimant on April 22, 1982. Mr. Purcell stated that they attempted to lift the dust collector but it was to heavy. Mr. Purcell indicated he couldn't remember if they were able to move it even a little. Mr. Purcell stated he did not hear a pop or snap in claimant's back. Mr. Purcell testified that he couldn't recall claimant complaining about his back that day. Mr. Purcell stated:

> Q. Since Mr. Hartl has returned to work which I believe the record shows was on September 20th, 1982 or at least that's when he had been released to return to work, have you been his supervisor?
>
> A. Yes.
>
> Q. And has he continued to do the same duties as before?
>
> A. Yes.
>
> Q. Before April 22nd, 1982?
>
> A. Yes.
>
> Q. Has his job been changed in any way?
>
> A. Not since the episode with the dust collector, I can't recall any.
>
> Q. Has it been changed in any way to lighter duty?
>
> A. No, I don't think so.
>
> Q. From your observations, is he able to do every duty or task on his job that he did prior to April 22nd, 1982?
>
> A. From my observation, I think he can. It's obvious that he is still having trouble with his back but he has been doing the work.
>
> Q. Has he requested any restrictions?
>
> A. No.
>
> Q. Has he been placed on any restrictions?
>
> A. No.

On cross-examination Mr. Purcell indicated that it is essential to claimant's job that he is able to lift.

W. E. Blair, D.C., who testified by way of deposition, indicated he first saw claimant on October 31, 1973. Dr. Blair gave a history of seeing claimant for back complaints during the 1970's but last saw claimant on April 4, 1980.

David C. Naden, M.D., who testified by way of deposition stated he is a specialist in orthopedic surgery and first saw claimant on May 7, 1980. Dr. Naden next saw claimant in May of 1982 and found evidence of a herniated disc. Dr. Naden stated that he received a history from claimant and opined that his work related injury had some bearing on his herniated disc. Dr. Naden stated:

> Q. Dr. Naden, I know that you responded to my request for a more recent report and I have a summary of that, but I have misplaced, or for some reason it has not been filed, your letter. What is your opinion of the present level of permanent impairment carried by Mr. Hartl without regard to causation?
>
> A. Well, I would say that he has at least a 15 to

17 1/2 percent PPD rating of the entire back as a result of his back affliction.

Dr. Naden indicated that claimant had two to three percent or based on defendants' hypothetical five percent of his permanent impairment related to his prior condition. Dr. Naden attributed ten percent impairment to claimant's work related injury.

On cross-examination Dr. Naden revealed that on June 30, 1982 he performed a partial laminectomy at L3-4 level bilateral. Dr. Naden indicated claimant would have been released to return to work ten to twelve weeks after the surgery. Dr. Naden testified that claimant should not be lifting over 50 pounds on a regular basis, and avoid extensive bending, or twisting of his back but he has not imposed any specific restrictions on claimant's activities. It would appear from his records that Dr. Naden returned claimant to work September 20, 1982.

APPLICABLE LAW

An employee is entitled to compensation for any and all personal injuries which arise out of and in the course of the employment. Section 85.3(1).

Claimant has the burden of proving by a preponderance of the evidence that he received an injury on April 22, 1982 which arose out of and in the course of his employment. McDowell v. Town of Clarksville, 241 N.W.2d 904 (Iowa 1976); Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

The claimant also has the burden of proving by a preponderance of the evidence that the injury of April 22, 1982 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman, 261 Iowa 352, 154 N.W.2d 128.

While a claimant is not entitled to compensation for the results of a preexisting injury or disease, the mere existence at the time of a subsequent injury is not a defense. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756, 760-761 (1956). If the claimant had a preexisting condition or disability that is aggravated, accelerated, worsened or lighted up so that it results in disability, claimant is entitled to recover. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812, 815 (1962).

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

ANALYSIS

The greater weight of evidence indicates that claimant received an injury arising out of and in the course of his employment with defendant employer on April 22, 1982. Although the memory of Dennis Purcell appeared lacking, he did remember having claimant try to move the piece of equipment claimant talked about and its weight.

Although it was not raised by the parties as an issue at the beginning of the hearing some of the evidence defendants inquired into may lead one to think there was an issue of lack of notice of claimant's injury. The greater weight of evidence indicates that defendants had notice. Claimant's testimony in fact was not contradicted by the testimony of Dennis Purcell. Mr. Purcell merely indicated he had a lack of memory. The undersigned believes claimant when he states he told his supervisor of his injury.

Claimant has also met his burden in showing he has a functional impairment of ten percent as a result of his injury on April 22, 1982. The causal connection of such impairment is supported by the testimony of Dr. Naden as well as the testimony of claimant. This was a material aggravation of a preexisting problem.

However, functional impairment is only one of the factors in determining a person's industrial disability. Claimant is 47 years old and has an eighth grade education. Claimant has spent the majority of his life working in jobs as a laborer doing work that requires lifting. In 1956 claimant started working for defendant employer and is a good worker. Since his injury claimant has returned to the job he had held at the time of his injury and has been able to continue working without complaints by his supervisors. Claimant is well motivated and has not had any reduction in actual earnings. Although claimant should have some restrictions on his activities, none have actually been placed on him. Based on the evidence presented it is determined that claimant has an industrial disability of fifteen percent as a result of his April 22, 1982 injury.

Claimant raised the issue as to whether 86.13 benefits apply to this injury. Claimant's prior condition plus his own supervisor's lack of memory are adequate to make plausible defenses to claimant's action. Defendants have not appeared unreasonable in denying claimant's claim.

Claimant contends that defendants have to pay back the group carrier for payments that it made to claimant if claimant proves his injury arose out of and in the course of his employment. The undersigned finds no legal authority nor has any been argued that would support such a holding. Section 85.38(2) only speaks of credit to be given defendants for payments under such a plan, not the rights of the different insurance carriers or the employer.

FINDINGS OF FACT AND CONCLUSIONS OF LAW

WHEREFORE, based on the evidence presented and the principles of law previously stated, the following findings of fact and conclusions of law are made:

FINDING 1. On April 22, 1982 claimant was injured while trying to move a dust collector with his supervisor.

FINDING 2. Claimant told his supervisor that he may have injured himself in trying to move the dust collector the day of or day after the injury.

CONCLUSION A. Claimant received an injury arising out of and in the course of his employment.

CONCLUSION B. Claimant gave defendants proper notice of his injury.

FINDING 3. Claimant's injury aggravated a preexisting back condition.

FINDING 4. As a result of his injury on April 22, 1982 claimant has a functional impairment of ten percent (10%).

CONCLUSION C. Claimant met his burden in proving a causal connection between his injury and the impairment on which he is basing this claim.

FINDING 5. Claimant is forty-seven (47) years old.

FINDING 6. Claimant has an eighth grade education.

FINDING 7. Claimant's jobs prior to his employment with defendant employer were mainly as a laborer and required lifting.

FINDING 8. Claimant started working for defendant employer in 1956.

FINDING 9. Claimant has a good work record.

FINDING 10. Since his injury claimant has returned to the position he held at the time of his injury and has performed his duties.

FINDING 11. Claimant is well motivated and has not had an actual reduction in earnings.

CONCLUSION D. Claimant has met his burden in proving that he has an industrial disability of fifteen percent (15%) as a result of his injury on April 22, 1982.

CONCLUSION E. Defendants did not unreasonably delay commencement of benefits.

CONCLUSION F. The undersigned does not have jurisdiction of the group carrier and does not have the authority to order defendants to reimburse the group carrier.

THEREFORE, defendants are to pay unto claimant twenty-one (21) weeks of healing period benefits at a rate of two hundred seventy-nine and 14/100 dollars ($279.14) per week and seventy-five (75) weeks of permanent partial disability benefits at a rate of two hundred seventy-nine and 14/100 dollars ($279.14) per week.

Defendants are to reimburse claimant for the following medical bills.

Orthopedic Surgeons	$1,625.00
Donald Paulsen	368.00
Mercy Hospital	6,003.07
Marion Heights Pharmacy	15.25
William Basler	401.00

Defendants are to pay unto claimant thirty-seven and 70/100 dollars ($37.70) for his mileage expense.

Defendants are to be given credit for all payments previously made to claimant or to the providers of medical services, including credit for the following.

Mercy Hospital	$2,341.14
Mercy Hospital	3,193.12
W. R. Basler, M.D.	165.00
Orthopaedic Surgeons	1,525.60
Donald Paulsen, M.D.	294.40

Accrued benefits are to be made in a lump sum together with statutory interest at the rate of ten percent (10%) per year pursuant to section 85.30, Code of Iowa, as amended.

Costs are taxed to defendants pursuant to Industrial Commissioner Rule 500-4.33.

Defendants shall file a final report upon payment of this award.

Signed and filed this 13th day of August 1984.

DAVID E. LINQUIST
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

MICHAEL M. HARVARD, Claimant, vs. FRYE COPY SYSTEMS, Employer, and AMERICAN MUTUAL LIABILITY INSURANCE COMPANY, Insurance Carrier, Defendants.	FILE NO. 613673 R E V I E W - R E O P E N I N G D E C I S I O N FILED AUG 1 IOWA INDUSTRIAL COMMISSIONER

This is a proceeding in review-reopening brought by Michael M. Harvard, the claimant, against Frye Copy Systems, his employer, and American Mutual Liability Insurance Company, the insurance carrier, to recover additional benefits under the Iowa Workers' Compensation Act by virtue of an admitted industrial injury which occurred June 8, 1979.

This matter was heard in Des Moines, Iowa on January 5, 1984 and considered as fully submitted at the conclusion of the hearing.

We shall be concerning ourselves with the nature and extent of claimant's disability, if any.

Based upon the undersigned's notes, the record in this matter consists of the oral testimony of the claimant, claimant's exhibits A through Z, and defendants' exhibits 1 through 11.

The commissioner's file shows that the defendants have paid the claimant a healing period up to February 26, 1983 at the stipulated weekly rate of $177.32 and further that the defendants are paying an additional 50 week period of permanent partial disability based upon a 10 percent functional impairment of the body as a whole.

There is sufficient credible evidence contained in the undersigned's notes to support the following statement of facts:

Claimant, age 40, married with three dependent children, a felon with three convictions, is currently employed in Detroit, Michigan as a parking attendant at a country club.

Claimant fell on June 8, 1979 while attempting to change a roll of carbon paper in his machine. Oil on the floor in the proximity of his work station seems to have been the cause. Claimant struck his head, injured his foot and lower back. The hospital records introduced support the claimant's testimony concerning the injury. (Claimant's exhibits X & Y)

Claimant began to experience low back discomfort after his head and foot pains subsided. A series of examinations confirmed that claimant has a medical problem at the L-5 level. (Cl. exs. D & E) Claimant's treating physician, John H. Kelly, M.D., reports his most recent findings as follows: (Cl. ex. A)

> Michael Harvard was originally seen by us July 12, 1979, one month following an injury to his back. At that time, we felt that he had a midline disc protrusion. We followed him and treated him conservatively following the injury. His course of recovery was protracted. He was admitted to the hospital in December 1979, and a myelogram showed a defect at the L4-5 level. An epidural injection of Cortisone afforded some relief of pain. In December, he was referred to Dr. Dubansky for a second opinion. After Dr. Dubansky's consultation, I lost track of him and did not see him again until 1983. Apparently, he had not returned to work or had much treatment over that period of time.
>
> We saw the patient April 7, 1983 and referred him for a CAT scan. The CAT scan showed some pathologic changes at the L4-5, L5-S1 levels. Objective findings at that time were not remarkable. Neurologically, he is intact.
>
> I think that the findings are compatible with his original injury; however, I am not certain of the extent of his disability. It would be my opinion that the patient could return to light work. He does, in my opinion, have approximately a 10% permanent partial impairment of the body as a whole as a result of the back condition which is the direct result of the fall he described in 1979.

Marvin Dubansky, M.D., in his report of February 28, 1983 (Defendants' exhibit 9) agrees with Dr. Kelly's medical opinion.

The claimant has the burden of proving by a preponderance of the evidence that the injury of June 8, 1979 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

In applying the foregoing legal principles to the case at hand, it is clear that the claimant has sustained his burden of proof by establishing that his current complaints of low back and leg discomfort are causally connected to the work injury under review.

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

The opinion of the supreme court in Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963) cited with approval a decision of the industrial commissioner for the following proposition:

> Disability * * * as defined by the Compensation Act means industrial disability, although functional disability is an element to be considered . . . In determining industrial disability, consideration may be given to the injured employee's age, education, qualifications, experience and his inability, because of the injury, to engage in employment for which he is fitted. * * * *

In applying the foregoing legal principles to the case at hand, it is concluded that the claimant has sustained an industrial disability of 20 percent of the body as a whole. The report of Timothy J. King, M.A., CRC (Cl. ex. Z & Def. ex. 11) is particularly helpful to the undersigned in assessing claimant's disability. The report confirms the undersigned's impression that retraining of the claimant will be a difficult task due to his educational deficiences. Claimant appears to have a weight lifting limitation of 15 to 20 pounds. It is clear that claimant's future employment activities will be limited to physical activities as opposed to mental activities and necessarily based upon claimant's current complaints of pain, his job opportunities are and will be limited.

Notwithstanding claimant's current reluctance to accept conservative surgery, it is the view of the undersigned, based upon many years of experience, that claimant's physical complaints will ultimately increase sufficiently to where a change of heart will occur. In the absence of a future intervening cause, defendants shall be responsible for the attending medical expenses.

THEREFORE, after having seen and heard the witnesses in open hearing and after taking into account all of the credible evidence contained in this record, the following findings of fact are made:

1. That this agency has jurisdiction of the persons and the subject matter.

2. That on June 8, 1979 claimant sustained an admitted industrial injury which arose out of and in the course of claimant's employment.

3. That all of claimant's attending medical expenses have been paid.

4. That the claimant's healing period ended on February 26, 1983.

5. That the claimant has been paid a 50 week period of permanent partial disability for a 10 percent functional impairment of the body as a whole.

6. That the claimant's physical activities have been curtailed and that such curtailment is causally connected to the injury under review.

7. That retraining of the claimant will be difficult due to his educational deficiences both past and future.

8. That claimant's future job opportunities are severely restricted due to his inability to accept and retain formal instruction.

9. That based upon claimant's three prior felony convictions, future employment requiring bonding will be difficult.

10. Claimant appears to be in need of future medical care in the form of corrective surgery.

11. That the claimant is found to have sustained an industrial disability of 20 percent of the body as a whole.

THEREFORE, IT IS ORDERED that beginning on January 10, 1984 defendants shall pay the claimant an additional fifty (50) week period of permanent partial disability at the rate of one hundred seventy-seven and 32/100 dollars ($177.32) per week together with statutory interest from the date due. Any accrued benefits are payable in a lump sum.

Costs, in accordance with Industrial Commissioner Rule 500-4.33, are charged to the defendants.

Signed and filed this 30 day of August, 1984.

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

HARVEY DAVID HASCALL, Claimant, vs. KAY WOLTMAN d/b/a SHELBY MARKET: Employer, and HAWKEYE SECURITY INSURANCE COMPANY, Insurance Carrier, Defendants.	:	FILE NO. 731598 A R B I T R A T I O N D E C I S I O N

INTRODUCTION

This is a proceeding in arbitration brought by Harvey David Hascall, claimant, against Kay Woltman d/b/a Shelby Market, employer, and Hawkeye Security Insurance Company, insurance carrier. Claimant alleges that he sustained an injury to his back on April 5, 1983 for which he seeks benefits. The hearing commenced June 22, 1984 at the Pottawattamie County Courthouse in Council Bluffs, Iowa with Michael G. Trier, Deputy Industrial Commissioner presiding. The claimant appeared in person with his attorney James E. Thorn. The defendant, Kay Woltman, appeared in person and with Gregory G. Barntsen, the attorney representing both defendants. The case was considered fully submitted upon conclusion of the hearing.

The record in this proceeding consists of the testimonies of Harvey David Hascall, Anthony Gress and Kay Woltman. Claimant's exhibits 1 through 31 inclusive were admitted into evidence.

ISSUES

The issues presented by the parties at the time of hearing are a determination of claimant's entitlement to benefits for temporary total disability, healing period and/or permanent partial disability and whether claimant is entitled, under section 85.39 of the Code of Iowa, to reimbursement for the expense of a medical examination performed by Ronald K. Miller, M.D. The issues also include a determination of claimant's entitlement to compensation for mileage and a determination of the costs of this proceeding.

It was stipulated by the parties that claimant did sustain an injury arising out of and in the course of his employment and that a causal connection existed between that injury and the disability which claimant presently exhibits. It was also stipulated that the rate of compensation is $155.03 per week in the event of an award.

REVIEW OF THE EVIDENCE

Claimant testified that he is 48 years of age and was born February 2, 1936 in Erickson, Nebraska. He stated that his height is five feet six inches and his weight is 135 pounds.

Claimant testified that he attended grade school at Shelby, Iowa where he completed the seventh grade but quit while in the eighth grade. He entered the air force when he was 17 years old and was dishonorably discharged in 1955.

Claimant described a work history which consisted primarily of alternating employment between Smith Grocery and Locker in Des Moines, Iowa and Disco Mart, a chain store in Oregon, prior to the commencement of his employment at Shelby Market. The work he performed at both of those previous places of employment consisted of cutting meat. Claimant stated that in 1981 he returned to Shelby to live with his mother and commenced his employment at the Shelby Market.

Claimant testified that when working for Smith Grocery and Locker and Disco Mart he would carry beef quarters which weighed as much as 200 pounds. He stated that at the Shelby Market the meat came in boxes which weighed in the range of 50 to 100 pounds each. The boxes contained pieces of meat weighing generally in the range of 40 or 50 pounds. He stated that the boxes came to the market by truck and that he unloaded them from the truck using a cart and stacked them in the cooler. He stated that when meat was needed he sometimes took it from the cooler a piece at a time and sometimes by taking the entire box.

Claimant testified that on April 5, 1983 he was unloading a truck putting boxes of meat in the cooler when he injured his back.

Claimant stated that prior to August 5, 1983 his back was average. He stated that he could move the boxes without any problem. He related that in 1976 he had injured his back lifting and that he underwent surgery following which he was off work for approximately three and one-half months. He related that following that surgery he worked briefly but shortly thereafter quit and did not return to continual regular employment until approximately two years following the surgery.

Claimant testified that upon injuring his back on April 5, 1983, he ceased working and sought treatment from Charles L. Pigneri, D.O., in Oakland, Iowa. He stated that he traveled 40 miles, round trip, each time he saw Dr. Pigneri. He related that Dr. Pigneri referred him to Behrouz Rassekh, M.D., in Council Bluffs. Claimant testified that Dr. Rassekh's office is approximately 40 miles each way from Shelby and that the office is located by Jennie Edmundson Memorial Hospital.

Claimant testified that after undergoing diagnostic tests, including a myelogram, Dr. Rassekh recommended surgery and that such was eventually performed.

Claimant testified that his back still hurt when he returned to work in early August, 1983. He stated that he went back to his old job but that Kay Woltman helped with the lifting. He stated that he tried to work but that he felt he could not handle the job and quit in November, 1983. Claimant related spending the winter of 1983-1984 in Oregon where he did not actively seek work. He stated that his back improved and he returned to Iowa in March, 1984 where he commenced work at the Embers Cafe in Avoca, Iowa. He described his duties there as cooking hamburgers and steaks. He related that he had to lift 35 pounds once each day, but that generally someone else did the lifting for him. He stated that the job required eight or nine hours of continued standing each day and that his back and left leg starting hurting again so that he quit approximately two or three weeks prior to the hearing in this case.

Claimant testified that he plans to go back to Oregon but that he does not know what he could do in the way of employment. He does not believe he could cut meat due to the lifting which that occupation requires. He related making contact with the Iowa Vocational Rehabilitation Agency but stated that his case had not progressed any further.

Claimant testified that he does not think he could perform a job which required him to be on his feet for more than approximately two hours continuously. He stated that the pain he endures is worse in the mornings and that it is aggravated when he sneezes, and when he sits down or gets up. He stated that he feels that his recovery from this most recent surgery is progressing similar to the recovery from the first. He stated that he is not currently taking any medication.

On cross-examination claimant related that when working at the Shelby Market he spent approximately half of his time in the produce and dairy departments. Claimant related that following his first surgery he supported himself playing pool and that when he had returned to Shelby, Iowa in 1981, he worked part-time bartending.

Claimant testified that he had been paid in full for the compensation due during the time he was off work following the injury and that the defendants had paid all expenses incurred for his medical care.

Anthony Gress testified that he resides in Shelby, Iowa and has most of his life. He stated that he has been in the drywall construction business for approximately 30 years and that during the last 14 years he has been self-employed running his own business which serves an area within a 150 mile radius of Shelby, Iowa.

Gress testified that he is 49 years old and has known claimant since approximately the age of 13. He stated that he has had contact with claimant over the years on the occasions when claimant did return to Shelby and that he has seen claimant approximately four times per week since claimant returned to Shelby in 1981. He stated that he felt that claimant was a good worker, made his own way and was not afraid of work. He stated that prior to claimant's most recent surgery he was agile but that claimant now moves around like an old man.

Kay Woltman testified that she owns the Shelby Market Grocery Store and has for approximately two and one-half years. She testified that claimant quit his employment with her and told her that he was doing so because he would not work with one of the other employees. She stated that claimant had initially told her he was going to take some time off but that when the time off ended he did not return to work.

Woltman stated that before April 5, 1983 claimant handled the meat, produce and milk without any apparent difficulty but that she could tell a difference in his activity after the surgery. She also stated that the claimant was doing his job satisfactorily before he quit and that she had been available to help with the lifting whenever such was required.

Claimant's exhibit 24 relates that claimant was released to return to work on August 8, 1983.

In exhibit 26, a report dated November 17, 1983, Dr. Rassekh states:

> As far as the cause and relationship is concerned, patient related the April 5, 1983 onset of the pain to putting some meat in the cooler. One could say, with the fact that he has had previous disc removal at the same level on the opposite side, that he did have disc degeneration but the accident probably was an aggravating factor.
>
> Due to previous injury and as you will see in the Office Notes, he was given apparently a 20% partial-permanent disability after his operation in Oregon. At the last visit on September 8, 1983 Mr. Harvey Hascall was given a partial-permanent disability of 25% total as a whole body which would be an increase of 5%.

In exhibit 27, a report dated June 8, 1984, Dr. Miller states:

> This gentleman, in my opinion, has a 30% total permanent impairment to the body as a whole. I would generally rate this as 20% related to the old injury and 10% related to the new injury. I think that there is a positive causal relationship between this gentleman's problem and his incident while he was lifting at work on April 5, 1983.

Exhibit 11 is a report from Donald T. Smith, M.D., the surgeon who performed claimant's first back surgery. The report is dated September 9, 1976 and states:

> The patient named above was re-examined in my office on 20 August, 1976. Mr. Hascall attempted to return to work as a meatcutter [sic] but was unable to continue because of pain with excessive bending, lifting, etc., associated with that occupation. He tells me that he is hoping to enroll in a card dealer's school and I heartily would concur that considering his physical status that this type of employment would be more suitable for a long term beneficial back result.
>
> ...
>
> It would be my opinion Mr. Hascall has made an excellent recovery from his recent lumbar surgery. He is having some modest residuals both from his original injury and surgery which I would feel could be considered mild to mildly moderate from a physical impairment standpoint. The patient has a transitional type of lumbosacral back and I believe may have further difficulty with extreme activities and I would concur as stated in his seeking lighter type of employment. I believe his condition is stationary at this time and could be considered for closure.

Claimant received compensation for the 1976 injury. The order of the Workmen's Compensation Board is in the record as exhibit 13 and the pertinent part thereof states:

> The Evaluation Division has considered the medical reports and all other information submitted regarding your injury or disease, and has determined that you are entitled to an award of permanent partial disability...
>
> The Board finds and therefore ORDERS you entitled to compensation for temporary total disability inclusively from
>
> March 8, 1976 thru August 20, 1976 less time worked; AND the Board ORDERS the named insurance company to pay you an award of compensation equal to 64 degrees for 20 percent unscheduled disability resulting from injury to your low back.

Claimant's exhibit 30 is a mileage claim for 760 miles of travel and exhibit 31 is a statement of costs involving expenditures made in the prosecution of this case.

ANALYSIS AND APPLICABLE LAW

The claimant has the burden of proving by a preponderance of the evidence that the injury of April 5, 1983 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

Drs. Rassekh and Miller relate claimant's current disability to the injury of April 5, 1983. There is no contradictory medical evidence in the record and, consistent with the stipulation of the parties, a causal connection between the injury and the disability is found to exist.

An employer takes an employee subject to any active or dormant health impairments, and a work connected injury which more than slightly aggravates the condition is considered to be a personal injury. Ziegler v. United States Gypsum Co., 252 Iowa 613, 620, 106 N.W.2d 591 (1960), and cases cited.

While a claimant is not entitled to compensation for the results of a preexisting injury or disease, the mere existence at the time of a subsequent injury is not a defense. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756, 760-761 (1956). If the claimant had a preexisting condition or disability that is aggravated, accelerated, worsened or lighted up so that it results in disability, claimant is entitled to

recover. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812, 815 (1962).

When an aggravation occurs in the performance of an employer's work and a causal connection is established, claimant may recover to the extent of the impairment. Ziegler 252 Iowa 613, 620, 106 N.W.2d 591, 595 (1960).

In exhibit 26 Dr. Rassekh noted that the accident probably aggravated claimant's preexisting back condition. As shown at page 9 of exhibit 29, the most recent surgery disclosed an extruded disc fragment beneath the nerve root and was removed. It is clear that if the injury is termed to be an aggravation, that it certainly is a material aggravation.

There is no concise evidence in the record of the amount of functional impairment which claimant exhibited following the 1976 surgery. Exhibit 13 awards him compensation for 20 percent unscheduled disability resulting from an injury to his low back. Whether that 20 percent refers to functional impairment or a concept similar to industrial disability as used in Iowa is unclear. Dr. Rassekh believes claimant to presently have a 25 percent impairment and Dr. Miller believes claimant to have a 30 percent impairment. Although Dr. Rassekh speaks in terms of disability, his testimony, as shown in the depositions and reports, is interpreted by the undersigned to mean impairment rather than industrial disability.

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

The opinion of the supreme court in Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963) cited with approval a decision of the industrial commissioner for the following proposition:

> Disability * * * as defined by the Compensation Act means industrial disability, although functional disability is an element to be considered . . . In determining industrial disability, consideration may be given to the injured employee's age, education, qualifications, experience and his inability, because of the injury, to engage in employment for which he is fitted. * * * *

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

From the experience of the undersigned, a functional impairment of 20 percent of the body as a whole would be unusually high for the type of surgery claimant underwent in 1976 if the same is measured using the same standards and factors as are commonly used by physicians in the State of Iowa at the present time. It should be noted that the 20 percent rating does not appear in a medical report. Claimant's present total functional impairment is found to be in the range of 25 to 30 percent.

Claimant has little in the way of demonstrated work skills which would enable him to be gainfully employed at the present time if he cannot perform heavy lifting. Dr. Rassekh has suggested a 50 pound lifting limitation and avoidance of repeated bending and lifting. After two surgeries claimant certainly should not be carrying beef quarters or boxes of beef weighing nearly 100 pounds. Claimant has exhibited problems with prolonged standing as would normally occur working as a meat cutter or as a cook. Even claimant's employer has noted a difference in his activity since the injury.

Claimant's age is such that complete retraining is unlikely. He has not demonstrated the capacity for further formal education. His efforts at rehabilitation would best be directed to the grocery or food service business where he does have some background and experience. Although no direct testimony was introduced, one would expect that claimant would be skilled in evaluating the quality of meat as a result of his experience in cutting meat for retail sales.

Although claimant does possess marketable skills, his inability to perform moderate and heavy lifting will eliminate him from employment at a majority of the places where he would otherwise be suited to work.

Claimant has not actively sought rehabilitation, however, and does not appear to be highly motivated to return to work. His past employment history contains a number of job changes.

It should be noted that claimant was steadily employed immediately prior to the injury working as a meat cutter. It should also be noted, however, that the duties of working as a meat cutter caused the injury to occur. Claimant probably was able to work at his own pace while at the Shelby Market and it is apparent that it will be difficult for him to find employment for which he is now presently suited.

The primary issue in this case is a determination of the amount of disability which is related to claimant's April 5, 1983 injury. Dr. Miller felt that claimant's impairment had increased by 10 percent as a result of the injury and Dr. Rassekh felt that the increase was in the range of 5 to 10 percent. The evidence indicates a conflict between the 20 percent disability awarded by the Oregon Workmen's Compensation Board and the impairment rating which Dr. Rassekh would normally impose following a procedure similar to that which claimant underwent in 1976. It can fairly be concluded that Dr. Rassekh does not appear to agree that claimant's preexisting impairment was 20 percent. It is therefore concluded that claimant's functional impairment increased by 10 percent of the body as a whole as a result of the April 5, 1983 injury.

If claimant's disability were to be measured industrially, it would fall in the range of 40 percent. If an evaluation were to be made of his industrial disability following the 1976 injury, a rating of approximately 20 percent would be reasonable. It is therefore found and concluded that when the disability arising from the April 5, 1983 injury is measured industrially, that the same is 20 percent of total disability.

Claimant's mileage claim, as shown in exhibit 30, is supported by the testimony and other exhibits and such will be allowed in full.

The statement of costs, as shown in exhibit 31, will be allowed in accordance with Industrial Commissioner Rule 500-4.33 as to the charges of $115.00 and $32.40 respectively charged by Rex M. Blair & Associates. The expert witness deposition fee charged by Dr. Rassekh will be limited to $150.00 in accordance with Iowa Code section 622.72.

Under section 85.27 of the Code of Iowa the employer has the right to choose the medical care which an employee shall receive. That section provides a method of resolving a dispute if the employee is dissatisfied with that care. In this case it is unclear as to whether claimant was directed to Dr. Pigneri or whether he chose to see Dr. Pigneri on his own. In any event, the defendants acquiesced in care by Dr. Pigneri and the resulting care by Dr. Rassekh. Such, in effect, makes those physicians the physicians retained by the employer for purposes of section 85.39 of the Code of Iowa. An evaluation of permanent disability had been made by Dr. Rassekh and claimant apparently felt the same to be too low. Application for independent examination was made and the employer resisted the same. It should be noted that the employer did, at all times, have the right to require claimant to submit to an examination by another physician. It apparently chose not to do so and such confirms that Dr. Rassekh was a physician retained by the employer. It is therefore concluded that claimant is entitled to an independent examination from Ronald K. Miller, M.D., and that the employer shall be responsible for the cost thereof in the amount of $103.00.

FINDINGS OF FACT

1. Claimant is a resident of the State of Iowa and his place of employment at the time of injury was in the State of Iowa.

2. Claimant injured his back on April 5, 1983 while moving boxes of meat in the cooler at his employer's place of business in Shelby, Iowa.

3. At the time of injury claimant was employed by Kay Woltman d/b/a Shelby Market working as a meat cutter and in the produce and dairy departments of the grocery store.

4. Following the injury claimant was medically incapable of performing work in employment substantially similar to that he performed at the time of the injury from April 6, 1983 through August 7, 1983. Claimant returned to work on August 8, 1983. Claimant was paid compensation for the time he was absent from work between April 5, 1983 and August 8, 1983.

5. The injury claimant sustained resulted in 10 percent permanent impairment of the body as a whole.

6. Claimant's rate of compensation is $155.03 per week.

7. Claimant received medical care from Drs. Pigneri and Rassekh, which care was reasonable and necessary for treatment of the injury.

8. Claimant has a 10 percent functional impairment as a result of the injury. He is restricted in his ability to lift and perform repeated actions in the nature of lifting and bending.

9. Claimant is 48 years of age. He dropped out of school during the eighth grade and has had no further formal education.

10. Claimant's work experience is primarily in the area of meat cutting, but he does have a limited amount of experience as a cook, grocery store produce manager and grocery store dairy section manager.

11. Claimant is not highly motivated to find gainful employment.

12. Claimant was able to return to work with the defendant employer but left at his own choosing. Subsequently he has not found other continuous gainful employment.

13. Claimant had a preexisting impairment and disability arising from an injury which he sustained in 1976.

14. In obtaining medical care claimant traveled a total of 760 miles.

15. Claimant incurred costs in the prosecution of this proceeding in the total amount of $297.40 as shown on exhibit 31 and charges in the amount of $103.00 for obtaining an examination and report from Ronald K. Miller, M.D.

CONCLUSIONS OF LAW

This agency has jurisdiction of the subject matter of this proceeding and of the parties hereto.

The injury claimant sustained to his back on April 5, 1983 arose out of and in the course of his employment with Kay Woltman d/b/a Shelby Market.

Claimant's healing period ran from April 6, 1983 until August 7, 1983, both dates inclusive, for which he has been fully paid compensation by defendants.

As a result of the injury claimant is permanently partially disabled to the extent of 20 percent of total disability when the same is measured industrially.

Claimant is entitled to reimbursement for the expenses incurred in obtaining an examination and report from Ronald K. Miller, M.D., in the amount of $103.00.

Claimant is entitled to receive payment for traveling 760 miles in obtaining medical care at the rate of $.24 per mile for a total amount of $182.40.

Claimant is entitled to reimbursement for the costs of this proceeding in the amount of $297.40.

ORDER

IT IS THEREFORE ORDERED that defendants pay claimant one hundred (100) weeks of compensation for permanent partial disability at the rate of one hundred fifty-five and 03/100 dollars ($155.03) commencing August 8, 1983. Defendants shall pay all past due amounts in a lump sum.

IT IS FURTHER ORDERED that defendants pay interest pursuant to section 85.30 of the Code of Iowa.

IT IS FURTHER ORDERED that defendants pay claimant one hundred three and no/100 dollars ($103.00) for the expenses of an independent medical examination under the provisions of section 85.39 of the Code of Iowa.

IT IS FURTHER ORDERED that defendants pay claimant one hundred eighty-two and 40/100 dollars ($182.40) as reimbursement for expenses incurred for transportation necessary to receive medical care for the injury.

IT IS FURTHER ORDERED that defendants pay to claimant the costs of this action in the amount of two hundred ninety-seven and 40/100 dollars ($297.40).

IT IS FURTHER ORDERED that defendants file an activity report within twenty (20) days from the date of this decision.

Signed and filed this 21st day of August, 1984.

IOWA INDUSTRIAL COMMISSION

STATEMENT OF THE CASE

Defendants appeal from a proposed review-reopening decision wherein claimant was awarded additional temporary total disability benefits and medical expenses. The record on appeal consists of the transcript of the review-reopening proceedings; claimant's exhibits 1 through 36; defendants' exhibits A through I; the deposition testimony of James L. Blessman, M.D.; and the briefs and filings of all parties on appeal.

ISSUES

The issues on appeal are extent of temporary total benefit period and entitlement to permanent partial disability benefits.

REVIEW OF THE EVIDENCE

The parties stipulate that the applicable rate of compensation is $328.65 per week. (Transcript, page 15) Claimant was 33 years old at the time of the hearing. He is married and has three children. Claimant graduated from high school in 1968 and has had no subsequent schooling or formal training. (Tr., pp. 5-6) He worked as a laborer and machine operator in a factory following graduation, and then drove trucks for various employers. He began driving for defendant employer in November of 1981. (Tr., pp. 8-14) His duties included loading and unloading, and he was paid by mileage and an hourly rate. His gross earnings were approximately $584 a week. (Tr., p. 14) On April 13, 1982 claimant was assisting in the loading of his trailer when he stepped back and fell between the trailer and the dock, injuring his left leg and left buttock. (Tr., pp. 18-19) Claimant drove the load to Des Moines, reported the injury, and was sent to Herbert Rosen, D.O., the company doctor. (Tr., pp. 19-20; Defendants' Exhibit I) Dr. Rosen reported his findings as: "Skinned leg and skin loss L outer thigh, Hematoma very large L inner lower leg: L hip pain - pulled pain into L shoulder: neck tightening up: sweat attack." (Def. Ex. C) Claimant returned home and consulted George Hegstrom, M.D., for treatment of the blood clot below his left knee. He was released by Dr. Hegstrom to return to work on April 26, 1983. (Def. Ex. C, Tr., pp. 20-21) Claimant testified that his left buttock, left side and tailbone was tender, but his doctors believed it would improve with time. (Tr., pp. 21-22) Claimant continued to drive a semi truck through the summer and into the fall, but his tailbone became more painful, and he was referred by Dr. Hegstrom to Mark Brodersen, M.D., an orthopedic surgeon. (Tr., pp. 22-23; Claimant's Ex. 2) Dr. Brodersen saw claimant on October 5, 1982 and advised sitz baths, one week of rest, and the use of a ring cushion. (Cl. Ex. 1) Dr. Brodersen reported that claimant suffered from coccydynia.

> It is my feeling that Mr. Hass suffers from a problem called coccydynia. I believe that his stated cause of pain is correct. I think that a fall such as he describes could cause the type of problem that he is having at this point. In regards to the question about the x-rays, it is my feeling that he does have a slight abnormality of the tip of the coccyx or tailbone. It is not possible to determine from his initial x-rays whether or not this was present prior to his injuries. I think that this may be merely an anatomic abnormality and does not necessarily represent a fracture. In regards to his prognosis, I feel that in general these patients continue to have a long-term period of discomfort and aggravation. Generally, they do seem to gradually improve as time passes, however.
>
> In regards to his current status I, at this point in time, would have nothing other to add in regards to treatment. Because he continues to have a significant amount of discomfort, I have referred him to Doctor Blessman at the Mercy Medical Center Pain Clinic in Des Moines. (Cl. Ex. 2)

James L. Blessman, M.D., examined claimant in November 1982 for complaints of persistent pain in the sacrum and coccyx region. (Def. Ex. F) Dr. Blessman noted:

> Physical examination here revealed an antalgic gait, especially on the left. Range of motion of his spine was normal. His neurological reflexes

were within normal limits and sensation was intact. Palpation of the coccyx, both externally and by rectal examination, was extremely painful. Impression: Coccyodynia [sic] with no evidence of radiculopathy.

He was seen by our Anesthesiologist, Dr. Dana Simon, who concurred with the above diagnosis and gave him a caudal epideral steroid injection. The patient got immediate complete relief from his chronic pain problem; however, the pain relief lasted only approximately twelve days and then gradually began returning. During this period of time, he was instructed in several different types of exercise including; therapeutic aquatics, yoga, and several different forms of aerobic exercises. The patient was instructed in autogenic training including progressive muscle relaxation, guided imagery, hypnosis, and biofeedback type stress management.

....

Medication used, during his stay in the Pain Center, was Indocin 50 mgs. three times a day with food, and Tylenol two tabs every three hours as needed. We also placed him on a group of nutritional supplements specifically: L-Tryptophan, Vitamin C, Vitamin B-6, and Vitamin B-3.

When the patient's pain began to return, we had him re-evaluated by Dr. Simon who felt that a repeat caudal epideral nerve block was indicated and this will be done one week from discharge. Hopefully this will prolong his relief. I have recommended to the patient that he stay completely off work until following the nerve block next Monday. After this, would expect that we will want to have him stay off work an additional three weeks and then return to his usual employment. There will be no restrictions on bending, stooping, or lifting, when he returns to his usual employment. I would try to negotiate with his employer the first four weeks that he is working in that he be given rather short trips as the only difficulty he has had, even in the past, was in sitting and in all the bouncing involved in driving a truck.

I feel his prognosis for complete recovery is quite good. I have asked him to make an appointment in my office to see me right after the first of the year. He will also be seeing Dr. Dana Simon about that same time to follow-up his second caudal epideral injection. He could be given a total of four caudal epiderals if these were required; however, at this point, it appears that one more injection should get him back to the point where he can return to his usual employment. (Def. Ex. F)

Dr. Blessman testified by deposition that he estimated claimant would have reached a point where no further medical improvement was expected by February 1, 1983. (Blessman Deposition, pp. 17-18) Dr. Blessman explained that claimant improved greatly during his initial treatment at the Pain Center but then became discouraged. Dr. Blessman speculated that claimant's attitude was related to marital difficulties claimant was experiencing. (Blessman Dep., pp. 16-22) Dr. Blessman saw claimant on January 10, 1983 and reported:

> Seen today followup his Pain Center treatment program. He's still having considerable pain in his coccyx radiating up into the LS area of his back. At this point he has full ROM of his back. He has been seeing a counselor, Chuck Roberts, in Ames. Seems to be helping somewhat. Has not returned back to work nor does he feel like he's anywhere near ready. Appears to be poorly motivated to return to work. At this point I do not feel that I have anything further to offer him. Have recommended that he return to see Dr. Simon for followup of his last nerve block and probable repeat nerve block. Failing success here, would recommend he return to Dr. Broderson, his orthopedic surgeon, who referred him down to me 8 months ago. (Cl. Ex. 7)

Dr. Blessman stated that claimant's pain was so severe that riding in his pickup pained him and claimant was unwilling to consider returning to work. (Blessman Dep., p. 15) At that time Dr. Blessman revised his opinion and did not feel claimant would return to work because of pain and motivational factors. (Blessman Dep., pp. 19-20) Dr. Blessman recommended claimant see Marvin H. Dubansky, M.D., for additional orthopedic consultation. (Tr., p. 23; Cl. Ex. 13) On March 3, 1983 Dr. Dubansky reported his findings following examination of claimant.

> Was in the pain center - swimming pool, which helped some, and exercises. None of the exercises the patient demonstrated to me were pelvic tilt exercises or did he receive instructions in correct use and care of the back. He had some cryotherapy which helped temporarily. He also had an epidural nerve block with Dr. Simon, having 3 altogether, the last being January 1983. The first shot helped, and the second felt "super", but the pain gradually came back after each one. The third shot helped for 5 or 8 days and then wore off.
>
> ....
>
> At present he sits on a rubber donut and when he does his legs get numbness down to his toes.
>
> The patient walks without a limp. Chest expansion 3 1/2". There is tenderness from about the 3rd lumbar down to and including the tip of the coccyx which is quite sore. There is also tenderness on the left sacroiliac area. He flexes with fingertips to the lower tibiae, measuring 80 deg. in the back. Extension is 25 deg. Right and left lateral bending 25 deg. Straight leg raising goes to 90 deg. bilaterally. Knee and ankle reflexes are 2+. There is no muscle weakness on testing dorsi- and plantar flexion, inversion and eversion of the feet, flexion and extension of the knees, abduction and adduction of the hips. The sensation is symmetrical and intact to pinprick. The leg lengths are equal between the anterior superior spine and inner malleolus. Circumferential measurements calf and thigh and similar areas symmetrical. There is complete range of hip and knee motion.
>
> (Sent with the patient) Review of these x-rays including a pre-employment x-ray taken before his injury reveals no evidence of fracture or bony abnormality
>
> At this time I feel that Mr. Hass has a so-called "coccydynia".
>
> These can be a problem but if he has had 2 or 3 cortisone injections into the coccyx apparently this has been of no help to him but in some cases it would be.
>
> He has had just about all kinds of treatment. However, in my opinion he has not really had correct back exercises, such as pelvic tilt and instructions in how to use his back. Whether or not this will influence his low back complaints, leg pains, etc. I don't know, but I think it should be at least worked with.
>
> A copy of this letter is going to Dr. Simon. Told the patient to contact Dr. Simon so that Dr. Simon can make arrangements perhaps to have this done either personally or by a therapist under his direction.
>
> Frankly at this time I can find no evidence of bony injury by x-ray, and I can find no clinical evidence of nerve root compression. (Cl. Ex. 13)

Claimant testified that Dr. Dubansky contacted Dr. Blessman regarding different exercises and Dr. Blessman directed a change in claimant's physical therapy program. (Tr., pp. 39-40) Claimant reported he went to the physical therapy department of Mercy Hospital and received ultrasound and hot pack treatments on his back and began new exercises. (Tr., p. 40) Claimant stated that in March Dr. Blessman changed his medication from Zomax to Meclomin. (Tr., p. 41) Mercy Hospital Medical Center records indicate claimant received five physical therapy treatments in February and March. (Cl. Ex. 32-33)

On May 5, 1983 claimant was evaluated by Stuart R. Winston, M.D., a neurosurgeon, at the suggestion of claimant's attorney. (Cl. Ex. 15; Tr., p. 98) Dr. Winston reported:

> His main complaints revolve around a sore tailbone, left belt level muscle spasm and back aches which go up and down and across at about that level. He states that working around the house and yard hurts and that he develops primarily "back aches". Sitting on his bed or his couch can aggravate his tailbone pain. He does exercises and takes baths daily for their heat medicinal purposes.
>
> We repeated lumbosacral and views of the sacrum and coccyx on May 5, 1983 and compared those with the former films. There are no changes and they appear normal. Bone imaging, i.e., bone scanning, was done on May 10, 1983 and it to [sic] is normal.
>
> I feel that the patient suffers from chronic intermittent muscle strain and pain related to contusion of the coccygeal area. I feel that he has probably reached a plateau and any permanency here would be related primarily to the pain since there is no evidence of any anatomic disruption or neurologic involvement. I would think that the patient probably might, if allowed to return to his job, be able to carry on although doing simple things around the home would tend to mitigate against heavy lifting and the like. Perhaps retraining would be in order if this would be his desire. I, quite frankly, feel that the patient could return to his work without any danger to himself but might find that, from time to time, he

would have to have some heat and massage, etc., for his discomfort.

Permanent partial disability, in my view, related to pain in his case would amount to about 5%. (Cl. Ex. 15)

On May 20, 1983 Dr. Rosen examined claimant for Department of Transportation recertification and issued a work release effective June 21, 1983. (Cl. Ex. 16, 17, 18) Dr. Rosen recommended claimant protect the tailbone area from irritation by using a doughnut cushion. (Cl. Ex. 17) Claimant stated that the possibility of surgery on his tailbone had previously been discussed but that none of his doctors had recommended such surgery. (Tr., p. 104) Claimant testified at the June 22, 1983 hearing that he was ready to return to work. (Tr., p. 98)

Robert V. Wolf, director of personnel and labor relations for defendant employer, testified that there were no company or D.O.T. prohibitions against claimant using a rubber cushion while driving. He stated that claimant could stop and stretch to relieve any discomfort, and was in fact required to do so to make periodic checks of truck tires and equipment. (Tr., pp. 108-110) Mr. Wolf testified that all company trucks are supplied with adjustable air seats which can be regulated for comfort. (Tr., p. 110) He reported that defendant employer needed drivers and claimant could begin working the next day. (Tr., p. 118) Mr. Wolf explained that company procedure called for claimant to obtain a release to work from the attending physician, Dr. Blessman, before being scheduled for a D.O.T. physical with the company doctor, Dr. Rosen. Mr. Wolf stated the work release had to be held up until Dr. Blessman released claimant. (Tr., pp. 116-117)

Defendants' final report filed March 25, 1983 states that claimant has been paid temporary total disability benefits from April 14, 1982 to April 25, 1982 and again from October 1, 1982 to March 24, 1983.

APPLICABLE LAW

The claimant has the burden of proving by a preponderance of the evidence that the injury of April 13, 1982 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

An injury is the producing cause; the disability, however, is the result, and it is the result which is compensated. Barton v. Nevada Poultry Co., 253 Iowa 285, 110 N.W.2d 660 (1961); Dailey v. Pooley Lumber Co., 233 Iowa 758, 10 N.W.2d 569 (1943).

ANALYSIS

Defendants argue on appeal that claimant could have returned to employment on or about February 3, 1983 but for his lack of motivation to do so. They maintain that claimant's entitlement to temporary total benefits terminated on that date.

In October of 1982, Dr. Brodersen predicted that claimant would probably experience a long-term period of discomfort and aggravation, and that improvement usually occurs over a gradual period of time. Claimant was then referred to the Pain Center where initial success was achieved with nerve blocks. Dr. Blessman estimated that through continued use of nerve block injections and autogenic training, claimant should be able to return to his usual employment in four weeks. However, in January 1983 Dr. Blessman revised that estimate, reporting that claimant was poorly motivated and had not made the expected progress. Dr. Blessman noted that claimant continued to have "considerable pain" in the coccyx which radiated into the lumbar-sacrum area. Dr. Blessman recommended another nerve block and referred claimant to Dr. Dubansky for further orthopedic evaluation. There is no indication in Dr. Blessman's January 1983 report that he believed claimant was able to return to work.

Dr. Dubansky examined claimant in March and reported findings of tenderness in the lumbar, coccyx and sacroiliac regions. Dr. Dubansky recommended a different program of physical therapy. In May claimant was evaluated by a neurologist who advised claimant to use heat and massage and expressed the belief that claimant could return to work. That same month, claimant reported to Dr. Rosen, the company doctor, for an examination for D.O.T. certification. Dr. Rosen released claimant to return to work effective June 21, 1983.

There is sufficient evidence in the medical reports of Drs. Dubansky and Winston that claimant continued to experience pain which impeded his activities and caused him discomfort in the sitting position required by his work duties. In the period following February 1, claimant continued to seek medical assistan for his pain and appears to have promptly followed through on the various recommendations of his doctors. None of the medical reports prior to May of 1983 state that claimant is able to assume his employment duties, and, in fact, Mr. Wolf indicated that at the time of the D.O.T. examination in May, claimant had not yet been released to work by Dr. Blessman. Claimant was released by the company doctor to return to work on June 21, 1983, and that date will represent the termination of claimant's temporary total disability.

Claimant has been paid benefits up to March 24, 1983 and is entitled to an additional 13 weeks of temporary total benefits.

Defendants contend in their second issue that the question of permanency was tried before the deputy and should have been addressed in his ruling. They argue that the medical evidence establishes that claimant has suffered no permanent impairment. The May 1983 report of Dr. Winston, who determined a five percent permanent partial disability based upon pain, would not appear to support this assertion. However, the deputy was correct in finding that the issue of permanency was not ripe for determination at the time of the hearing. Claimant testified he was ready to return to his normal work duties, and Mr. Wolf indicated that defendant employer was prepared to put claimant to work. As matters stand as the close of the record, claimant will return to his regular employment following termination of the temporary disability period. Should subsequent events indicate the need for reconsideration of the permanency question, claimant may petition for review-reopening and the opportunity to present new evidence.

The proposed decision of the deputy awarded claimant certain medical expenses incurred in the treatment of the work-related injury. Defendants have not contested this award on appeal, and the findings of the deputy as to medical costs are incorporated into this ruling.

FINDINGS OF FACT

1. Claimant was employed as a truck driver by defendant employer on April 13, 1982.

2. While working, claimant sustained an injury to his tailbone, left leg and buttock.

3. Claimant returned to work after approximately two weeks.

4. Claimant continued to experience pain in the coccyx region as a result of the work-related injury.

5. Claimant discontinued working in October of 1982 and was treated by an orthopedic surgeon, Dr. Brodersen, for coccydynia.

6. Claimant did not return to work and consulted various other doctors for relief of his pain.

7. Claimant's treatment included physical therapy, medication and nerve block injections.

8. After February of 1983 claimant continued to experience pain when he sat or attempted to work around his house.

9. In May claimant was examined by Dr. Rosen for purposes of D.O.T. certification.

10. On June 21, 1983 it was medically indicated that claimant could return to work substantially similar to employment in which he was engaged at the time of the injury.

11. As a result of his April 13, 1982 injury claimant has been paid temporary benefits through March 24, 1983.

12. Claimant is entitled to additional temporary total disability benefits through June 21, 1983 for a total of 12 5/7 weeks.

13. Claimant's applicable rate of compensation is $328.65 per week.

14. Claimant intended to return to his regular work duties following his release to work. A determination as to whether claimant has sustained a permanent partial disability may not be made at this time.

CONCLUSIONS OF LAW

WHEREFORE, it is found:

Claimant has sustained his burden of proof that he is entitled to temporary total disability benefits from March 25, 1983 through June 21, 1983 as a result of his April 13, 1982 injury.

Claimant is entitled to the payment of medical expenses incurred in the treatment of the April 13, 1982 injury.

No determination of permanent disability may be made at this time.

THEREFORE, the deputy's decision is slightly modified.

ORDER

THEREFORE, it is ordered:

That the defendants pay the claimant an additional twelve and five-sevenths (12 5/7) weeks of temporary total disability benefits at the weekly rate of three hundred twenty-eight and 65/100 dollars ($328.65) in a lump sum together with statutory interest from the dates due.

That defendants are to pay the following medical expenses:

Charles E. Roberts, MSW	$120.00
Eidbo Clinic	20.00
Neuro-Associates, P.C.	100.00
Family Pharmacy	45.45
Mercy Hospital	241.00
Mercy Hospital	227.00
Radiology & Nuclear Medicine	115.00
Transportation reimbursement	228.40

That costs are charged to the defendants as contemplated by Industrial Commissioner Rule 500-4.33.

That defendants are ordered to file a final report within twenty (20) days from the date of this decision.

Signed and filed this 25 day of July, 1984.

PULLEY FREIGHT LINES,
Employer,
and
CARRIERS INSURANCE COMPANY,
Insurance Carrier,
Defendants.

FILE NO. 700755

R E V I E W -

R E O P E N I N G

D E C I S I O N

FILED
DEC 9 1983
IOWA INDUSTRIAL COMMISSIONER

This is a proceeding in review-reopening brought by Kenneth L. Hass, the claimant, against Pulley Freight Lines, his employer, and Carriers Insurance Company, the insurance carrier, to recover additional benefits under the Iowa Workers' Compensation Act as the result of an admitted industrial injury which occurred on April 13, 1982 and for which claimant received twenty-six and two-sevenths week period of temporary total disability benefits at the stipulated weekly rate of $328.65. Claimant was last paid weekly entitlment on March 24, 1983.

This matter was heard in this agency's office in Des Moines, Iowa on June 22, 1983 and considered as fully submitted at the conclusion of the hearing.

Based upon this deputy's notes the record in this matter consists of the live testimony of the claimant and Robert Wolf as well as the evidentiary deposition of James L. Blessman, M.D., together with claimant's exhibits 1 to 27 and 29 to 36 and defendants' exhibits A to I.

The issue in this matter appears to be whether or not claimant's continuing difficulty with "coccydynia" and its associated pain is sufficiently severe so as to prevent him from performing his normal duties as a truck driver thereby entitling him to a period of disability beyond the dates voluntarily paid by the defendants.

There is sufficient credible evidence contained in this deputy's notes to support the following statement of facts:

Claimant, age 33, married with three dependents, a resident of Jewell, Iowa, has been a truck driver during his entire employment history. The claimant has been a driver for the defendant employer since 1981 and on April 13, 1982, while loading his trailer with produce, claimant fell between the rear of the trailer and the loading dock due to unforeseen removal of the metal plate used as a bridge allowing a smooth entry into the trailer interior and the loading dock.

Claimant was sent to Herbert Rosen, D.O., the company physician, who in his report of May 11, 1982 (defendant's exhibit C) reported, in part, as follows:

> 6. Give accurate description of nature and extent of injury and state your objective findings: Skinned leg and skin loss L outer thigh, hematoma very large L inner lower leg: L hip pain - pulled pain into L shoulder: neck tightening up: sweat attacks

Claimant's healing was delayed due to a blood clot in his left leg. Mark Brodersen, M.D., an orthopedic surgeon associated with the McFarland Clinic in Ames, Iowa, was authorized to treat the claimant in late summer of 1982. In his report of November 1, 1982 (claimant's exhibit 2) he reported as follows:

> In regards to your information in regards to Kenneth Hass, the following information is provided. It is my feeling that Mr. Hass suffers from a problem called coccydynia. I believe that his stated cause of pain is correct. I think that a fall such as he describes could cause the type of problem that he is having at this point. In regards to the question about the x-rays, it is my feeling that he does have a slight abnormality of the tip of the coccyx or tailbone. It is not possible to determine from his initial x-rays whether or not this was present prior to his injuries. I think that this may be merely an anatomic abnormality and does not necessarily represent a fracture. In regards to his prognosis, I feel that in general these patients continue to have a long-term period of discomfort and aggravation. Generally, they do seem to gradually improve as time passes, however.
>
> In regards to his current status I, at this point in time, would have nothing other to add in regards to treatment. Because he continues to have a significant amount of discomfort, I have referred him to Doctor Blessman at the Mercy Medical Center Pain Clinic in Des Moines.

Thereupon, claimant became a patient of James L. Blessman, M.D., certified member of American Board of Family Practice, and on the staff of Mercy Pain Center in Des Moines, Iowa.

Dr. Blessman expressed doubt on the amount of pain that the claimant complained of following a marked improvement following an epidural injection. (Deposition p. 10, ll. 8-18) Subsequent nerve blocks were unsuccessful in reducing claimant's discomfort. (Depo. p. 14, l. 10) Dr. Blessman also expressed doubt concerning claimant's motivation to return to work.

At the hearing Robert Wolf, personnel director for the employer, offered to allow the claimant to return to work. Mr. Wolf authorized the use by the claimant of a rubber donut while driving to relieve his coccyx pain. Mr. Wolf authorized necessary stops by the claimant while enroute so as to allow him to walk and stretch so as to relieve his discomfort. All of this was conditional upon Dr. Rosen, the company physician, issuing a return to work slip. This was done. Dr. Rosen released the claimant to return to work as of the date of the hearing. (Cl. ex. 18) Claimant stated that he would report for duty the next day, June 23, 1983. So much for claimant's lack of motivation.

The claimant has the burden of proving by a preponderance of the evidence that the injury of April 13, 1982 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

In applying the foregoing legal principles to the case at hand, it is clear that the claimant has borne his burden of proof. All of the medical practitioners whose opinions are a part of the evidence, Dr. Marvin Dubansky, Dr. Blessman, Dr. Brodersen, Dr. Dana Simon and Dr. Stuart Winston, agree that claimant's condition is painful, the only issue being whether such pain continues to be disabling. Claimant appears to have returned to work putting to rest claimant's claim for additional healing period benefits.

Claimant's claim for permanent partial disability of the body as a whole appears to be premature. The doctors all appear to be of the opinion that claimant's coccyx be given time to heal and hopefully this painful condition will resolve itself.

Dr. Blessman approved of claimant's visit to Charles E. Roberts, MSW, a counselor in Ames, Iowa (Depo. p. 16, l. 10) and accordingly the charges so incurred are the defendants' re-

sponsibility.

The unpaid charges of Dr. Walter B. Eidbo, M.D., incurred on May 20, 1983 are payable by the defendant.

The reasonable cost of claimant's independent examination by Dr. Winston is payable by the defendant.

The physical therapy sessions at Mercy Hospital in Des Moines, Iowa are payable by the defendants.

WHEREFORE, after having heard and seen the witnesses in open hearing and after taking into account all of the credible evidence contained in this deputy's notes, the following findings of fact are made:

1. That this agency has jurisdiction of the persons and the subject matter.

2. That the claimant sustained an admitted industrial injury on April 13, 1982 resulting in a period of temporary total disability of a twenty-six and two-sevenths week duration.

3. That claimant's rate of entitlement is $328.65

4. That the claimant was unable to perform acts of gainful employment until June 22, 1983 at which time he returned to work.

5. That the claimant is entitled to an additional 13 week period of temporary total disability benefits.

6. That claimant's claim for permanent partial disability is premature in that his "coccydynia" may very well improve resulting in a less painful situation.

WHEREFORE, IT IS ORDERED that the defendants pay the claimant an additional thirteen (13) week period of temporary total disability benefits at the weekly rate of three hundred twenty-eight and 65/100 dollars ($328.65) in a lump sum together with statutory interest from the dates due.

Defendants are further ordered to pay the following medical expenses:

Charles E. Roberts, MSW	$120.00
Eidbo Clinic	20.00
Neuro-Associates, P.C.	100.00
Family Pharmacy	45.45
Mercy Hospital	241.00
Mercy Hospital	227.00
Radiology & Nuclear Medicine	115.00
transportation	228.40

Costs are charged to the defendants as contemplated by Industrial Commissioner Rule 500-4.33.

Defendants are ordered to file a closing notice within twenty (20) days from the date below.

Signed and filed this 9 day of December, 1983.

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

MARIANNA HAYES,	:	
	:	
Claimant,	:	File No. 735407
	:	
vs.	:	
	:	A R B I T R A T I O N
EAGLE SIGNAL DIVISION,	:	
	:	D E C I S I O N
	:	
Employer,	:	F I L E D
Self-Insured,	:	
Defendant.	:	DEC 28

INTRODUCTION

This is a proceeding in arbitration brought by Marianna Hayes, claimant, against Eagle Signal Division, self-insured employer, defendant, to recover benefits under the Iowa Workers' Compensation Act for an alleged injury of April 25, 1983. It came on for hearing on June 28, 1984 at the Bicentennial Building in Davenport, Iowa.

The industrial commissioner's file contains no filings.

At the time of hearing the parties stipulated to a gross weekly wage of $290.64 and a marital status of married with four exemptions; that claimant lost no time from work; that the medical expenses were fair; and that permanent disability commenced on the date of the injury.

The record in this matter consists of the testimony of claimant, Elmer Hayes, James Neifing, Carl Madsen and Bob Blette; claimant's exhibit 1, a diagram of the material claimant was working with at the time of her injury; claimant's exhibit 2, a series of medical expenses; claimant's exhibit 3, a letter from J. Albert deBlois, D.O., dated March 19, 1984; claimant's exhibit 4, a letter from Robert W. Milas, M.D., dated March 6, 1984; defendant's exhibit 1, a listing of gross pay; defendant's exhibit 2, additional earnings records; defendant's exhibit 3, a metal base; and defendant's exhibit 4, a small part with a brass terminal. The parties filed briefs.

ISSUES

The issues in this matter are whether or not claimant's injury arose out of and in the course of her employment; whether or not there is a causal relationship between claimant's injury and any disability she now may suffer; whether or not claimant is entitled to permanent partial disability; and whether or not claimant is entitled to the payment of medical expenses pursuant to Iowa Code section 85.27.

STATEMENT OF THE CASE

Married claimant with two dependent children, who has a GED and who has worked for defendant employer for more than twenty-fo years, recalled the circumstances of her April 25, 1983 injury thusly: She was taking small parts with a brass terminal on one end and inserting them into a block. Wires were pulling out of a ring and the flanges on the terminal were bent in an attempt to keep them in place. She used an ordinary screwdriver to bend the flanges. She used the screwdriver in her right hand and pressed as hard as she could press. This was the first time she had done the job which she worked on for three and one-half to four hours. After the flanges were bent they were checked with a lighted magnifying glass. If the flanges had not been opened enough, another attempt was made to open them. The rate to make 100 percent on this work was 600 pieces per hour or a total of 1200 flanges. She was unsure how many she had done, but she thought she was close to 100 percent one of the hours she worked.

She complained to her foreman and to her group leader that her right shoulder blade hurt. She finished the day. She observed trouble with a pain in her shoulder and into her arm. The work was not done the next day.

She went to personnel where she saw Pat West who rubbed liniament on her shoulder. She was not sent to the doctor.

She was called in by Neifing and Madsen who acted as if they knew nothing about her seeing Dr. deBlois. Neifing told her that she had to see the company doctor and then "hee hawed" around. She denied that any company doctor was offered to her. She insisted that she had to see the doctor and ultimately said she would send the bill through group or would cancel her appointment and go to the company doctor.

Dr. deBlois gave her pain pills and did Cortisone injections which helped until she became immune. Therapy was then tried for two or three times each week from December through January or a part of February. A laser and heat were used on her shoulder. Complaints about her being off work led to her quitting that treatment. She continues to work as a hydraulic operator and in subassembly.

Claimant, who is still treating with Dr. deBlois--who has been unable to find a medication which stops her pain--complained of lots of problems depending on what she is doing. She is

bothered by movement and by standing and walking too much. Her pain is constant, but sometimes much worse as determined by what her activities have been. Pain is aggravated by reaching. At times she is better on weekends; at other times she is not. Overall, she seems to think that her shoulder is not that much problem on weekends. She is unable to lie on her right side at night.

Claimant claimed that she has paid for all prescriptions and for treatment by Dr. deBlois except for her last visit. She has been reimbursed for some expenses by the group carrier. She indicated that she was sent by Dr. deBlois to Dr. DeAngelo, who in turn sent her to Dr. Milas.

Claimant stated that she has taken some vacation because she had shoulder pain. She went nowhere on vacation, but rather stayed at home.

Claimant acknowledged seeing the doctor for things other than her shoulder and most recently for a blood test because of the possibility of low potassium. In March of 1984 she had an auto accident when an uninsured motorist slid into her. She told that she had injury to her forehead and a whiplash. Pain came from the back of her head around to her forehead. She had blurred vision. She told that she recuperated from the accident after having been off for a week. Bills were covered by her insurance carrier and no law suit was filed.

Before April 1983 she had seen Dr. deBlois for menstrual and sinus trouble. She denied osteopathic manipulation to her back.

Elmer Hayes, claimant's spouse of twenty-five years, recalled that claimant came home complaining of her shoulder and the cords in her neck. He told her to take her problem to the union. He rubbed on linament. He remembered claimant's sitting in hot water and using a heating pad. He described her as in constant pain.

He testified that claimant complains quite often of pain, but she bears with it.

James Neifing, manager of personnel and industrial relations, who has been employed by defendant for eight years, recounted a May 3, 1983 meeting with claimant as follows: He first became aware of claimant's alleged problem on that date when claimant reported to West in personnel that she was going to Dr. deBlois for her shoulder. He got Madsen and sent for claimant. He explained to claimant the difference between workers' compensation and group insurance. She insisted on seeing Dr. deBlois. She was told she could see the company doctor. It was agreed that claimant could go to her own doctor. He heard nothing further of the incident until the chief steward came to Madsen with bills for claimant's treatment.

Neifing indicated that medical bills incurred and submitted directly to the group carrier by the employee would be paid. Forms could be those maintained in the personnel office or those available from the doctor. He acknowledged there were advantages to the company to having claims paid under the group plan.

Neifing thought the work claimant was doing on April 25, 1983 had been done by five persons over a two day period at the end of which time all defective parts had been completed.

Carl Madsen, supervisor of personnel who has worked for defendant employer for four years and whose duties include handling employee safety and benefits programs, also recollected the meeting with claimant: Neifing told her of the difference between compensation and group benefits. She said she wished to keep her appointment with the doctor for that day. She was informed of the availability of two company physicians. She expressed her confidence in Dr. deBlois. She was told her visit would be under the group plan and not the compensation policy.

The witness also does work in the payroll area. In April of 1983 claimant's earnings were 129%, in May 129%, in June 134%, in July 132%, in August 135% and in September 132%. He characterized claimant as a high earner and one of the top in the plant. He agreed that the amount of earnings would depend on the work done and that the work done was light.

Madsen testified that he and Neifing did not tell claimant her injury was workers' compensation because they were not certain it was. The company has continued to deny the claim.

Bob Blette, claimant's supervisor of April 25, 1983, testified to no awareness of claimant's injury until he heard about it from her group leader. He made further explanation of the work claimant was doing on April 25, 1983 by saying that an attempt was made to salvage a number of defective brass terminals. A magnifying glass was used to see if the flanges had been opened as far as possible and also to see if the flanges had been fractured in the opening process. The job was run for two days in one area and a day in another. He estimated that claimant had done the work for a little more than three hours. He denied ever being told by personnel to give claimant an easier job.

Records from defendant employer show that claimant usually made in excess of 100% and in excess of 120% as well.

A report from J. Albert deBlois, D.O., dated March 19, 1984 reports claimant was seen on May 3, 1983 for pain in the right shoulder. He understood that her job involved constant repetitive use of her right hand, arm and shoulder and a large amount of force in using a screwdriver for precision work. Claimant had full range of motion with pain centered over her right shoulder and along the right scapula. Paraspinal myospasm was present in the upper thoracic area. Claimant was treated conservatively with anti-inflammatories. X-rays taken later in the month were negative.

Subsequently, claimant was injected in trigger points with Xylocaine and Aristocort. The doctor thought these injections produced satisfactory results. Physical therapy was started on December 6, 1983.

Claimant seemingly told Dr. deBlois that her pain was not a problem during periods of rest or inactivity. He wrote: "In my opinion, the problem is work related and is caused by her repetitive use of the hand & shoulder in her job activity. The prognosis is satisfactory if the type of work activity is greatly reduced or eliminated." He found claimant "capable of working with the shoulder but not...rapid, repetitive activity necessary for running of the 500+ pieces presently required."

Anthony D'Angelo, Jr., D.O., saw claimant on February 23, 1984 and diagnosed right scapular pain. He proposed ruling out a cervical disc.

Robert W. Milas, M.D., neurosurgeon, saw claimant on March 5, 1984 at which time she gave a history of progressive discomfort in the right scapula since April 1983 and of treatment by Dr. deBlois. Neurologically, claimant was intact. Motion in her cervical and thoracic spine was normal. The doctor's impression was right scapular pain of unknown etiology. No evidence of a herniated disc was found.

APPLICABLE LAW AND ANALYSIS

The first issue to be determined is whether or not claimant's injury arose out of and in the course of her employment. In order to receive compensation for an injury, an employee must establish that the injury arose out of and in the course of employment. Both conditions must exist. Crowe v. DeSoto Consolidated School District, 246 Iowa 402, 68 N.W.2d 63 (1955).

In the course of relates to time, place and circumstances of the injury. An injury occurs in the course of the employment when it is within a period of employment at a place where the employee may be performing duties and while she is fulfilling those duties or engaged in doing something incidental thereto. McClure v. Union County, 188 N.W.2d 283, 286 (Iowa 1971).

In addition to establishing that an injury occurred in the course of employment, the claimant must also establish the injury arose out of employment. An injury "arises out of" the employment when a causal connection between the conditions under which the work was performed and the resulting injury followed as a natural incident of the work. Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

Claimant claims injury on April 25, 1983 from repeatedly using a screwdriver to open flanges. Claimant worked at this job for three and one-half to four hours doing as many as 600 pieces per hour. Claimant's spouse verified her coming home with shoulder and neck complaints.

A letter from Dr. deBlois reports claimant's first being seen by him on May 3, 1983 for pain in the right shoulder which she told him had occurred at work. The doctor believed claimant's "job involves constant and repetitive use of the right hand, arm and shoulder apparatus. A large amount of force is required when a screwdriver is used in precision work." He expressed the feeling that claimant "is capable of working with the shoulder but not in the job situation she has been in and not in the rapid, repetitive activity necessary for the running of the 500+ pieces presently required."

Claimant was seen by Dr. Milas on March 5, 1984 whose impression was that the etiology for claimant's right shoulder pain was unknown.

There is no evidence of claimant's having right shoulder and arm complaints prior to the time she was seen on May 3, 1983. The letter from Dr. deBlois finds her problems to be work related. The undersigned believes the record supports the finding that claimant had an injury to her right upper thoracic area including the rhomboid muscle group on April 25, 1983 which arose out of and in the course of her employment.

The claimant has the burden of proving by a preponderance of the evidence that the injury of April 25, 1983 is causally related to the disability on which she now bases her claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

An award of benefits cannot stand on a showing of a mere possibility of causal connection between the injury and the claimant's employment. An award can be sustained if the causal connection is not only possible, but fairly probable. Nellis v. Quealy, 237 Iowa 507, 21 N.W.2d 584 (1946). Questions of causal connection are essentially within the domain of expert testimony. Bradshaw, 251 Iowa 375, 101 N.W.2d 167. However,

expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish., 257 Iowa 516, 133 N.W.2d 867. See also Musselman, 261 Iowa 352, 154 N.W.2d 128.

Claimant continues to complain, but the matter of causal connection to disability is primarily a medical issue. Medical evidence in this case is scanty. The letter of Dr. deBlois correctly describes claimant's job activity at the time of her her injury, but that job was done on a single occasion for less than half a work day. Claimant, subsequent to April 25, 1983, was involved in an auto accident. No documentation was offered as to time claimant took vacation allegedly because of pain or to show that claimant saw a doctor on those days off. Claimant, in fact, stipulated to no loss of time.

Claimant has not shown by a preponderance of the evidence that any disability she now suffers is causally related to her injury of April 25, 1983 and for that reason no consideration will be given to awarding permanent partial disability.

The remaining issue is claimant's entitlement to benefits under Iowa Code section 85.27 which provides in pertinent part:

> The employer, for all injuries compensable under this chapter or chapter 85A, shall furnish reasonable surgical, medical, dental, osteopathic, chiropractic, podiatric, physical rehabilitation, nursing, ambulance and hospital services and supplies therefor and shall allow reasonably necessary transportation expenses incurred for such services.

Defendant has denied the compensability of this claim and therefore cannot seek control of the medical treatment. Holbert v. Townsend Engineering Company, 32 Biennial Report of the Industrial Commissioner 78 (Review Decision 1975). The letter from Dr. deBlois supports awarding payment of the doctor's charges, of prescription charges and charges for treatment at River Rehabilitation, Inc. Claimant testified that she was referred to Dr. DeAngelo by Dr. deBlois and his charges also will be allowed.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant is forty-four (44) years of age.

That claimant has a GED.

That claimant has worked for defendant employer for more than twenty-four (24) years.

That claimant is an outstanding production worker.

That on April 25, 1983 claimant worked at opening flanges between three and one-half and four hours.

That the work of opening flanges required use of a screwdriver in the right hand.

That April 25, 1983 was the only date on which claimant did the flange opening job.

That claimant had an automobile accident in March of 1984 which resulted in an injury to her forehead and a whiplash.

That claimant missed no work at the time of her injury other than possibly time to see the doctor.

That claimant has incurred medical expenses for treatment of her injury.

That the opinion of Dr. deBlois was based on an inaccurate description of claimant's usual work.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has established by a preponderance of the evidence an injury arising out of and in the course of her employment on April 25, 1983.

That claimant has failed to prove by a preponderance of the evidence a causal relationship between her injury of April 25, 1983 and any disability she now suffers.

That claimant has shown entitlement to benefits under Iowa Code section 85.27.

ORDER

THEREFORE, IT IS ORDERED:

That defendant pay the following medical expenses:

Prescription charges	$120.05
Albert deBlois, D,O.	396.00
River Rehabilitation, Inc.	440.00

That defendant pay costs of these proceedings pursuant to Industrial Commissioner Rule 500-4.33.

Signed and filed this 28 day of August, 1984.

IOWA INDUSTRIAL COMM

STATEMENT OF THE CASE

Defendant appeals from an arbitration decision wherein the Iowa Industrial Commissioner was found to have subject matter jurisdiction in these proceedings.

The record on appeal consists of the testimony of claimant, John Newmeister and David Neitzke; claimant's exhibits A and B; defendant's exhibits 1 through 5; and the briefs and filings of all parties on appeal.

ISSUE

Whether the Iowa Industrial Commissioner has subject matter jurisdiction over claimant's workers' compensation proceedings.

REVIEW OF THE EVIDENCE

Claimar . was a twenty-four year old single male residing in Whitehall, Wisconsin at the time of hearing. Claimant's involvement began with defendant employer while he was a welding student at Western Wisconsin Technical Institute in 1979. (Transcript, pages 94-95)

Claimant recalled that he and his roommate, David Neitzke, were told of a job opportunity with defendant employer by their welding instructor, Bill Van Riper. Claimant testified that Mr. Van Riper gave them the telephone number of the defendant employer in Des Moines, Iowa and told them to ask for Vern Reynolds, the field supervisor of defendant employer. (Tr., p. 95

Claimant testified that Neitzke made the telephone call to Reynolds in the claimant's presence. Claimant testified that

Neitzke was told by Reynolds' secretary that Reynolds was out of the office so Neitzke left a message for Reynolds to return his call. (Tr., pp. 95-97)

Claimant testified that a couple days later, Neitzke recieved a call from Vern Reynolds. Claimant testified that Reynolds offered both claimant and Neitzke jobs in Elwood, Indiana. (Tr., pp. 97-101)

In corroboration of claimant's testimony, David Neitzke recalled the series of events at the hearing:

Q. Did you call Des Moines, Iowa?

A. Yes.

Q. Did you talk to the person that Mr. Van Riper told you to talk to?

A. No.

Q. Who did you talk to? Anyone?

A. His secretary, I believe.

Q. Did you identify yourself when you called down there?

A. Yes.

Q. Did you tell them why you were calling?

A. For a job, yes.

Q. You told them you were calling for a job?

A. Yes.

Q. Wh. did the secretary tell you?

A. That he wasn't in right now, but to leave my name and phone number and they'd have him call me back.

Q. Did someone call you back?

A. Yes, about two days later.

Q. Who was that person?

A. I'm blank right now.

Q. Was it Mr. Reynolds?

A. Yes. Vern Reynolds.

Q. Where did he call you? Did he call you in La Crosse?

A. Yes.

Q. Did he identify himself when he called?

A. Yes.

Q. What did you say to him or what did he say to you when he called?

A. I told him I was looking for a welding job.

Q. Did he say anything about Pittsburgh-Des Moines Steel Company hiring at that time?

A. Yes.

Q. What did he say?

A. He said they were hiring -- said they had job openings and it sounded good to me so --

Q. Excuse me. I didn't here what you said.

A. He said they were hiring; there were job openings.

Q. Was there any discussion about salary?

A. Yes.

Q. Did he tell you how much the job would pay?

A. Yes, around $10 an hour.

Q. Was there any discussion about job location?

A. Yes.

Q. What did he say in that regard?

A. It would consist in a lot of traveling. They had a job in Elwood, Indiana.

Q. He said there was a job at that time in Elwood, Indiana?

A. Yes.

Q. Did you tell him that you were interested in the job?

A. Yes, I did.

Q. What did he tell you?

A. "If you want the job you're hired." He told me to report down to Elwood, Indiana, at 7:00, to Gaylord Brandt.

Q. Now let me -- he told you that if you wanted the job you're hired, was that your testimony?

A. Yes.

Q. You know Jim Hegge, don't you?

A. Yes.

Q. Was he your roommate at Western Wisconsin Technical Institute?

A. Yes.

Q. Was he with you when Mr. Van Riper told you about the job?

A. Yes.

Q. Was he with you when you called down to Iowa the first time you called down there?

A. Yes.

Q. Was Mr. Hegge with you when he called back?

A. No.

Q. Did you and Mr. Hegge ever talk about this job or about this prospective job that Mr. Van Riper had told you about?

A. Yes.

Q. What was said?

A. He said if the job sounded good to me to vow for him too. He wanted a job, too.

Q. I'm sorry. What was that please?

A. He said if the job sounded good to me to tell him that he'd like a job, too, with me.

Q. When did he say that?

A. Before. We talked about it before he called back about the job.
(Tr., pp. 77-81)

Vern Reynolds testified in a telephonic deposition that he did recall talking to Neitzke from his office in Des Moines, Iowa. Reynolds testified that he told Neitzke there were openings in Elwood, Indiana but that he would have to go the the job site and interview with Gaylord Brandt, the foreman. (Defendant's Exhibit 5, p. 8)

Reynolds testified that he told Neitzke that if claimant wanted a job, he too should visit with the foreman and "if they were qualified, he'd put them on." Reynolds testified that the foreman on the job site makes the final decision regarding the hiring of an employee. (Def. Ex. 5, p. 9)

John Newmeister is senior construction manager of defendant employer. Newmeister testified that it is company policy to hire at the job site. He stated that in the company union contract, "the job starts and ends at the job site." Newmeister testified that the union contract governed the employment of boilermakers, boilermaker helpers, and boilermaker learner helpers. He testified claimant has classified as a boilermaker/welder. Newmeister testified that he did not know whether claimant was a union worker or not. (Tr., p. 58)

Claimant and Neitzke began working for defendant employer on June 4, 1979. (Claimant's Ex. A, Def. Ex. 1) Claimant testified that when they arrived for their first day of work, they immediately asked for the foreman, Gaylord Brandt. Claimant testified they introduced themselves as "the boys from Wisconsin that Mr. Reynolds had hired." Claimant testified that Brandt then responded "okay, lets get some equipment for you," and then he started looking for safety belts and hard hats. (Tr., pp. 101-103) Both claimant and Neitzke filled out employment cards. (Cl. Ex. A, Def. Ex. 1) Claimant testified that after working one week, Neitzke quit his job. Claimant testified that he continued to work in Elwood, Indiana for a month at which time he also quit. Claimant testified that he called the foreman a few days later and told him he had quit. (Tr., pp. 106-107) After being out of work for about a week and a half, claimant testified he called Vern Reynolds in Des Moines, Iowa and asked for his job back. Regarding this chain of events, claimant testified:

Q. Did you go back to work for Pittsburgh-Des Moines Steel Company?

A. Yes.

Q. How did that come about?

A. Well, after about a week and a half or so I got worried that I was -- figured that I had better get a job so I called Des Moines.

Q. Who did you talk to?

A. Vern Reynolds.

Q. What did you say to him?

A. Asked him for my job back.

Q. What did he say?

A. He said, "Okay, you're going to go to Waukesha, Wisconsin, and you'll be working for Tom West."

Q. He hired you back, did he?

A. Yes.

Q. Over the telephone?

A. Yes.

Q. He told you where to report to?

A. Yes.
(Tr., p. 107)

Vern Reynolds testified that he remembered claimant calling him up and telling him that he was available to work, but Reynolds couldn't remember when or for what job. (Def. Ex. 5, pp. 36-37)

Claimant testified that when he arrived in Waukesha, Wisconsin, he did not have to fill out an application for employment card as he had in Indiana. (Tr., p. 108) Claimant recalled he worked in Waukesha for a couple of months. From July 21, 1979 until the time of his injury, claimant worked for defendant employer in the following states: Wisconsin, Nebraska, Minnesota, Oklahoma, Texas, Iowa, North Dakota, Illinois, and Kentucky. (Def. Ex. 2) Claimant was injured on December 17, 1980 in Wises Landing, Kentucky when he fell off a ladder working for the defendant employer.

APPLICABLE LAW

The industrial commissioner's subject matter jurisdiction over workers' compensation claims based on injuries sustained outside the state is governed by Iowa Code section 85.71:

> If an employee, while working outside the territorial limits of this state, suffers an injury on account of which he, or in the event of his death, his dependents, would have been entitled to the benefits provided by this chapter had such injury occurred within this state, such employee, or in the event of his death resulting from such injury, his dependents, shall be entitled to the benefits provided by this chapter, provided that at the time of such injury:
>
> 1. His employment is principally localized in this state, that is, his employer has a place of business in this or some other state and he regularly works in this state, or if he is domiciled in this state, or
>
> 2. He is working under a contract of hire made in this state in employment not principally localized in any state, or
>
> 3. He is working under a contract of hire made in this state in employment principally localized in another state, whole workers' compensation law is not applicable to his employer, or
>
> 4. He is working under a contract of hire made in this state for employment outside the United States.

The primary focus under Iowa Code section 85.71 is on the jurisdiction where the employee's employment is "principally localized." George H. Wentz, Inc. v. Sabasta, 337 N.W.2d 495, 500 (Iowa 1983). A person's employment is principally localized in this or another state when (1) his employer has a place of business in this or such other state and he regularly works at or from such place of business, or (2) if clause (1) foregoing is not applicable, he is domiciled and spends a substantial part of his working time in the service of his employer in this or such other state. Iowa Beef Processors, Inc. v. Miller, 312 N.W.2d 530, 533 (Iowa 1981).

The place of contract or hiring becomes significant "only when the employment is not principally localized in any state, the law of the state where employment is principally localized is not applicable to the employer, or the employment is outside the United States. George H. Wentz, Inc., 337 N.W.2d at 500.

Where the contract is entered into within the state, even though it is to be performed elsewhere, its terms, its obligati and its sanctions are subject in some measure, to the legislati control of the state. Pierce v. Foley Bros., Inc., 168 N.W.2d 346, 352 (Minn. 1969).

A contract for employment is made at the time and place where the last act necessary to complete meeting of the minds o the parties is performed. George H. Wentz, Inc., 337 N.W.2d 495, 500.

While Iowa courts have not addressed the issue of offer and acceptance of a contract made by telephone, the prevailing view in other jurisdictions is that the contract comes into existenc at the place where the offerer utters the words of acceptance. Standard Oil Co. v. Lyons, 130 F.2d 965 (8th Cir. 1942); Pierce, 168 N.W.2d 346, 355; Travelers Ins. Co. v. Workmen's Comp. Appea Bd., 68 Cal.2d 7, 64 Cal Rptr. 440, 434 P.2d 992.

Citing Lyons at 968, the court stated:

> If by this conversation Bergsted simply made an offer to give decedent employment upon his reporting for work in Illinois, the offer would be accepted by the act of reporting for work and the contract would be an Illinois contract because that would be the place where the final act necessary to consummate the contract was performed....If, however, there was a promise for a promise, an acceptance by the offeree of the offer of employment, the contract was entered into at once....In such circumstances, the place of making the contract would be the place where the offeree used the telephone.

ANALYSIS

On the question of the jurisdiction of the Iowa Industrial Commissioner to hear the workers' compensation proceeding of claimant, all parties agree that if Iowa has jurisdiction in this case it must rest upon Iowa Code section 85.71, which requires that the contract of hire be made in this state for employment not principally localized in any state.

Defendant herein has cited several cases which it believes establish that no contract was entered into in the state of Iow between claimant and defendant employer. In reviewing these cases, however, they are found to be distinguishable, and the conclusion reached is that, had the facts of the case at bar been present in these cases, those courts would have held that contract was entered into in the state of Iowa. It was made clear in these cases that, ordinarily, to constitute an accepta of an offer there must be an expression of the intention by work, sign, writing, or act communicated or delivered to the person making the offer or his agent. These cases indicate that the controlling question is not whether a party accepted the offer but where he accepted it, and that it is agreed that a contract is deemed to have been made where the final assent is given.

Accordingly, the question that must be answered in the case at bar is, where was the acceptance or assent finally given?

At the center of controversy is the July 1979 contract in which claimant was rehired. The record clearly indicates that claimant offered his services from Wisconsin and they were accepted by defendant employer's agent, Vern Reynolds, in Iowa. Unlike the June 1979 contract that claimant made with Reynolds through a third party, claimant made his July 1979 offer direct to Reynolds. Further, in June of 1979, claimant's work qualifi tions were unknown to Reynolds. By July of 1979, Reynolds was well aware of claimant's capabilities. Thus, defendant's argument that the July 1979 contract was made at the job site appears far less compelling.

The deputy industrial commissioner was also correct in finding the collective bargaining agreement inapplicable to the claimant. The deputy correctly stated that a contract comes into existence where the meeting of minds takes place, not where the contract is to be performed. Since it has already been decided that the contract was made in Iowa, this issue need not be addressed any further.

FINDINGS OF FACT

1. Defendant employer is a Pennsylvania corporation with its principal place of business in Pittsburgh, Pennsylvania.

2. In 1979 defendant employer maintained its central district office in Des Moines, Iowa and was authorized to do business in the state of Iowa.

3. In 1979 claimant was domiciled in the state of Wisconsi

4. In June 1979 claimant was hired by defendant employer t work in Elwood, Indiana as a welder.

5. Approximately late June or early July 1979, claimant formally quit his employment with defendant employer.

6. In July 1979 claimant called from Wisconsin to Vern Reynolds in Iowa, and offered to return to work for defendant employer.

7. In July 1979 Reynolds, on behalf of defendant employer,

accepted claimant's offer to return to work and told claimant to report to a job in Waukesha, Wisconsin.

8. From July 1979 to December 17, 1980 claimant worked in at least eleven different stated for defendant employer.

9. On December 17, 1980 claimant was involved in a work-related injury in Wises Landing, Kentucky.

10. Claimant was working under a contract entered into in July 1979 with defendant employer at the time of his injury.

11. Claimant has received workers' compensation benefits pursuant to the laws of the state of Kentucky.

CONCLUSION OF LAW

The Iowa Industrial Commissioner has subject matter jurisdiction in this proceeding.

THEREFORE, it is ordered:

That this matter shall come on for hearing before the Iowa Industrial Commissioner.

That the defendant pays costs pursuant to Industrial Commissioner Rule 500-4.33.

Signed and filed this 28 day of September, 1984.

IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in arbitration brought by Thomas J. Hein, claimant, against Foreman Tire & Service, Inc., employer, and American Mutual Insurance Company, insurance carrier, for benefits as a result of an alleged injury on March 11, 1983. This case was heard by the undersigned on June 15, 1984 at the Woodbury County Courthouse in Sioux City, Iowa.

The record consists of the testimony of claimant, Rex Foreman; claimant's exhibits 1 through 11 and defendants' exhibits A, B, C and D.

ISSUE

The sole issue for determination is the nature and extent, if any, of permanent partial disability to the claimant as a result of a myocardial infarction on March 11, 1983.

At the time of the hearing, claimant moved to amend the petition to include a request for additional compensation pursuant to chapter 86.13, Code of Iowa. Said motion is hereby overruled.

EVIDENCE PRESENTED

Claimant testified he is 35 years of age, married and the father of one son, age eight years. He stated that he has completed high school though he was an average to less than average student. Claimant explained that after high school he began employment with TG & Y Stores which provided him with a number of in-house management trainee programs. Claimant also advised that he has received additional management training while in the employee of the Goodyear Stores.

Claimant's employment with TG & Y continued from 1968 to 1971 during which time he moved from the position of manager trainee at a store in Fremont, Nebraska to the co-manager of the TG & Y Store in Sioux City, Iowa. His salary increased from $400 a month to $850 a month plus bonuses. Claimant said he quit TG & Y Stores in 1971 to accept employment with Coit International as an area supervisor. He described this position as that of a wholesale fabric salesman which required a considerable amount of travel. He advised that his salary with Coit International was approximately $1,000 per month. In 1973 claimant again changed jobs and began employment with Goodyear Tire & Rubber Company. His first position with Goodyear was that of salesmanager for which he was paid $400 per month plus commission. He stated that he was later promoted to service manager and from service manager to credit manager and from credit manager to assistant manager. Claimant advised that when he ceased his employment with Goodyear Tire & Rubber Company he was earning approximately $1,200 per month plus bonuses. At that time claimant went to work for Foreman Tire & Service, Inc., as a manager at a salary of approximately $1,400 per month. Claimant described all of these jobs as "working manager" type positions which required not only his managerial skills but also a certain degree of physical labor. Claimant testified that while he was in the employ of Foreman Tire & Service, Inc., he would spend a little over 50 percent of his time performing jobs requiring physical exertion and the remainder of his time would be involved in general accounting, bookkeeping, and managerial activities.

Claimant stated that on March 11, 1983 he was the only employee of Foreman Tire & Service, Inc., at the Haywood location due to the recent resignation of another employee. He stated that he left for work that morning at about 6:00 a.m. and went to the store to open it up for the business day. He stated that things were somewhat hectic that day due to the fact that he was the only employee at the store and was having to conduct regular business as well as interviews for the vacant position. Near closing time claimant was in the process of cleaning up the shop when he decided to move the tire mounting machine outside to wash it up. He stated that he moved the machine outside, which weighed several hundred pounds, and as he was doing so he began to perspire greatly and experience hot flashes. Claimant said he felt dizzy, felt a sharp pain in his left side and began to have a "spacey" sensation. He said he was, however, able to complete the task and then headed for home. Claimant testified that when he got home he was experiencing severe pain and became aware of the fact that he needed medical attention. At that time he called 911 for an ambulance to take him to the hospital. Claimant said he was in the hospital from March 11 to March 30 or 31 as a result of what was later described to him as an acute myocardial infarction.

Claimant testified that he has not been employed since March of 1983. He said that since September of 1983 he has looked for employment at K-Mart, several insurance companies and a bank. He said that in total he has sought employment at about 40 to 50 different places. He said that most of the potential employers asked about his physical health on their employment applications and though most have not said anything to him about his heart condition, some employers have in fact said that they would not hire him due to his present problems. He stated that the defendant insurance carrier has not assisted him in finding employment and that he has not been able to return to his former employment. Claimant testified that since his myocardial infarction on March 11, 1993 he has found that he is more sensitive to very hot and very cold weather, that he has found it necessary to restrict his physical activities and that he occasionally suffers chest pain. Claimant admitted that he continues to smoke though he has been advised that smoking is dangerous to his health.

Claimant appeared well dressed at the hearing and expressed himself in an articulate and personable way. He indicated that he would be willing to relocate to find employment and that he would consider any employment for which he is qualified.

Rex Foreman testified that he is a co-owner of the Foreman Tire & Service, Inc., and that he hired claimant to work in the Haywarden Store in 1980 as a manager. Mr. Foreman indicated that in his opinion claimant would not be able to perform the job as manager at the store at this time due to the requirement for physical labor in the position. He did, however, indicate that there were jobs available in the Sioux City area for which the claimant would be qualified and would not require physical labor. He indicated that although he was aware of these jobs he had not communicated their availability to the claimant.

Deborah A. Hanson testified by way of deposition that she is employed as a rehabilitation counselor for the State of Iowa Rehabilitation Education and Services Branch of the Department of Public Instruction. She outlined her educational background and indicated that she has been employed in her present position since August of 1974. Ms. Hanson testified that she first saw claimant on March 7, 1984. She indicated that a release of information was obtained from the claimant and an interview was conducted at that time. She outlined the work history that she received from Mr. Hein. She stated that the purpose of the interview was to determine whether or not the claimant qualified for vocational rehabilitation services.

Ms. Hanson testified that there are three basic criteria

which must be met in order for an individual to qualify for the vocational rehabilitation program. First, she stated is whether or not an individual does in fact have a disability. Second, is whether or not that disability presents a substantial vocational handicap, and third, is whether or not the agency believes it can give substantial benefit to that individual. Ms. Hanson testified that based upon her interview of Mr. Hein and a review of his background and medical situation that he did not in fact qualify for vocational rehabilitation services because it was their opinion that he did not have a substantial vocational handicap. She based this opinion on the fact that claimant had a background of management, general sales, general clerical activities and experience in those areas which would give him marketable skills. It was her opinion that such jobs were generally available in the Sioux City area. She did not believe that claimant suffered any significant disadvantage because of his age or his present health. She did admit, however, that some employers would be concerned about claimant's heart condition and that that concern may cause some employers to reject him as a potential employee.

Claimant's exhibit 1 contains numerous medical reports from several different doctors. A review of these reports indicates that on March 11, 1982 claimant suffered a myocardial infarction following excertion at work. At the time of the myocardial infarction, claimant was suffering from a preexisting athero-sclerotic coronary disease. Clark Hyden, M.D., Ronald A. Drauer, M.D., and Paul From, M.D., all concur that claimant's myocardial infarction was the result of aggravation of the preexisting coronary disease. In other words, claimant's employment aggravated the preexisting condition bringing about the myocardial infarction at a time earlier than it otherwise would have occurred. They all agree, however, that the underlying coronary disease is not work related.

Three different doctors examined claimant to determine the functional impairment resulting from the myocardial infarction. Stephen R. Zumbrun, M.D., examined claimant on August 31, 1983 and found that claimant was suffering a 20 to 25 percent limitation in his functional aerobic tolerance. Dr. Ronald Drauer examined claimant on January 25, 1984 and found that claimant had an approximate decrease of 15 to 20 percent in his capacity to perform physical work as a residual of the myocardial infarction. Dr. Paul From also examined claimant and concluded that claimant was suffering a physical impairment of 20 to 45 percent. It was Dr. From's opinion that of the 20 to 45 percent impairment presently suffered by the claimant that approximately 75 percent of the impairment was due to the myocardial infarction and approximately 25 percent of the impairment was due to coronary artery disease in the left coronary system. None of the doctors were willing to state that claimant's left coronary artery occlusion was the result of either the right coronary occlusion or subsequent myocardial infarction. All of the physicians who examined claimant seemed to concur that his prognosis was guarded. Each of the doctors indicated some concern with claimant's weight and the fact that he had not yet quit smoking. Each of the physicians also recommended that claimant avoid strenuous working situations and that he not partake in competitive sports.

APPLICABLE LAW

A finding of impairment to the body as a whole found by a medical evaluator does not equate to industrial disability. This is so as impairment and disability are not identical terms. Degree of industrial disability can in fact be much different than the degree of impairment because in the first instance reference is to loss of earning capacity and in the later to anatomical or functional abnormality or loss. Although loss of function is to be considered and disability can rarely be found without it, it is not so that an industrial disability is proportionally related to a degree of impairment of bodily function.

Factors considered in determining industrial disability include the employee's medical condition prior to the injury, after the injury, and present condition; the situs of the injury, its severity and the length of healing period; the work experience of the employee prior to the injury, after the injury and potential for rehabilitation; the employee's qualifications intellectually, emotionally and physically; earnings prior and subsequent to the injury; and age, education, motivation, and functional impairment as a result of the injury and inability because of the injury to engage in employment for which the employee is fitted. Loss of earnings caused by a job transfer for reasons related to the injury is also relevant. These are matters which the finder of fact considers collectively in arriving at the determination of the degree of industrial disability.

There are no weighting guidelines that are indicated for each of the factors to be considered. There are no guidelines which give, for example, age a weighted value of ten percent of total, education a value of fifteen percent of total, motivation - five percent; work experience - thirty percent, etc. Neither is a rating of functional impairment entitled to whatever the degree of impairment that is found to be conclusive that it directly correlates to that degree of industrial disability to the body as a whole. In other words, there are no formulae which can be applied and then added up to determine the degree of industrial disability. It therefore becomes necessary for the deputy or commissioner to draw upon prior experience, general and specialized knowledge to make the finding with regard to degree of industrial disability. See Birmingham v. Firestone Tire & Rubber Company, II Iowa Industrial Commissioner Report 39 (1981); Enstrom v. Iowa Public Services Company, II Iowa Industrial Commissioner Report 142 (1981); Webb v. Lovejoy Construction Co., II Iowa Industrial Commissioner Report 430 (1981).

ANALYSIS

It is clear from the facts presented that claimant is in fact suffering a permanent impairment as a result of the myocardial infarction which occurred on March 11, 1983. It is also clear, however, that claimant's present impairment is greater than that caused solely by the March 11, 1983 injury. At least part of his impairment is the result of left coronary artery disease for which no particular cause has been established. Dr. From gives a broad range of impairment from 20 to 45 percent of which he says 75 percent is the result of the myocardial infarction. Dr. Drauer finds claimant suffering a 15 to 20 percent impairment. While physical impairment is not the sole criteria for determining industrial disability, it is clear in this case that claimant does in fact suffer a significant physical impairment which limits his ability to perform physical activity. As a result, claimant will be forced to change both his personal and professional life style in order to accommodate the limitations imposed upon him at this time. These physical limitations will to some extent reduce the number of jobs available to claimant and may reduce his ability to earn income.

Claimant has a strong managerial background particularly in the retail sales area. Thus far in his working career, claimant has demonstrated an ability to move up the ladder to higher paying positions with considerable consistency. While it is clear claimant may no longer be able to function in the capacity of a "working manager," it is also apparent that he still retains his managerial skills and that those skills are indeed marketable. It should be noted that claimant did not qualify for vocational rehabilitation services from the State of Iowa because he has not in fact suffered a significant or substantial vocational handicap. Although claimant does not have any formal education beyond high school, his background with employer sponsored training programs nevertheless makes him an attractive candidate for managerial positions.

Claimant's age would not appear to be a disadvantage in the employment market. Assuming claimant does not suffer any fatal heart attacks in the future, he would still offer an employer some 30 years of service. The problem, of course, is claimant's prognosis. Each of the doctors expressed considerable concern about this man's prognosis. Each used the term guarded in describing claimant's future well being. This would surely be of concern to any employer who carefully examines claimant's present physical condition. He is still suffering from coronary artery disease. He is still smoking. He is still overweight. He has not apparently continued with an exercise program and consequently he remains an excellent candidate for future coronary difficulties. Claimant would be well advised for his own benefit and that of his eight year old son to follow his physicians' advice and attempt to reduce the risk factors which he presently maintains.

In summary, claimant is a 35 year old man suffering a significant physical impairment as the result of his myocardial infarction. Although the impairment is significant, it must be noted that claimant has an extensive educational background and work experience in managerial areas where physical requirements would be minimal. He is articulate and personable and possesses marketable job skills. He has demonstrated some unwillingness to reduce those factors which would most likely cause him additional coronary problems in the future. He has in the past demonstrated an ability to increase his earning capacity with each of his employers and there would not appear to be any reason why he cannot do so now. Claimant's physical limitations do not preclude him from the job market but merely limit the number of jobs available to him. Although the number of jobs available to him are limited, it would not appear that he would suffer significant loss of income as a result of the physical limitations. Based upon all of the factors relevant to a determination of industrial disability, claimant has proven by a preponderance of the evidence that he has suffered an industrial disability as a result of the myocardial infarction equal to 25 percent.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

1. Claimant is 35 years old, married and has one child.

2. Claimant has a high school education and several years of management training with TG & Y Stores and Goodyear Tire and Rubber Company.

3. Claimant is personable and articulate.

4. Claimant has demonstrated managerial ability and has a long work history of consistent advancement.

5. On March 11, 1983 claimant suffered a myocardial infarction as the result of work-related stress and a preexisting atherosclerotic coronary disease.

6. Claimant suffers a significant physical impairment as the result of the myocardial infarction.

7. Claimant should avoid strenuous physical activity and competitive sports.

8. Claimant has shown poor motivation to reduce coronary risk factors such as obesity and smoking.

9. Claimant has a guarded prognosis.

10. Claimant's rate of compensation is $204.74.

11. The parties stipulated at the hearing that the conversion date from healing period to permanent partial disability is October 10, 1983.

CONCLUSION OF LAW

THEREFORE, IT IS CONCLUDED:

Claimant has proven by a preponderance of the evidence that he suffers a permanent partial disability for industrial purposes of twenty-five (25) percent as a result of the injury of March 11, 1983.

ORDER

IT IS THEREFORE ORDERED that defendants pay unto claimant one hundred twenty-five (125) weeks of compensation at the rate of two hundred four and 74/100 dollars ($204.74) for permanent partial disability from October 10, 1983. All accrued payments to be made in a lump sum together with statutory interest.

Costs of this action are taxed to defendants pursuant to Industrial Commissioner Rule 500-4.33.

Defendants are to file an activity report upon completion of this award.

Signed and filed this 25th day of September, 1984.

FOODS, INC.,

Employer,

and

MARYLAND CASUALTY CO.,

Insurance Carrier,
Defendants.

File No. 688647

A P P E A L

D E C I S I O N

FILED

AUG 21 1984

IOWA INDUSTRIAL COMMISSIONER

By order of the industrial commissioner filed June 27, 1984 the undersigned deputy industrial commissioner has been appointed under the provisions of §86.3, Code of Iowa, to issue the final agency decision on appeal in this matter. Defendants appeal from an adverse review-reopening decision.

The record consists of the transcript; claimant's exhibits 1 through 6; and defendants' exhibit A, all of which evidence was considered in reaching this final agency decision.

Defendants state the issues on appeal:

I. Whether the proposed review reopening decision of the deputy industrial commissioner is supported by substantial evidence in the record made before the agency when, viewed as a whole, so as to allow an award of twenty-two per cent (22%) industrial disability as the result of the work related injury at issue.

IA. Industrial disability is determined by consideration of the employee's age, education, qualifications, experience, functional disability and, inability because of the injury to engage in employment for which he or she is fitted.

A review of the record discloses that the hearing deputy's findings of fact and conclusions of law are proper.

Wherefore, the review-reopening decision filed December 13, 1982 is hereby adopted as the final agency decision.

FINDINGS OF FACT

WHEREFORE, it is found:

Claimant sustained an injury in the course of her employment December 2, 1981.

Claimant suffered lumbosacral strain with lower left radiculopathy. Subsequent to a work return in March 1983, a herniated disc at L4-5 was discovered.

Claimant's work as a clerk/cashier in defendants' supermarket required standing, twisting, turning, lifting of small grocery items, and, at times, lifting of 50 pound bags of dog food.

Claimant has been advised to restrict lifting in excess of 25 pounds by one physician and in excess of 15 pounds by another.

Dr. Carlstrom approved claimant's return to work as a clerk/cashier on a job hardening basis wherein she initially worked only two hours per day in March 1983. Claimant was unable to sustain such schedule.

It is unlikely claimant's condition will improve so significantly that she will be able to return to her former position as a clerk/cashier.

Claimant performed well in vocational evaluation regarding bookkeeping and other clerical skills she could likely perform within her physical restrictions.

Claimant is fifty-five (55) years old. Her work experience in bookkeeping and other clerical areas ended in 1960.

Defendant employer advised claimant that an intracompany transfer from clerk/cashier to office work is against its policy.

Claimant earned in excess of nine dollars ($9.00) per hour as a clerk/cashier at her injury date; entry level clerical positions would pay approximately three and 45/100 dollars ($3.45) per hour.

Claimant's functional impairment rating is between five percent (5%) and twelve percent (12%).

Claimant is a high school graduate with subsequent on-the-job training in credit management and bookkeeping.

The insurer advised claimant's counsel that further treatment by Dr. McClain was disallowed in October 1982. Claimant sought treatment subsequent to that time.

CONCLUSIONS OF LAW

THEREFORE, it is concluded:

Claimant has established a causal relationship between her December 2, 1981 injury and her present disability.

Claimant has sustained an industrial disability of twenty-two percent (22%) of the body as a whole.

Claimant is not entitled to reimbursement for costs incurred for medical services provided by Dr. McClain after defendants advised that such treatment was no longer authorized.

ORDER

THEREFORE, it is ordered:

Defendants pay claimant one hundred ten (110) weeks of permanent partial disability benefits at the stipulated rate of two hundred thirty-five and 94/100 dollars ($235.94) per week with credit for the nineteen (19) weeks of benefits previously paid.

Defendants are hereby ordered to pay interest on the award pursuant to §85.30, The Code, from April 19, 1984.

Defendants are to file an activity report upon payment of this award.

Signed and filed this 21st day of August, 1984.

Insurance Carrier, Defendants.	:	

INTRODUCTION

This is a proceeding in review reopening brought by Ruth A. Hewitt, the claimant, against her employer, Foods, Inc., and Maryland Casualty Co., the insurance carrier, to recover additional benefits under the Iowa Workers' Compensation Act as a result of an injury sustained December 2, 1981.

This matter came on for hearing before the undersigned deputy industrial commissioner in Des Moines, Iowa December 16, 1983. The record was considered fully submitted at that time.

An examination of the industrial commissioner's file indicates that a first report of injury was filed December 7, 1981; a memorandum of agreement was filed December 21, 1981.

At time of the hearing, the parties stipulated that the rate of weekly compensation is $235.94; that medical bills are fair and reasonable; and that any additional award of permanent partial disability will "tack on" to those amounts already paid. The amended form 2A filed establishes that defendants had paid 19 weeks of permanent partial disability as of the hearing date.

The record consists of the testimony of claimant, Ruth Hewitt, of her husband, William S. Hewitt, of her daughter, Karen Donahue, of Ross Nixon, of Willam Miller, and of Kathleen Benson; claimant's exhibit 1 through 7; and defendants' exhibit A. Claimant's exhibit 1,3, and 4 were offered jointly. Reserved rulings on objections will be made in the review of the evidence.

ISSUES

The issues to be decided are:

1.) Whether a causal relationship exists between the alleged injury and the disability.

2.) Whether claimant is entitled to permanent partial disability benefits.

3.) Whether certain treatment by David McClain, D.O., is compensable under section 85.27.

REVIEW OF THE EVIDENCE

Claimant testified in her own behalf. Claimant is 54 years old, married and has reared three daughters and four foster sons. One daughter remains at home. Claimant has a high school diploma and began, but did not complete, a secretarial shorthand course at the American Institute of Business. She completed a six month credit management training program with the National Association of Credit Managers in 1947. Between 1949 and 1960, claimant held various jobs as a payroll clerk, bookkeeper, and credit manager. She then raised her foster sons and her adopted daughters. She began employment with Foods, Inc. as a part-time cashier and checker at Dahl's, the retail supermarkets operated by the employer, in 1968. She left in 1970, but returned to full-time employment as a courtesy counter clerk in 1974 and remained employed until March 1983. At the time of her injury, she was working as a clerk/cashier.

She reported her earnings in March 1983 as $10.50 or $10.55 per hour. On her injury date, her duties included lifting all groceries over the scanner and standing throughout the day albeit with break periods every 2 hours. She reported groceries include pet food packed in 25 to 50 pound containers.

Claimant stated she smokes one and one half packs of cigarettes a day and drinks 1 or 2 drinks per evening. Claimant relayed that she slipped on the ice and broke her tail bone in 1975. This resulted in 3 weeks bed rest followed by a period of part-time work only. Claimant reportd she had no back problems following that incident.

On the injury date, December 2, 1981, claimant reports she was pushed into the work counter when a customer slammed a grocery cart into her. She reports Mark Brase, the assistant manager, was sacking groceries for her at the time. In response to his questioning, claimant reported she was "ok" but left work within the hour. Defendants' objection to this testimony is overruled. Claimant reports she called Ross Nixon, who directed her to seek medical attention from her own doctor. Claimant saw Dr. Hatchitt and reports she had continued treatment with him until January 1982 with little improvement. Defendants' objection to this testimony is overruled.

Claimant attempted a work return in January 1982. She reports she worked about 50 hours but found she could not handle the pain. Dr. Hatchitt referred her to Dr. McClain, an orthopedic specialist, in March 1982. Claimant states her employer never indicated that treatment by Dr. McClain was not authorized. Dr. McClain hospitalized claimant for traction and physical therapy throughout March 1982. Claimant was discharged in a full body cast. She reports this hospitalization "did not help much." Claimant described her pain as running down her middle back with numbness and tingling in the left leg and some numbness in the right leg.

Claimant reported William Miller referred her to Crawford Rehabilitation and set up her appointments with Dr. McClain. She states he directed her to Dr. Carlstrom for a second opinion. She reports it was not her understanding that treatment by Dr. McClain was no longer authorized.

Dr. Carlstrom directed claimant to Younkers Rehabilitation Center where she underwent physical therapy in Summer, 1982. Claimant reports Dr. Carlstrom restricted her to lifting 15 pounds or less, and advised her that neither twisting or turning nor standing nor lifting for prolonged periods was in her best interests. Claimant understood the doctor believed she should seek other employment and she could not continue work which involved lifting.

Claimant returned to work in February 1983 working first a two day or three day week. She reported lifting all items coming across her scanner even if their weight exceeded Dr. Carlstrom's weight restrictions. She stated even lifting a gallon of milk caused her pain.

Claimant returned to Dr. Carlstom who ordered both a bone and CT scan and informed Dahl's claimant could not work. Claimant reported the CT scan showed a disc pressing on a nerve.

Claimant reported that from March 1983 she has had problems getting out of of bed, bathing, walking, standing, cleaning her home, and lifting her grandchildren. She last saw Dr. Carlstrom in September, 1983. He has not lifted her restrictions. She reported she has discussed several job possibilities with employers in an attempt to ascertain whether she could perform them. These included working as a waitress, as a convenience store clerk, and working as a file clerk. She felt she would be unable to perform these jobs with her physical disabilities. Claimant has paid $115.00 of unreimbursed medical expenses to Dr. McClain.

On cross-examination, claimant stated that all three of her daughters, now ages 19, 18, and 16, were living at home on the injury date. Claimant's mother-in-law, who suffered from advanced senility though in good physical health, also lived with the family until her death in October 1983. Claimant and her family cared for this lady with assistance of a home health aid who visited biweekly. Claimant admitted she has not sought employment as a credit manager since beginning employment with Dahl's.

Claimant denied she had ever received treatment for alcohol consumption or that her doctors had advised her that her alcohol consumption was a problem. Claimant denied ever telling her physicians she drank two beers and mixed drinks each day. She stated she is allergic to beer. She admitted she had taken a six pack to the hospital and stated Dr. McClain permitted this and allowed her to drink two cans per day though she only drank one.

Claimant denied she had missed approximately one half of her scheduled physical therapy sessions. She stated she had missed three or four because of illness. Claimant's physical therapy sessions ended in August 1982. She admitted reporting her condition improved while in physical therapy.

Claimant has undergone testing with state vocational rehabilitation. Claimant reported vocational rehabilitation did not recommend additional training but recommended she consider employment as a clerk, bookkeeper, or secretary.

Claimant denied Dr. Carlstrom ever advised her she could return to work when her symptoms subsided. She also denied ever telling Crawford Rehabilitation that her family obligations would prevent her from ever returning to full-time employment. Claimant admitted that she has not inquired at Dahl's regarding her employment status since March 1983. Claimant admitted that, in Fall 1982, her attorney advised her that the insurer would no longer pay for treatment by Dr. McClain. Claimant's counsel objected to questions regarding whether counsel advised claimant of defendants' right to choose medical treatment as protected by the attorney client privilege. The objection is sustained.

On redirect examination, claimant testified that Dr. Carlstrom's treatment had been of no greater help than Dr. McClain's. Claimant denied ever discussing her household duties with the physcial therapist. She stated that Dahl's does not provide stools for its checkout personnel and that Dahl's has never offered her a clerical job but has informed her that intra-company job transfers violate company policy. Claimant believes she could do bookkeeping and coupons in Dahl's offices. She understands that she has not been released to return to work when she returned in March 1983. Claimant stated that when the

store is busy, it is not possible to stop and seek assistance when lifting. She expressed her belief that Dahl's policy is that the employee either do the job or go home.

Claimant's husband of 36 years testified in her behalf. He characterized claimant's pre-injury physical condition as "very good." He substantiated that claimant now has daily pain which hinders her ability to perform routine household activities. He stated claimant had been improving until her work return where upon her condition had become "worse than it was in the first place." On cross-examination, he admitted claimant does bookkeeping for his cleaning business and does some housework such as dishes, cooking, and folding laundry. He characterized the daughter who lives at home as emotionally disturbed and requiring close supervision.

Karen Donahue, claimant's daughter, testified in her mother's behalf. She also substantiated claimant's pain and stated claimant can perform only a limited amount of housework. She reported seeing claimant fall twice. She stated claimant has difficulty sleeping.

William Miller, a claims representative for the insurer, testified in defendants' behalf. Claimant's counsel's objections to substantial portions of the witness' testimony on the general grounds that the witness lacked direct contact with claimant and the ensuing direct knowledge concerning her condition and physical abilities are overruled. The substance of the witness' testimony related to the insurance company's handling of claimant's claim, an issue of which he has direct knowledge. Objections regarding the relevancy of such testimony are also overruled. Mr. Miller's testimony was fully considered in the preparation of this decision. It need not be set forth in full. Of significance are the facts that claimant's counsel was advised in 1982 that treatment by Dr. McClain would no longer be authorized; that the insurer sought and obtained a job analysis of claimant's job by Crawford Rehabilitation and that Dr. Carlstrom approved claimant's work return after reviewing such analysis.

On cross-examination, it was established that further treatment by Dr. McClain was disallowed in October 1982. The witness opined that, the notice of work return which claimant received could have led claimant reasonably to assume she was being ordered back to work. The witness expressed his understanding claimant was to return to work for monitoring to ascertain whether she could perform her job. He reported inquiry was made as to whether claimant could work in Dahl's offices but that management indicate jobs were not available. On redirect, the witness stated he had understood Dr. Carlstrom permitted claimant to return to work without weight restrictions.

Ross Nixon, a manager for Dahl's, was next called in defendants' behalf. Mr. Nixon supervises cashiers. He related that he was a cashier for Dahl's from 1970 through 1973 and that he is familiar with cashiers' work duties. He stated, that but for 50 pound bags of dog food and deicer and 25 pound bag of dog or cat food, most grocery items weigh 10 pounds or less. He reported that cashiers need not lift dog food since this is price marked and need not be scanned. He explained that cashiers are "somewhat mobile" at their station, receive two 15 minute breaks and one half hour lunch break each day. He reported cashiers generally will not be at their stations for more than two hours without a break. He stated he is familiar with Dahl's employment policy, but was unaware of any restriction on transfer from a cashier to an office position. He reported observing claimant carry her nine or ten month old grandchild while shopping, but stated he has never observed claimant shopping or pushing a shopping cart. He relayed that claimant has not approached him regarding reemployment since March 1983.

On cross-examination, the witness did not dispute that claimant could have been told that intracompany transfers were against company policy. He agreed he had never asked claimant whether she need a stool at her station even though stools had been provided other workers post-injury. He admitted cashiers are required to lift grocery sacks into cars and these sacks weigh 15 pounds or more. He recited that cashiers receive one break in each three hours of work. He agreed that cashiers occasionally lift up to 25 pounds and even agreed occasional may be defined as meaning up to 33 percent of their work time. He stated cashiers pack groceries when they are available to do so.

Kathleen Benson of Crawford Rehabilitation next testified in defendants' behalf. Ms. Benson has testified before this agency on numerous occasions. Her qualifications are well known to the undersigned and will not be fully set forth herein.

Claimant's objections to oral testimony regarding defendants' exhibit A and Crawford's business records concerning claimant are overruled.

Ms. Benson outlined Crawford's procedure in handling claimant's case. It was established that claimant missed 14 physical therapy sessions. Ms. Benson testified that Crawford prepared a job analysis and report regarding the duties and physical requirements of claimant's position with Dahl's. She characterized the cashier's position as one where the worker would be shifting [her] weight continually and as one of constant motion. Ms. Benson expressed her belief that claimant's exhibit 3 understates claimant's clerical skills in that claimant possesses transferable skills beyond the entry level which provide claimant career alternatives. The witness cited bank teller, ticket agent, information clerk-cashier, audit clerk, bookkeeper 1, general ledger bookkeeper, inventory clerk, traffic manager, traffic clerk, or security officer as positions claimant could pursue. She stated such positions are available in the Des Moines area. Ms. Benson opined claimant is employable though "job hardening" would be appropriate initially.

On cross-examination, it was established that illness was a substantial factor in claimant's absences from physical therapy; that entry level wages would be approximately $3.45 per hour; and that age may have a positive or negative impact on employability.

On further cross-examination, the witness testified that by signing off on claimant's exhibit 6, Dr. Carlstrom agreed that claimant was physically able to attempt progressive part-time duties as described in the job analysis with a maximum goal of return to full-time employment.

Karen E Donahue was called as a rebuttal witness for claimant. She testified that in July, 1983 her son, claimant's grandson, weighed approximately 14 pounds; that there were no unusual stresses in claimant's home; and that hospital and defendants' representatives cancelled several of claimant's physical therapy sessions and medical appointments.

Joint exhibit 1 is the medical reports regarding claimant. These were fully reviewed in rendering this decision. Of special significance were the following: An October 7, 1982 letter of David B. McClain, D.O., to Jack Strokesberry of Rehabilitation Education and Services Branch of the Department of Public Instruction states claimant is in treatment for lumbosacral strain with lower left radiculopathy and advises claimant should avoid lifting in excess of 25 pounds on more than an occasional basis; an October 25, 1982 letter of Dr. McClain to claimant's counsel opines that claimant has sustained a permanent partial impairment of 12 percent of the body as a whole as a result of her work incident: A May 10, 1983 letter of Thomas A. Carlstrom, M.D., to claimant's counsel states as follow:

> To take your questions one by one: Number one, no I do not believe Mrs. Hewitt's return to work in March of this year had anything to do with her lumbar disc protrusion. Number two, yes I believe Mrs. Hewitt can return to her previous employment at Dahls, [sic] should her symptoms improve significantly. Most likely she will not experience enough improvement in her symptoms to return to work. I do believe she has basically reached maximum benefits of healing at the present time and should be considered permanently stable at her present level.
>
> To answer questions [sic] three, based on the answer to question two, yes I do believe she has suffered a permanent partial impairment. The AMA criteria would suggest a 5-7% permanent partial impairment.

An April 21, 1983 letter of Dr. Carlstrom to the insurer reports claimant's CT scan shows a herniated disc at L4-5 on the left. A March 8, 1983 letter of Dr. Carlstrom to whom it may concern advises that claimant remain off duty for an indefinite period. An October 19, 1982 Carlstrom letter to Mr. Strokesberry states as follows:

> Her examination is consistent with a myofascial back pain picture with mildly diminished forward bending, but otherwise normal range of motion of her low back and normal neurological exam. I have recommended to her workmen's compensation insurance company that she be given a partial permanent disability and rehabilitated to a job requiring no lifting, no forward bending, no prolonged sitting or standing, and have recommended a weight limit of fifteen pounds. I do believe her disability may improve in the future, although she has been stable for sometime, and would be pessimistic about that eventuality.

A June 7, 1982 letter of Dr. Carlstrom to Crawford Rehabilitation states: "I do believe Mrs. Hewitt is very tense woman, an in addition, may be experiencing some secondary gain from her disorder. I would [sic] pessimistic that any treatment modality will result in a rapid improvement in her symptoms, but will keep you informed as to her progress."

Claimant's exhibit 2 is several statements of Dr. McClain which apparently show medical costs in the amount of $115.00. Joint exhibits 3 and 4 are a copy and corrected copy of the vocational evaluation of claimant apparently by State Rehabilitation Services. The corrected copy recites that all claimant's activities were evaluated seated and no attempts were made to evaluate her in standing activities. The evaluation states:

> The above stated competitive skills would probably only allow for Ruth to obtain the minimum wage for an entry level position. Evaluator feels that besides the fact of seeking new employment, she would need to prepare to accept possibly less wages and less benefits if it is necessary to change her place of employment.

Claimant's exhibit 5 is a February 8, 1983 letter of Maryland Casualty to claimant's counsels which states: "Please have your client report to Mr. Ross Nixon at the Dahls [sic] Food Store at

3425 Ingersoll, Des Moines, Iowa at 10 A. M. February 14, 1983. Foods, Inc. is agreeable and does offer to your client working ONLY TWO HOURS as opposed to regular eight hour work day."

Claimant's exhibit 6 is a December 14, 1982 letter of Crawford Rehabilitaion in which Dr. Carlstrom gives his signature approval to the following statement:

> Having reviewed the job analysis of Ms. Hewit's [sic] previous position at Dahls [sic] where she worked as cashier/checker, it is my opinion that Ms. Hewit [sic] is physically able to perform progressive, part-time job duties as described in the written job analysis. Regular evaluation with the employers and Ms. Hewit [sic] concerning her progress and the physical demands required on-the-job are recommended with full-time employment viewed as a maximum goal.

Defendants' exhibit A is a job analysis of the position of cashier/checker at Dahl's Grocery Store on Ingersoll Avenue, Des Moines, prepared by Crawford Rehabilitation.

APLLICABLE LAW AND ANALYSIS

We first must decide whether a causal relationship exists between claimant's injury and her disability.

The claimant has the burden of proving by a preponderance of the evidence that the injury of December 2, 1981 is causally related to the disability on which she now bases her claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

There appears to be little dispute that claimant's injury is related to her disability. Both Drs. McClain and Carlstrom have causally connected the injury and the disability and have assigned claimant functional impairment ratings. Dr. Carlstrom does not believe that claimant's disc protrusion resulted from her March 1983 work return. However, the evidence does not suggest that that condition is unrelated to claimant's original injury. Claimant's life restrictions and work problems arose only after her injury. This factor also suggests a causal connection where the record does not intimate other conditions arising subsequent to the injury from which claimant's disability might result. Thus, claimant has carried her burden of establishing a causal relationship between her injury and disability. The extent of her disability remains undecided, however.

An injury is the producing cause; the disability, however, is the result, and it is the result which is compensated. Barton v. Nevada Poultry Co., 253 Iowa 285, 110 N.W.2d 660 (1961); Dailey v. Pooley Lumber Co., 233 Iowa 758, 10 N.W.2d 569 (1943).

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

In Parr v. Nash Finch Co., (Appeal decision, October 31, 1980) the Industrial Commissioner, after analyzing the decisions of McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (Iowa 1980) and Blacksmith v. All-American, Inc., 290 N.W.2d 348 (Iowa 1980), stated:

> Although the court stated that they were looking for the reduction in earning capacity it is undeniable that it was the "loss of earnings" caused by the job transfer for reasons related to the injury that the court was indicating justified a finding of "industrial disability." Therefore, if a worker is placed in a position by his employer after an injury to the body as a whole and because of the injury which results in an actual reduction in earning, it would appear this would justify an award of industrial disability. This would appear to be so even if the worker's "capacity" to earn has not been diminished.

For example, a defendant employer's refusal to give any sort of work to a claimant after he suffers his affliction may justify an award of disability. McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (Iowa 1980).

Claimant is a 55 year old woman whose work experience is as a cashier and as a clerk bookkeeper and as a credit manager. Her functional impairment ratings rage from 5 to 12 percent of the body as a whole. The evidence suggests that it is unlikely claimant will recover sufficiently to return to her previous position. This fact may result at least in part from secondary gain claimant receives from her injury. While claimant has participated in vocational rehabilitation evaluation she has made no formal attempts to find employment in fields which remain open to her. Neither has she inquired regarding her employment status with Foods, Inc. On the other hand, the record suggests Foods, Inc., has not offered claimant office work which she likely could perform with her restrictions. Also, if claimant accepted a clerical position within the physical restrictions, she would likely receive a salary equaling only one-third to one-half that which she received as a cashier at Dahl's. This is a substantial reduction in earning capacity and must be considered in determing claimant's industrial disability. Further, to be considered is claimant's age. Claimant is 55 years old. While maturity may be an asset in some employment situations, it is less so where the employee may need substantial retraining in order to function successfully in the work environment. The record reveals that claimant has aptitude in the clerical area but has not worked in these fields since 1960. Thus, she would need training in the bevy of innovations in procedures and production equipment that have taken place in the last quarter century. This fact substantially reduces the realism of any expectation that claimant gain lucrative employment in clerical areas. When these factors are all considered, it is apparent claimant's industrial disability is considerably higher than her functional impairment rating. Claimant's permanent partial disability is determined to be 22 percent of the body as a whole.

The question of claimant's right to be reimbursed for payments made to Dr. McClain remains. "Claimant is not entitled to reimbursement for medical bills unless he shows that he paid them from his own funds." See Caylor v. Employers Mut. Cas. Co., 337 N.W.2d 890 (Iowa App. 1983).

The record established that claimant has paid the $115.00 owed Dr. McClain. Claimant's counsel was advised in October 1982 that further treatment by Dr. McClain was not authorized, however. Defendants acted reasonably in believing counsel would act as claimant's agent and inform her of the disallowance. His knowledge is imputed to claimant. Under section 85.27, the employer has the right to choose the medical care provided claimant. Therefore, claimant is not entitled to reimbursement for charges incurred after being advised that care with Dr. McClain was no longer authorized. Certainly all charges after November 1982 are disallowed. It is uncertain whether a charge of $15.00 incurred October 20, 1982 should be disallowed. If claimant can make a showing that such was incurred before defendants' withdrawal of authorization of care by Dr. McClain, such will be allowed.

FINDINGS OF FACT

WHEREFORE it is found:

Claimant sustained an injury in the course of her employment December 2, 1981.

Claimant suffered lumbosacral strain with lower left radiculop Subsequent to a work return in March 1983, a herniated disc at L4-5 was discovered.

Claimant's work as a clerk/cashier in defendants' supermarket required standing, twisting, turning, lifting of small grocery items, and, at times, lifting of 50 pound bags of dog food.

Claimant has been advised to restrict lifting in excess of 25 pounds by one physician and in excess of 15 pounds by another.

Dr. Carlstrom approved claimant's return to work as a clerk/cashier on a job hardening basis wherein she initially worked only two hours per day in March 1983. Claimant was unable to sustain such schedule.

It is unlikely claimant's condition will improve so significant that she will be able to return to her former position as a clerk/cashier.

Claimant performed well in vocational evaluation regarding bookkeeping and other clerical skills she could likely perform within h r physical restrictions.

Claimant is fifty-five (55) years old. Her work experience in bookkeeping and other clerical areas ended in 1960.

Defendant employer advised claimant that an intracompany transfer from clerk/cashier to office work is against its policy.

Claimant earned in excess of nine dollars ($9.00) per hour

as a clerk/cashier at her injury date; entry level clerical positions would pay approximately three and 45/100 dollars ($3.45) per hour.

Claimant's functional impairment rating is between five percent (5%) and twelve percent (12%).

Claimant is a high school graduate with subsequent on-the-job training in credit management and bookkeeping.

The insurer advised claimant's counsel that further treatment by Dr. McClain was disallowed in October 1982. Claimant sought treatment subsequent to that time.

CONCLUSIONS OF LAW

THEREFORE, it is concluded:

Claimant has established a causal relationship between her December 2, 1981 injury and her present disability.

Claimant has sustained an industrial disability of twenty-two percent (22%) of the body as a whole.

Claimant is not entitled to reimbursement for costs incurred for medical services provided by Dr. McClain after defendants advised that such treatment was no longer authorized.

ORDER

THEREFORE, it is ordered:

Defendants pay claimant one hundred ten (110) weeks of permanent partial disability benefits at the stipulated rate of two hundred thirty-five and 94/100 dollars ($235.94) per week with credit for the nineteen (19) weeks of benefits previously paid.

Interest accrues pursuant to section 85.30 as amended.

Defendants pay costs of this action.

Defendants file a final report upon payment of this award.

Signed and filed this 27th day of April, 1984.

Claimant,	:	
vs.	:	File No. 622908
CITY OF CEDAR RAPIDS,	:	A P P E A L
Employer,	:	D E C I S I O N
and	:	
BITUMINOUS INSURANCE COMPANY,	:	FILED
Insurance Carrier, Defendants.	:	AUG 27 1984
		IOWA INDUSTRIAL COMMISSIONER

By order of the industrial commissioner filed June 27, 1984 the undersigned deputy industrial commissioner has been appointed under the provisions of §86.3, Code of Iowa, to issue the final agency decision on appeal in this matter. Defendants appeal from an adverse review-reopening decision.

The record consists of the transcript; claimant's exhibits 1 through 23; and defendants' exhibits A through J, all of which evidence was considered in reaching this final agency decision.

The outcome of this final agency decision will modify the review-reopening decision somewhat; however, that modification will be in favor of the claimant.

ISSUES

The hearing deputy awarded a 15 percent permanent partial disability and allowed a $4,000 credit against the award on account of a third party settlement.

The issues on appeal are stated by defendants:

I. Whether Appellee's disability for industrial purposes is accurately assessed at fifteen percent of the body as a whole.

II. Whether Appellant-Bituminous Insurance Company took $4,000.00 from said $10,000.00 settlement and waived its claim to any further credit for the remainder of the settlement.

EVIDENCE PRESENTED

Claimant was hurt in a work-connected car-pedestrian accident on January 11, 1980. Claimant had a dislocated left shoulder, a fracture of the left sacrum, a fracture of the spine of the tibia of the left knee and a fracture of the tibia of the left leg, as well as a contusion of the calf and multiple abrasions on the chestwall on the left. Claimant was treated by Martin F. Roach, M.D., and returned to work on March 3, 1980. He had to return to the hospital again on June 1, 1980 for follow-up care. Dr. Roach assigned a permanent partial disability. Claimant had developed a traumatic cyst on his thigh as a result of the injury. When asked upon what the doctor based the five percent rating, he replied that it was "on that traumatic cyst and the subsequent sequela." (Roach dep., p. 9 ll. 14-15)

Claimant was examined twice by John R. Walker, M.D., who was more specific as to the actual source of claimant's problems. In his report of March 10, 1982, Dr. Walker states:

1. He still has some disability due to the dislocated left shoulder in the form of a slight loss of motion in abduction and pain and discomfort.

2. He has a very painful, burning type of scar in the region of the trauma and also in the region of the main trauma, where his traumatic cyst was removed surgically.

3. He has a moderate lumbosacral sprain.

4. He has a definite sacroiliac injury with disruption of the joint due to his comminuted fracture of the pelvis.

5. He has a chronic sacroiliac sprain on the left side only due to this injury.

6. He has some loss of muscle tissue laterally in the vastus lateralis with a painful, burning scar.

7. He has some more or less insignificant scars of both calves.

8. He has a chronic sprain in the region of the astragulo-tibial joint on the left laterally.

Dr. Walker first opined claimant's impairment was 18 percent of the body as a whole and later raised that amount to 20 percent.

Claimant was 55 years of age at the time of the hearing and a high school graduate. He had worked part-time at Wilson and Company and in a grocery store while in high school. He worked at Wilson and Company full-time until 1948 when he became employed by the Cedar Rapids Street Department. After service in the Korean Conflict, he was reemployed by the street department and has been there for some 35 years. His experience was varied, including labor, truck driving, and heavy equipment operating. He was in management for about the past 13 years.

Claimant entered into a settlement with the representatives of the third party who had caused the accident. Under the agreement, claimant received $6,000 and the workers' compensation insurance carrier, The Bituminous Insurance Company, received $4,000. No memorandum of settlement was filed with the industrial commissioner.

APPLICABLE LAW

The legal authorities as cited by the hearing deputy are adequate and correct. Specifically, section 85.22(4) states: "A written memorandum of any settlement, if made, shall be filed by the employer or insurance carrier in the office of the industrial commissioner."

Also, it should be emphasized that claimant's disability is industrial which is reduction of earning capacity, and not mere functional impairment. Such disability includes consideration of functional impairment, age, education, qualifications, experience, and claimant's inability, because of the injury, to engage in employment for which he is fitted.

ANALYSIS

Defendants argue that Dr. Roach's rating of five percent permanent partial impairment (as opposed to Dr. Walker's rating of 20 percent) is superior. One would agree, of course, that between these two doctors, who have very similar qualifications, Dr. Roach's knowledge of the case is superior because he was the treating doctor. Although Dr. Roach's rating is accorded more weight, Dr. Walker's rating is not to be ignored.

Perhaps the main problem here is that defendants base too much emphasis on the permanent impairment rating and attempt to equate it to the disability rating. As shown above in the applicable law, impairment is only one factor of disability, and it is not a figure which is added to or substracted from in order to reach the amount of disability.

Here, in this case is a 55 year old man whose background shows considerable achievements. Also, he has retained his position with the employer. Nevertheless, at claimant's age, his employment horizons are limited because of his injury. Thus, a permanent partial disability of 15 percent is not excessive.

With respect to the third party release, defendants argue that they are entitled to indemnity from the recovery; however, indemnity applies where a workers' compensation claimant brings a third party action in district court, wins his lawsuit, and owes indemnity from the damage award. Section 85.22(1), Code of Iowa. Such is not the case here.

In the present case, defendants participated in the settlement between claimant and the third party, and defendants released their subrogation rights against the third party. The question then becomes whether defendants have any right to a credit against their liability for workers' compensation payments. Section 85.22(4), The Code, clearly says that defendants are required to file a memorandum of the settlement with the industrial commissioner. It would seem that the very reason for this requirement is to avoid future confusion as to the amount of the credit. Therefore, if defendants participated in a settlement under §85.22(3) and wanted credit against future compensation liability, they should have made the required filing under §85.22(4). Defendants did not do so and will not be allowed the credit.

The findings of fact in the review-reopening decision are adopted except that number 10 has been changed slightly, and the conclusions of law are adopted except that number 7 will be deleted. The order, likewise, is adopted except that defendants will not be given a credit.

FINDINGS OF FACT

1. Claimant was employed by defendant City of Cedar Rapids on January 11, 1980.

2. Claimant was struck by a vehicle.

3. That at the time claimant was struck he was performing duties for the City of Cedar Rapids,

4. Defendants filed a memorandum of agreement concerning a January 11, 1980 injury.

5. Claimant was paid compensation for lost time.

6. Claimant sustained permanent partial disability to the body as a whole because of said injury.

7. Claimant's disability for industrial purposes is fifteen percent (15%) of the body as a whole.

8. Claimant, claimant's wife and defendant insurer entered into settlement with the alleged third party tort-feasor Dennis Neuzil whereby a total of $10,000 was paid on behalf of Neuzil to claimant, his wife and the insurer.

9. Defendant Bituminous Insurance took $4,000 from said settlment and waived claim to further credit for the remainder.

10. Claimant and his wife received $6,000 as their share of the third party settlement.

11. The charge of Dr. Walker in the amount of $324 is reasonable.

12. The gross weekly wage is $315.

CONCLUSIONS OF LAW

1. Claimant was employed by defendant City of Cedar Rapids on January 11, 1980.

2. Claimant sustained an injury arising out of and in the course of his employment on January 11, 1980.

3. Claimant is entitled to no further healing period compensation.

4. The rate of compensation is $192.28.

5. Defendants will be ordered to pay seventy-five (75) weeks of permanent partial disability compensation at the rate of one hundred ninety-two and 28/100 dollars ($192.28) per week.

6. Defendants will be ordered to pay three hundred twenty-four dollars ($324) for Dr. Walker's examination pursuant to section 85.39, Code of Iowa.

ORDER

IT IS THEREFORE ORDERED that defendants pay unto claimant seventy-five (75) weeks of permanent partial disability compensation at the rate of one hundred ninety-two and 28/100 dollars ($192.28) per week.

IT IS FURTHER ORDERED that defendants pay three hundred twenty-four ($324) to Dr. Walker for the examination pursuant to section 85.39, Code of Iowa.

Costs of this proceeding are taxed against defendants.

Interest is to accrue in this award from March 7, 1984.

A claim activity report shall be filed upon payment of this award.

Signed and filed this 27th day of August, 1984.

		IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This matter came on for hearing at the Linn County Courthouse in Cedar Rapids on September 9, 1983 at which time the record was closed although briefs were later filed.

A review of the commissioner's file reveals that an employer's first report of injury was filed January 14, 1980. A memorandum of agreement was filed January 21, 1980 calling for the payment of $192.28 in weekly compensation. A final report was filed on February 29, 1980 showing that claimant was paid 6 2/7 weeks of compensation.

The record consists of the testimony of the claimant, Doug Fields, Don Fleagle and Freda Hoskins; claimant's exhibits 1 through 23; and defendants' exhibits A through K.

ISSUES

The issues for resolution are:

1) The nature and extent of disability;

2) The rate of compensation; and

3) The applicability of a third party settlement.

STATEMENT OF THE EVIDENCE

At the commencement of the hearing the parties stipulated as to the items in the petition for declaratory ruling, excepting paragraph seven.

Claimant, presently age 55, is a high school graduate. He worked part-time at Wilson and Company and in a grocery store while he was in high school. He worked at Wilson's full-time until 1948. He then became employed for the Cedar Rapids Street Department. He was in the service during the Korean conflict. He then became re-employed by the street department. He has been employed by the street department for 35 years. He was a laborer, a truck driver and heavy equipment operator. For about the last 13 years he has been in management.

Claimant testified that on the date of injury he was paid $640 every two weeks. In addition to the regular pay and regular overtime, claimant was entitled to be paid standby pay which apparently compensated him for being available for emergencies.

On January 11, 1980 claimant was on standby and at 5:45 a.m. was called to erect a barricade. Claimant testified that it had been raining and that there had been a drop in temperature. While claimant was turning the barricade flasher to face traffic he was struck by a vehicle driven by Dennis Neuzil. Claimant was taken to the hospital and his treating physician was Martin F. Roach, M.D., a Cedar Rapids orthopedist. Claimant had a dislocated left shoulder, fracture of the left sacrum, fracture of the tibia spine of the left knee and fracture of the fibula of the left leg. He had a contusion of the calf and multiple abrasions over the chest wall on the left side. Claimant underwent closed reduction under intravenous IV Valium on the day of admission.

Post-reduction x-rays were normal. His calf contusion and swelling gradually subsided. Claimant continued to complain of pain in the left hip and pelvis and "coned down" views revealed disruption of the sacroiliac joint. He was started on ambulation with a walker, partial weight bearing on the left side and gradually improved. Claimant was released from the hospital on January 16, 1980.

Claimant continued to see Dr. Roach. On January 28, 1980 Dr. Roach undertook to start claimant on exercises for his quadriceps and shoulder. Claimant continued to be treated by Dr. Roach. The record (exhibit I) indicates that claimant returned to work about March 1, 1980.

On June 1, 1980 claimant was admitted to the hospital. A large traumatic synovial cyst on the left thigh had developed and was excised. A drain was placed in the thigh and later removed. Claimant was discharged from the hospital on June 8, 1980. Exhibit 7 indicates that claimant returned to work about June 21, 1980. Claimant returned to see Dr. Roach on two occasions following this date. On July 14, 1980 Dr. Roach noted a couple of areas of sensitivity along the lateral thigh but had good range of hip motion and negative straight leg raising.

Claimant testified that he does not do as much on the job as he did formerly. He testified that he has dislocated his shoulder twice since he returned to work. He testified that in the last year his hip is getting worse. He testified that it hurts when he sits down. He has seventeen people working for him. He stated that he has become more cautious in movements. He stated that his mental attitude is worse in that he is touchy in the office.

Claimant testified that he entered into a settlement with representatives of Dennis Neuzil. The settlement was in the amount of $10,000 paid by Neuzil. A copy of the release is labeled exhibit F. Claimant testified that $6,000 went to claimant and $4,000 went to the workers' compensation insurance carrier. Claimant stated that he considers the money received to have been paid on a 50-50 basis to himself and his wife. The record indicates that no memorandum of settlement was filed with this agency. Claimant stated that he and his wife are having some marital problems. These existed prior to the injury.

At the time of the hearing claimant testified that he would like to get out of management and back into labor. His complaints were that he had left hip pain, back pain and shoulder pain.

On cross-examination, claimant admitted that he was making more money. He went back to essentially the same duties. Claimant indicated that he was able to perform the duties necessary to get the job done, but was unable to do what he did formerly. Claimant indicated that he sought no medical attention in 1981. Claimant testified that he gardens and that he laid a patio since the injury. Claimant testified that at the time he signed the release he was represented by counsel but "didn't think" to have counsel examine the document.

Don Fleagle is a foreman of the Cedar Rapids Street Department. He testified that claimant had some trouble after he returned to work and that claimant attempts to hide his injury. He testified that claimant has not changed much since he returned to work. He stated that claimant's work ability has not been affected.

Doug Fields is head of the Cedar Rapids Sewer Department. This witness testified that he did not see much change in claimant's work performance after the injury. He indicated that claimant is not one to complain, but he could tell when claimant was having an off day.

Frieda Hoskins, claimant's wife, testified that claimant had lost interest in many avocational activities. She testified that their relationship had deteriorated in that claimant is moody. She testified that she was not a party to the negotiations surrounding the third party settlement. This witness indicated that some problems between herself and claimant stemmed from a 1978 injury which the witness sustained. However, she did indicate that matters were clearing up prior to claimant's injury and worsened thereafter. She had some psychological problems in 1981. She testified that the couple has had severe marital problems which antedated the injury.

Claimant last saw Dr. Roach on July 14, 1980. He performed another examination on February 10, 1983. In December 1981 Dr. Roach gave a permanency rating. He indicated that claimant had sustained a five percent partial disability because of the injury. The rating was based on more than loss of function (deposition p. 8).

Claimant was seen by John R. Walker, M.D., a Waterloo orthopedist, on March 10, 1982. Claimant was complaining of low back pain and pain in the left buttock. He had a catching in his left hip. He had numbness over the left lateral thigh. He had pain across the top of his left foot. He had pain over the left anterior chest wall and complained that his left arm had become weaker. Physical examination showed that claimant lacked the last fifteen degrees of complete abduction of the left shoulder and the abduction adduced was not smooth. There was tenderness over the pectoralis major muscles with tenderness in the deltoid region anteriorly of the left shoulder. There was no atrophy of the arm or forearm and the biceps, triceps and forearm reflexes were within normal limits. Examination of the low back revealed tenderness at L4, L5 and over the sacroiliac joint. Straight leg raising tests were positive. Internal pelvic torsion tests revealed that there was some discomfort in the left sacroiliac joint.

Examination revealed that the claimant was limber and could touch his fingers to his toes. He had some discomfort upon coming upright. X-rays revealed a well-healed fracture of the upper one-fourth with the middle one-fourth of the fibula. X-rays of the pelvis revealed what appeared to be a well-healed fracture of the pubic ramus. Dr. Walker thought claimant sustained a permanent partial disability of 18 percent to the body as a whole.

Dr. Walker examined claimant again on August 6, 1982. The examination on that date showed some difference in that some atrophy of the left leg was observed. Dr. Walker observed that claimant had lost fifteen degrees of external rotation of the left shoulder, lost the last fifteen degrees of complete abduction of the left shoulder and had developed some deltoid muscle atrophy. Dr. Walker raised his permanent partial disability rating to twenty percent.

APPLICABLE LAW

1. Sections 85.3 and 85.20, Code of Iowa, confer jurisdiction on this agency in workers' compensation cases.

2. The claimant has the burden of proving by a preponderance of the evidence that the injury of January 11, 1980 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

3. As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

4. For example, a defendant employer's refusal to give any sort of work to a claimant after he suffers his affliction may justify an award of disability. McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (Iowa 1980).

5. Section 85.34(1) deals with healing period compensation.

6. Section 85.22 deals with subrogation rights under the workers' compensation act.

7. Section 85.36 deals with the computation of gross weekly wage.

ANALYSIS

Based on the foregoing principles, it is found that claimant sustained a permanent partial disability to the body as a whole because of the injury of January 11, 1980.

Claimant is 55 years of age and has spent the major portion of his life working for the Cedar Rapids Street Department. He will, in all likelihood, continue to work for the Cedar Rapids Street Department until he retires. Claimant has not been cast out of a job because of his injury. His employer accepted him

back. Granted, some loyalty and some civil service rules may have facilitated claimant's return, but claimant has not fallen under the holding in recent cases which indicate that an employer's refusal to offer employment may be evidence of disability. Considering the elements of industrial disability, it is found that claimant is disabled to the extent of fifteen percent of the body as a whole.

I have examined the record with regard to healing period paid to date in this case and it appears to "dovetail" with the medical evidence presented.

Defendants have asserted a defense of election of remedies. Defendants' theory is that the language of the release precludes claimant from pursuing an action for compensation before this agency. While the argument advanced is novel, it is in error. The release was not executed in defendants' favor (but in favor of the third party tort-feasor). The law states that no release can be effective without the approval of the industrial commissioner. There being no such approval, the defense must fail.

Claimant has submitted a bill for 85.39 examination by Dr. Walker. The cost of the March 10, 1982 examination will be allowed. Section 85.39 envisions a single examination or at most two to three examinations in close temporal proximity. $324.00 will be ordered to be paid.

The issue of the subrogation interest presents a question rarely litigated before this agency. It is clear that the insurer, claimant and claimant's wife entered into a settlement with the third party tort-feasor for $10,000. An informal agreement was had whereby the insurer received $4,000 and claimant and his wife $6,000. The two questions presented are whether the settlement is effective if not filed and whether the settlement interest of the wife is deducted from the credit.

As to the first question, it is found that a settlement does not have to be filed to be effective. No affirmative action is required by this agency, especially in the instance where the parties agree to the terms of the settlement.

The language of section 85.22(5) stating that money "paid as damages resulting from and because said injury was caused under... liability" is determinative of the second question. Certainly a wife's claim arises out of a cause of action which may have been compensable. To hold that the loss of consortium claim was a separate cause would negate the clear intention of section 85.22. All one need do to circumvent the statute would be to lump a major portion of the settlement with the spouse's claim. This was not the intent of the law. Defendants will receive their $4,000 credit pursuant to their agreement. There will be no reduction of credit for loss of consortium.

Claimant asserted that rate was in issue. Claimant testified that his bi-weekly gross pay was about $10 higher than that revealed on the filings made with this office. However, no tax returns or other tangible evidence was offered to indicate that the rate shown on the forms provided is incorrect. It is still claimant's burden to prove a higher rate. He has not sustained his burden. Claimant's rate will be awarded at $192.28.

Claimant has listed some out-of-pocket expenses, wishing to have them taxed as costs. Forty-two miles were incurred as mileage seeking treatment from Dr. Roach. These expenses shall be allowed in the amount of $10.08. A number of other items were submitted, all of which falls within the preview of Rule 500-4.33 of the industrial commissioner. No specific order shall be issued except for mileage.

FINDINGS OF FACT

1. Claimant was employed by defendant City of Cedar Rapids on January 11, 1980.

2. Claimant was struck by a vehicle.

3. That at the time claimant was struck he was performing duties for the City of Cedar Rapids.

4. Defendants filed a memorandum of agreement concerning a January 11, 1980 injury.

5. Claimant was paid compensation for lost time.

6. Claimant sustained permanent partial disability to the body as a whole because of said injury.

7. Claimant's disability for industrial purposes is fifteen percent (15%) of the body as a whole.

8. Claimant, claimant's wife and defendant insurer entered into settlement with the alleged third party tort-feasor Dennis Neuzil whereby a total of $10,000 was paid on behalf of Neuzel to claimant, his wife and the insurer.

9. Defendant Bituminous Insurance took $4,000 from said settlement and waived claim to further credit for the remainder.

10. Claimant and his wife received $6,000 because of the injury.

11. The charge of Dr. Walker in the amount of $324 is reasonable.

12. The gross weekly wage is $315.

CONCLUSIONS OF LAW

1. Claimant was employed by defendant City of Cedar Rapids on January 11, 1980.

2. Claimant sustained an injury arising out of and in the course of his employment on January 11, 1980.

3. Claimant is entitled to no further healing period compensation.

4. The rate of compensation is $192.28.

5. Defendants will be ordered to pay seventy-five (75) weeks of permanent partial disablity compensation at the rate of one hundred ninety-two and 28/100 dollars ($192.28) per week.

6. Defendants will be ordered to pay three hundred twenty-four dollars ($324) for Dr. Walker's examination pursuant to section 85.39, Code of Iowa.

7. Defendants will receive a four thousand dollar ($4,000) credit for compensation and medical paid previously.

ORDER

IT IS THEREFORE ORDERED that defendants pay unto claimant seventy-five (75) weeks of permanent partial disability compensation at the rate of one hundred ninety-two and 28/100 dollars ($192.28) per week.

IT IS FURTHER ORDERED that defendants pay three hundred twenty-four dollars ($324.00) to Dr. Walker for the examination pursuant to section 85.39, Code of Iowa.

IT IS FURTHER ORDERED that defendants receive a four thousand dollar ($4,000.00) credit toward the total amount paid on this claim.

Costs of this proceeding are taxed against defendants.

Interest is to accrue in this award from the date of this decision.

A final report shall be filed upon payment of this award.

Signed and filed this 7th day of March, 1984.

JOSEPH M. BAUER
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

KENNETH LEROY HUTCHISON,	:	FILED
Claimant,	:	File No. 687421 AUG 30 1984
vs.	:	A P P E A L IOWA INDUSTRIAL COMMISSIONER
AMERICAN FREIGHT SYSTEM, INC.,	:	D E C I S I O N
Employer, Self-Insured, Defendant.	:	

By order of the industrial commissioner filed June 27, 1984, the undersigned deputy industrial commissioner has been appointed under the provisions of section 86.3 to issue the final agency decision on appeal in this matter. Defendant appeals from an adverse review-reopening decision.

The record consists of the hearing transcript; claimant's exhibits 1 through 20; defendant's exhibits A through Z, inclusive and defendant's exhibits AA, AB, AC, AE, AF, AG (there was no exhibit AD), all of which evidence was considered in reaching this final agency decision.

The outcome of this final agency decision will retain that of the review-reopening decision as to the first three appeal points presented by defendant; the matter brought up by defendant last appeal point will be remanded to the hearing deputy for further action.

ISSUES

The review-reopening decision ordered defendant to pay 89 weeks of healing period, 50 weeks of permanent partial disability interest, and to pay "to claimant" certain benefits under section 85.27, Code of Iowa. The defendant was further ordered to pay some mileage.

Defendant states the issues:

1. Causal connection between the alleged injury of November 1, 1981, and the subsequent long history of medical care and disability.

2. The nature and extent of Claimant's disabilities and impairments.

3. Whether the course of medical treatment incurred by the Claimant was "authorized" under the terms of the Iowa Compensation Act.

4. Does the record support the Findings of Fact, the Conclusions of Law, and the Order contained in the Review-Reopening Decision filed herein on April 27, 1984?

EVIDENCE PRESENTED

This is a complex and difficult case, and feelings run high on both sides. Briefly, claimant was hurt and received treatment by Herbert Rosen, D.O., some time after which he was sent to the Mayo Clinic in Minnesota. He still claimed pain in his foot and went to another Des Moines doctor, David L. Friedgood, D.O. There is a conflict in the evidence as to whether or not the employer could be construed to have authorized that care. Claimant was sent by the employer to Michael J. Taylor, M.D., a psychiatrist. Claimant then went on his own to J. D. Bell, D.O., who performed three surgeries.

The record has been exhaustively summarized in a 32 page decision by the hearing deputy. The undersigned designee of the industrial commissioner has likewise examined and analyzed the record at length. At this time a chronological approach to the facts would be most helpful.

November 1, 1981.

Claimant was hurt when a piece of steel slid and struck him. An eyewitness, Bruce A. Wolfe says the steel struck claimant's left arm, shoulder and slid down his right leg. Claimant was pinned beneath the steel until Wolfe managed to move it. Claimant was given initial treatment at Iowa Lutheran Hospital in Des Moines.

November 2, 1981.

Claimant was treated by Dr. Rosen for pain in his left foot.

December 4, 1981.

At the behest of the employer claimant visited Joshua D. Kimelman, D.O., who recommended claimant try to walk normally.

December 16, 1981.

Claimant still had a swollen left ankle, but Dr. Rosen was unable to find any fracture.

December 18, 1981 - December 28, 1981.

Claimant was admitted to Iowa Lutheran Hospital where a hidden fracture was found in the left ankle. He was discharged with a cast on his left foot. To this time, the records do not indicate claimant had any problems in his left arm, left shoulder or neck. Claimant testified (Transcript, page 67) that he had symptoms in his arm and "back across my shoulder blade" but thought that at that time it was just a sprain.

January 1982.

The cast was removed from his left leg and foot, but claimant still had pain.

February 25, 1982.

A report from the Mayo Clinic written by Miguel E. Cabanela, M.D., recommended that claimant return to a normal gait and stated that claimant had a "functional" problem. Claimant testified that he told Dr. Cabanela about pain in the neck and arm as well as the leg (Tr., p. 70); however, the doctor wrote "[a]t the end of the interview on February 19, he asked me what I was going to do about his neck, but he had not mentioned his neck before." Dr. Cabanela's examination showed claimant's neck was normal.

March 26, 1982.

Dr. Rosen reported that claimant could return to work by the end of March.

April 2, 1982.

Dr. Rosen signed a return to work slip.

April 7, 1982.

Claimant quit working after two and one-half days at which time his weekly indemnity payments were stopped. On that day, he visited Dr. Rosen, but the doctor was not in. A nurse or secretary in the doctor's office obtained an appointment for claimant to visit Dr. Friedgood.

April 8, 1982.

A report by Dr. Friedgood showed that claimant mentioned pain in his neck radiating into his right shoulder. It also shows that claimant had "good bulk, tone and strength in his left leg." Dr. Friedgood, however, noted some problems in claimant's right foot and leg.

April 13, 1982.

Dr. Rosen reported that claimant needed no further treatment.

April 21, 1982.

Iowa Lutheran Hospital's physiotherapy reports show claimant treated for low back, neck and left foot problems. The difficulty with the left foot was described as a peripheral neuropathy.

April 28, 1982.

A report by Dr. Friedgood referred to a traumatic neuropathy in his right foot, but the word "right" was altered to read "left" (Exhibit N). When claimant was asked why he returned to Dr. Friedgood around this time, he stated his frustration: "Because I wasn't getting nowhere. I was feeling a little relief while I was having the sessions, but right after they quit working on me, my symptoms came right back."

May 7, 1982.

A physiotherapy report showed claimant had problems with his left hip, leg and ankle and neck and left shoulder.

May 26, 1982.

A report by Dr. Friedgood showed claimant was treated for his left arm and cervical radiculopathy. The report also stated claimant was able to work.

June 1982.

Claimant went on ADC.

July 20, 1982.

Claimant was seen by Dr. Taylor, the psychiatrist, who stated:

> I find no evidence that Mr. Hutchison suffers from any mental disorder which causes any limitation in his ability to function. I view Mr. Hutchison as an excellent candidate for the Pain Clinic at Mercy and think that there's a good probability that he would benefit from treatment at that facility.

August 2, 1982.

A physical therapy report (Exhibit L) showed that claimant stated that he was going to see Dr. Friedgood "because he is still having considerable pain in his neck and shoulder and also in his low back and leg."

August 4, 1982.

A report by Dr. Friedgood states that the doctor cannot explain "the various symptoms in his head and neck region and in his arms." (Exhibit T) Dr. Freidgood also believed that a pain clinic would be a good idea for claimant.

August 16, 1982.

The claimant first saw Dr. Bell.

September 14, 1982.

A left arthrogram showed a partial tear in the left rotator cuff. (Exhibit X)

September 17, 1982.

A consultation report by Robert Hill, D.O., showed a "strong suggestion of both cervical and perhaps lumbar neuropathic disorder, undoubtedly from trauma." (Exhibit X)

September 21, 1982.

An arthroscopic examination of the left knee showed a mild chrondromalacia. (Exhibit X)

September 27, 1982.

A report by Larry L. Richards, D.O., shows a reactive depression due to physical incapacitation and injury.

October 13, 1982.

Dr. Bell did surgery on claimant's left leg and foot, releasing a tarsal tunnel syndrome.

October 11, 1982.

A letter from defendant's counsel to claimant's counsel stated that defendant wanted claimant examined by Dr. Kimelman.

October 19, 1982.

A letter from claimant's counsel to defendant's counsel stated that claimant objected to seeing Dr. Kimelman at that time.

October 21, 1982.

Defendant's counsel responded that the care by Dr. Bell and Dr. Richards was unauthorized and that defendant tendered the care of Dr. Kimelman.

October 27, 1982.

A letter from claimant's counsel to defendant's counsel stated in part:

> Mr. Hutchison takes the position that treatment reasonably suited to treat the injury as required by §85.27 was not provided by the employer. Specifically, Mr. Hutchison would point to the fact that the injury occurred on or about November 1, 1981 and he did not receive surgical relief until he sought out Dr. Bell's services in September of 1982. Further, Mr. Hutchison feels that Dr. Taylor's recommendation with respect to a pain clinic were not supplemented. These feelings of Mr. Hutchison are not meant to be exhaustive, but Mr. Hutchison is not agreeing to waive your client's responsibility under §85.27 for appropriate medical care. We have some difficulty transferring to Dr. Kimmelman's [sic] care now that Dr. Bell has performed two surgeries and a third one is indicated. He is reluctant to leave the care of Dr. Bell at this time.

November 12, 1982.

A letter from defendant's counsel to claimant's counsel stated in part:

> So that there will be no misunderstandings between you and me, please be advised that as of this time and at all times heretofore the only authorized care for this claimant for which the employer will assume responsibility is that in the office of Dr. Kimelman and Dr. Rosen. Since we did not authorize any surgery by Dr. Bell and since we have received no reports of what Dr. Bell has done and only a one-sentence report by Dr. Richards which did not address itself to any real indentification of any problems of this claimant, we must regard all of this care as unauthorized and without giving us the basis for the authorization of care in the future.

January 11, 1983.

A surgery report by Dr. Bell shows the left median elbow nerve was decompressed.

July 13, 1983.

A hospital report by Dr. Bell showed claimant's left shoulder had chronic bicipital tenosynovitis. Dr. Bell operated for a small tear in the rotator cuff, some one-quarter inch or longer. (Bell dep., 19)

October 28, 1983.

Claimant was admitted to Des Moines General Hospital for treatment of adhesive capsulitis of the left shoulder.

December 21, 1983.

Claimant returned to work and has been working since that time.

December 29, 1983.

A report by Dr. Bell showed a left shoulder impairment which equates to nine percent of the whole person. There is no other impairment as a result of the injury.

APPLICABLE LAW

The authorities cited by the hearing deputy basically are proper. The citation of Barnhart v. Mag, Inc., I Iowa Industrial Commissioner Report 16 (Appeal Decision 1981) may not apply here, however. The fourth unnumbered paragraph of §85.27, Code of Iowa, states:

> For purposes of this section, the employer is obliged to furnish reasonable services and supplies to treat an injured employee, and has the right to choose the care. The treatment must be offered promptly and be reasonably suited to treat the injury without undue inconvenience to the employee. If the employee has reason to be dissatisfied with the care offered, he should communicate the basis of such dissatisfaction to the employer, in writing if requested, following which the employer and the employee may agree to alternate care reasonably suited to treat the injury. If the employer and employee cannot agree on such alternate care, the commissioner may, upon application and reasonable proofs of the necessity therefor, allow and order other care. In an emergency, the employee may choose his care at the employer's expense, provided the employer or his agent cannot be reached immediately.

The right to choose the care implies an obligation to manage the treatment actively. Zimmerman v. L. L. Pelling Co., II Iowa Industrial Commissioner Report 462, 463 (Appeal Decision 1982). Also, in the context of the case, the industrial commissioner stated in Rittgers v. Iowa Parcel Service, III Iowa Industrial Commissioner Report 210, 213 (Appeal Decision 1982):

> Although defendants are entitled to choose the claimant's medical care provider, it appears questionable that the claimant's condition would have improved as it did had defendants continued control of claimant's care. Defendants had ceased providing care for the claimant subsequent to the first proceeding. Examination by doctors of defendants' choice currently concurs with the care provided by Dr. Johnson. The care provided to claimant by Dr. Johnson proved to be reasonable and necessary for the treatment of claimant's employment related injuries as contemplated by Iowa Code section 85.27. The expenses involved in the services of Dr. Johnson and the surgery of March 3, 1981 should properly be paid for by the defendants.

See also Larson, The Law of Workmen's Compensation, Vol. 2, §61.12(d), pp. 10-692 to 10-707.

"Claimant is not entitled to reimbursement for medical bills unless he shows that he paid for them with his own funds." Caylor v. Employers Mut. Cas. Co., 337 N.W.2d 890 (Iowa App. 198

ANALYSIS

The issues will be considered in the order given by defendant.

1. Concerning the issue of causal relationship, Dr. Bell is the only physician with a total perspective of claimant's case, and his unrebutted testimony establishes a causal connection between the injury and the necessity for a treatment and the resulting disability. (Bell dep., 23) From this uncontested evidence, one can only conclude that the requisite causal relationship exists.

2. With respect to the issue of the nature and extent of claimant's disability, one considers first his functional impairment which is shown to be nine percent in unrebutted testimony. Otherwise, claimant has a GED, having gone through the ninth grade in high school. His experience has been in medium and heavy labor. Considering claimant's physical limitati due to the injury, his restricted experience and education, but also that he retains a job with his employer, a ten percent permanent partial disability is not excessive.

3. Concerning the dispute over whether or not claimant's medical case was authorized, the above chronology shows that the treatment by Dr. Roesen on the left foot was not successful initially and the fracture was not found for two months. Claimant still complained and there was virtually no more treatment of his left foot until October 1982 when Dr. Bell performed the tarsal tunnel release. The employer sent claimant to the Mayo Clinic, which shows good management of the medical case. However, Dr. Cabanela found a no organic pathology and found that claimant had a "functional" problem. He further stated that claimant should return to his normal gait and to work. The ensuing evidence tends to show that Dr. Cabanela badly missed the mark: Claimant did have a problem with his foot and a subsequent psychiatric examination by Dr. Taylor, who is well-respected, showed claimant had no serious mental problems And, even though Dr. Richards stated that claimant had a reactive depression, Dr. Cabanela's suggestion that claimant's problems were functional tends to indicate claimant had no physical problems, which was not the case.

At any rate, claimant continued to complain but in April 1982, Dr. Rosen said claimant should return to work. Claimant managed to see Dr. Friedgood, and a traumatic neuropathy was diagnosed. There is some question as to whether Dr. Friedgood was mistaken when he said the neuropathy was in the right foot and not the left foot. The Iowa Lutheran Hospital report, certainly, says it is the left foot.

Whatever, claimant was treated by Dr. Friedgood and still had problems.

In is important that claimant was next sent to Dr. Taylor who recommended a pain center, but nothing was done. That is to say, defendant did not follow the advice of its own chosen physician.

By this time, claimant had had his workers' compensation weekly indemnity payments cut off, was on ADC, and was refused the services of the pain center. It is not unreasonable that he sought out the services of Dr. Bell and had three surgeries, all of which, by unrebutted evidence, are tied to the injury.

Of course, claimant's actions are by no means model for a workers' compensation claimant. He very nearly lost all of his medical and allied benefits under §85.27. Still, his actions show one signal fact: He was right about having a physical basis for his pain. Thus, although he was returned to work and had his complaints dismissed at the Mayo Clinic, he had pain which later, undisputed evidence by Dr. Bell showed came from the injury.

Defendant's actions certainly are not censurable. They provided claimant care by a licensed physician and they sent claimant to a famous health institution, the Mayo Clinic. However, they did not abide by the advice of another doctor of their own choosing, Dr. Taylor. That is to say, the management

of the medical case could have been more active. There is a substantial difference between an employer's actively monitoring a claimant's care and passively waiting for a claimant to state his or her dissatisfaction with that care. Monitoring the care includes an attempt to interpret helpfully the reports so that a claimant's treatment will be more efficacious. Here, Dr. Taylor pointed the way, and the employer should have followed.

Finally, there is some analogy to the Rittgers case, cited above. It is not the best comparison, however, because here defendant had not ceased to furnish care, as in the Rittgers case. The case is comparable in that the care furnished by Dr. Bell improved claimant's medical case and resulted in a lesser degree of disability than the course of treatment set by the employer's care for the nine-month period November 1982-August 1983.

Considering all the above factors, the medical and allied expenses which are connected to the injury are compensable under the above interpretation of §85.27.

4. The extent of those expenses is another matter and leads to the reason for the remand. Defendant's arguments that a portion of the bills should not be considered as connected to the injury may have substantial validity. It is difficult to determine whether the bills are connected to the injury because many of the sub-exhibits in exhibit 19 are illegible photocopies. The method used to determined whether or not the bills were connected to the injury apparently was to read them as well as possible and make the decision. In the analysis portion of the review-reopening decision, the hearing deputy showed which bills were non-compensable.

In fairness to defendant, it would be best to list separately each compensable bill and show (1) the identity of the bill, (2) the amount and, (3) the reason for the causal relationship.

In fairness to claimant, claimant should be given an opportunity to present any other outstanding bills which had accrued by the date of the first hearing.

Finally, the order to make payment "to claimant" is proper under the Caylor case, above, only when it is shown claimant has actually himself paid the bills; the order should be appropriately amended where necessary.

The findings of fact basically are adopted except that number 13 is amended and numbers 17 and 21 are deleted because of the nature of the remand. The conclusions of law and order are amended.

FINDINGS OF FACT

1. Claimant sustained an injury arising out of and in the course of his employment on November 1, 1981.

2. The injury occurred when a sheet of steel weighing from 600 to 1000 pounds fell striking claimant's left forearm and left side and came to rest upon claimant's left ankle pinning him to the floor.

3. The accident caused a fracture in claimant's left ankle and resulted in denervation in that ankle.

4. The injury to claimant's ankle was resolved by surgery which was performed October 13, 1982 and healed with no residual permanent impairment.

5. The accident caused an injury to claimant's left forearm in the nature of constriction of the median nerve.

6. The constriction of claimant's median nerve was resolved by surgery performed January 11, 1983 and healed with no residual permanent impairment.

7. The accident caused a tear in the rotator cuff of claimant's left shoulder.

8. Claimant's rotator cuff tear was surgically repaired.

9. The injury to claimant's rotator cuff caused a residual permanent impairment of nine percent of the body as a whole.

10. Claimant is a married 33 year old male who has a GED but no higher education or specialized vocational training.

11. All of claimant's prior work experience has been in the nature of medium to heavy physical labor.

12. Claimant was unable to perform the regular duties of his employment from and after November 1, 1981 until December 21, 1983 when he returned to work, except for the three days he returned to work on a trial basis in April of 1982.

13. The employer's management of claimant's medical case was such that claimant's action of seeking care without authorization was reasonable; further that that care improved claimant's health and lowered the otherwise possibly higher cost of care.

14. The employer denied that the physical ailments for which claimant sought medical care subsequent to April 6, 1982 were the result of a work related injury.

15. Defendant did not pay weekly compensation benefits to claimant subsequent to April 6, 1982.

16. The medical care which claimant received from Drs. Friedgood, Bell, Richards, Egly, Anesthesiologist Affiliated, Des Moines General Hospital, Mayo Clinic, Hammer Medical Supply and Iowa Methodist Medical Center were reasonably suited for treatment of the injuries claimant sustained at work November 1, 1981.

17. Claimant traveled 608 miles in order to obtain medical care, the expense of which defendant has not paid.

18. Claimant's healing period consists of 110 weeks, 4 days.

19. Claimant's permanent partial disability is 10 percent.

CONCLUSIONS OF LAW

IT IS THEREFORE CONCLUDED:

1. This agency has jurisdiction of the subject matter of this proceeding and its parties.

2. The work related injury of November 1, 1981 caused injuries to claimant's left shoulder, forearm and ankle.

3. Claimant's healing period consists of one hundred ten (110) weeks, four (4) days of which defendant has paid claimant twenty-one (21) weeks, four (4) days leaving an unpaid balance of eighty-nine (89) weeks.

4. Claimant's rate of compensation is three hundred seven and 38/100 dollars ($307.38) per week.

5. Claimant is ten percent (10%) permanently partially disabled in industrial terms.

6. Employer's management of claimant's case under §85.27 was such that claimant's seeking care without authorization was proper.

ORDER

IT IS THEREFORE ORDERED that defendant pay claimant eighty-nine (89) weeks of healing period compensation over and above that already paid at the rate of three hundred seven and 38/100 dollars ($307.38) per week commencing April 7, 1982.

IT IS FURTHER ORDERED that defendant pay claimant fifty (50) weeks of permanent partial disability compensation at the rate of three hundred seven and 38/100 dollars ($307.38) per week commencing December 21, 1983.

IT IS FURTHER ORDERED that defendant pay interest at the rate of ten percent (10%) per annum from the date each payment became due until the same is paid pursuant to Iowa Code section 85.30.

IT IS FURTHER ORDERED that if defendant has not previously paid the bill of Mayo Clinic in the amount of four hundred one and 70/100 dollars ($401.70) that it shall do so now.

IT IS FURTHER ORDERED that defendant pay claimant one hundred forty-five and 92/100 dollars ($145.92) for reimbursement of travel expenses incurred in obtaining medical care.

IT IS FURTHER ORDERED that defendant pay all amounts which have accrued in a lump sum. This includes all weekly benefits for claimant's healing period and all weekly benefits for permanent partial disability which have accrued since December 21, 1983 but which have not yet been paid.

IT IS FURTHER ORDERED that defendant pay the costs of this action pursuant to Industrial Commissioner Rule 500-4.33 which are taxed against them in the amount of four hundred forty-six and 82/100 dollars ($446.82).

IT IS FURTHER ORDERED that defendant file a claim activity report within twenty (20) days from the date of this decision.

WHEREFORE, this case is remanded to the hearing deputy to show a listing of the compensable bills as follows: (1) show the identity of the bill; (2) the amount; and, (3) the reason for the causal relationship. The hearing deputy may, if he chooses, give claimant an opportunity to present any bill claimed to be compensable which was received prior to the hearing. Finally, the hearing deputy is authorized to pre-hear and hear any evidence which he feels is necessary in order to complete the medical and allied benefits portion of this case.

Signed and filed this 30th day of August, 1984.

Barry Moranville

BARRY MORANVILLE
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

KENNETH LEROY HUTCHISON,	:	FILE NO. 687421
Claimant,	:	
vs.	:	REVIEW -
AMERICAN FREIGHT SYSTEM, INC.,	:	REOPENING
Employer, Self-Insured, Defendant.	:	DECISION

INTRODUCTION

This is a proceeding in review-reopening brought by Kenneth Hutchison, claimant, against American Freight System, Inc., a self-insured employer.

Claimant seeks further weekly benefits and payment of medical expenses as a result of the injury which occurred on November 1, 1981.

The hearing commenced February 15, 1984 in the hearing room at the office of the Iowa Industrial Commissioner in Des Moines, Iowa.

The record in this proceeding consists of the testimonies of claimant, Anita K. Smith, Bruce A. Wolfe and David Babcock. Also admitted into evidence were claimant's exhibits 1 through 20, jointly offered exhibits A through W, defendant's exhibits A through Z, AA, AB, AC, AE, AF and AG.

ISSUES

The issues presented by the parties at time of hearing are whether or not there is a causal connection between the injury claimant suffered November 1, 1981 and the extended history of disability and medical care which claimant alleges; a determination of the nature and extent of any disability which is found to be related to that injury; a determination concerning whether or not the medical expenses which claimant presents are the responsibility of the defendant, particularly with regard to the authorization for such expenses; a determination of the costs of this proceeding and of the relative rights of the parties with regard to the subrogation rights and lien held by the Iowa Department of Human Services.

The parties presented a written stipulation which states that the correct rate of compensation in the event of an award is $307.38 per week; that the charges for the medical and hospital services rendered to claimant were fair and reasonable; that claimant did not work from November 2, 1981 through April 1, 1982, for which claimant was paid compensation; that claimant was again off work from April 7, 1982 through December 20, 1983 for which no compensation has been paid; that claimant returned to his regular employment duties on December 21, 1983 and that defendant paid claimant's air fare to and from the Mayo Clinic in Rochester, Minnesota in the sum of $272.00.

REVIEW OF THE EVIDENCE

Anita K. Smith testified that she is employed by the State of Iowa, Department of Human Services in the Medical Utilization and Review Unit. She stated that she works on subrogation claims pursuant to chapter 249A of the Code of Iowa. She identified exhibit 10 as being a payment history of all of claimant's medical expenses which were paid by the Department of Human Services and that exhibit 19 is copies of claims which had been submitted to the department for payment and which were believed to be related to the injury of November 1, 1981. The witness related that many of the claim forms noted in exhibit 19 were marked as to indicate that the medical care was not related to a work related injury. She did not know why the full amount charged was sometimes not paid. She agreed that exhibit 10 may have numerous items which are not related to the injury of November 1, 1981.

Bruce A. Wolfe testified that he has been employed at American Freight Systems for five years. He related that on November 1, 1981 at approximately 11:45 p.m. he was working with claimant unloading a trailer when a sheet of steel fell, hit claimant's left shoulder and arm and pushed claimant against the side of the truck. He related that claimant fell and that the steel landed on his left leg. Wolfe stated that claimant ended up on his hands and knees with the steel on his left foot and that he, Wolfe, moved the steel enough to allow claimant to pull his foot out from under it. Wolfe testified that claimant could get up by himself, but that he could see that claimant was hurt and he went to get the foreman.

Wolfe testified that the weight of the piece of steel was such that he could not carry it by himself. He stated that claimant had made no prior complaints on the day of the accident and that up to the time of the accident claimant did his usual customary job.

Kenneth L. Hutchison testified that he is married with five children and is 33 years of age. He related that on November 1, 1981 he was employed as a dock worker and a freight handler at American Freight Systems. He stated that his job involves moving numerous amounts of anything and everything. He described the accident of November 1, 1981 as it had been described by Bruce Wolfe. He described the sheet of steel as being approximately five and one-half feet wide, eight feet long, constructed of one quarter-inch steel and weighing 700 to 1000 pounds.

Claimant stated that after the accident he felt pain in his left side and foot, in particular the left forearm across and above the knee, the shin bone and the left foot and ankle. He stated that he filled out an accident report and rode home with a coemployee.

Claimant testified that when he arrived home he discussed the injury with his wife and had trouble sleeping. He related that he went to Lutheran Hospital, was examined and sent to Herbert Rosen, D.O. He related that the treatment he was given consisted of ultrasound, heat packs and changing the dressings on his abrasions. He stated that he used a cane and crutches at that time. He stated that he was experiencing pain in his arm and across his shoulder blade and that he could not walk due to the pain in his foot and leg.

Claimant described seeing Joshua Kimelman, D.O., on December 4, 1981 and being told to walk on the foot.

Claimant stated that he still was not feeling better and that Dr. Rosen sent him to Lutheran Hospital where special x-rays were performed which disclosed a fracture in his left foot. Nerve damage was also detected. His foot was then placed in a cast which was removed in three weeks because his foot became swollen and painful. He stated that he experienced a lot of pain across the top of his foot and down the center of his foot after the cast had been removed and that he continued to see Dr. Rosen. He stated that he was also experiencing pain in his arm and shoulder at times.

Claimant described being sent to Mayo Clinic for tests but, that his neck and shoulder were not tested. He stated that he had advised the personnel at Mayo Clinic of problems in his arm but that the person who took the history apparently limited the examination to his left foot.

Claimant testified that Dr. Rosen released him to go back to work as shown in exhibit I but that he was unable to tolerate the pain and left after working only two and one-half days. Claimant testified that the following morning he went to Dr. Rosen's office and that the nurse informed him that the doctor would be gone until Monday. At claimant's request she scheduled an appointment with David L. Friedgood, D.O., as shown on exhibit O. Claimant testified that he had seen the nurse there on other occasions and believed her to be a regular employee. Claimant stated that he saw Dr. Friedgood on the eighth of April and that he related complaints involving his neck, shoulder, arm, knee and foot. He stated that he was given a TENS unit and sent to Iowa Lutheran Hospital for physical therapy. Claimant stated that he felt that the physical therapy was not working and asked Dr. Friedgood to write a letter to his union representative and employer, which letters are identified as exhibits N and P. Claimant stated that he was advised that his employer did not have that type of work available. Claimant testified that he continued to see Dr. Friedgood until shortly after he had been examined by Michael J. Taylor, M.D.

Claimant testified that he returned to see Dr. Rosen about two weeks after he left work in April. He stated that Dr. Rosen kept telling him to go back to work and that he would not refer claimant to any other physician.

Claimant testified that he received no weekly compensation benefits after April 7, 1982 and that the employer did not pay Dr. Friedgood nor the charges for physical therapy. He identified exhibit 7 as the statement he received from Dr. Friedgood for the services provided for the symptoms which he began experiencing after the accident of November 1, 1981.

Claimant testified that he began seeing Jimmy D. Bell, D.O., in August of 1982 upon the suggestion of an acquaintance. He described his complaints as that he could not tighten his arm or raise it above his shoulder without pain and that he also was experiencing pain in his knee, foot and lower back. Claimant described being hospitalized for EMG's, an arthrogram of his shoulder and nerve tests on his arm. He related being hospitalized November 12, 1982 for surgery on his foot, in January, 1983 for surgery on his elbow, in July, 1983 for surgery on his shoulder and in October, 1983 for manipulation of his shoulder. Claimant related that he engaged in physical therapy during his course of treatment and that he saw Dr. Bell on numerous occasions.

Claimant testified that in October of 1982 he was made aware that his employer had offered him treatment by Dr. Kimelman but that he refused that treatment as he was already being treated by Dr. Bell and also because Dr. Kimelman had not helped when he had seen him previously.

Claimant identified exhibit 13 as a summary of the travel which he performed in order to obtain medical care and related that the round trip mileage shown on the exhibit was the round trip mileage from his home to the place where treatment was provided.

Claimant testified that exhibit 9 is a statement he received from Iowa Methodist Medical Center for the repeat arthrogram which was performed there at the request of Dr. Bell.

Claimant testified that exhibit 8 is the bill he received from Hammer Medical Supply for the TENS unit that he received under the direction of Dr. Friedgood for relief of the symptoms which he began to experience following the November 1, 1981 accident.

Claimant testified that he received no benefits of any nature from his employer after April 7, 1982 and that he was able to return to work December 21, 1983. He stated that he still has sharp pain when raising his left arm higher than his shoulder but that surgery removed the constant pain which he previously experienced following the accident. Claimant stated that surgery improved the problem in his foot and that it corrected the problem in his elbow.

Claimant testified that he quit high school in the tenth grade and received his GED in 1972. He stated that he has no other specialized education or vocational training.

Claimant testified that most of the work that he has done has been in the nature of labor. He related working in a bindery, for Elena Chemical Corporation and as a gas station attendant. He stated that he can do his present job but that it is difficult. He relates that he uses his right arm to compensate for the left and that he uses two wheel carts and a motor tow more than he did prior to the accident.

Claimant examined exhibit J and related that the reference in it to his right foot is in error and that he does not know how the word "right" in exhibit N came to be altered. He related that Dr. Bell advised the surgeries which were performed and that he chose to have them in order to be able to function.

Claimant testified that he served in the Marines but received a medical discharge due to a chipped bone in his wrist which had arisen from a motorcycle accident in 1967. He denied telling anyone that he had received a dishonorable discharge.

Claimant stated that he is now earning $13.21 per hour and has had the benefit of all pay increases which occurred while he was off work. He denies seeing any notice posted on a bulletin board at work which lists the doctors which the company has authorized to provide medical treatment for work related injuries.

Claimant testified that he had advised Drs. Kimelman and Rosen of problems in his arm and shoulder but that when he was seeing them his main complaint was his foot. He could not explain why entries of those complaints did not appear in their records and reports.

Claimant related that he had a history of bronchial trouble which was not related to this claim and also that his ingrown toenails were not related to this claim.

Claimant admitted having an injury to his right wrist from a 1967 motorcycle accident and also head injuries. He stated that a lawn mower threw a piece of metal into his right ankle when he was approximately eight years of age and that approximately seven months before the accident at work he was involved in an auto accident. He stated that he did not tell Dr. Bell about the auto accident.

Claimant admitted that he had been convicted of a felony in the State of California.

David Babcock testified that he is the terminal manager for American Freight Systems in Des Moines, Iowa. He stated that the bulletin board has a list of approved doctors on it and that such list appears on both the union board and on the company board. He testified that no one in the terminal authorized Dr. Rosen's nurse to refer claimant to Dr. Friedgood. He stated that the company has no light duty available and has not since November of 1981. He also stated that he does not know if the bill for claimant's care at Mayo Clinic has been paid.

The exhibits in this case consist of many pages of medical records concerning claimant's attendance at work, copies of letters involving the discussion between counsel concerning authorization for claimant's medical care and statements and summaries of claimant's medical and travel expenses. The undersigned has thoughly reviewed all of those exhibits. Joint exhibits A through W are the same as the defendants' exhibits A through W.

Exhibit A is the emergency record of claimant's treatment at Lutheran Hospital on November 2, 1981. It notes:

> O. Superficial abrasions of the left forearm, the thigh, the left lower leg and the left ankle. The arm, thigh and lower leg are unremarkable with no swelling or ecchymosis and good circulation. There is mild tenderness to palpation over the dorsolateral aspect of the left ankle joint. There is no swelling or ecchymosis. The patient can bear weight without pain but there is discomfort with ankle range of motion. X-ray negative.

Exhibit B consists of several pages. Most noteable include the radionuclide bone imaging report of November 30, 1981 which indicates a bone injury in claimant's left ankle. The radiographic report dated December 12, 1981 discloses a longitudinal undisplaced fracture disclosed by a lateral tomogram which corresponds perfectly to the site of increased activity shown in the earlier bone scan. On the first page of the exhibit, the discharge summary, appears the following statement:

> Problem is to prevent a nerve pathology and a foot ptosis and causalgia and re-evluation [sic] by Orthopedics confirmed this and he will be treated outpatient to try to ambulate him. All attempts made to relieve distress, but he is persistent about it and it does look like he is not able to walk well....EMG shows early denervation, possible left medial and lateral plantar, as well as the extensor halluces brevis....

Exhibit C is a report from Orthopedic Associates, P. C., dated December 4, 1981. It relates the increased activity from the bone scan report and the early tomogram which did not show evidence of fracture. The impression notes is an apparent contusion and sprain of ankle.

Exhibit D is a surgeon's report from Dr. Rosen dated January 5, 1982 which relates that nerve damage was present.

Exhibit E is an EMG dated January 13, 1982 which shows denervation in the extensor halluces brevis, the same as was earlier noted on December 17, 1981 as appears on the second page of exhibit B.

Exhibit F is a report of Miguel R. Cabanela, M.D., from Mayo Clinic, dated February 25, 1982. It relates a possible plantar nerve lesion but the majority of the report deals with claimant's lumbar spine.

Exhibit G is another EMG report dated March 22, 1982 which concludes that its results are similar to the previous EMGs.

Exhibit H is a report from Herbert Rosen, D.O., dated March 26, 1982. In it he states:

> Regarding his original problem of a burning sensation, it was considered some type of mild neuritis. Be aware that multiple EMG's have revealed very minimal or no impairment of the nerves. If there was a slight change, it was considered not severe enough for any type of impairment at this time period.
>
> ...
>
> He did have a fracture of the bone which healed satisfactorily and I feel there is no impairment regarding the bone.
>
> Mr. Hutchison has also had Orthopedic consultations and has been encouraged by the Orthopedist to return to full duties to prevent any impairment of a leg.
>
> ...
>
> My goal is to place him in a position of active work capacity with minimal functional inability; I, therefore, cannot at this time place any inability until he returns to his full duties. This is a difficult type of evaluation to make because of the type of case he has.
>
> Of great importance is, I find most of his problems are subjective at this time and so, too, have the consultants.
>
> It is my intent that he be returned to full duties by the end of March. I feel, in my opinion, that he is capable of performing his work duties. It is necessary that he perform these to determine his ability for the use of his leg. I find no other impairment of the leg, other than subjectively having a "burning sensation".

Exhibit I is the return to work release from Dr. Rosen dated April 2, 1982.

Exhibit J is a report from David L. Friedgood, D.O., dated April 8, 1982, addressed to Dr. Rosen, which includes the following statement:

> He has recently tried to return to work, was able to work for about three days and then noted that his foot began hurting more and was swelling and he had to leave work....

The physical examination notes mild weakness in claimant's "right" [sic] foot and the impression noted is some form of traumatic neuropathy involving his "right" [sic] foot.

Exhibit K is Dr. Rosen's report dated April 13, 1982 which relates the possible posttraumatic neuropathy and neuritis and that it is his opinion that the injury should heal if patient uses leg as advised by himself and the orthopedist. He also indicates that no further treatment is needed if the patient follows instructions regarding using the leg. He indicates that the patient was able to resume work on April 3, 1982.

Exhibit L consists of 11 pages of physical therapy progress notes and records covering the period from April 9, 1982 through August 2, 1982. On the second page which appears to have been

dictated on May 24, 1982 reference is made to left shoulder pain. Similar references continue thereafter through the exhibit.

Exhibit M is the report of a chest x-ray which shows no abnormality in claimant's lungs, mediastinum or bony structures.

Exhibit N is a letter from Dr. Friedgood which states that claimant is suffering from a traumatic neuropathy involving his "right" [sic] foot and that this disability is entirely related to the pain which he is experiencing. He recommends continued supportive care including physical therapy and suggests light duty work. He states that he expects a nearly full recovery eventually.

Exhibit O appears to be a note from Dr. Rosen's office which indicates that Sue Hill arranged an appointment with Dr. Friedgood on April 8, 1982.

Exhibit P is a letter from Dr. Friedgood to defendant dated May 6, 1982 which advises them that he has been seeing claimant for neurologic problems related to his accident of several months ago.

Exhibit Q is a letter from Dr. Friedgood to Dr. Rosen dated May 26, 1982. He notes some decreased pin sensation along the inferior aspect of claimant's left upper arm. He states that he feels claimant is capable of returning to work in a position that does not involve heavy lifting or long periods of time on his feet.

Exhibit R is an EMG report of claimant's left arm and paraspinal muscles dated June 9, 1982 which shows results within normal limits.

Exhibit S is a report from Michael J. Taylor, M.D., dated July 20, 1982. His observation includes the fact that claimant had a blister on his right hand from the use of a previous cane. He was unable to find any mental disorder which caused a limitation in claimant's ability to function and opined that claimant was an excellent candidate for the pain clinic at Mercy Hospital.

Exhibit T is a report from Dr. Friedgood to claimant's attorney dated August 4, 1982 which relates an inability to explain claimant's symptoms in his head, neck and arms. He indicates that he had referred claimant to the Mercy Hospital Pain Clinic in the past and states that Dr. Taylor's suggestion concerning it is excellent. He again states that claimant is capable of working except that he cannot stand for any length of time.

Exhibit U consists of several pages of what appears to be claimant's progress notes with Dr. Bell. They reflect treatment for complaints concerning claimant's left ankle, left arm and shoulder, cervical and dorsal spine as well as treatment for some matters such as a stuffed head and ingrown toenails. The exhibit appears to contain notes from physical therapy as well as the doctor's own progress notes.

Exhibit V is a report from Dr. Bell dated August 16, 1982. It reflects complaints of pain in claimant's cervical spine, left shoulder, left knee and both feet. The physical examination notes the following:

> Strength testing cannot be adequately tested in the upper extremities due to the patient having a subacromial tenderness on the left. Range of motion is satisfactory in passive action of the left shoulder girdle region. The patient abducts his arm to 90 degrees without any scapulothoracic motion at the present time. After the circumduction [sic] and normal motions are satisfactory. There appears to be no atrophy of the deltoids or the musculature of the shoulder girdle, bilaterally. Examination of the lower extremities demonstrates neurologically intact lower extremities.

Exhibit W contains 25 pages of records of Des Moines General Hospital concerning an admission on September 14, 1982. Pages 7 and 8 are a report of consultation dated September 27, 1982 from Larry L. Richards, D.O. His final impression is noted as, "reactive depression secondary to physical incapacitation and injury." He recommends administration of the Minnesota Multiphasic Personality Inventory, psychotherapy on an as needed basis and antidepressant therapy if the depression continues or worsens. The interpretations from the MMPI states the following: "Individuals who obtain similar profiles often present themselves as being physically ill. Pain is a frequent complaint and it is often localized in the extremities." At page 11 there is noted evidence of a left lower lumbar radiculopathy. The 13th page notes a left shoulder arthrogram which notes a partial tear involving the rotator cuff. The 14th page is a summary of x-ray reports which deal with the lumbar spine, left foot, left knee, chest, cervical spine and left shoulder. All were found to be normal with the exception of the lumbar spine as shown on the 15th page by the addendum dated September 18, 1982. The 17th page shows a normal lumbar and cervical myelogram while the 18th page shows a normal lumbar discogram. The 25th page relates an arthroscopic examination of claimant's left knee which disclosed no significant abnormalities.

Exhibit X consists of records from Des Moines General Hospital dealing with claimant's admission October 13, 1982 and also contains duplication of the contents of exhibit W. The 20th page is a more legible copy of the left shoulder arthrogram report than what was found in exhibit W. The 6th page of the exhibit is the report of operation for the correction of the anterior tarsal tunnel syndrome which was performed October 13, 1982. It reflects a decompression of the peroneal nerve at the ankle.

Exhibit Y consists of records of Des Moines General Hospital dealing with claimant's admission on January 11, 1983 and the resulting correction of what had been diagnosed to be a pronator syndrome in claimant's left elbow by surgical decompression of the left median nerve at the level of the elbow. The 2nd page of the exhibit is the report of operation for that surgery and it is noted that a restricted area was found around the median nerve and that decompression was performed. The 34th page of the exhibit relates a date of admission on January 1, 1983 and that the surgery was performed on January 1, 1983. This is inconsistent with all other reports dealing with the left elbow surgery and is presumed to be an error. Exhibit Y also contains duplication of reports previously in the record as parts of exhibits W and X dealing with claimant's two previous admissions.

Exhibit Z consists of records from Des Moines General Hospital dealing with claimant's admission on October 28, 1983. The 3rd page of the exhibit is the final progress report which reflects that claimant underwent a manipulation under anesthesia for correction of adhesive capsulitis in his left shoulder. The exhibit also notes that claimant had bilateral ingrown toenails surgically removed while he was under anesthesia for the shoulder manipulation.

Exhibit AA is a report from Dr. Bell dated November 9, 1982 addressed to defendant's counsel which indicates the diagnosis of an anterior tarsal tunnel syndrome and pronator syndrome. He relates that the surgical release of the left ankle has been performed.

Exhibit AB consists of records from Des Moines General Hospital dealing with claimant's admission of July 11, 1983. The 6th page of the exhibit, which is part of the history and physical, indicates that orthopedic examination reveals normal range of motion of all extremities with the exception that abduction is limited to approximately 90 degrees at the left shoulder and there is pain elicited with movement of the left arm at the shoulder joint. The 14th page of the exhibit is the report of operations which indicates that during surgery, examination of the lateral insertion of the rotator cuff at the humeral head demonstrated a one and one-half centimeter tear at the insertion in the humeral head. It goes on to describe the surgical repair of the tear. The report also describes the arthrotomy and tenodesis which was concurrently performed.

Exhibit AC is the report of Dr. Bell addressed to claimant's counsel dated December 29, 1983. In the report Dr. Bell states:

> Mr. Hutchinson was seen in my office on 12/15/83 at which time he was examined and given full duty, back to work release. He has a 15% permanent partial disability of his left shoulder due to his injury of the rotator cuff. At the present time he is rehabilitating well and I will see him again in two months' time.
>
> The 15% upper extremity permanent partial disability converts into a 9% whole man disability rating.

Exhibits AE, AF, and AG consist of a warning letter, final warning letter and letter of discharge addressed to claimant asserting absenteeism during the period commencing December 7, 1979 up to and including April 25, 1981. Where a cause is indicated the majority of the absences relate to sickness, injury or family illness. The greater portions of the other absences are related to being late for work.

Claimant's exhibit 1 is the records of Des Moines General Hospital dealing with claimant's admission on October 13, 1982 and the surgical decompression of the deep peroneal nerve at the ankle in order to resolve the anterior tarsal tunnel syndrome. The exhibit is generally a duplication of what is already in the record through other exhibits.

Claimant's exhibit 2 is a record of claimant's admission to Des Moines General Hospital on October 24, 1982. The report notes that it is a recheck of the surgical incision in claimant's left leg and ankle.

Claimant's exhibit 3 is a report from Larry L. Richards, D.O., dated October 25, 1982 addressed to defendant's counsel which indicates that he diagnosed claimant in September of 1992 as suffering from reactive depression and that psychotherapy treatment was given on September 22 and 24.

Claimant's exhibit 4 consists of records from Des Moines General Hospital dealing with the surgery in his left elbow performed January 11, 1983. It duplicates the reports which are already in the record as part of other exhibits.

Claimant's exhibit 5 is a report of Dr. Bell to claimant's counsel dated January 28, 1983. The reports states:

> At the present time, I feel that I can say with reasonable degree of medical certainty that the relationship between the left ankle pain and the injury date of October 31, 1981, [sic] is connected. The left forearm and elbow complaint, at the

present time, I feel is similarly related.

Claimant's exhibit 6 is a statement from Mayo Clinic addressed to claimant seeking payment in the amount of $401.70 for services performed February 17, 1982 to February 19, 1982.

Claimant's exhibit 7 is a statement from Neurological Associates of Des Moines addressed to claimant seeking payment in the amount of $170.00 for services rendered on April 8, 1982, April 20, 1982, May 6, 1982 and May 26, 1982. It should be noted that this involves Dr. Friedjood.

Claimant's exhibit 8 is a cure of default notice addressed to claimant in accordance with the Iowa Consumer Credit Code seeking payment in the amount of $115.46 to satisfy claimant's account with Hammer Medical Supply.

Claimant's exhibit 9 is a statement from Iowa Methodist Medical Center addressed to claimant seeking payment in the amount of $131.65 for services rendered April 11, 1983 related to an arthrogram.

Exhibit 10 was admitted and received into evidence. It was, however, taken by the witness, Anita K. Smith, when she left the hearing room and it has not been subsequently recovered. The exhibit consisted of a computer printout which summarized the contents of what is also in the record as claimant's exhibit 19. In view of its nature as a summary of other evidence which is in the record, its loss is not material.

Exhibits 11 and 12 are photographs with exhibit 11 showing what appear to be scars on claimant's left shoulder and the crease of his left elbow while exhibit 12 shows claimant's left foot to be elevated and bandaged.

Claimant's exhibit 13 is a summary of travel expenses in which claimant seeks reimbursement in the amount of $155.52 for traveling 648 miles in obtaining medical care.

Exhibits 14 through 18 consist of letters between counsel for claimant and defendant dealing with claimant's medical care. In exhibit 14 defendant's counsel seeks to have claimant re-examined by "Dr. Kimmelman" [sic]. Exhibit 16 is the reply which states that claimant was hospitalized in September of 1982, has been treated by Drs. Bell and Richards and that he objects to seeing "Dr. Kimmelman" [sic]. Exhibit 15 is a response to that letter which states that care by Dr. Bell and Dr. Richards is unauthorized and which offers care by "Dr. Kimmelman" [sic]. It also states that if claimant should decline the offer, defendant will take the position that it has offered appropriate medical care and has no further responsibility in that regard. Exhibits 17 and 18 generally restate the contentions of the parties with regard to medical care.

Claimant's exhibit 19 consists of 58 numbered pages of health insurance claim forms dealing with claimant, the majority of which make reference to the conditions for which he underwent surgery. The reports reflect the provider of care, the amount charged and the amount that was paid by the Iowa Department of Human Services.

Claimant's exhibit 20 is a deposition of Jimmy D. Bell, D.O., taken November 7, 1983. Regarding claimant's history and complaints Dr. Bell stated:

> A. Reading from the dictation of the office notes of August 16, 1982, "He was a 32-year-old Caucasian male. Patient was seen on August 16, 1982 complaining of an injury he suffered on February 1, 1981. He stated that he was unloading a semitruck and two sheets of heavy steel fell on him. Since that time he had been treated by his company doctor and has been seen at the Mayo Clinic. During a conversation he felt that the Mayo Clinic believed that he was a malingerer and he received no satisfaction from that examination.
>
> "At the present time he is complaining of numerous complaints located in the cervical spine, left shoulder, left knee and bilateral foot. The patient complains that approximately one month prior to going to the Mayo Clinic, it was about two months after the original injury, he developed back pain. His main complaint prior to that was the left lower extremity region. Since that time he has had problems in the neck and left shoulder as well as the left lower extremity, referable mainly to the knee and left foot. He states that he is now beginning to have some kind of painful sensation in the right foot."

Dr. Bell stated that the reference to February 1, 1981 could be a typographical error. He went on to describe his examination as follows:

> A. Reading from the examination on August 16, "Cervical spine is examined. There appears to be trigger point activation on the left side as compared to that of the right. Neurological examination is essentially unremarkable at the present time. During the examination the patient states that he sometimes has some numbness and tingly sensation in the left thumb and index finger of the left hand. Carpal tunnel examination of left upper extremity is essentially negative at the present time.
>
> Strength testing cannot be tested in the upper extremities due to the patient having subacromial tenderness on the left. Range of motion satisfactory in passive action of the left shoulder girdle region. Patient abducts his arm to 90 degrees without any scapulothoracic motion at the present time. After the circumduction and normal range of motions are satisfactory.

With regard to claimant's foot and ankle, the following discussion occurred:

> A. At that time we made a diagnosis of what is called anterior tarsal tunnel syndrome of the left foot and we scheduled his surgery for an outpatient surgical procedure.
>
> Q. What abnormal findings were there that allowed you to make that diagnosis on 10-7-82?
>
> A. Previous EMG had demonstrated some abnormalities in the muscle which would go along with the compression of the nerve involved.
>
> ...
>
> Q. What did you do next, Doctor? Did you see him again?
>
> A. Scheduled for surgery. He had surgery and he was visited in the office periodically for his recovery time.
>
> Q. When was surgery undertaken?
>
> A. On or about 10-12-82.
>
> Q. What surgery was undertaken, Doctor?
>
> A. The release of tarsal tunnel, anterior tarsal tunnel.
>
> Q. Can you tell me a little bit about how this procedure is carried out in general terms?
>
> A. Skin incision is made over the anterior aspect of the foot carried down to the deep peroneal nerve through the extensor retinaculum at the ankle. The artery, nerves and veins are then tied and the extensor retinaculum is incised to relieve pressure off the nerve.
>
> Q. Did you make any observations that led you to believe there was an abnormal condition once you got in there, after you had opened Mr. Hutchinson up?
>
> A. No. The anatomy in that area is pretty much the same in either a diseased or nondiseased state so from gross examination you cannot tell.

Discussion concerning the treatment for claimant's left elbow and forearm complaints progressed as follows:

> Q. Did you see Mr. Hutchinson then again after December 15 of '82?
>
> A. Yes, we visited with him numerous times. He was scheduled for an outpatient surgical procedure on his left forearm to release the median nerve at the elbow.
>
> Q. When was that procedure undertaken?
>
> A. On or about 1-10-83.
>
> ...
>
> Q. Prior to 1-10-83 what physical complaints did Mr. Hutchinson have? Did you see him just prior to that?
>
> A. His main complaints are that of his shoulder and his forearm complaint.
>
> ...
>
> Q. Can you tell me what you found upon doing that surgery?
>
> A. Surgical procedure is and clinical findings is that similar to the tarsal tunnel release. The pathology is not grossly abnormal from that of normal anatomy. The procedure is to relieve pressure on the median nerve, deep fascia and muscle that is laying up against it and this was performed.
>
> Q. Did you find any areas that appeared to you to be restricted or compressing the median nerve?

A. There were at that time fascial bands laying over the median nerve that appeared to be tight and those were broken down to bring more freedom for the median nerve to travel through that area surface.

Discussion moved to the problem in claimant's shoulder and the following was related:

A. On 3-7-83 he was seen in the office and his pain persisted in his shoulder and at that time we ordered an arthrogram to be performed. As soon as an arthrogram was to be performed, then we were going to see him back.

...

Q. Doctor, had there been a previous, to your knowledge, arthrogram performed on this patient?

A. Yes. He had hospitalization at Des Moines General Hospital at which time he had had a battery of tests run to eliminate certain problems due to the multiplicity of the complaints and some of the conflicting reports on the EMG. He had had a positive arthrogram report from Des Moines General and subsequent negative report from I believe it was Iowa Methodist.

...

Q. Now, Mr. Hutchinson then was ultimately hospitalized for surgery on the left shoulder?

A. Yes, he was.

Q. And the date of that hospitalization was July 11, 1983, is that correct, Doctor?

A. I do not have that date, but that is reasonable.

Q. Did you go in and do surgery on the left shoulder?

A. Yes, I did.

...

Q. What was the name of the surgery that you did?

A. It was a decompression of his -- the shoulder. The articulation of the joint motion between the acromion and the humerus were very tight and impinged on the soft tissue. It is called shoulder impingement syndrome.

Commonly the things that are found in those are the bicipital tendon is subluxal or moves, slides, more motion than it should have in the groove in the shoulders. The tissues are pressed up against the bony structures and they are tried to carry through an arc of motion. And in Ken's case the small tear in the rotator cuff was identified that the first arthrogram had previously diagnosed.

Q. You then did see a tear?

A. Yes.

Q. How big was that tear if you recall?

A. Approximately a quarter of an inch, maybe a little larger.

Q. Medically in your judgment is that kind of tear the kind of tear that would produce the symptoms that this patient complained of?

A. Yes, it is.

...

Q. Did you see him again after 7-26-83?

A. Yes. He was to remain in therapy on 10-13-83. He had not -- or was not able to recover his range of motion to his shoulders and developed what is called adhesive capsulitis, a frozen shoulder. At that time we decided that therapy had been prolonged far enough and that we would take him to the hospital and put him to sleep and manually carry his shoulders to a range of motion to speed up his recovery from the surgery.

Q. Did you do that?

A. Yes, that was subsequently done.

The doctor then described his impression of claimant's current impairment as follows:

A. He does not have full range of motion. He has some restrictions of internal rotation. He does have a painful range of full motion in other planes.

Q. What areas is he limited in terms of his range of motion in his left shoulder?

A. Internally he has pain limitation. He has recovered enough to go through the major components of shoulder motion at the present time. This will improve as he works on his therapy.

Q. At this time have his complaints of pain resolved themselves?

A. No. He is still in the recovery phase of his pain in his shoulder. This will resolve as he gets further into the range of motion exercises.

Q. Earlier in the deposition you indicated that he was complaining of some pain in his left ankle, I believe of a pulling nature?

A. The conversation as best I [sic] can recollect was that we asked him why he was limping and he stated that he was having some pulling sensations.

Q. Does he have any other complaints that you are aware of at this This will improve as he works on his therapy.

Q. At this time have his complaints of pain resolved themselves?

A. No. He is still in the recovery phase of his pain in his shoulder. This will resolve as he gets further into the range of motion exercises.

Q. Earlier in the deposition you indicated that he was complaining of some pain in his left ankle, I believe of a pulling nature?

A. The conversation as best I can recollect was that we asked him why he was limping and he stated that he was having some pulling sensations.

Q. Does he have any other complaints that you are aware of at this time?

A. No.

Q. Do you expect or do you know whether Mr. Hutchinson has any permanent partial impairment in the left ankle or foot?

A. I do not see any permanent partial disability in his left ankle at the present time. His left shoulder is a different story. We will have to evaluate that six months after his last procedure, which was his manipulation under anesthesia.

Q. Do you know or can you say with a reasonable degree of medical certainty whether or not he will have any permanent partial disability or loss of range of motion or impairment of any kind in the left arm at the elbow?

A. I do not believe that there will be any.

Concerning the cause of claimant's impairment the following discussion occurred:

Q. Doctor, when you first saw Mr. Hutchinson, you took then a rather lengthy history, I understand?

A. Yes, it was a long interview.

Q. And he gave you a history of how he had allegedly injured himself, is that correct?

A. That's correct.

Q. Now, based upon your findings, your surgery, the history that have taken [sic] from this patient and with your training, can you say with a reasonable degree of medical certainty whether there is a relationship between the injury Mr. Hutchinson allegedly suffered in his employment and the conditions that you treated him for; namely, the injury, the trapped nerve in the left ankle, the trapped nerve in the left or impinged nerve in the left medial area of the elbow and the rotater [sic] cuff tear in the left shoulder?

A. Based on a reasonable degree of medical certainty, if Mr. Hutchinson has not complained of these complaints prior to his accident, then all of the circumstances he described to me are compatible with injury to those areas.

With regard to claimant's ability work to and the amount of time he was unable to be employed, Dr. Bell was questioned and responded as follows:

Q. Can you say during the period you treated Mr. Hutchinson, which appears to run from August 16 of 1982 through the present time, whether he would be able to return to employment during that period at

any time if that employment required that he be on his feet six hours out of an eight-hour day and lift up to 100 pounds on a regular basis?

A. If the question is during the time that I was examining and treating him could he do that kind of work, the answer is no.

Q. Could he do work during that period of time that required him to stand on his feet six hours out of an eight-hour day and lift up to 50 pounds?

A. No.

Q. Would Mr. Hutchinson have been able to do work that required him during this period of time, again August 16, 1982 to the present time, that required him to stand on his feet six hours out of an eight-hour day and repeatedly lift or carry 25 pounds?

A. We are moving into an area now where the ambiguity of how many repetitions, which side of the body you are using, in a normal fashion to use the left side of his body would not have been compatible with standing on his feet for six hours and doing repetitious work with the left side of his upper extremity.

Q. Do you know, can you say with a reasonable degree of medical certainty based upon the information you have given at this deposition, when Mr. Hutchinson will be able to return to his employment if that employment will require him to be on his feet six hours of an eight-hour day and repeatedly lift and/or carry weights up to 100 pounds?

A. I am not sure that he will ever been [sic] able to lift weights up to 100 pounds with that left shoulder. Standing on his feet I think is reasonable, but I do not feel that he probably will be able to do repetitious work at that major weight handling.

Q. Can you say within a degree of medical certainty what kind of work he would be suited for at the point at which he recovers?

A. Well, we will have to make that decision probably in six months.

Dr. Bell indicated that a diagnosis of claimant's actual physical problems had been difficult. When questioned concerning whether or not the complaints had been consistent with his physical findings, Dr. Bell stated:

A. Mr. Hutchinson had numerous complaints and due to that fact -- sorting out all of his complaints required extensive testing, consultation and final sorting out those complaints that were not relevant to the shoulder, the forearm and his ankle. Those complaints referable to his painful forearm and shoulders have been consistent. It has been difficult diagnosing and treating Mr. Hutchinson due to the number of complaints that he has had.

APPLICABLE LAW

The claimant has the burden of proving by a preponderance of the evidence that the injury of November 1, 1981 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

An injury to a scheduled member which, because of after-effects (or compensatory change), creates impairment to the body as a whole entitles claimant to industrial disability. Barton v. Nevada Poultry Co., 253 Iowa 285, 110 N.W.2d 660 (1961). Dailey v. Pooley Lumber Co., 233 Iowa 758, 10 N.W.2d 569 (1943).

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

An injury to the shoulder is an injury to the body as a whole. Alm v. Morris Barick Cattle Co., 240 Iowa 1174, 38 N.W.2d 161 (1949).

Where an employer fails to monitor the care an employee is receiving it cannot later complain that the care was unauthorized. Zimmerman v. L. L. Pelling Co., 2 Iowa Industrial Commissioner Report 442 (Appeal Decision 1982).

If the employer denies the compensability of an injury it cannot guide the medical treatment. Barnhart v. MAQ, Inc., 1 Iowa Industrial Commissioner Report 16 (Appeal Decision 1981).

Interest which is payable under Iowa Code section 85.30 begins to accrue on the date a compensation payment became due. Farmers Elevator Co., Kingsly v. Manning, 286 N.W.2d 174 (Iowa 1979).

ANALYSIS

There appears little doubt that the accident happened as described by claimant and Bruce Wolfe. The precise weight of the steel sheet cannot be determined although estimates range from 600 pounds to 1000 pounds. Wolfe characterized it as more than he could carry by himself. The fact that it was of sufficient weight to hold claimant and that Wolfe could only raise it enough for claimant to escape confirms that it was within the range of those estimates.

Claimant's initial emergency care confirmed abrasions located on his left arm as well as his ankle as shown by exhibit A.

D. K. Rafferty, M.D., found an area of very definite increased activity on November 30, 1981 as is shown in the bone scan on page 9 of exhibit B. Such was apparently discounted as shown by the contents of exhibit C and the nature of the treatment which was initially provided to claimant. On December 17, 1981 the lateral tomogram shown in exhibit D at page 4 demonstrated a longitudinal undisplaced fracture of the tibia with the fracture line corresponding perfectly to the increased activity noted in the bone scan. An abnormal EMG was attained that same day as reflected in exhibit B at page 2. It suggested early denervation of the left medial and lateral plantar as well as the extensor halluces brevis. Injury to the left peroneal and posttibial nerve was also suspected. Evidence of nerve damage continued to appear throughout the exhibits in the case as shown in exhibits E, F and G.

In October of 1982 Jimmie D. Bell, D.O., diagnosed an anterior tarsal tunnel syndrome of claimant's left lower extremity and performed a surgical decompression of the deep peroneal nerve. Dr. Bell felt that the surgery had resolved the problem without any residual permanent impairment. Claimant states that he still has occasional heel pain but that the surgery improved the problems in his foot.

Dr. Bell felt that the condition in claimant's foot had arisen from the work related injury as it was described to him. Dr. Friedgood had previously diagnosed a traumatic neuropathy as shown in exhibits J and T and related the problem to the injury at work. As shown in exhibits D and K, Dr. Rosen was aware that nerve damage had resulted from the injury but he, nevertheless, termed claimant's complaints as subjective. The circumstances of the accident itself are consistent with nerve damage of the type noted by all three physicians. There is no reasonable conclusion but that the injury did cause nerve damage to claimant's left foot which was surgically resolved by Dr. Bell.

The problems concerning claimant's left upper extremity and shoulder are not as easily resolved. The first recorded notations of complaints involving the left upper extremity are found in exhibit J dated April 8, 1982 and relate to the shoulder. Exhibit A, emergency room report from Lutheran Hospital dated November 2, 1981 notes superficial abrasions on the left forearm.

Dr. Bell diagnosed a partial tear of the rotator cuff, found such to exist during the surgery and made a surgical repair of the defect.

Dr. Friedgood found decreased pin sensation in the left arm as shown in exhibit Q. The EMG was not abnormal, however. Dr. Bell diagnosed a pronator syndrome and surgically released the left median nerve at the elbow. During the surgery he found the nerve to, in fact, be constricted. Dr. Bell found no permanent impairment in claimant's elbow post-surgically and claimant agrees that surgery corrected his elbow problem.

At time of the last examination Dr. Bell found claimant's range of shoulder motion to be limited by pain. He assigned a 15 percent permanent partial impairment rating of the shoulder which he converted to a 9 percent of the whole man. Claimant states that the surgery on his shoulder relieved the constant pain but that he still had sharp pain when he moves his arm above shoulder level.

Dr. Bell opined that the upper extremity defects were caused by the accident at work. His opinion is not controverted by any other medical evidence in the record. The circumstances of how the accident occurred are consistent with the injuries which were found by Dr. Bell. His opinion concerning causation of the upper extremity injury will be adopted.

In reaching this decision, consideration has been given to the fact that Dr. Bell's opinion is based, to a large degree,

upon claimant's denial of previous problems in his upper left extremity. The felony conviction, results of the MMPI, inconsistent statements regarding use of alcohol and other inconsistencies in claimant's history and complaints are all recognized as consideration which could effect his credibility. The fact remains, however, that he did work without limitation prior to the trauma of November 1, 1981. He had continuing complaints after the trauma. Surgical treatment resolved those complaints except for the residual permanent impairment in his shoulder. Claimant is now able to perform his old job with minimal limitation. The conditions which were confirmed by surgery could reasonably be expected to have arisen from an accident of the type described in this case.

Claimant's foot was his initial concern. It is not incredible that little attention was directed to the arm and shoulder until his foot had become less symptomatic.

An injury to the shoulder is an injury to the body as a whole and claimant's disability must be evaluated industrially.

Claimant is presently 33 years of age. At time of hearing he had been back to work for nearly two months and apparently had been able to adequately perform his job. Presently he earns $13.21 per hour and has received the benefit of all pay increases which occurred during the time he was absence from work.

Claimant quit high school in the tenth grade and received a GED in 1972. He has no other specialized vocational training. His prior work experience consists of medium to heavy physical labor.

Heavy lifting and lifting above shoulder level are part of claimant's usual work. The fact that he retains his position and earning level significantly reduces his industrial disability from what it might otherwise be. Some loss of his earning capacity is present, however, primarily as a result of the physical impairment. When claimant's disability is measured industrially he is found to have a permanent partial disability of 10 percent.

Defendant provided claimant with medical care prior to April 2, 1982. It is found that continuing care by Dr. Rosen had been offered at all times.

Subsequent to April 6, 1982 defendant did not pay weekly benefits to claimant which action indicates a denial that the condition was the result of a work related injury. Defendant was certainly aware that claimant had continuing complaints and even Dr. Rosen, the assigned physician, related those complaints to the injury. Nevertheless, defendant did not take any action which could reasonably be construed to constitute an attempt to resolve those complaints.

Claimant had seen Dr. Friedgood and Dr. Kimelman prior to April 2, 1982 and this was admittedly authorized by the defendant. At hearing defendant urged that the care provided after April 2, 1982 by Dr. Friedgood was unauthorized. The appointment to see Dr. Friedgood was made through Dr. Rosen's office without any warning or objection. Dr. Friedgood corresponded concerning claimant with the defendant employer and Dr. Rosen as shown in exhibits P and Q without any objection to his treatment ever being voiced. Prior to the time that the services of Dr. Kimelman were offered in October of 1982, his status was the same as that of Dr. Friedgood. Both conducted a prior examination but had not provided any further treatment. It was not until defendant's counsel learned that claimant was receiving treatment from Dr. Bell in Des Moines General Hospital that the offer of Dr. Kimelman was made.

Defendant's denial of authorization for treatment by Dr. Bell and Dr. Friedgood is found to be unreasonable under the existing circumstances. The right to select medical treatment carries with it a corresponding responsibility to provide prompt treatment which is reasonably suited for the complaint or injury. As shown by exhibit 14 which is dated October 11, 1982, defendant sought to have claimant examined by Dr. Kimelman. Reference is made to treatment only after exhibit 16 had been sent to defendant's counsel. The last word from Dr. Rosen was in the nature of a statement that claimant's complaints were subjective and that he should go back to full duty at work. Such is not found to be reasonable medical care. Claimant saw Dr. Taylor as requested in July of 1982 but the employer did not follow the recommendations made by Dr. Taylor. More than six months elapsed between the time claimant left work on April 6, 1982 until medical care or treatment, other than examination, was offered by the defendant. During all this time it did nothing to manage claimant's case and was not paying compensation benefits which it had the obligation to do if it felt that claimant's condition were actually work related. Such denial is confirmed by paragraph 9 of defendant's answer to claimant's petition.

Defendant had abandoned claimant's care and left him to his own means. Prompt treatment reasonably suited for the injury had not been offered for more than six months. Under these circumstances the employer will not be allowed to interrupt the successful ongoing course of treatment or avoid liability for its expense.

The expenses of claimant's medical care are not easily ascertained. Exhibits 6, 7, 8, and 9 reflect expenses which are clearly related to treatment of the injuries claimant sustained at work on November 1, 1981. They are the following:

Mayo Clinic	$401.70
Neurological Associates of Des Moines	$170.00
Hammer Medical Supply	$115.46
Iowa Methodist Medical Center	$131.65

Exhibit 19 is 58 pages of health insurance claim forms for treatment received by claimant. By review of those forms together with exhibit U, the other exhibits in the case and claimant's testimony, the majority of the charges on exhibit 19 are found to be related to claimant's work related injury. Exceptions to this general statement are, however, the following:

a. Page 3 is a statement from Des Moines General Hospital for services rendered October 28, 1983 to October 31, 1983 which includes bilateral removal of ingrown toenails. The expense of that period of hospitalization can fairly be divided equally between the two medical problems. Of the total charge of $1,325.58, $662.79 is attributed to the work related injury.

b. Page 4 is a statement from Wilden Clinic in the amount of $447.00 which includes $205.00 for removal of ingrown toenails. Only $222.00 of that statement is attributable to the work related injury.

c. Pages 10 and 11 are actually the same statement with a total charge of $37.50.

d. Page 16 is a duplicate of page 15 and will not be charged twice.

e. Page 26 contains a charge of $26.00 on February 22, 1983 which is unexplained. Reference to exhibit U does not clarify the situation. Of the total charges on page 22 only $34.00 is related to claimant's injury at work.

f. Page 40 contains a charge of $2.75 for a knee brace which has not been shown to be work related.

g. Page 41 is a duplicate of page 40 and will not be charged twice.

h. Page 43 includes charges of $17.00 for services on November 29, 1982 which are not explained and cannot be found to be related. The total work related charges on page 43 are $34.00.

i. The total amount charged on page 51 is illegible although the nature of the treatment is clear. The amount paid by the Department of Human Services is shown to be $579.98 and defendant's liability will be limited to that amount.

j. Page 58, the charge from R. W. Evans, D.O., of Wilden Clinic is not shown to be related except by claimant's testimony and it appears from the testimony that Dr. Evans did not provide any actual care.

When the charges contained in exhibit 19 which have been found to be related to treatment of the injuries claimant sustained November 1, 1981 are totaled the result is as follows:

Des Moines General Hospital	$13,631.81
Wilden Clinic - Dr. Bell	5,746.98
Anesthesiologist Affiliated	1,151.25
Larry L. Richards, D.O.	440.00
Neurological Associates of Des Moines - Dr. Friedgood	35.00
Des Moines Emergency Medicine, P. C. - James Egly, D.O.	20.00

Claimant testifed that he traveled from his home to obtain medical care at the times and places noted on exhibit 13. Reference to the other evidence in the record indicates that he did appear at the places shown on the dates indicated. Duplication appears, however, on December 15, 1982, March 17, 1983, April 7, 1983 and October 13, 1983 where claimant was seen on the same day at two locations in the same building or same general area. Accordingly his total mileage claim has been reduced by 40 miles to result in 608 miles of compensable mileage at $.24 per mile for a total of $145.92.

Claimant's affidavit of costs was filed and resisted by defendant. Industrial Commissioner Rule 500-4.33 includes cost of transcription as cost to be taxed. Where the deposition is admitted into evidence the expense of transcription is an appropriate cost and the entire amount of $132.32 will be taxed. The limitation of Iowa Code section 622.72 is retained in Rule 500-4.33 and only $150.00 will be allowed as an expert witness fee for Dr. Bell's testimony. The commissioner's rule does not, however, adopt the restriction of Iowa Code section 622.64 and the service fees for the supeona in the amount of $14.50 are found to be reasonable and will be taxed as costs. The costs of the reports from Dr. Bell at $75.00 each are within the rules and will be taxed. Total costs to be taxed against defendant are the sum of $446.82.

The reference in Dr. Friedgood's reports to claimant's right ankle is considered by the undersigned to be a typographical error as claimant's complaints have generally centered on his left side and, more importantly, because the EMG's upon which Dr. Friedgood relies were performed upon claimant's left side.

It appears that claimant could have performed light duty work during much of the time he was off work but the employer has indicated that none was available and that none was offered.

In his deposition on November 9, 1983, Dr. Bell stated that claimant was about two months away from being released medically and that he could not, at that time, perform duties which were similar in description to what was described as his regular work duties. Dr. Bell stated that claimant had been unable to do such work during all the time claimant had been under his treatment. The record shows only one short period of return to work after the accident. Claimant's subsequent medical condition appears substantially unchanged until the surgical treatment was rendered. In exhibit 4 Dr. Rosen relates that sending claimant back to work was to determine claimant's ability to use his leg. Close examination of Dr. Rosen's statement seems to indicate that his intention when he returned claimant to work in April was somewhat of an experiment. The opinions of Dr. Bell are given the greater weight due to the fact that Dr. Rosen had not seen claimant after the brief return to work and that Dr. Bell was claimant's treating physician. It is found that claimant's healing period ended December 20, 1983 by virtue of his return to work on December 21, 1983. There is no showing in the record that claimant could have reached the point of maximum medical improvement prior to that date.

FINDINGS OF FACT

1. Claimant sustained an injury arising out of and in the course of his employment on November 1, 1981.

2. The injury occurred when a sheet of steel weighing from 600 to 1000 pounds fell striking claimant's left forearm and left side and came to rest upon claimant's left ankle pinning him to the floor.

3. The accident caused a fracture in claimant's left ankle and resulted in denervation in that ankle.

4. The injury to claimant's ankle was resolved by surgery which was performed October 13, 1982 and healed with no residual permanent impairment.

5. The accident caused an injury to claimant's left forearm in the nature of constriction of the median nerve.

6. The constriction of claimant's median nerve was resolved by surgery performed January 11, 1983 and healed with no residual permanent impairment.

7. The accident caused a tear in the rotator cuff of claimant's left shoulder.

8. Claimant's rotator cuff tear was surgically repaired.

9. The injury to claimant's rotator cuff caused a residual permanent impairment of 9 percent of the body as a whole.

10. Claimant is a married 33 year old male who has a GED but no higher education or specialized vocational training.

11. All of claimant's prior work experience has been in the nature of medium to heavy physical labor.

12. Claimant was unable to perform the regular duties of his employment from and after November 1, 1981 until December 21, 1983 when he returned to work, except for the three days he returned to work on a trial basis in April of 1982.

13. The employer failed to provide prompt medical care to claimant which was reasonably suited to treat his injury.

14. The employer denied that the physical ailments for which claimant sought medical care subsequent to April 6, 1982 were the result of a work related injury.

15. Defendant did not pay weekly compensation benefits to claimant subsequent to April 6, 1982.

16. The medical care which claimant received from Drs. Friedgood, Bell, Richards, Egly, Anesthesiologist Affiliated, Des Moines General Hospital, Mayo Clinic, Hammer Medical Supply and Iowa Methodist Medical Center were reasonably suited for treatment of the injuries claimant sustained at work November 1, 1981.

17. The charges for the services provided to claimant for treatment of his work related injury were reasonable in relation to the services rendered.

18. Claimant traveled 608 miles in order to obtain medical care, the expense of which defendant has not paid.

19. Claimant's healing period consists of 110 weeks 4 days.

20. Claimant's permanent partial disability is 10 percent.

21. The total charges for medical care for injuries of the work related incident are $21,843.85 which have not been paid by the employer but a possibility exists that $401.70 owed to Mayo Clinic may have previously been paid by the employer.

CONCLUSIONS OF LAW

IT IS THEREFORE CONCLUDED:

1. This agency has jurisdiction of the subject matter of this proceeding and its parties.

2. The work related injury of November 1, 1981 caused injuries to claimant's left shoulder, forearm and ankle.

3. Claimant's expenses of medical care for the injuries total twenty-one thousand eight hundred forty-three and 85/100 dollars ($21,843.85) which are the responsibility of the employer under Iowa Code section 85.27 but have not been paid by the employer.

4. Claimant's healing period consists of one hundred ten (110) weeks four (4) days of which defendant has paid claimant twenty-one (21) weeks four (4) days leaving an unpaid balance of eighty-nine (89) weeks.

5. Claimant's rate of compensation is three hundred seven and 38/100 dollars ($307.38) per week.

6. Claimant is ten percent (10%) permanently partially disabled in industrial terms.

7. Defendant failed to provide claimant prompt medical care reasonably suited for treatment of his injuries and did not acknowledge claimant's medical problems were work related, which circumstances denied the defendant the right to choose the care which claimant will receive and avoids defendant's defense that the medical expenses incurred by claimant for treatment of his injuries were unauthorized.

ORDER

IT IS THEREFORE ORDERED that defendant pay claimant eighty-nine (89) weeks of healing period compensation at the rate of three hundred seven and 38/100 dollars ($307.38) per week commencing April 7, 1982.

IT IS FURTHER ORDERED that defendant pay claimant fifty (50) weeks of permanent partial disability compensation at the rate of three hundred seven and 38/100 dollars ($307.38) per week commencing December 21, 1983.

IT IS FURTHER ORDERED that defendant pay interest at the rate of ten percent (10%) per annum from the date each payment became due until the same is paid pursuant to Iowa Code section 85.30.

IT IS FURTHER ORDERED that defendant pay to claimant the expenses incurred in obtaining medical care for his injuries as follows:

Des Moines General Hospital	$13,631.81
Wilden Clinic and Jimmy D. Bell, D.O.	5,746.98
Anesthesiologist Affiliated	1,151.25
Larry L. Richards, D.O.	440.00
Neurological Associates of Des Moines and David L. Friedgood, D.O.	205.00
Des Moines Emergency Medicine, P. C. and James Egly, D.O.	20.00
Hammer Medical Supply Company	115.46
Iowa Methodist Medical Center	131.65
TOTAL	$21,442.15

IT IS FURTHER ORDERED that if defendant has not previously paid Mayo Clinic in the amount of four hundred one and 70/100 dollars ($401.70) that it shall do so now.

IT IS FURTHER ORDERED that defendant pay claimant one hundred forty-five and 92/100 dollars ($145.92) for reimbursement of travel expenses incurred in obtaining medical care.

IT IS FURTHER ORDERED that defendant pay all amounts which have accrued in a lump sum. This includes all weekly benefits for claimant's healing period and all weekly benefits for permanent partial disability which have accrued since December 21, 1983 but which have not yet been paid.

IT IS FURTHER ORDERED that defendant pay the costs of this action pursuant to Industrial Commissioner Rule 500-4.33 which are taxed against them in the amount of four hundred forty-six and 82/100 dollars ($446.82).

IT IS FURTHER ORDERED that defendant file a claim activity report within twenty (20) days from the date of this decision.

IT IS FURTHER ORDERED that defendant may, if it so desires, satisfy its obligations to claimant and the lien rights of the Iowa Department of Human Services by making payment of medical expenses payable jointly to the claimant and the Iowa Department of Human Services and delivering the same to claimant's counsel, Michael Sheesley.

Signed and filed this 27th day of April, 1984.

INTRODUCTION

This matter came on for hearing at the offices of the Iowa Industrial Commissioner in Des Moines on November 14, 1984 at which time the record was closed.

A review of the commissioner's file reveals that an employers first report of injury was filed on January 11, 1978. A memorandum of agreement was filed on February 6, 1978 calling for the payment of $74.30 in weekly compensation. This matter was the subject of prior litigation, culminating in an agreement for settlement, wherein it was agreed that claimant's industrial disability was ten percent of the body as a whole. The parties also agreed that claimant was entitled to 84 weeks of healing period compensation. The record consists of the testimony of the claimant; claimant's exhibits 1, 2 and 3; defendants' exhibits A, B and C; and all previous filings.

ISSUES

The issues for resolution are:

1) Whether there is a causal connection between the injury and the condition; and

2) The nature and extent of injury.

STATEMENT OF THE EVIDENCE

Claimant, age 37, was employed by defendant employer on December 31, 1977. Claimant had been involved in restaurant work for a number of years. Claimant testified that on December 31, 1977 she was employed as night manager (although her title was otherwise). She testified that she slipped and fell and while falling, hit her neck on a table leg. She testified that she landed on her right side. She testified that her back was out of place. Claimant testified that she had no prior back problems.

Claimant testified that she did not work and was off work until November 1979 when she became employed as a dispatcher at the sheriff's office in Minneapolis, Kansas. Claimant testified that she left this sedentary job after two months. In February 1980 she became employed as a restaurant cook and worked only two weeks. In June 1980 she became employed as a grill cook for a period of two or three weeks. Claimant testified that she did not sustain any injuries subsequent to the original injury.

Claimant indicated that she can only walk about two blocks before she has to sit down because of lower back pain. Claimant testified that she could stand for only five minutes before she wants to sit down because of hospital back pain. Claimant testified that she would not pick up things normally. She can only lift from five to six pounds. She takes a medication called Triavil which she states helps her sleep. She receives assistance from social services in Kansas. Claimant testified that she went to job training for a two week period.

On cross-examination, claimant testified that she saw Drs. Schramm, Hudson and Blair in addition to receiving physical therapy from Ina Hellweg. She testified that her work at the Colonial House in Salina ceased in February 1980. Claimant testified that she then tried to work at a truck stop in Salina, Kansas. Claimant testified that she had difficulty walking and standing. Claimant testified that she suffers from depression. She testified that the two week school she attended was a school designed to be more in the nature of an extended aptitude testing procedure. Claimant testified that her condition has changed in that she cannot work at all and that she has nervous problems relating to the injury.

A discussion of the medical evidence in this case necessarily involves a look at the commissioner's file which was presented as evidence in this case. Claimant's injury occurred on New Year's Day 1978. Claimant wrote a lengthy holograph to this agency which was received on February 26, 1979. Claimant relates that she saw Dr. Ralph Schramm, D.C., of Guthrie Center. Claimant was apparently complaining of arm, elbow and shoulder pain. Claimant relates that Dr. Schramm referred her to Frank M. Hudson, M.D., a Des Moines Neurosurgeon. Claimant was admitted to Iowa Methodist Mecical Center on February 9, 1978. Dr. Hudson thought claimant had degenerative disc disease. Extensive testing showed spinal fluid protein of 23 mg. %. He diagnosed claimant as having a cervical muscle bundle spasm, and when an electromyogram was done it was suggested and was interpreted as consistent with bilateral carpal tunnel syndrome. Because the right hand was claimant's primary concern, section of the right transverse carpal tunnel ligament was performed on February 15, 1978. The relief of the symptoms in the right hand was thought to be excellent. Claimant continued to participate in physical therapy consisting of twice daily hot packs, massage and ultrasound to the back of the neck. Claimant was seen by Donald Blair, M.D., a Des Moines orthopedist, who diagnosed epicondylitis about the right lateral epicondyle and this was injected with cortisone. Claimant was discharged from the hospital on February 17, 1978.

After claimant's discharge from the hospital she indicated that the elbow problems gradually returned. A secondary area of complaint was relative to the low back with an occasional sensation of burning in the anterior aspect of the right thigh. Examination revealed discomfort across the lumbosacral region of the back into the posterior aspect of the thigh. Claimant complained that at times some feeling of the lower leg going to sleep was present. On forward bending claimant was able to touch her toes with low back discomfort. Claimant's remaining back motions aggravate her low back symptoms. The right straight leg raising test goes to 80°, the left to 90° with some aggravation of her low back discomfort, but with no leg radiation. On sensory examination there was some diminution described over the lateral right calf and foot. Knee jerks and ankle jerks were active and normal. There was good strength on flexion and extension. Dr. Blair indicated that claimant's symptoms were suggestive of some mild nerve root irritation. He thought that claimant should lose weight. He thought claimant had chronic lumbosacral strain, including obesity. Dr. Blair gave claimant a prescription for a lumbosacral support.

The records indicate that claimant saw R. D. Pennington, D.C., of Salina, Kansas. Dr. Pennington diagnosed claimant's condition as subluxation-fixation complex; cervical sprain; brachia neuralgia; and myofascial fibrositis. Claimant's letter reveals that the reason she moved to Salina, Kansas was because her husband had found work there after becoming unemployed here.

Dr. Blair indicated that he saw claimant on June 5, 1978. Dr. Blair noted that claimant weighed 253 pounds. He thought claimant's marked obesity contributed to her low back symptoms. Dr. Schramm also wrote a report concerning claimant's condition on September 10, 1979. Dr. Schramm noted that claimant experienced back pain. His diagnosis was discussed above. He indicated that claimant was given a cervical collar. Claimant was treated with chiropractic manipulations. Dr. Schramm wrote his report more than a year after seeing the claimant, so he stated determination of permanency was difficult. He did indicate, though, that the "distinct possibility" of recurring pain and stiffness was present. Dr. Pennington wrote two reports which were considered as evidence in this case. The reports are undated and indicate that claimant had extreme soreness and muscle spasms of the trapezius, rhomboid and latissimus dorsi with muscle spasm upon palpation. There was also bilateral spasm of the lateral cervical muscles from the wrist up the radial side of the right forearm, more pronounced in the elbow, and stiffness of the deltoid muscle on the right, with some tenderness of the triceps braculi. X-rays showed no evidence of bone fracture and a subluxation-fixation complex. Dr. Pennington felt claimant had sustained a myofascial fibrosis and brachial neuralgia which was causally connected to the fall. Dr. Pennington then assigned a five percent impairment to the body as a whole for the injury.

The other report that was submitted indicates that Dr. Pennington was of the opinion that claimant could not return to her former employment. He went on to state that claimant had a disability of from ten to fifteen percent of the body as a whole because of claimant's inability to return to her former occupation.

On December 15, 1980 the parties submitted an application for agreement for settlement. The parties proposed that a ten percent disability to the body as a whole be approved. Additionally, the parties agreed that claimant should be paid healing period and medical expenses. Claimant also was to receive a $300 advance for medical expenses. An approval of agreement for settlement was entered on December 15, 1980.

Claimant presented herself for treatment at the Smoky Hill Family Practice Center in Salina, Kansas. Claimant was first treated by Ronald E. Hunninghake. At the time claimant was being treated for calluses on her foot. About four months later a social security disability rating was given because of neck pain and pain in her back, legs and arms. Dr. Hunninghake's diagnoses were chronic cervical strain and chronic pain syndrome. He recommended that claimant see an orthopedist. On June 4, 1982 Dr. Hunninghake indicated that claimant had a long history of chronic cervical pain syndrome exacerbated by prolonged standing and heavy lifting. The recommendation was made that claimant lose weight.

On July 6, 1982 claimant was seen by Dr. Richard Early who recommended weight loss. No mention was made of pain. On August 10, 1982 claimant complained of pain in her right shoulder and elbow due to the fall at work. Claimant related this to the fall five years previously. Physical examination revealed that claimant was very tender over the right trapezoid and rhomboid muscles. Claimant desired a prescription of Benadryl. Claimant had taken some of this and had had some remission of symptoms.

No medication was prescribed, since the medicine taken was an antihistimine. Dr. Early felt that claimant's weight problem was far more significant than claimant's shoulder discomfort. He thought the loss of weight should first be pursued, since it may have well been the cause of the pain. Dr. Early recommended that claimant continue her diet and to pursue symptomatic self-care (e.g., hot water bottles, exercises and medication).

On October 21, 1983 Dr. Hunninghake stated that claimant should not pursue any further work in the restaurant business involving heavy lifting becaue of the back pain "allegedly from a fall that occurred in December of 1977." Dr. Hunninghake examined claimant in 1982 and she had chronic mild fibrosis in her back. Dr. Hunninghake wrote a report on November 8, 1983 indicating that claimant was "having additional difficulties relating to her fall on December 31, 1977."

Claimant testified that she can now walk only two blocks before sitting down. She states that she can stand for only five minutes because her hip and back become severe. She testified that her source of income is $155 a month from social services in Kansas. Claimant also complains of depression. She went to a two week aptitude testing procedure. Claimant testified that she has worked for short periods of time since the injury, and has quit on each occasion. Claimant states that there has been a change in her condition in that she cannot stand and this has made her nervous.

APPLICABLE LAW

1. Sections 85.3 and 85.20, Code of Iowa, confer jurisdiction on this agency in workers' compensation cases.

2. Section 85.26(2), Code of Iowa, provides that an award for payments may be reviewed within three years from the last payment of weekly benefits.

3. By filing a memorandum of agreement it is established that an employer-employee relationship existed and that claimant sustained an injury arising out of and in the course of employment. Freeman v. Luppes Transport Co., 227 N.W.2d 143 (Iowa 1975). This agency cannot set this memorandum of agreement aside. Whitters & Sons, Inc. v. Karr, 180 N.W.2d 444 (Iowa 1970).

4. In Blacksmith v. All-American, Inc., 290 N.W.2d 348 (Iowa 1980) the court indicated that a change in earning capacity subsequent to an original award which is proximately caused by the original injury also constitutes a change in condition. Similarly, a claimant's inability to find other suitable work after making bona fide efforts to find such work may indicate that relief would be granted. McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (Iowa 1980).

5. The claimant has the burden of proving by a preponderance of the evidence that the injury of December 31, 1977 is causally related to the disability on which she now bases her claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

6. Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

ANALYSIS

The agreement for settlement was approved on December 15, 1980. In order to reopen the case successfully, the claimant must show a change of condition since that date. This change of condition must be within the meaning of the law. The record indicates that payment of $10,300 was made in 1980 contemplating payment of weekly compensation and permanent partial disability compensation. An amount of $300 was reserved for future medical expenses. The parties agreed that claimant was disabled to the extent of ten percent of the body as a whole. "Temporary total disability" compensation was paid for a period exceeding 84 weeks. At the commencement of the hearing it was indicated that there were no outstanding medical bills nor additional lost time. $130 was expended by claimant in securing medical information. Claimant last worked on about June 1980. She tried to work, albeit unsuccessfully in the summer of 1981, after the approval of the agreement for settlement. The dictates of Blacksmith indicate that claimant has sustained a change of condition within the meaning of that case. Claimant's condition has stabilized, thus, showing that she is not entitled to healing period compensation. However, claimant is entitled to be paid additional permanent disability within the meaning of McSpadden, 288 N.W.2d 181.

Claimant is 37 years of age, has a high school education (GED) and one year of college. Most of her employment experience is in the food service area. Claimant did serve a short time as a dispatcher. She has made repeated attempts to return to work. Medically, the issue of causation is not as clear as the factual evidence would indicate. Claimant has not sustained a physical injury of sufficient severity as to be able to be surgically corrected. However, claimant's injury is of sufficient severity to preclude her working despite her attempts to do so. Considering the elements of industrial disability, it is found that claimant's total disability for industrial purposes is twenty percent, thus, entitling the claimant to be paid an additional ten percent or fifty weeks at the rate of $74.30. Claimant also is entitled to be reimbursed $130 for medical reports. See Industrial Commissioner Rule 500-4.33.

FINDINGS OF FACT

1. Claimant was employed by defendant employer on December 31, 1977.

2. Claimant hurt her neck and back when she fell at work on December 31, 1977.

3. Defendants filed a memorandum of agreement concerning a December 31, 1977 injury.

4. Claimant and defendants entered into an agreement for settlement whereby they agreed that claimant was entitled to in excess of eighty-four (84) weeks of healing period and fifty (50) weeks of permanent partial disability compensation at the rate of seventy-four and 30/100 dollars ($74.30) per week.

5. The agreement for settlement was approved December 15, 1980.

6. Claimant has made bona fide efforts to return to work since the approval of the agreement for settlement and has been unable to do so for any sustained period.

7. Claimant has sustained a change of condition since the approval of the agreement for settlement.

8. Claimant's condition has stabilized.

9. Claimant's disability, for industrial purposes, is twenty percent (20%) of the body as a whole.

10. Claimant incurred a medical expense of one hundred thirty dollars ($130.00) to obtain reports.

CONCLUSIONS OF LAW

1. This agency has jurisdiction of the parties and the subject matter.

2. Claimant sustained an injury arising out of and in the course of employment on December 31, 1977.

3. Claimant is entitled to be paid an additional fifty (50) weeks of permanent partial disability compensation at the rate of seventy-four and 30/100 dollars ($74.30).

4. Claimant is entitled to be reimbursed one hundred thirty dollars ($130.00) for a medical report.

ORDER

IT IS THEREFORE ORDERED that defendants pay unto claimant an additional fifty (50) weeks of permanent partial disability compensation at the rate of seventy-four and 30/100 dollars ($74.30) per week.

IT IS FURTHER ORDERED that defendants reimburse claimant one hundred thirty dollars ($130.00) for medical reports.

Interest is to accrue on this award from the date of this decision pursuant to section 85.30, Code of Iowa.

Defendants will file a final report upon payment of this award.

Costs of this proceeding are taxed against defendants pursuant to Industrial Commissioner Rule 500-4.33.

Signed and filed this 6th day of July, 1984.

JOSEPH M. BAUER
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

ANDREW H. JACKSON,

Claimant,

vs.

R & R WELDING SUPPLY COMPANY,

Employer,

and

HARTFORD INSURANCE COMPANY,

Insurance Carrier,
Defendants.

File No. 689113

A P P E A L

D E C I S I O N

FILED

JUL 23 1984

IOWA INDUSTRIAL COMMISSIONER

By order of the industrial commissioner filed April 20, 1984 the undersigned deputy industrial commissioner has been appointed under the provisions of §86.3, Code of Iowa, to issue the final agency decision on appeal in this matter. Defendants appeal an adverse review-reopening decision.

The record on appeal consists of the transcript; claimant's exhibits 1 through 44; and defendants' exhibits A through E, all of which evidence was considered in reaching this final agency decision.

The outcome of the proposed agency decision will be modified in that an award of 25 percent of the body as a whole for industrial purposes will be granted instead of a 40 percent award for such disability.

ISSUES

The review-reopening decision, as indicated above, granted an award of 40 percent of the body as a whole for industrial purposes and awarded certain benefits under §85.27, The Code, for medical and allied services.

The issues on appeal are stated by defendants:

I. The Deputy's decision does not adequately recite the "evidence relied upon, standards applied, and reasoning used in reaching conclusions of fact and law," all in violation of specific Iowa Supreme Court directives.

II. The Deputy's decision violates the directives of the Industrial Commissioner in that he has factored various elements of industrial disability and added them to the functional impairment.

III. The Claimant's employment relationship with this defendant was discontinued due to poor economic conditions. As a consequence, no award of industrial disability may be premised of this factor.

IV. The Employer and Insurance Carrier have the "right to choose the care" in the area of medical treatment. All medical treatment secured by Claimant directly or by referral from his own physician is unauthorized and not the responsibility of the Defendants.

V. The Employer and Insurance Carrier are entitled to credit for all benefits previously paid.

EVIDENCE

In his work for the employer, claimant worked with spools of welding wire which weighed 1,000 pounds; such spools were run off into 60 pound coils or 30 pound spools. Claimant describes his injury thus:

> I was loading a side plate on a 1,000-pound spool and had my knees on the right-hand side of it. And I bent over the 1,000-pound spool to pick up the other plate and was putting the big brass nut on, keeping the pressure against the side plate, when the 1,000-pound spool tipped. And as it went over, I grabbed it to bring it back; and it just drug me right down to the floor. (Tr., pp. 19-20 11. 22-25 and 1-4)

Claimant was hospitalized for some 10 days with thoracic and lumbar back complaints.

Claimant continued to have back problems.

Examinations, including CAT scans have failed to show any reason for surgery; however, Robert A. Hayne, M.D., a qualified neurosurgeon, rated claimant at three percent permanent partial impairment and Robert C. Jones, M.D., a qualified neurosurgeon, rated claimant at 15 to 20 percent permanent impairment of the body as a whole.

Claimant states that the "severe pain is in the small of my back and down my left leg and into my left foot," adding that his left knee also bothers him. (Tr., p. 36) Also, claimant wears a TENS unit, an electrical pain suppressor.

Claimant was released to return to work and actually did so in February 1982. However, the next day, he was told that his services would no longer be required. (Tr., pp. 25-26)

Claimant is a high school graduate, age 36, and hopes to obtain some schooling in accounting or bookkeeping. He describes his life presently as follows: "Oh, get up in the morning, I usually turn the shower on real hot to get my back loosened up, and then I'll use the back traction for about a half hour and walk down to the Hy-Vee Store and back and light household duties." (Tr., p. 37 11. 11-15)

Randall A. Jones, of the sales department of R & R Welding, was called on behalf of the employer and testified that he was on the premises when claimant was hurt but did not see the injury. He rode with claimant in the ambulance to the hospital.

Keith A. Kline, branch manager of the employer's Des Moines office, testified for defendants that claimant was not discharged because of his injury. He stated as follows as to why claimant's employment was terminated:

> A. Due to the economic condition which we're all suffering and still are suffering. We had a position of not utilizing a respooler for an excess of sixty days as had been the case for at least four additional days during that year while Mr. Jackson was ill. Therefore, we found we did not need that particular function and did not replace it.
>
> Q. Have you replaced it since that time?
>
> A. Approximately four and a half months ago we did replace that employment.
>
> Q. And why didn't you replace it until four and a half months ago?
>
> A. There was not the demand for the welding product. (Tr., p. 76 11. 5-19)

Ronald D. Waugh testified for defendants that he was the store manager for the employer in Des Moines and was claimant's direct supervisor. With respect to claimant's discharge, Mr. Waugh stated:

> A. At that time we were thinking that we wouldn't need him in spooling, full-time man back there, because we'd gotten along without him for sixty days or so. I said that I didn't particularly want him to come back to work that day because I had to do some talking with Keith and we'd get in touch with him.
>
> Q. Did you get in touch with him?
>
> A. Yes, I did.
>
> Q. Why?
>
> A. Told him his services were no longer needed.
>
> Q. Why weren't they needed?
>
> A. Because we just didn't have the business to pay for a full-time man back there at that particular time. (Tr., p. 92 11. 10-25)

APPLICABLE LAW

Claimant has the burden to prove the extent of his disability. Olson v. Goodyear Service Stores, 255 Iowa 1112, 125 N.W.2d 251 (1963).

In Catalfo v. Firestone Tire & Rubber Co., 213 N.W.2d 506 (Iowa 1973), the court says at page 510:

> A deputy industrial commissioner is charged with making findings of fact and conclusions of law in proceedings before him. §86.23, The Code. We believe the deference courts are required to give his findings of fact in a direct appeal from a review-reopening decision carries with it a correlative duty on his part to state the evidence he relies upon and specify in detail the reasons for his conclusions. His decision must be sufficiently detailed to show the path he has taken through conflicting evidence.

In discussing industrial disability, the Iowa Industrial Commissioner in Birmingham v. Firestone Tire & Rubber Co., 2 Iowa Industrial Commissioner Report page 39, 40 (1981) stated:

> There are no guidelines which give, for example, age a weighted value of fifteen percent of total, motivation - five percent; work experience - thirty percent, etc. Neither is a rating of functional impairment entitled to whatever the degree of impairment that is found to be conclusive that it directly correlates to that degree of industrial disability to the body as a whole. In other words,

there are no formulae which can be applied and then added up to determine the degree of industrial disability. It therefore becomes necessary for the deputy or commissioner to draw upon prior experience, general and specialized knowledge to make the finding with regard to degree of industrial disability.

In Webb v. Lovejoy Construction Co., 2 Iowa Industrial Commissioner Report 430 (1981), the industrial commissioner held that a temporary downturn in the economy would not entitle claimant to additional compensation benefits.

The case of McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (Iowa 1980) at 192 states that "a defendant-employer's refusal to give any sort of work to a claimant after he suffers his affliction may justify an award of disability." And the court said that Blacksmith v. All-American, Inc., 290 N.W.2d 348 (Iowa 1980) at 354, was "the case of an employee who has no apparent functional impairment and who wants to work at the job he had before but is precluded from doing so because his employer believes the past injury disqualifies him, resulting in a palpable reduction in earning capacity."

The fourth unnumbered paragraph of §85.27, The Code, states:

> For purposes of this section, the employer is obliged to furnish reasonable services and supplies to treat an injured employee, and has the right to choose the care. The treatment must be offered promptly and be reasonably suited to treat the injury without undue inconvenience to the employee. If the employee has reason to be dissatisfied with the care offered, he should communicate the basis of such dissatisfaction to the employer, in writing if requested, following which the employer and the employee may agree to alternate care reasonably suited to treat the injury. If the employer and employee cannot agree on such alternate care, the commissioner may, upon application and reasonable proofs of the necessity therefor, allow and order other care. In an emergency, the employee may choose his care at the employer's expense, provided the employer or his agent cannot be reached immediately.

ANALYSIS

The first two appeal points may be handled together. In his analysis, the hearing deputy stated:

> Dr. Jones indicates that the claimant has a 15 percent to 20 percent functional impairment of the body as a whole. (Cl. ex. 12)
>
> Dr. Hayne indicates that the claimant has a 3 percent functional impairment of the body as a whole. (Cl. ex. 5 & 6)
>
> It is concluded that this claimant has a 10 percent functional impairment of the body as a whole.

Defendants complain, first, that the "award" of functional impairment was made arbitrarily. However, although not explained in any detail, it is clear that the hearing deputy split the difference between the two estimates of permanent impairment to arrive at the 10 percent impairment. Defendants state, second, that 15 percent permanent disability was added to the 10 percent impairment (making a total of 25 percent disability), which does not seem to be the case at all. Again, the hearing deputy could have explained the process more completely; however, there is no reason to assume that the hearing deputy was ignorant of the distinction between the impairment and the disability when he clearly recited legal propositions which show impairment is a mere part of, not an equivalent to, disability. The third matter, that of the question of the employer's refusal to re-hire claimant, will be determined below.

Defendants make the point that under the Birmingham case, 2 Iowa Industrial Commissioner Report 39, 40 since there are no formulae, the factors cannot be added to the percentage evaluation of permanent impairment to arrive at the disability figure. As has already been stated, it is not believed by the undersigned deputy industrial commissioner that that procedure was used in this case, and therefore no violation of the principle in Birmingham has occurred.

It is true, however, that the hearing deputy apportioned the disability into two parts: (1) That part which considers those factors of industrial disability such as age, education, experience, physical impairment, etc., totalling 25 percent and (2) that disability which is attributable to the employer's alleged refusal to re-hire claimant totalling 15 percent, making a grand total of 40 percent. Such a method of apportioning or pro-rating the disability is not prohibited and, in fact, clearly shows the thought process which seems to be the desired aim of Catalfo, 213 N.W.2d 506.

Therefore, the method of assessing the 15 percent impairment for the alleged refusal to re-hire claimant is not questioned. However, whether or not it should be a part of the award is another matter.

Claimant testified with respect to this issue as follows:

Q. Did you, in fact, then return to work?

A. Yes.

Q. And when was that?

A. I took the note in to Ron Waugh on February 3rd.

Q. And did you work on February 3rd?

A. No, he just patted me on the back and told me he was glad to have me back and see me in the morning.

Q. February 4th?

A. Yes.

Q. Did you go to work on February 4th?

A. No.

Q. Why is that?

A. They called me -- Ron called me about quarter to six or six-thirty that night and told me I was no longer needed for employment.

Q. And have you been employed since that time?

A. No. (Tr., pp. 25-26 ll. 10-25 and 1-4)

The employer's testimony has been set out above.

In his reasoning for allowing the 15 percent permanent partial disability for the refusal to re-hire claimant, the hearing deputy stated:

> Defendant's [sic] termination of the claimant following the injury is contrary to a doctrine recently announced in McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (Iowa 1980).
>
> In light of the foregoing legal principles, it is concluded that the claimant has an industrial disability of 40 percent of the body as a whole. Defendants' testimony that claimant was discharged due to an economic slow down belies the facts that he was discharged the day he reported back to work with a medical restriction. It is clear from the attitude and demeanor of the defendants' witnesses that the defendant employer did not want a man with a bad back working for them, notwithstanding that they were dealing with an industrial injury.

The hearing deputy's decision, of course, has significance. See Iowa State Fairgrounds Security v. Iowa Civil Rights, 322 N.W.2d 293 (Iowa 1982). However, even though the attitude and demeanor of the defendants' witnesses is important in reaching a decision, it does not seem possible to conclude from only the attitude and demeanor that the employer did not want to re-hire claimant on account of his back. Instead, the written record shows to the contrary: (1) Claimant's testimony does not show defendants' reasons for not re-hiring him, simply that he was not re-hired; (2) The employer's testimony clearly shows that the reason he was not re-hired was because of an economic downturn.

On the whole, it must be concluded that the employer's reason for not re-hiring claimant was because of an economic downturn, not because of his injured back. The tenor of the rulings in Blacksmith and McSpadden pertain to only increased disability on account of a refusal to re-hire because of an injury, not because of an economic downturn.

In summary, then, claimant's industrial disability is 25 percent, and that is the amount which will be awarded. As the review-reopening decision showed, claimant is a man of 36 years of age, and a high school graduate. It appears that he has a good potential for rehabilitation, but it also appears that his injury is severe enough to provide a rather substantial disability.

As for the argument on the question of the employer's right to choose the care, the bills were entered into the record (Tr., pp. 9-13) and no objection was made. It is assumed that defendants waived any lack of foundation to which they might have objected, and that the bills' presence in the record sufficiently substantiates the right to recovery. Therefore, no change will be made in the order to pay those bills.

Finally, defendants should of course get credit for any payments heretofore made.

FINDINGS OF FACT

1. While working for R & R Welding, claimant hurt his low back while loading a 1,000-pound spool and was dragged to the floor.

2. As a result, claimant has a permanent partial impairment of between three percent and 20 percent of the body as a whole.

3. Claimant is age 36, a high school graduate and has had mainly laboring jobs in his work career.

4. Claimant has good rehabilitation potential.

5. The employer failed to re-hire claimant because of an economic downturn.

CONCLUSIONS OF LAW

Claimant sustained an injury which arose out of and in the course of his employment on December 1, 1981.

Said injury entitles claimant to payment of healing period benefits at the rate of one hundred fifty-seven and 62/100 dollars ($157.62) from December 1, 1981 until August 30, 1982.

Said injury caused claimant to sustain an industrial disability of twenty-five (25) percent of the body as a whole and entitles claimant to compensation benefits for permanent partial disability for a period of one hundred twenty-five (125) weeks at the rate of one hundred fifty-seven and 62/100 dollars ($157.62) per week.

Claimant failed to prove that the employer failed to re-hire him because of his injury.

ORDER

THEREFORE, defendants are hereby ordered to pay weekly compensation benefits unto claimant from December 1, 1981 until August 30, 1982 for the healing period at the rate of one hundred fifty-seven and 62/100 dollars ($157.62) and to pay permanent partial disability benefits unto claimant for a period of one hundred twenty-five (125) weeks at the rate of one hundred fifty-seven and 62/100 dollars ($157.62), said payments to be made in a lump sum together with statutory interest from the date of this decision. Defendants are to receive credit for any payments heretofore made.

Defendants are further ordered to pay the following medical and allied expenses under §85.27, The Code:

Transportation expense	$ 357.92
Abbot Northwest Hospital	230.00
Hammer Pharmacy	232.64
Drug expense	6.41
Robert Hayne, M.D.	65.00
Robert Jones, M.D.	620.00
Mercy Hospital	4,393.23
Ronald Evans, D.O.	160.00
Douglas Chiropractic	208.20
Peter Wirtz, M.D.	50.00
Iowa Methodist Hospital	1,007.02
Alexander Lifson, M.D.	145.00
Kenneth B. Heitoff, M.D.	100.00
Mercy Center Anesthesiologists	317.00

Costs of this action are taxed against defendants.

Defendants are ordered to file an activity report within twenty (20) days from the date below.

Signed and filed this 23rd day of July, 1984.

ANDREW H. JACKSON,	:	
Claimant,	:	
vs.	:	File No. 689113
R & R WELDING SUPPLY COMPANY,	:	REHEARING
Employer,	:	RULING
and	:	FILED
HARTFORD INSURANCE COMPANY,	:	AUG 22 1984
Insurance Carrier, Defendants.	:	IOWA INDUSTRIAL COMMISSIONER

On July 23, 1984 the undersigned deputy industrial commissioner wrote a final agency decision which granted, inter alia, interest "from the day of this decision." Claimant moved for rehearing, and defendants resisted.

The original review-reopening decision, which was reviewed by the undersigned, granted merely statutory interest. It was filed February 29, 1984. In a review-reopening case, interest accrues from the date of the award. Bousfield v. Sisters of Mercy, 249 Iowa 64, 86 N.W.2d 109 (1957). Therefore, the final agency decision should have granted interest from February 29, 1984.

WHEREFORE, statutory interest on the award of weekly compensation benefits will accrue from February 29, 1984.

SO ORDERED.

Signed and filed this 22nd day of August, 1984.

vs.	:	FILE NO. 689113
R & R WELDING SUPPLY COMPANY,	:	REVIEW-
Employer,	:	REOPENING
and	:	DECISION
HARTFORD INSURANCE COMPANY,	:	FILED
Insurance Carrier, Defendants.	:	FEB 29 1984
	:	IOWA INDUSTRIAL COMMISSIONER

This is a proceeding in review-reopening brought by Andrew H. Jackson, the claimant, against R & R Welding Supply Company, his employer, and Hartford Insurance Company, the insurance carrier, to recover additional benefits under the Iowa Workers' Compensation Act by virtue of an admitted industrial injury which occurred on December 1, 1981 at the employer's place of business resulting in a period of temporary total disability of eight and six-sevenths weeks at an agreed rate of $157.62.

This matter was heard in Des Moines, Iowa on September 6, 1983 and considered as fully submitted at the conclusion of the hearing.

Defendants made all of the necessary statutory filings prior to the commencement of this proceeding. In this decision we shall concern ourselves with the nature and extent of claimant's disability, if any.

Based upon the undersigned's notes the record in this matter consists of the oral live testimony of the claimant, Randall Jones, Keith Cline and Ron Waugh, together with claimant's exhibits 1-44 and defendants' exhibits A-E.

There is sufficient credible evidence contained in the undersigned's notes to support the following statement of facts:

Claimant, age 36, married with four dependent children and a high school graduate, has had a series of employments since his honorable discharge from the U.S. Marine Corps. Claimant began his work experience for the defendant employer on January 1,

1980. Claimant operated a machine which reduced 1,000 pound spools of MIG welding wire to deliverable weights of 30 to 60 pounds. Defendant employer operates a retail delivery service of welding supplies to customers in the central Iowa region. On December 1, 1981 while attempting to mount a one-half ton roll of continuous welding wire, the wire spool slipped and knocked the claimant to the floor. Claimant was found by fellow employees and taken to the Iowa Lutheran Hospital. (Claimant's exhibit 21) Claimant, at the direction of D. D. Schmitt, M.D., received physical therapy during his 10 day hospital stay. (Cl. ex. 2) Some 30 days post-injury Dr. Schmitt assessed the claimant's condition as follows: (Cl. ex. 20) "ASSESSMENT: Thoracic and lumbar strain. Rule out herniated intervertebral disk." A myelogram was performed which disclosed no identifiable abnormality. Claimant was returned to his employment duties on February 3, 1982. Defendant employer advised claimant that his job was filled and that due to an economic slow down, no work was available.

Claimant's recovery since has not proceeded well, and accordingly, claimant sought medical assistance from Robert C. Jones, M.D., a neurosurgeon on February 26, 1982. (Cl. ex. 10 & 13)

On April 21, 1982 Dr. Jones reported as follows: (Cl. ex. 14)

> Since my letter of February 26, 1982, I saw Mr. Jackson again on March 18th and he was using Bactrac for his low back and, at his request, I gave him a slip to return to light duty so he could draw unemployment. He was doing his exercises. He was denied Workerman's [sic] Compensation by Hartford. I gave him a back to work slip with a 30 pound weight restriction and he said he was 40% better.
>
> When seen on April 20th there was some improvement with the Bactrac at first but none since his last visit. X-rays from Lutheran showed a normal lumbar spine and myelogram. On examination there was tenderness at lumbosacral bilaterally and I referred him to Dr. Simon, anesthesiologist, who has a special interest in these pain problems, to see if some injections might help. Limitation of forward bending was present to 30 degrees. I suggested continuing with the Bactrac and I will see him again in 2 weeks.

Thereafter, on May 10, 1982, claimant was sent to Robert A. Hayne, M.D., another neurosurgeon, who reported on August 30, 1982, in part, as follows: (Cl. ex. 5 & 6)

> I first saw Andrew H. Jackson for examination on May 10, 1982. He was thirty five years of age and had a history dating back to December 1, 1981, at which time he stated he was injured on the job. He had been working at the R&R Welding Company and "a plate tripped and dragged him down". He was taken to Lutheran Hospital by ambulance and he remained there for eleven days. He had been unable to work since the accident. He was experiencing pain in the region of the neck and between the shoulder blades. He felt at the time of the May 10th examination that the pain was not as severe as it had previously been. Along with the neck pain, he was having pain in the low back with pain down the back of the posterior left lower extremity. He had been seen by Doctor Charles Roland and Doctor Robert Jones. He had been treated with home traction. In January of 1982, a lumbar myelogram which had been carried out at Lutheran Hospital was reported to be normal. Coughing and sneezing would accentuate the pain in the extremity. He stated that his left knee would give out at times.
>
> His past medical history reveals he had problems with kidney stones in April of 1969 and February of 1976.
>
> Neurological examination on May 10, 1982, showed the strength and coordination of the upper and lower extremities to be normal. The knee reflexes were 1+ on either side with the ankle reflexes being 0-1+ on the right and 1+ on the left. There was marked limitation of forward motion of the lumbar spine region. Sensation was normal. There was no evidence of muscular atrophy. The blood pressure was 125/98. The physical examination otherwise was within normal limits.
>
> He was admitted to Iowa Methodist Medical Center on May 18, 1982. A repeat lumbar myelogram was carried out which showed no x-ray evidence of a protruded intervertebral disc or other abnormality. He was discharged from the hospital on May 20, 1982, and it was recommended he continue on conservative type measures.
>
> He was seen in my office on July 2, 1982 at which time he was complaining of pain in the back of the left lower extremity. He stated he had been discharged from his job. The neurological examination did not disclose any new findings. Because of his persistence of pain, it was felt advisable for him to have a CT scan of the lumbar spine carried out.
>
> On July 8, 1982, a CT scan of the lumbar spine was carried out in St. Louis Park, Minnesota. This was a normal scan. There was no evidence of pathological disc bulge or herniation. There was no stenosis of the spinal canal noted. There was mild scoliosis with convexity to the left seen, but there was no evidence of spondylolysis, spondylolisthesis or disc space narrowing.
>
> In view of the negative findings on the myelogram and CT scan, I recommended he continue on conservative measures. He should be instructed in good body mechanics so that activity does not place stress and strain on his low back region. His permanent disability referable to his symptomatology that dates back to the injury on December 1, 1981, appears to be no greater than 3% of body total.

Of further interest is the report of James Blessman, M.D., medical director of Mercy's Pain Center who reports on November 30, 1982 as follows: (Cl. ex. 1)

> Thank you for referring your patient, Andrew Jackson, to me for evaluation and treatment of his chronic pain syndrome.
>
> As you are aware, he is a thirty-five year old gentleman who had previously been employed by R & R Welding as a warehouse worker. He gave a history of having had low back and left leg pain and pain going down the back of his left leg since December of 1981. He was also complaining of pain in his left knee. He denied any previous problems with back pain prior to the injury in December of 1981. He described the injury as a twisting injury to his back while he was wrestling with a 1,000 lb. roll of welding wire. He felt immediate, sudden, severe pain in his back radiating down his left leg. His initial treatment was by Dr. Roland and he was originally hospitalized for two weeks of bedrest and physical therapy. Since that time, he has had a total of three myelograms and two CAT Scans--all of which failed to reveal any surgically correctable lesions. He has had a trial of epideral steroids times two, without any benefit, and his second one was complicated by temporary paralysis and a deral leak requiring a few days of bedrest. He has previously been given a 3% disability rating by Dr. Hayne, who examined him for the insurance company. He has had multiple chiropractic treatments. He has had considerable dispute with his previous employer, in fact, he was discharged from employment while on complete disability.
>
> At the time I first saw him he was on no medications and had no medication allergies. He had a history of hypertension in the past. He had had two episodes of kidney stones--one in 1969 and one in 1976. He also had had a fractured jaw in 1964 and surgeries for lipomas on his back and chest in 1980 and 1981. He also had had a T & A as a child. The remainder of his review of systems was negative. His mother died of cancer at age sixty-two; his father is living and well at age eighty-one. He has two brothers, ages thirty-eight and forty-one, who are both in excellent health.
>
> Social history: He is married and has four children, ages from three to thirteen. He has a high school education and four years of service in the military, the Marine Corps. He has not been able to work since the time of his injury in December of 1981. He admits to drinking a six pack of beer weekly. He is a non-smoker and did not participate in any regular form of exercise at the time of initial evaluation. He reported that he had gained approximately twenty-five pounds since the time of his injury. He did not report any excess intake of caffeine.
>
> On physical examination, he is alert, oriented, and in no acute distress, although he was complaining of pain in his back. EENT examination was normal. Range of motion of his neck was full. His lungs were clear with good breath sounds bilaterally. Heart was regular, without murmurs. Abdomen was soft. Liver and spleen were not palpable. Examination of his back reveals no previous lumbar surgery and sensation was intact. Range of motion was markedly decreased, limited to 5° extension, 10° flexion, 10° lateral side bending, and marked limitation of rotation. Impression, upon admission, was chronic back strain, and mental depression secondary to chronic back pain.
>
> He was treated with a very comprehensive pain management approach here at Mercy Pain Center. He was instructed on several different types of exercise, including yoga, aquatics, and aerobic exercises. He was a very well motivated patient and participated actively in everything we ask him to do. Because of persistent pain in his knee, he was seen in consultation by Dr. Peter Wirtz for evaluation of his left knee. He finally underwent

an arthrogram which was essentially within normal limits. However, because of the persistence of his knee pain, Dr. Wirtz recommended that he have a follow-up arthroscopy if he continued to be symptomatic with his left knee. At the time of discharge, the patient was somewhat reluctant to go ahead with the arthroscopy because of the marked discomfort that he had following his arthrogram. He was instructed in several different types of autogenic training including: biofeedback, self-hypnosis, progressive muscle relaxation, and guided imagery.

He was placed on our usual nutritional program which restricted him from refined sugars, caffeine, nicotine, alcohol, and decreases his intake of white flour, red meat, and sodium. Medication used consisted of Elavil 50 mgs. at bedtime, however, this had to be discontinued because of marked sedation; he was also placed on our usual nutritional supplements which include Tryptophan, Vitamin C, Vitamin B-3, and Vitamin B-6.

As stated above, he was a very well motivated and cooperative patient. He was seen in counseling by our Psychologist, Dr. Dianne Alber, and seemed to progress quite well through the Program. His family stresses included being unemployed at the present time, having his wife also unemployed, having four children at home, one of which is markedly retarded and requires lots of parental supervision. The patient spent four years in the Marine Corps and considerable time in Viet Nam, having some very bad experiences in the Country. He feels that he was affected by Agent Orange and I would expect he is still suffering from considerable emotional strain related to his Viet Nam experience.

In physical therapy we treated him with transcutaneous electrical nerve stimulation and biofeedback. He responded quite well to the TENS therapy, and will arrange for a home TENS unit for him. He had complete relief of his pain while the unit was on; however, as soon as it would be turned off the pain would return. By using the TENS frequently throughout the day, he was able to participate in our very active exercise program and begin rehabilitating his back.

I feel that Andy has a very high potential for physical rehabilitation. He also appears to be quite bright and well motivated. I would highly recommend him for some additional educational rehabilitation in addition to the physical rehabilitation that we have already started. At this time, I feel that he is healthy enough to enroll in any type of educational rehabilitation program and would recommend that he proceed with this rather than returning to heavy manual labor.

It is also extremely important that he continue with his active exercise rehabilitative program, and would recommend that he obtain a one year membership in the YMCA and continue with supportive psychological counseling, which possibly could be obtained through the VA System at minimal cost to him. Should he choose to do this privately, I would recommend that he continue seeing our Psychologist, Dr. Dianne Alber.

If I can be of any further assistance, I would be happy to see Andy again. I do feel that he has had a very successful chronic pain management program.

On September 16, 1982 Alexander Lifson, M.D., of the Institute for Low Back Care reported, in part, as follows: (Cl. ex. 7)

DIAGNOSTIC IMPRESSIONS:
1. Chronic pain syndrome.

RECOMMENDATIONS: Patient was provided with the booklet Be Good to Your Back for further information in regards to total low back care and isometric exercises. We have encouraged that the patient undergo a weight loss program which is sensible in nature, two to three pounds weekly, to attain a 35-pounds weight loss. We have referred the patient to a chronic pain rehabilitation program to help the patient develop coping mechanisms in regards to handling his pain. We see no pathological reason in regards to the lumbar spine for his pain profile. A brochure was given to the patient in regards to the Chronic Pain Program at Sister Kenny Institute, but one similar to this program would be just as efficient and helpful. No further follow-up is indicated at this time with our clinic.

C.

Ronald C. Evans, D.O., following an examination reported on January 17, 1983, in part, as follows: (Cl. ex. 8)

In my opinion, Mr. Jackson, as a result of a work related accident occurring on 12/1/81 has sustained a severe lumbar sprain syndrome, with discogenic sciatica to the left leg; L5-S1 suspected. I did not elect a trial therapeutic period for this patient. Due to the nature of this condition supported by my findings upon examination, the prognosis in this case must be considered poor. It should be noted that the patient's response to conservative therapy has been consistent in view of the severity of this condition.

With the patient's less than desirable response to conservative management, a further consultation appointment has been made for Mr. Jackson with Dr. Lifson at Sister Kenny Low Back Institute on September 16, 1982. We may yet realize resolution of this problem thru surgical or percutaneous desensitization procedures. Dr. Lifson is indeed a physician in whom this office places great confidence, and will act in the best interests of the patient.

After review of my clinically objective findings for this patient, reports, radiogrpahs [sic] and other supportive data, it is my opinion that an alternate form of therapy is indicated.

After thorough review of all medical records supplied with this patient, I find that the records do reflect the facts as related by the patient in his history; that these facts and physical events are compatible with the described mode of onset. I further find the medical records and the ongiong [sic] residual symptoms to be supported by my physical examinatin [sic] of this patient.

The degree of permanent disability has not yet been determined for this patient. Enough time has elapsed since onset, that should you desire a rating of permanent impairments for Mr. Erdman [sic] may be accomplished by this office.

Claimant has not been gainfully employed since his date of discharge alleging that his injury and the associated pain prevents him from so doing.

The claimant has the burden of proving by a preponderance of the evidence that the injury of December 1, 1981 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

In applying the foregoing legal principles to the case at hand, it is clear that the claimant has sustained his burden of proof by providing competent medical evidence in support of his contention that he has suffered permanent injury.

Dr. Jones indicates that the claimant has a 15 percent to 20 percent functional impairment of the body as a whole. (Cl. ex. 12)

Dr. Hayne indicates that the claimant has a 3 percent functional impairment of the body as a whole. (Cl. ex. 5 & 6)

It is concluded that this claimant has a 10 percent functional impairment of the body as a whole. It is further concluded that the claimant's healing period ended August 30, 1982, the date of Dr. Hayne's report wherein he concludes that claimant's condition will not improve.

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

The opinion of the supreme court in Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963) cited with approval a decision of the industrial commissioner for the following proposition:

> Disability * * * as defined by the Compensation Act means industrial disability, although functional disability is an element to be considered . . . In determining industrial disability, consideration may be given to the injured employee's age, education, qualifications, experience and his inability, because of the injury, to engage in employment for which he is fitted. * * * *

In applying the foregoing legal principles to the case at hand, it is clear that this claimant will have difficulty in regaining a place in the labor force without additional training. Claimant's days of being able to provide an employer with heavy labor are at an end. It is found that the claimant has sustained an industrial disability of 25 percent of the body as a whole.

Defendant's termination of the claimant following the injury is contrary to a doctrine recently announced in McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (Iowa 1980).

In light of the foregoing legal principles, it is concluded that the claimant has an industrial disability of 40 percent of the body as a whole. Defendants' testimony that claimant was discharged due to an economic slow down belies the facts that he was discharged the day he reported back to work with a medical restriction. It is clear from the attitude and demeanor of the defendants' witnesses that the defendant employer did not want a man with a bad back working for them, notwithstanding that they were dealing with an industrial injury.

THEREFORE, after having seen and heard the witnesses in open hearing and after taking all of the credible evidence contained in this record into account, the following findings of fact are made:

1. That this agency has jurisdiction of the persons and the subject matter.

2. That the claimant sustained an admitted industrial injury on December 1, 1981 when a 1,000 pound roll of wire forced him to the floor.

3. That the claimant's failure to perform acts of gainful employment from December 1, 1981 until August 30, 1982 is casually connected to the injury under review.

4. That the claimant achieved maximum medical recovery on August 30, 1982 resulting in a healing period entitlement of thirty-nine and three-sevenths weeks at the weekly rate of $157.62.

5. That the claimant was discharged by the defendant employer on February 3, 1982 due to the industrial back injury he sustained.

6. That the claimant is well motivated and an excellent candidate for rehabilitation.

7. That the claimant has sustained an industrial disability of 40 percent of the body as a whole.

8. That a portion of claimant's medical bills remain unpaid.

WHEREFORE, IT IS ORDERED that the defendants pay the claimant a healing period of thirty-nine and three-sevenths (39 3/7) weeks duration at the weekly rate of one hundred fifty-seven and 62/100 dollars ($157.62) beginning on February 3, 1982 together with statutory interest from the date due.

IT IS FURTHER ORDERED that beginning on February 4, 1982 defendants pay the claimant a two hundred (200) week period of permanent partial disability at the weekly rate of one hundred fifty-seven and 62/100 dollars ($157.62) together with statutory interest.

Accrued benefits are payable in a lump sum.

IT IS FURTHER ORDERED that defendants pay the following medical expenses incurred by the claimant and necessary to treat his injury:

Transportation expense	$ 357.92
Abbott Northwest Hospital	230.00
Hammer Pharmacy	232.64
Drug expense	6.41
Robert Hayne, M.D.	65.00
Robert Jones, M.D.	620.00
Mercy Hospital	4,393.23
Ronald Evans, D.O.	160.00
Douglas Chiropractic	208.20
Peter Wirtz, M.D.	50.00
Iowa Methodist Hospital	1,007.02
Alexander Lifson, M.D.	145.00
Kenneth B. Heitoff, M.D.	100.00
Mercy Center Anesthesiologists	317.00

Costs are charged to the defendants in accordance with Iowa Industrial Commissioner's Rule 500-4.33.

Defendants are ordered to file an activity report within twenty (20) days from the date below.

Signed and filed this 29 day of February, 1984.

VIKING PUMP-HOUDAILLE INDUSTRIES, Employer,	:	R E O P E N I N G
	:	D E C I S I O N
and	:	
LIBERTY MUTUAL INSURANCE COMPANY, Insurance Carrier, Defendants.	:	FILED SEP 27 1984 IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in review-reopening brought by Paul Kammerdiner, claimant, against Viking Pump-Houdaille Industries, employer, and Liberty Mutual Insurance Company, insurance carrier, for the recovery of further benefits as the result of an injury on January 28, 1982. Claimant's rate of compensation as indicated in the memorandum of agreement previously filed in this proceeding and stipulated by the parties is $250.68. A hearing was held before the undersigned on August 17, 1983.

The record consists of the testimony of claimant, Judith Kammerdiner and Roger Fiscus; claimant's exhibits 1 through 14; and defendants' exhibits A through E.

ISSUES

The issues presented by the parties at the time of the prehearing and the hearing are whether there is a causal relationship between the alleged injury and the disability on which he is now basing his claim and the extent of healing period and permanent partial disability benefits he is entitled to. The parties stipulated that second period of time off work was June 2, 1982 to June 13, 1982 and August 24, 1982 to December 21, 1982.

FACTS PRESENTED

On January 28, 1982 claimant received an injury arising out of and in the course of his employment with defendant employer when while lifting up a casing to throw in a barrel he felt pain in his back. Claimant revealed that he had no prior back problems. Claimant stated he was with his foreman at the time the pain occurred and talked to him about it. Claimant went to first aid and took some bufferin. Claimant indicated that his foreman set up an appointment for him with the company physician. Claimant testified that he was kept off work for a week with bedrest and physical therapy because of back and right leg pain and returned to work February 8 or 9. Claimant testified he continued to have pain so he started seeing E. C. Vorland, D.C. Claimant revealed that he could not remember if he told defendants he was seeing a chiropractor. Claimant stated he continued to have back and right leg pain.

Claimant testified that defendant employer had periodic shutdowns because of lack of work and had one for one week in May of 1982. Claimant indicated that they returned to work on May 10, 1982. On May 11, 1982 claimant again experienced pain while chopping logs and indicated that the pain was similar to his previous pain and in the same area. Claimant revealed that he started seeing Glen L. Groothuis, D.C., but continued to work.

On June 2, 1982 claimant saw his family physician who was in the same medical group as defendant employer's company doctor, and was placed in the hospital in traction for one week. Claimant again returned to work and had an additional three treatments by Dr. Vorland. On August 17, 1982 claimant was seen by David F. Poe, M.D. On August 24, 1983 a myelogram was taken and a ruptured disc was discovered. Claimant had surgery performed by HoSung Chung, M.D., on September 28, 1982. Claimant revealed he returned to work on December 20, 1983.

Claimant testified that following his surgery his right leg pain had disappeared and his back pain was greatly improved. Claimant stated he can lift now but has pain across his leg if he does a great deal of heavy lifting. Claimant has returned to the same job he had at the time of his injury but limits himself on what he lifts and the way he lifts. Claimant indicated he no longer shovels and opined he could no longer be a core helper or laborer, but felt he would be able to do the job of a core worker. Claimant has not missed work because of his back since December 21, 1982.

Judith Kammerdiner testified she is claimant's wife and remembered claimant complaining of leg pain in January of 1982. Mrs. Kammerdiner revealed that claimant complained a lot about back pain and leg pain. Mrs. Kammerdiner disclosed that she did most of the driving because claimant couldn't twist to look over his shoulder and also had a hard time tying his right shoe lace. Mrs. Kammerdiner opined that since his surgery claimant's pain has not been as bad and disclosed that claimant has started taking over driving again as well as mowing the lawn.

Roger Fiscus testified that he is assistant manager with defendant employer and indicated that claimant does his job well and is a good employee. Mr. Fiscus stated he was with claimant when he was injured and saw claimant experience the pain. Mr. Fiscus revealed that since his surgery claimant has done well and that he hasn't noticed claimant's limitations.

In a report dated October 14, 1982, HoSung Chung, M.D., disclosed that claimant underwent a hemilaminectomy and diskectomy at level L4-5 on the right and exploration of L5-S1 interspace on the right on September 28, 1982. Dr. Chung disclosed that claimant had been doing well without any subjective complaints.

In a report dated June 15, 1983 Arnold E. Delbridge, M.D., stated:

> Mr. Kammerdiner was seen initially on May 10, 1983 and then he appeared to be consistent as far as his findings are concerned. Therefore I don't think he changes significantly from one exam to the next in terms of motion and that type of thing.
>
> On exam at the time I saw him, Mr. Kammerdiner appeared comfortable. He was able to sit. He was able to walk. He was able to heel and toe walk without difficulty. Other than having some throbbing pain in his right leg he did not have noticeable weakness in his lower extremities according to him. He also did not have any difficlty with bladder problems or other potency problems.
>
> On exam at the time I saw him he had a loss of ten degrees of flexion of his back but otherwise a full range of motion. He had negative straight leg raising. He had symmetrical reflexes. He may have a tiny bit of residual weakness in his right great toe but that is minimal.
>
> On reviewing his operative report we found that they took the disc from L4 in his lumbar spine and explored the L5 disc but did not remove disc material.
>
> Considering that this gentleman had a disc space invaded, very minimal residual findings in his right leg and a ten degree loss of forward flexion I would rate him at an 8% permanent impairment.

APPLICABLE LAW

The claimant has the burden of proving by a preponderance of the evidence that the injury of January 28, 1982 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1967). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient: a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 258 N.W. 899, (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, ___ (1963).

The industrial commissioner has said on many occasions:

> Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 125 N.W.2d 251 (1963).

Barton v. Nevada Poultry, 253 Iowa 285, 110 N.W.2d 660 (1961).

> A finding of impairment to the body as a whole found by a medical evaluator does not equate to industrial disability. This is so as impairment and disability are not identical terms. Degree of industrial disability can in fact be much different than the degree of impairment because in the first instance reference is to loss of earning capacity and in the later to anatomical or functional abnormality or loss. Although loss of function is to be considered and disability can rarely be found without it, it is not so that an industrial disability is proportionally related to a degree of impairment of bodily function.
>
> Factors considered in determining industrial disability include the employee's medical condition prior to the injury, after the injury and present condition; the situs of the injury, its severity and the length of healing period; the work experience of the employee prior to the injury, after the injury and potential for rehabilitation; the employee's qualifications intellectually, emotionally and physically; earnings prior and subsequent to the injury; and age, education, motivation, and functional impairment as a result of the injury and inability because of the injury to engage in employment for which the finder of fact considers collectively in arriving at the determination of the degree of industrial disability.
>
> There are no weighting guidelines that are indicated for each of the factors to be considered. There are no guidelines which give, for example, age a weighted value of ten percent of total, education a value of fifteen percent of total, motivation - five percent; work experience - thirty percent, etc. Neither is a rating of functional impairment entitled to whatever the degree of impairment that is found to be conclusive that it directly correlates to that degree of industrial disability to the body as a whole. In other words, there are no formulae which can be applied and then added up to determine the degree of industrial disability. It therefore becomes necessary for the deputy or commissioner to draw upon prior experience, general and specialized knowledge to make the finding with regard to degree of industrial disability.

See Birmingham v. Firestone Tire & Rubber Company, II Iowa Industrial Commissioner Report 39 (1981); Enstrom v. Iowa Public Services Company, II Iowa Industrial Commissioner Report 142 (1981); Webb v. Lovejoy Construction Co., II Iowa Industrial Commissioner Report 430 (1981).

ANALYSIS

Claimant has met his burden in proving that all of his back and leg problems were related to his injury on January 28, 1982. The undersigned found claimant and his wife credible. Claimant and his wife testified that the wood chopping incident did not change the location or kind of pain he had previously experienced. The medical reports also indicate that the symptoms of which claimant complained were the same from January 28, 1982 until the surgery on claimant's back. Furthermore, no contradictory evidence was submitted.

Claimant has also met his burden in proving he has some permanent impairment as a result of his injury. Dr. Delbridge rated claimant's permanent impairment at eight percent. However, permanent impairment is only one of the criteria in determining a person's industrial disability. Claimant was born on November 6, 1947 and is a high school graduate. Claimant has taken a six week course in blueprint reading and a course in metallurgy. Claimant has worked for defendant employer since he was 18 in jobs of laborer, core maker helper, core maker and inspector. Claimant's jobs have required some heavy lifting.

Since his surgery claimant has returned to the job he held at the time of his injury and has been able to handle his job. Although claimant may not experience an actual reduction in earnings, he has suffered a reduction in his earning capacity. As disclosed by claimant, he has changed the way he lifts things and the amount he lifts. Other employers would be less likely to hire claimant if he loses his job for any reason. It is determined that as a result of his injury, claimant has an industrial disability of fifteen percent.

FINDINGS OF FACT AND CONCLUSIONS OF LAW

WHEREFORE, based on the evidence presented and the principles of law previously stated, the following findings of fact and conclusions of law are made:

FINDING 1. On January 28, 1982 claimant was injured while working for defendant employer.

FINDING 2. On May 11, 1982 claimant had a pain while chopping wood but that episode did not increase claimant's problems.

FINDING 3. As a result of that injury claimant required surgery on his back.

FINDING 4. As a result of his injury and back surgery claimant has a permanent impairment of eight prcent (8%) of the body.

FINDING 5. Claimant was born on November 6, 1947.

FINDING 6. Claimant is a high school graduate and completed a six week course in blueprint reading as well as a course in metallurgy.

FINDING 7. Claimant has worked for defendant employer since he was eighteen (18) years old.

FINDING 8. Claimant has worked as a laborer grinding cores, core maker's helper, core maker and inspector.

FINDING 9. Claimant returned to the job he held at the time of his injury afer recovery from his surgery.

FINDING 10. Claimant is a good worker.

FINDING 11. Claimant has been able to handle his job since returning to it.

CONCLUSION A. Claimant has met his burden in proving his problems are causally connected to the injury he received on January 28, 1982.

CONCLUSION B. Claimant has met his burden in proving he has an industrial disability of fifteen percent (15%) as a result of his injury on January 28, 1982.

ORDER

THEREFORE, defendants are to pay unto claimant eighteen and six-sevenths (18 6/7) weeks of additional healing period benefits at a rate of two hundred fifty and 68/100 dollars ($250.68) per week and seventy-five (75) weeks of permanent partial disability benefits at a rate of two hundred fifty and 68/100 dollars ($250.68) per week.

Defendants are to be given credit for benefits paid under the group plan.

Defendants are ordered to reimburse claimant for any medical bills shown in claimant's exhibit 12 which were paid by claimant or remain unpaid.

Defendants are ordered to reimburse claimant sixty-nine and 17/100 dollars ($69.17) for mileage expenses.

Interest is to accrue in this award from the date of this decision.

Accrued benefits are to be made in a lump sum together with statutory interest at the rate of ten percent (10%) per year pursuant to section 85.30, Code of Iowa, as amended.

Costs are taxed to defendants pursuant to Industrial Commissioner Rule 500-4.33.

Defendants shall file a final report upon payment of this award.

Signed and filed this 27th day of September, 1984.

and	:	A P P E A R A N C E
ROCKWOOD INSURANCE CO. TRUCKERS INSURANCE ASSOC.,	:	FILED
Insurance Carrier, Defendants.	:	SEP 27 1984
		IOWA INDUSTRIAL COMMISSIONER

Defendants filed their special appearance challenging the jurisdiction of the industrial commissioner on July 2, 1984. Claimant did not file a formal response, but filed an affidavit of claimant's counsel on July 27, 1984. Defendants filed a request for hearing on July 10, 1984. Pursuant to an order of this agency filed August 7, 1984, a telephone hearing was held August 14, 1984. Defendants filed their brief in support of special appearance on August 17, 1984.

In their special appearance, defendants assert the following facts: Claimant's employer is Lorenzen Trucking, a sole proprietorship with its principal place of business in Omaha, Nebraska. The employer has not maintained an office in Council Bluffs, Iowa since February 1, 1984 when the employer's base of operations was moved to Omaha, Nebraska. The employer has not conducted business in Council Bluffs since its move to Omaha. Claimant is an over-the-road truck driver whose injury occurred in Detroit, Michigan. Claimant drove trucks owned by the employer and leased to others with each trip commencing and ending at the employer's base of operations in Omaha, Nebraska effective February 1, 1984. Also, as of February 1, 1984, all communications of claimant by telephone were with the employer or his representatives in Omaha, Nebraska. On or after that date the employer's dispatcher operated from the employer's Omaha office.

Defendants further assert that based on the foregoing recital of facts, claimant's employment was principally localized in Nebraska on his alleged injury date and that the employer's place of business was in Nebraska on the injury date, and that claimant regularly worked at or from that place of business, and that the Iowa Industrial Commissioner and the Iowa courts of general jurisdiction do not have jurisdiction of the subject matter of claimant's petition under section 85.71.

Defendants also assert a lack of personal jurisdiction over defendants and a resulting constitutional deprivation of property without due process of law.

The affidavit of claimant's attorney states that the affiant is familiar with the operation of the employer, Lorenzen Trucking and Booth Refrigerated Freight; that the employer has just recently moved its operation from Council Bluffs, Iowa to Omaha, Nebraska; that at the time of claimant's injury, the employer's operations were located in Council Bluffs, Iowa; and the employer hired claimant through that location.

At oral hearing, claimant further alleged the employer continues to do business in Iowa and defendants admitted payroll checks for Lorenzen Trucking are drawn on a Council Bluffs, Iowa bank though either mailed from or picked up in Omaha. Defendants stated defendant Lorenzen Trucking is a subsidiary of defendant Booth Refrigerated Lines, Inc., a Nebraska corporation located in Omaha.

Claimant's petition alleges a May 9, 1984 injury date and that claimant's address is "RR 1, Fairfax, Missouri [sic] Iowa 64446." All parties agree claimant's domicile is in Iowa.

Section 85.71 provides:

> If an employee, while working outside the territorial limits of this state, suffers an injury on account of which he, or in the event of his death, his dependents, would have been entitled to the benefits provided by this chapter had such injury occurred within this state, such employee, or in the event of his death resulting from such injury, his dependents, shall be entitled to the benefits provided by this chapter, provided that at the time of such injury:
>
> 1. His employment is principally localized in this state, that is, his employer has a place of business in this or some other state and he regularly works in this state, or if he is domiciled in this state, or
>
> 2. He is working under a contract of hire made

in this state in employment principally localized in another state, whose workers' compensation law is not applicable to his employer, or

3. He is working under a contract of hire made in this state for employment outside the United States.

In interpreting section 85.71(1), the Iowa Supreme Court in Iowa Beef Processors, Inc. v. Miller, 312 N.W.2d 530, 534, Iowa 1981), stated domicile alone is not sufficient to entitle an employee, injured outside Iowa, to benefits under our Act, but rather, some meaningful relationship between domicile and the employer-employee relationship must exist. The court then held that the employer's placement of a help wanted ad, to which claimant responded, in an Iowa newspaper was not material to claimant's employment and was, therefore, insufficient to supply the necessary connection. The court did not address the issue of how sufficient the connection between domicile and the employment relationship must be to entitle an employee injured in another state to benefits under our Act.

The Iowa Supreme Court next addressed the interpretation of section 85.71 in George H. Wentz, Inc. v. Sabasta, 337 N.W.2d 495 (Iowa 1983). In Wentz, the court expressly overruled Haverly v. Union Construction Co., 18 N.W.2d 629 (Iowa 1945). That case held that making an employment contract in Iowa without more would support an award of benefits under our Act. The Wentz court at 499 said: "We think Iowa law on extraterritorial application of our workers' compensation act has changed since the Haverly decision, and the rule of that case is no longer valid."

The court then said at page 500:

The place of contract or hiring becomes significant only when the employment is not principally localized in any state, the law of the state where the employment is principally localized is not applicable to the employer, or the employment is outside of the United States....Permitting recovery of Iowa benefits based solely on a showing the contract of hire was made in Iowa, following Haverly, would render nugatory the additional requirements of subsections 85.71(2), (3) and (4) of the act.

In Iowa Beef Processors and Wentz, the court referred to the Counsel of State Governments Model Act definition of principally localized employment which reads as follows:

A person's employment is principally localized in this or another state when (1) his employer has a place of business in this or such other state and he regularly works at or from such place of business or (2) if clause (1) foregoing is not applicable, is domiciled and spends a substantial part of his working time in the service of his employer in this or such other state.

Section 85.71(1) clearly is inapplicable to claimant. Claimant's employment is not principally localized in this state since claimant does not regularly work in Iowa. Claimant is domiciled here but the only apparent relationship between his domicile here and the employer-employee relationship is that his employer had a place of business in this state when claimant was hired and that the employer draws its payroll checks from an Iowa bank. Neither of these alone is sufficient to establish a meaningful relationship between claimant's domicile here and his relationship with an employer whose place of business was outside this state on claimant's injury date. Likewise, these two disjoint facts together are not sufficient to establish the requisite meaningful relationship and subsection 1 does not provide this agency with jurisdiction.

Subsection 4 is clearly inapplicable since claimant's employment is within the United States. Thus, claimant is within the purview of our Act only if his situation is within the perimeters of subsections 2 or 3.

Whether claimant's employment is principally localized in any state and if so, which state, is the controlling issue as regards subsection 2. We look to the Model Act definition of principally localized employment for assistance with this issue. The definition, in its subsection 1, finds principally localized employment when an employee's employer has a place of business in the state and the employee regularly works at or from such place of business. Claimant's employer has its place of business in Omaha, Nebraska. Claimant is an over-the-road truck driver. Claimant picks up his loads and is dispatched from the Omaha work site. He returns to that site. Communication between claimant and his employer originate at that site. Clearly, claimant regularly works from that job site. Indeed, despite the interstate nature of claimant's truck driving, in this regard his situation is little different from that of an intracity delivery person who is dispatched from and returns to a specific work site at completion of his assigned deliveries. Claimant, thus, works in employment principally localized in Nebraska and subsection 2 does not confer jurisdiction over his claimant upon this agency.

Subsection 3 also is inapplicable to claimant's circumstance. That section would only apply if Nebraska's workers' compensation law were not applicable to claimant's employer. Neither party specifically addressed this issue and facts expressly proving claimant's employer is within the purview of the Nebraska Act were not presented. Claimant's employer has his place of business in Nebraska, however. In the absence of exceptional circumstances which exempt him from that state's statutes, the employer is charged to abide by them. The reasonable inference, therefore, is that Nebraska's workers' compensation statute is applicable to claimant's employer. Thus, subsection 3 also does not grant this agency jurisdiction over claimant's claim.

Section 85.71 does not confer jurisdiction over claimant's claim onto the Iowa Industrial Commissioner. Defendants' special appearance is sustained. The issues of personal jurisdiction and constitutionality of the Iowa statute will not be addressed.

WHEREFORE, IT IS FOUND:

Section 85.71 does not confer jurisdiction over claimant's claim onto the Iowa Industrial Commissioner.

THEREFORE, IT IS ORDERED that defendants' special appearance is sustained.

Signed and filed this 27th day of September, 1984.

FILED
AUG 27 1984
IOWA INDUSTRIAL COMMISSIONER

By order of the industrial commissioner filed April 20, 1984 the undersigned deputy industrial commissioner has been appointed under the provisions of §86.3, Code of Iowa, to issue the final agency decision on appeal in this matter. Defendants appeal an adverse review-reopening decision.

There is no recitation of the record by the hearing deputy. The record appears to consists of the transcript; claimant's exhibits A, B, C and D; and defendants' exhibits A and B, all of which evidence was considered in reaching this final agency decision.

This final agency decision will modify the review-reopening decision in that the award for permanent partial disability will be lowered.

ISSUE

Defendants raise one issue on appeal: "Whether the Hearing Officer erred in finding that the Claimant's industrial disability is 30 percent of the body as a whole."

EVIDENCE PRESENTED

Claimant was hurt on February 1, 1979 when some materials fell from above as he was getting out of an elevator. Apparently some fellow employees threw flour and liquid food coloring onto claimant. He injured his neck and shoulder. He missed some six

days of work and was able to return to his usual activities. However, his neck did not respond well to treatment and he continued to have problems.

Defendants do not directly argue that there was no causal relationship between the injury and the resulting impairment. Rather, they point out that the evidence of Keith McLarnan, M.D., is equivocal in apportioning the disability. Dr. McLarnan, in part, states: "[t]he degenerative changes in the cervical spine could not entirely be accounted for in his accident in February, 1979. The accident may have aggravated a pre-exhisting [sic] condition." Further, the original treating physician, Aaron L. Katz, D.O., says nothing about permanent impairment, and William P. Isgreen, M.D., who evaluated claimant, found no impairment which was attributable to the injury.

Thus far, the recitation does not support a finding that any part of claimant's impairment was caused by the injury. However, in a report of October 6, 1982, Dr. McLarnan gave claimant a permanent partial impairment and stated that "I do not think this can be totally ascribed to his work." He went on to say that the degenerative changes account for claimant's impairment but his preexisting condition can be aggravated. Dr. McLarnan's opinion, as principal treating physician, is given the greater weight.

It is clear, therefore, that the resulting condition came from a combination of (1) the preexisting degenerative condition and (2) the work injury. A prior, nondisabling defect that contributes to the end result is not subject to apportionment, and an aggravation of that condition can be fully compensated. Varied Enterprises, Inc. v. Sumner, ___ N.W.2d ___ (Iowa August 22, 1984).

The question of whether or not claimant's termination from his employment has any compensable consequences requires a more substantial review of the record.

Claimant testified:

Q. What was the reason given for your discharge?

A. Oh, like I say, mis -- not for the safety precautions -- How they call?

Q. Failure to follow safety precautions?

A. Yes.

Q. Can you tell us what that incident involved?

A. There was a -- That day with no reason they have called union steward, and the union to come down with no reason. It's normal. If anything was wrong they have given warning letter or warning letter to be there, and that day came down with no reason.

Q. Well, what were they saying you were doing wrong?

A. Okay. And that day before this happened, we have argument about schedule or schedule -- working schedule to know what's my job, what I have to do. So that they refuse tell me, and they -- about the work, what work I have to do. They told me I have to do anything that they tell me to do, so --

Q. Is chis something different that had been happening --

A. Different than my regular job, yeah. That -- it was not my regular job, no.

Q. But previously had you been scheduled and --

A. Yes.

Q. -- had you been told by --

A. I had orders if I had to do something the day or two before to do.

Q. Now, did the -- did they say something to you about turning the electric off while cleaning the ovens?

A. No. They didn't say nothing. I have done some way -- There is two ways, they say. One way I knew, because I have worked the area for six, seven -- for six years. There is two kinds. There is switch bar.

Q. Switch bar?

A. Yeah.

Q. Switch bar.

A. Closing -- shut off the power. And I have done same way I knew it, so -- And five minutes later, everybody come back and say I don't have shut off the power. I didn't have locked the power, the main -- the main box.

Q. You hadn't turned off the power at the main box?

A. No. If I was -- First, if I was done that way that time, it's no lights to go on; and second, no one told me any difference than I knew.

Q. So your complaint was that nobody had told you that you had --

A. To do anything different, yeah.

Q. We can only talk one at a time, Bill. No one had told you to do it any different, and if you did shut off the main light then you wouldn't have any light to clean the oven?

A. Yes.

Q. Was that your understanding?

A. Yes.

Q. And that resulted in your being fired?

A. Yes. (Tr., pp. 42-43 ll. 4-25, 1-25 and 1-6)

Claimant further testified:

Q. Okay. They claimed that you violated a lockout procedure, do they not?

A. They claim.

Q. Pardon me?

A. They claim, but the truth, it's not there.

Q. Okay. Now, what's a lockout procedure?

A. It's -- Like I don't understand why they try to say -- First there was not my job to be there. I don't know what they have. I don't have no idea. I have done the way with safety -- with safety I knew it, and I have done it.

What they say, I don't have no idea how they come up with numbers. I don't understand with numbers. They put that in reading numbers. I don't have no idea.

Q. A lockout procedure has something to do with turning off machines for the safety of the employee, does it not?

A. Yes. I have done it.

Q. All right. And they claim that you violated a procedure for the safety of an employee, is that not true?

A. No, it wasn't. No.

Q. Don't they claim that?

A. They claim, but it wasn't.

Q. Okay. All right. They claim that you didn't turn off a machine --

A. Yes.

Q. -- for your own safety, do they not?

A. No, no. There is two -- also two ways to shut off, and I did it one way I knew. The way I have shut off is a mistake. Was not running. The machine was not running. I have shut off. And that part you cannot use lock on that bar, because it's thin bar. It's no way to pull.

They came out with the main power. It's not the case to do one with the other.

Q. But, again, the employer alleges, do they not, or they claim, do they not?

A. They claim.

Q. All right. And it's up for someone else to determine whether or not --

A. Yeah, yeah. They claim, but it's not the truth.

Q. All right. That's a matter for somebody else --

A. Yes.

Q. -- to decide?

A. Yes.

Q. Except for your termination in March of 1983 for the claimed violation of a company policy, do

you feel you could still be working at Continental Baking?

A. Yes. Not because they like me. (Tr., pp. 79-81 ll. 6-25, 1-25 and 1)

Clyde Edwards, the plant sanitarian and claimant's supervisor, testified:

Q. Had he been locking out the ovens?

A. This was the first time that he had locked out the oven, but he had used the lockout procedure in the mixing area, because when they clean mixers, they lock the mixers out the same way as the oven.

Q. Is that a safety precaution for that particular employee?

A. Yes. Any -- any person, maintenance, the engineers, sanitation or production, whenever they'd work on a piece of equipment, cleaning the inside, or whatever, they have to lock it out --

Q. Okay.

A. -- so it can't be turned on.

Q. Except for his current problem with the company, do you know of any reason why he could not still be working for Continental Baking?

A. No, I don't. (Tr., pp. 96-97 ll. 10-25 and 1)

The hearing deputy's analysis states as follows:

> Claimant's testimony, which stands unrebutted, concerning the harassment that he underwent at the hands of his co-employees borders upon the edge of unconscionable behavior.
>
> In addition, the assault which gave rise to this industrial injury, claimant's testimony relating to having his locker broken into on three occasions, having his car stolen, windshield smashed and tires slashed, indicate a pattern of physical and mental harassment that appears to have been condoned by the defendant employer. The net result of this outrageous conduct appears to be that the claimant was discharged by the defendant employer. The testimony of Clyde Edwards, claimant's foreman, belies the actions of the defendant employer. It is concluded that claimant was discharged by the defendant employer because of his industrial injury and the fact that claimant saw fit to file this proceeding. The testimony of Mr. Edwards is rejected as it relates to the reason for claimant's discharge.
>
> Claimant's discharge is found to be predicated upon claimant's injury which gives rise to claimant's continuing inability to find work.

Some of claimant's testimony about the vandalism is as follows:

Q. Okay. Have you ever been able to prove, Mr. Karras, that it was Continental Baking or persons employed by them were the ones who slashed your tires or broke your windshield or did things of that nature?

A. Just a minute. For one thing, the reason -- Like I said, one reason, say -- To prove, no. Mrs. Miller, she told me the windshield was -- She give me idea it was a little farther by -- It happened like mistake, all right?

The only thing I have, they have my car towed twice off the place for damage. If I have caught who it was -- If I have caught who has stolen my car or have the other things they have done, is not reason to repeat here, because it is responsible on him, the person who has done it.

Q. But you can't say somebody from Continental Baking did that?

A. Yes, because in the morning nobody else was there. It's snowing and -- and minutes from up -- to go from outside my car. I was running to get in. Was a minute. No one was walking on a snowing day.

The first time happened was wintertime, snowing, and no one moving round there. It's not -- I don't have to go -- If someone was stealing my car, they have -- get away, not get the car for damage, both times.

And after three weeks, they do it -- they do it again. The person who has the keys, after second time. There is -- Things speak for themselves what goes on there. (Tr., pp. 76-77 ll. 25 and 1-25)

APPLICABLE LAW

The authorities recited by the hearing deputy are adequate.

ANALYSIS

First, the evidence seems conclusively to show that claimant was discharged in a dispute over a safety procedure. Nothing in the evidence suggests that there was any connection to the injury. As defendants rhetorically ask, why would the employer wait four years after the injury to fire claimant because of the injury?

Second, the facts do show that claimant was harassed by fellow employees and that his injury was caused by certain of them. There was no showing, however, that the employer even remotely condoned such conduct. Thus, the matter of the discharge and of claimant's fellow employees bullying him and vandalizing his property may be labor disputes, but they are neither compensable nor even relevant to the Iowa Workers' Compensation Law.

Thus, since the review-reopening decision held that a wrongful discharge contributed to claimant's industrial disability, that disability must be re-evaluated.

Claimant was born in Greece in 1933 and went to the equivalent of sixth grade there. He had some experience in working in retail stores and drove a truck in the military service. In the late 50s and early 60s, he drove buses and trucks in Greece. He arrived in the United States in 1967 and began working for the defendant employer in the sanitation department. He has difficulty in reading and speaking English and has no formal education in this country. On the other hand, claimant appears to be a hard worker and his physical impairment is moderate. Considering the various factors of industrial disability, he is found to have sustained an industrial incapacity of 20 percent.

After claimant's appeal brief was filed, he and his attorney went separate ways, and the attorney filed an application for a lien. This decision does not concern that dispute, and it is left to the attorney to pursue his remedy.

Some of the findings of fact of the review-reopening decision have been retained, and one is new.

FINDINGS OF FACT

1. That this agency has jurisdiction of the persons and the subject matter.

2. That the claimant sustained an admitted industrial injury on February 1, 1979.

3. That said industrial injury occurred when unidentified co-employees threw flour and liquid food coloring onto claimant.

4. That the claimant was riding in a freight elevator at the time of this assault.

5. That in an attempt to flee this encounter, claimant jumped over the safety gate falling onto the floor from a height of five feet injuring his neck and shoulder.

6. That the defendant employer failed to conduct an investigation following this incident.

7. That the claimant has undergone additional mental harassment since this episode in the form of theft and damage to his personal property while on the defendant employer's premises.

8. That the claimant was discharged by the defendant employer in March of 1983.

9. That Dr. McLarnan's statement that the injury cannot be totally ascribed to his work is construed to mean that the work injury nevertheless did substantially contribute to claimant's cervical problems.

10. That some of claimant's medical expenses remain unpaid.

CONCLUSIONS OF LAW

On February 1, 1979 claimant sustained an injury which arose out of and in the course of his employment and which resulted in an industrial incapacity of twenty (20) percent of the body as a whole.

Claimant's discharge from his work by his employer was not connected to the injury.

ORDER

WHEREFORE, defendants are hereby ordered to pay weekly compensation benefits unto claimant at the rate of one hundred forty-three and 38/100 dollars ($143.38) for a period of one hundred (100) weeks for the permanent partial disability beginning on March 15, 1983, accrued payments to be made in a lump sum together with statutory interest from February 24, 1984.

Defendants are ordered to pay the following medical expenses:

Marian Health Center	$276.00
Keith McLarnan, M.D.	236.00

Costs are charged to the defendants under Iowa Industrial Commissioner Rule 500-4.33.

Defendants are ordered to file an activity report within twenty (20) days from the date below.

Signed and filed this 27th day of August, 1984.

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

VASILIOS KARRAS, Claimant,	:	
vs.	:	File No. 526945
CONTINENTAL BAKING CO., INC., Employer,	:	R E V I E W - R E O P E N I N G D E C I S I O N
and	:	
INSURANCE COMPANY OF NORTH AMERICA, Insurance Carrier, Defendants.	:	FILED FEB 24 1984 IOWA INDUSTRIAL COMMISSIONER

This is a proceeding in review-reopening brought by Vasilios "Bill" Karras, claimant, against Continental Baking Co., Inc., his employer, and Insurance Company of North America, the insurance carrier, to recover additional benefits under the Iowa Workers' Compensation Act by virtue of an industrial injury that occurred on February 1, 1979. This matter came on for hearing at the courthouse in Sioux City, Iowa on Tuesday, October 4, 1983, at 2:00 p.m., and considered as fully submitted at the conclusion of the hearing.

Prior to the commencement of litigation, defendants made all of the necessary appropriate statutory filings. It appears therefrom that the agreed rate for temporary total disability was $143.38 per week. It further appears that the appropriate rate for permanent partial disability is likewise $143.38 per week. Form 5 filed by defendants on May 7, 1979 indicates the claimant was paid temporary/healing period for three of the six day period from February 5, 1979 through February 10, 1979, for a total sum of $61.45. It does not appear any payment has been made to the claimant for permanent partial disability benefits.

The issues to be determined are whether there is a causal relationship between the claimant's injury and the resulting disability, as well as the extent of that disability. There is also an issue as to whether certain medical expenses were authorized by the employer under section 85.27.

There is sufficient credible evidence contained in this record to support the following statement of facts, to wit:

Claimant, Vasilios "Bill" Karras, single, was born on or about December 20, 1933 in the country of Greece. He attended school in Greece to a point that appears to be equivalent to a sixth grade education in the United States of America. Thereafter, he engaged in various unskilled work until he served in the Greek Army. It appears that prior to coming to the United States, he was employed principally as a driver of a truck. Claimant immigrated to the United States in August of 1967, and was employed August 14, 1967 as a janitor at Continental Baking Co., Inc. He was employed almost continuously as a janitor at Continental Baking Co., Inc. from August 14, 1967 to March 15, 1983. It appears that on or about May 11, 1969 claimant injured his back in the course of his employment resulting in herniated intervertebral discs at the L-4, L-5 level and L-5, S-1 levels. Semi-laminectomy of the L-4 and S-1 segments and excision of herniated discs were performed on July 17, 1969 and claimant was later determined to have eight percent to ten percent disability of the body as a whole.

The claimant's next injury was in February of 1975. The claimant was in a car accident at the time and sustained an injury to the neck. The claimant testified that he was bothered with this injury until the fall of 1976.

Claimant testified that on or about February 1, 1979, while riding the freight elevator from the mixing room to the basement, the elevator stopped between floors and someone dumped flour, caramel color and water on claimant from one of the upper levels. In getting out of the elevator which had been stopped between floors, claimant fell injuring his right arm, shoulder and neck. Claimant treated with Aaron K. Katz, D.O., for the injuries sustained during the months of February, March and April 1979, but actually missed only six days of work from the 5th day of February, 1979 through the 10th day of February, 1979. It appears that in October of 1979, claimant had an aggravation of the February 1, 1979 injury and again treated with Dr. Katz from October 15, 1979 through April 25, 1980.

Next, the claimant injured his left knee. This was in November of 1980 (Defendants' Exhibit 1, Item 15). In August of 1981 the claimant sustained a back injury. The record (Defs. ex. 1, item 16) reveals that the claimant was lowering a metal shelf and twisted his back. The next injury was in October, 1982. The claimant testified that he injury his left shoulder, neck and back. The record (Defs. ex. 1, item 17) reveals that the claimant was pulling a catch pan out from beneath the dough mixer. The catch pan was half full of water and hard to pull out. The floor was wet and the claimant's feet slipped out from under him and he fell backward on his arm and shoulder. The claimant's last injury was in March of 1983. This was an injury to the left knee. The claimant had surgery on the knee and testified that he was capable of going back to work six to eight weeks following the surgery. The claimant testified that following each of his injuries he was capable of doing what he did before and could do the same job now. However, no claims are being made in this action for such subsequent injuries. The difficulties that claimant experienced with his shoulder, neck and back did not appear to completely resolve themselves and in July of 1981 Dr. Katz referred him to Keith McLarnan, M.D. In a letter to the claimant's attorney dated January 18, 1982, Dr. McLarnan wrote: "...[T]he degenerative changes in the cervical spine could not entirely be accounted for in his accident in February, 1979. The accident may have aggravated (emphasis added) a pre-exhisting [sic] condition...."

In a follow-up letter to the claimant's attorney dated October 6, 1982, Dr. McLarnan wrote: (Defs. ex. 1, item 11)

> [H]e does not qualify for loss of motion in that plane of action. Nor does he qualify for loss of motion with head tilting at least 35 degrees to the left or the right and in anteflexion. However, retroflexion seems somewhat restricted for 3% evaluation.
>
> There is obvious X-ray evidence of anterior bridging and ankylosis between C4 and 5 and between C5 and 6 vertebral bodies and the alignment is off; hence, that's probably a 13%.
>
> Finally, he has had some radicular involvment for pain but I have never been able to depict clear cut loss of muscle strength or reflex pattern changes and in the latter examinations he has had less problem with sensation than originally, so I judge that to be about 5%. Accordingly, summation would be 21%.
>
> I do not think this can be totally ascribed to his work. These are degenerative changes...but (the accidents) could not be the sum total cause of these changes...

Dr. McLarnan has further indicated that the accidents that claimant has had could have caused an aggravation of preexisting problems or conditions of the claimant.

The defendants had the claimant evaluated by William P. Isgreen, M.D., on January 5, 1983. In his formal neurological evaluation dated January 5, 1983, Dr. Isgreen wrote: (Defs. ex. 1, item 12)

PHYSICAL EXAMINATION:

The general examination is unremarkable.

NEUROLOGICAL EXAMINATION:

Examination of the head and neck shows gingerly calculated movements of the neck in all directions,... There is no spasm. There is no point tenderness on percussion of the spine. Mobility as the man talks and gestures and moves ahead when other movements are called for, was perfectly unrestricted. This is both in the vertical and horizontal plane....

DISCUSSION:

The only abnormality of any note that I can detect... is depressed right ankle jerk....I really don't think it has anything to do with the accident as related from February of 1979.

The x-ray report from July of 1981 shows spondylitic changes in the cervical spine....

It really is inconceivable to my mind that this is related to the man's alleged accident in 1979.... However, I rather suspect that the man's degenerative disease would be at the same place it is right now with the same symptoms given injuries or not. In fact, cervical spondylitic disease...is not felt to be accident or injury related.

In Dr. Isgreen's January 5, 1983 letter to the defendants' attorney he states: (Defs. ex. 1, item 12)

> The man has cervical spondylitic disease as described on the x-ray of 1981. And the man's symptoms are not unusual for that entity....
>
> I find no permanent impairment in Mr. Karras as a result of his injury in 1979. His problem of a cervical...spondytlic [sic] problem is almost by definition not trauma related.... By enormous stretch of imagination and fact, one might say that a pre-existing condition was aggravated. It may have been aggravated for awhile but that state was not made worse by injury. The man would have gotten to the same place in the same amount of time, injury or not.

Since there is no evidence of preexisting problems or conditions to the neck and shoulder area of claimant that kept him from doing his work, one must assume that any problems or conditions claimant had in that area were dormant and were accelerated by the accident of February 1, 1979.

The balance of the exhibits submitted in conjunction with the trial of this case have been reviewed and considered in the final disposition of this case.

The claimant has the burden of proving by a preponderance of the evidence that the injury of February 1, 1979 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

In applying the foregoing legal principles to the case at hand, it is concluded that the claimant has bourne his burden of proof. The opinion of Dr. McLarnan as the attending physician is given the greater weight in this decision and it is found that the claimant has a 20 percent functional impairment of the body as a whole traceable to this elevator incident.

Claimant's testimony is given the greater weight in this decision. Claimant's 14 year history of employment by the defendant employer weighs heavily in the claimant's favor, especially when taken together with claimant's demeanor at the hearing.

Claimant's testimony, which stands unrebutted, concerning the harassment that he underwent at the hands of his co-employees borders upon the edge of unconscionable behavior.

In addition, the assault which gave rise to this industrial injury, claimant's testimony relating to having his locker broken into on three occasions, having his car stolen, windshield smashed and tires slashed, indicate a pattern of physical and mental harassment that appears to have been condoned by the defendant employer. The net result of this outrageous conduct appears to be that the claimant was discharged by the defendant employer. The testimony of Clyde Edwards, claimant's foreman, belies the actions of the defendant employer. It is concluded that claimant was discharged by the defendant employer because of his industrial injury and the fact that claimant saw fit to file this proceeding. The testimony of Mr. Edwards is rejected as it relates to the reason for claimant's discharge.

Claimant's discharge is found to be predicated upon claimant's injury which gives rise to claimant's continuing inability to find work.

For example, a defendant employer's refusal to give any sort of work to a claimant after he suffers his affliction may justify an award of disability. McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (Iowa 1980).

"Claimant is not entitled to reimbursement for medical bills unless he shows that he paid them from his own funds." See Caylor v. Employers Mut. Cas. Co., 337 N.W.2d 890 (Iowa App. 1983).

In applying the foregoing legal principles to the case at hand, it is concluded that the defendants failed to abide by the rule as announced above.

THEREFORE, after having seen and heard the witnesses in open hearing and after taking into account all of the credible evidence contained in this record, the following findings of fact are made:

1. That this agency has jurisdiction of the persons and the subject matter.

2. That the claimant sustained an admitted industrial injury on February 1, 1979.

3. That said industrial injury occurred when unidentified co-employees threw flour and liquid food coloring onto claimant.

4. That the claimant was riding in a freight elevator at the time of this assault.

5. That in an attempt to flee this encounter, claimant jumped over the safety gate falling onto the floor from a height of five feet injuring his neck and shoulder.

6. That the defendant employer failed to conduct an investigation following this incident.

7. That the claimant has undergone additional mental harassment since this episode in the form of theft and damage to his personal property while on the defendant employer's premises.

8. That the claimant was discharged by the defendant employer in March of 1983.

9. Notwithstanding defendant employer's position that claimant was discharged for failure to follow safety rules, it is found that claimant was discharged for reasons surrounding this industrial injury.

10. That the claimant has a 20 percent functional impairment of the body as a whole by reason of this injury.

11. That some of claimant's medical expenses remain unpaid.

12. That claimant's industrial disability is 30 percent of the body as a whole.

WHEREFORE, IT IS ORDERED that the defendants pay the claimant a one hundred fifty (150) week period of permanent partial disability beginning on March 15, 1983 at the weekly rate of one hundred forty-three and 38/100 dollars ($143.38) together with statutory interest from the date due.

Defendants are ordered to pay the following medical expenses:

Marian Health Center	$276.00
Keith McLarnan, M.D.	236.00

Costs are charged to the defendants under Iowa Industrial Commissioner's Rule 500-4.33.

Defendants are ordered to file an activity report within twenty (20) days from the date below.

Signed and filed this 24 day of February, 1984.

IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in review-reopening brought by Rose Kaster, claimant, against John Deere Davenport Works, self-insured employer, defendant, to recover additional benefits under the Iowa Workers' Compensation Act for an injury arising out of and in the course of her employment on September 28, 1981. It came on for hearing on July 12, 1984 at the Bicentennial Building in Davenport, Iowa. It was considered fully submitted at that time.

The industrial commissioner's file contains a first report of injury received January 28, 1982. On July 12, 1984 defendant filed a form 2A which shows the payment of weekly benefits from December 11, 1981 through January 31, 1982.

At the time of hearing the parties stipulated to a rate of compensation in the event of an award of $230.52 and to a conversion date of February 1, 1982.

The record in this matter consists of the testimony of claimant; claimant's exhibit 1, a bill from Lutheran Hospital; claimant's exhibit 2, nursing notes from defendant employer; claimant's exhibit 3, doctor's notes from defendant employer; claimant's exhibit 4, doctor's notes from defendant employer; claimant's exhibit 5, additional nursing notes; claimant's exhibit 6, a letter from M. A. Sanguino, M.D., dated September 12, 1983; claimant's exhibit 7, a letter from Dr. Sanguino dated September 30, 1983; claimant's exhibit 8, a letter from Dr. Sanguino dated November 14, 1983; claimant's exhibit 9, additional doctor's notes; claimant's exhibit 10, a report from Barry L. Fischer, M.D., dated April 4, 1984; claimant's exhibit 11, the curriculum vitae of Dr. Fischer; claimant's exhibit 12, a letter from John P. Johnson, D.O., with accompanying test results dated May 4, 1984; defendant's exhibit A, a letter from G. K. Dice, M.D., dated June 5, 1984; and defendant's exhibit B, a letter from Donovan D. Stiegel, M.D., dated January 9, 1984. Claimant filed a brief at the time of hearing.

ISSUES

The issues in this matter are whether or not there is a causal relationship between claimant's injury and any disability she now may suffer and whether or not she is entitled to permanent partial disability benefits.

STATEMENT OF THE CASE

Twenty-six year old single right-handed claimant commenced work for defendant on September 28, 1978 in the janitorial department where she was on hourly work. As of September 28, 1981 she had no restrictions.

She recalled the circumstances surrounding her injury on September 28, 1981 as follows: She was working the second shift. It was toward the end of her work time. She had cleaned the dispensery. She slipped and fell on a wet spot and landed on her knees and then threw her arms forward to catch herself. Her head jerked. She reported to the nurse. On her way home she noted that she was feeling sore and stiff. She saw the nurse again and then the company doctor who placed her on light duty. She was then seen by a series of doctors and she was hospitalized for a number of tests. She was off work from December 11, 1981 after an episode of laughing and received compensation until February 1, 1982.

When she went back to work, she was on light duty for a brief time and then went to regular duty. She took some time off for treatment. She was on layoff from October 10, 1982 until August 15, 1983. During that time she drew unemployment and a supplement from defendant.

After layoff she was again on light duty by order of the company doctor, Dr. Karlsson. After Thanksgiving she tried regular duty for four weeks, but she went back to light duty and she remained on light duty at the time of hearing. Her restrictions as assigned by Dr. Karlsson are avoidance of excessive head movement and no work above the shoulders.

Her present work assignment is as a "gofer" for other workers. She sometimes runs the strip tank. It is claimant's contention that she would make more money if she were doing incentive work. She claimed that she had quite a bit of overtime work in the janitor department. Her rate of pay at the time of injury was $10.35. It is now $10.41.

Claimant's current complaints are of tightness, pain and spasms in the back of her neck, tightness in the left scapula, pain in her left arm, redness and a cold feeling in her left hand, difficulty with pushing and pulling and a loss of grip strength. Her condition is aggravated by cold weather, and she is bothered by laughing, coughing, sneezing and certain movements of her head. Such things as having her hair done or going to the dentist are difficult. She also has difficulty with quick movements required by some sports activities. She takes Naprosyn.

Claimant acknowledged her testing has been negative and no surgery has been required.

Medical records from defendant show claimant pulled a muscle in her right shoulder on January 23, 1980, had neck pain in March of 1980, strained the left shoulder and scapula in May of 1980, complained of a sore shoulder in July of 1980 and reported neck, upper arm, right arm and upper back complaints in February 1981.

A note of September 30, 1981 records claimant's fall two nights before with soreness in the shoulder and left side which radiated to the spine. By the week after her fall she had soreness in her left shoulder and cervical spine.

She was seen by the company doctor, Dr. Karlsson, on October 8, 1981 at which time the muscle of the left trapezius was tense as were her paravertebral muscles on the left. There was a slight decrease in motion on bending to the right. The doctor's impression was muscle strain of the trapezius and possibly the low back. Claimant was placed on light duty with avoidance of pushing, pulling and twisting and of lifting weights over twenty pounds. Hot packs, ultrasound and Motrin were prescribed.

On December 8 Dr. Karlsson planned to refer claimant for evaluation to see if additional therapy or testing would be needed. However, on December 10, 1981 she had a sudden onset of pain in her back when she was laughing. The doctor observed that claimant's left arm was slightly bluer and colder than her right. Claimant's tilting her head to the right created pain. There was tenderness between the scapula and in the spine. Dr. Karlsson consulted with Dr. Rippenger who suggested a soft collar, muscle relaxants and bed rest.

Dr. Karlsson's note of December 15, 1981 reports Dr. Rippenger's feeling of a possible cervical disc protrusion. He recommended bed rest and exercise. Claimant was seen on January 15, 1982 and given a diagnosis of acute cervical strain. She was scheduled to return to work on January 30, 1982. She was to avoid using a buffer or doing heavy lifting. On February 17, 1982 claimant was moved to her regular work.

In August of 1983 claimant was placed under restrictions of no work above shoulder height, no repeated bending or twisting of the neck and limited use of the left arm.

In late November of 1983 claimant was returned to regular work. In January of 1984 claimant was restricted from gripping with both hands and from overhead work. At the end of the month the restriction was just on overhead work.

The following month restrictions were changed to no overhead work or repeated bending and twisting of the neck. As of April 5, 1984 those restrictions remained in effect.

M. A. Sanguino, M.D., neurologist, saw claimant on Septemer 12, 1983 at which time she complained of stiffness and pain in her neck with pain radiating into her left shoulder and occasional severe headaches. On examination there was tenderness in the supra-semispinalis on the left. The doctor's impression was chronic strain of the cervical spine, possible cervical myalgia or a cervical disc. He suggested cervical x-rays, electromyography and nerve conduction studies.

The above suggested tests were carried out and were termed essentially unremarkable and normal. Dr. Sanguino observed that claimant's left hand became colder than her right. He suspected a mild sympathetic dystrophy of the left upper extremity secondary to the injury. Claimant was started on Sinequan and a myelogram was proposed. The myelogram and a CT scan of the cervical spine were normal.

Donovan D. Stiegel, M.D., saw claimant on January 9, 1984 and concluded that claimant did not have thoracic outlet syndrome, causalgia or a sympathetic dystrophy. Claimant was exquisitely tender on the lateral aspect of the left side of her neck and in the right supraclavicular fossa over the scalene anticus. The doctor wrote: "I feel that this woman's symptoms are totally on the basis of strain, anxiety, and she has typical ligamenta nuchae tenderness, which goes along with this type of problem." As as vascular surgeon he did not recommend a surgery.

Barry Lake Fischer, M.D., board certified occupational physician, saw claimant on March 28, 1984 at which time she complained of pain, soreness and stiffness in her neck and left shoulder, pain and numbness in the left arm, swelling in the left arm and difficulty raising her left arm and turning her neck.

On examination Dr. Fischer found tenderness to palpation and pressure of the left cervical, rhomboid and trapezius area. There was decreased motion in the cervical spine. There was tenderness to palpation over the left shoulder as well as decreased shoulder range. Coolness of the skin suggested possible sympathetic dystrophy.

The doctor wrote that claimant had a strain to the left cervical, rhomboid and trapezius area with myositis, decreased motion in the cervical spine, residual left cervical tendonitis, a strain of the left shoulder with decreased motion and residual myositis on the left and the possibility of a reflex sympathetic dystrophy. A permanent partial disability of 25 percent of the left arm was assessed.

John T. Johnson, D.O., in a letter dated May 14, 1981 reports sending claimant to a neurologist, Daniel B. Johnson, M.D., who thought she had thoracic outlet syndrome, apparently based in part at least on his findings of slight prolongation of the distal ulnar sensory latency on the left. Dr. Johnson added that diagnosis to his own of chronic strain-type injury to the cervical, rhomboid and trapezius on the left with myositis of the musculature, decreased motion of the cervical spine with cervical tendonitis, decreased range of motion of the left arm and shoulder and probably a reflex sympathetic dystrophy.

Dr. Johnson causally connects claimant's condition to the injury and declares her condition to be permanent.

G. K. Dice, M.D., of defendant's medical department, apparently examined claimant in June of 1984. There was tenderness over the left trapezius and left corocoacromial ligament. Cervical ranges of motion were flexion 25°, extension 25°, right lateral bending 25°, left lateral bending 35°, right rotation 25° and left rotation 30°. A five percent impairment of the left upper extremity was assessed.

APPLICABLE LAW AND ANALYSIS

The claimant has the burden of proving by a preponderance of the evidence that the injury of September 28, 1981 is causally related to the disability on which she now bases her claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

Before her September 1981 injury claimant had complaints of a pulled muscle in her right shoulder, neck pain, strained left shoulder and scapula, the right arm and her upper back.

Claimant fell on her knees, threw her arms forward and jerked her head. Claimant has consistently complained of her left arm, shoulder and neck area. On examination shortly after her fall tenseness was found in the muscle of the left trapezius and paravertebral muscles. Her initial diagnosis was muscular strain of the trapezius and possibly the low back.

Claimant was seen frequently in the medical department where her complaints of shoulder and later neck pain were recorded on a persistent basis. She also developed trouble in her arms and hand.

On December 10, 1981 claimant had an aggravation of pain in a laughing incident according to medical department notes. Her trouble after that time seems to have been more in her neck and her diagnosis was of cervical strain. Claimant has been under restrictions of various sorts placed by the company doctor.

Claimant has had a number of tests of the cervical area which have been normal. She continued to have restriction of cervical motion in her most recent examinations. Several of claimant's physicians have suggested a possible sympathetic dystrophy. A vascular surgeon disagreed. Dr. Johnson specifically connects claimant's condition to her injury and finds her condition permanent. Drs. Fischer and Dice assign a permanent impairment to her upper extremity.

The record viewed as a whole supports the conclusion that claimant has a permanent condition related to her injury of September 28, 1981.

The next issue to be considered is that of permanent disability. Claimant has been given impairment ratings to her left upper extremity by the doctors she has seen. It is, of course, the province of this deputy commissioner to determine the site of the disability. Pullen v. Brown & Lambrecht, II Iowa Industrial Commissioner Report 308 (Appeal Decision 1982). Impairment of the cervical spine is disability to the body as a whole. Impairment of function of the shoulder also is considered disability of the body as a whole. Alm v. Morris Barick Cattle Co., 240 Iowa 1174, 38 N.W. 2d 161 (1949); Nazarenus v. Oscar Mayer & Co., II Iowa Industrial Commissioner Report 281 (Appeal Decision 1982).

Dr. Dice found tenderness over the left trapezius and left corocoacromial ligament. Although he does not indicate what normal values are in reporting the ranges of motion, the values he assigned appear to evidence some restriction in the cervical area. Dr. Fischer recorded decreased motion in both the cervical and left shoulder areas. He made a number of diagnoses relating to those areas. Claimant's restrictions involve neck movement as well as work overhead. In spite of the assessment made by the physicians of impairment to the upper extremity, claimant's testimony and the medical evidence support a finding that claimant has disability to her body as a whole.

The industrial commissioner has said on many occasions:

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 125 N.W.2d 251 (1963). Barton v. Nevada Poultry, 253 Iowa 285, 110 N.W.2d 660 (1961).

A finding of impairment to the body as a whole found by a medical evaluator does not equate to industrial disability. This is so as impairment and disability are not identical terms. Degree of industrial disability can in fact be much different than the degree of impairment because in the first instance reference is to loss of earning capacity and in the later to anatomical or functional abnormality or loss. Although loss of function is to be considered and disability can rarely be found without it, it is not so that an industrial disability is proportionally related to a degree of impairment of bodily function.

Factors considered in determining industrial disability include the employee's medical condition prior to the injury, after the injury, and present condition; the situs of the injury, its severity and the length of healing period; the work experience of the employee prior to the injury, after the injury and potential for rehabilitation; the employee's qualifications intellectually, emotionally and physically; earnings prior and subsequent to the injury; and age, education, motivation, and functional impairment as a result of the injury and inability because of the injury to engage in employment for which the employee is fitted. Loss of earnings caused by a job transfer for reasons related to the injury is also relevant. These are matters which the finder of fact considers collectively in arriving at the determination of the degree of industrial disability.

There are no weighting guidelines that are indicated for each of the factors to be considered. There are no guidelines which give, for example, age a weighted value of ten percent of total, education a value of fifteen percent of total, motivation - five percent; work experience - thirty percent, etc. Neither is a rating of functional impairment entitled to whatever the degree of impairment that is found to be conclusive that it directly correlates to that degree of industrial disability to the body as a whole. In other words, there are no formulae which can be applied and then added up to determine the degree of industrial disability. It therefore becomes necessary for the deputy or commissioner to draw upon prior experience, general and specialized knowledge to make the finding with regard to degree of industrial disability.

See Birmingham v. Firestone Tire & Rubber Company, II Iowa Industrial Commissioner Report 39 (1981); Enstrom v. Iowa Public Services Company, II Iowa Industrial Commissioner Report 142 (1981); Webb v. Lovejoy Construction Co., II Iowa Industrial Commissioner Report 430 (1981).

Right-handed claimant is a young woman. Evidence regarding her education was not supplied. Neither was information as to her work experience before she went to work for defendant. It seems, however, that most of her work experience has been for defendant. Claimant indicated she would make more money if she could do incentive work. She was doing hourly work at the time of her injury. Her hourly rate has increased from $10.35 to $10.41. Claimant seems motivated to continue to work.

Claimant's complaints have been persistent and she takes medication. She has done primarily light duty and she carries restrictions on both working overhead and on repeated bending and twisting of her neck.

Because defendant has kept her at work and has made provision for her restrictions, her industrial disability is less than it would be if defendant had failed to provide a job. On the other hand, she has a functional impairment which has reduced her versatility within the plant. Based on the Iowa case law, the discussion in this portion of the decision and the findings of fact set out below, it is determined that claimant has a permanent partial industrial disability of eight percent.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant is twenty-six (26) years of age.

That claimant is right-handed.

That claimant fell on her employer's premises on September 28, 1981.

That claimant had an aggravation of her condition resulting from the fall which kept her off work from December 11, 1981 until February 1, 1982.

That claimant was on layoff from October 10, 1982 until August 15, 1983.

That since February 1, 1982 claimant has spent most of her time on light duty.

That claimant's current complaints are of tightness, pain and spasm in the back of her neck, tightness in the left scapula, pain in her left arm, redness and a cold feeling in her left hand, difficulty with pushing and pulling and a loss of grip strength.

That claimant is troubled by laughing, coughing, sneezing and movement of her head.

That claimant takes Naprosyn.

That claimant had some prior complaints of her neck, shoulder and right arm.

That claimant is restricted from overhead work and from repeated bending and twisting of the neck.

That claimant has had cervical x-rays, electromyography and nerve conduction studies and a myelogram which were normal.

That a difference in the temperature in claimant's left upper extremity has been observed.

That claimant was an hourly worker before her injury.

That claimant continues to do hourly work rather than incentive work.

That claimant has had an increase in actual earnings since her injury.

That claimant has impairment of her body as whole.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has established by a preponderance of the evidence that her injury of September 28, 1981 is a cause of the disability on which she now bases her claim.

That claimant has shown entitlement to permanent partial industrial disability of eight percent (8%).

ORDER

THEREFORE, IT IS ORDERED:

That defendant pay unto claimant forty (40) weeks of permanent partial industrial disability at a rate of two hundred thirty and 52/100 ($230.52).

That defendant pay amounts due and owing in a lump sum.

That defendant pay interest pursuant to Iowa Code section 85.30.

That defendant pay costs pursuant to Industrial Commissioner Rule 500-4.33.

That defendant file a final report in sixty (60) days.

Signed and filed this 9 day of August, 1984.

Judith Ann Higgs
JUDITH ANN HIGGS
DEPUTY INDUSTRIAL COMMISSIONER

1

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

PATRICIA J. KERSH, widow of, SAM ELLIS KERSH, deceased, Claimant, vs. MASON & HANGER, SILAS-MASON COMPANY, INC., Employer, and TRAVELERS INSURANCE COMPANY, Insurance Carrier, Defendants.	File No. 695660 A P P E A L D E C I S I O N FILED JUL 25 1984 IOWA INDUSTRIAL COMMISSIONER

STATEMENT OF THE CASE

Claimant appeals from a proposed decision in arbitration wherein claimant, the surviving spouse of Sam E. Kersh, was denied death benefits. The record on appeal consists of the transcript of the arbitration proceeding; claimant's exhibits 1 through 6; and the deposition testimony of Rodney L. Pfeiff, Dwight Hill, Patricia J. Kersh, Todd Kersh, Joan Kersh, Keith Henry McNeil, William E. Anderson, Jr., M.D., and George R. Zimmerman, M.D. Also a part of the record are the briefs and filings of all parties on appeal. A request by claimant to present additional testimony and oral argument was denied by the industrial commissioner in a ruling filed June 21, 1984.

ISSUES

Claimant states the issues on appeal as:

1. The Deputy Industrial Commissioner erred in not considering credible evidence favorable to the Claimant and by omitting said evidence in his Statement of the Case.

2. The Deputy Industrial Commissioner erred by not giving Dr. Anderson's testimony any weight in his findings, especially where corroborated by Dr. Zimmerman's testimony, and by giving Dr. Zimmerman's testimony greater weight in medical areas where Dr. Anderson was clearly the superior medical authority.

3. The Deputy Industrial Commissioner erred in his Findings of Fact number 3 whereby he stated, "that following the fall Decedent did not seek medical assistance".

4. The Deputy Industrial Commissioner erred in his Findings of Fact number 7 whereby he stated, "that the results of the autopsy indicated that the Decedent expired by reason of a myocardial infarction".

REVIEW OF THE EVIDENCE

Sam E. Kersh, Sr., was 47 years old. He was married and had four dependent children. (Transcript, page 146; Claimant's Exhibit 1)

John Hostetter, an employee of defendant employer, testified that Sam Kersh had been employed by defendant employer for approximately 30 years and was working as a compressor control operator on January 24, 1982. (Tr., pp. 3-5) Mr. Hostetter stated he talked with Kersh during the shift change, and Kersh informed him he had taken a hard fall outside the air compressor building around 6:25 in the evening. (Tr., pp. 6-7) Mr. Hostetter testified that Kersh indicated he had slipped on the ice, hit his head, and lost consciousness. (Tr., pp. 7-9) Mr. Hostetter stated that Kersh called him later, about one o'clock in the morning, to ask if he (Kersh) had told something to his relief man. Kersh said he could not remember. (Tr., pp. 9-10)

Keith Henry McNeil testified by deposition that he was employed by defendant employer on January 24, 1982 and talked to Sam Kersh at midnight when he was beginning work and Kersh was finishing his shift. (McNeil Deposition, pp. 3-7) Mr. McNeil stated Kersh told him about the fall on the ice. McNeil recalled it was the same evening that Kersh's truck had been stuck on the road near the compressor house. (McNeil Dep., pp. 9-10) Mr. McNeil testified Kersh appeared normal in his speech and behavior. (McNeil Dep., p. 15)

Dwight Hill, testifying by deposition, stated he is employed by defendant employer as a fire inspector. Mr. Hill recalled that sometime in late January Sam Kersh came to the plant fire station and asked to see the emergency medical technician. (Hill Dep., pp. 3-6) Mr. Hill stated it was about 11:00 p.m., and Kersh said he had a headache. Hill took Kersh to the EMT on duty. (Hill Dep., pp. 7-8) Mr. Hill stated there was a field hospital at the plant, but it was closed at night. (Hill Dep., p. 11)

123

Rodney Pfeiff testified he is a fire officer and certified

EMT for defendant employer. (Tr., p. 74) On January 24, 1982 he examined Sam Kersh and gave him some aspirin. Mr. Pfeiff stated Kersh told him he had fallen on the ice, hit his head and had a headache. (Tr., pp. 75-77) Mr. Pfeiff stated Kersh had no cuts or swelling on the back of his head. He did not check Kersh's eyes, pulse or blood pressure. (Tr., pp. 75-79) Mr. Pfeiff testified that Kersh appeared normal and had no complaints except the headache. (Tr., pp. 83-85)

Patricia Kersh, wife of the deceased, testified her husband called from work on January 24, 1982 and told her about his fall. He complained of his head feeling "funny" when he came home, and he went to bed. (Tr., pp. 138-139) The next morning Kersh commented on his eyes being red. Kersh complained of a headache and a "tingly" sensation in his arm but said nothing about swelling or a cut on his head. The couple drove to two furniture stores and Mrs. Kersh recalled her husband seemed quiet and didn't go in to look at the furniture. (Patricia Kersh Dep., pp. 15-16) He had dinner with his family that evening and later went to work. (Joan Kersh Dep., pp. 6-7) Mrs. Kersh stated her husband changed shifts that night and worked midnight to eight o'clock. On Tuesday, the couple went to vote, and Kersh again complained about a headache. Mrs. Kersh stated her husband was taking Tylenol and his skin was gray in appearance. (Tr., pp. 141-143) In the evening Kersh slept in a chair and went to bed at 8:30 p.m. Kersh came out of the bedroom later, complaining that his throat was hurting. He asked his son to take him to the hospital. (Tr., pp. 144-145)

Joan Kersh, daughter of decedent, testified by deposition that when she saw her father on Tuesday, his eyes were red and his complexion was ashy. He complained of having a headache. (Joan Kersh Dep., p. 9) She stated her father had complained of his upper right arm hurting on Monday. (Joan Kersh Dep., p. 11)

Todd Kersh, decedent's son, testified that he drove his father to the hospital. His father leaned against the car window and used his inhaler during the ten minute drive. Todd stated his father complained his throat was on fire and was gasping for air. (Tr., pp. 129-134) At the hospital entrance Kersh fell and was helped inside by the nurses. (Tr., p. 135)

William E. Anderson, Jr., M.D., who was Kersh's physician, testified he was called at home by the hospital. When he arrived, C.P.R. was in progress and an ambu bag to facilitate breathing had been attached to an esophageal airway. (Tr., pp. 92-95) Kersh was in respiratory arrest but cardiac rhythm strips indicated a heartbeat was present. (Tr., p. 96) Dr. Anderson testified that Kersh had no pulse, was incontinent and rigid. Dr. Anderson noted that Kersh's eyes were swollen and bloodshot. (Tr., pp. 100, 107)

Resuscitation was unsuccessful and death was pronounced at 10:40 p.m. on January 26, 1982. Dr. Anderson reported the cause of death as: "[A]cute myocardial infarction and subsequent cardiorespiratory arrest and aspiration of gastric contents into his lungs that resulted in retarded inhibition of adequate Oxygen perfusion from the breathing apparatus into his blood stream." (Cl. Ex. 3)

Dr. Anderson noted that the family consented to an autopsy to find out what had happened. (Cl. Ex. 3)

George R. Zimmerman, M.D., and a board certified pathologist, testified he performed the autopsy on decedent on the morning of January 27, 1982. (Tr., p. 18) Dr. Zimmerman stated he was given a brief oral summary of the decedent's medical history prior to the autopsy. Dr. Zimmerman's autopsy report states:

> CLINICAL DATA: The deceased collapsed in the entrance way to the Emergency Room. His jaw was tightly clenched and the arms were rigid. There was no spontaneous respiration. An airway was inserted. At first there were strong slow carotid and radial pulses palpated about 58 to 60 per minute. The cardiac rhythm (ECG) subsequently went from sinus bradycardia to asystole. Resuscitation was unsuccessful.
>
> The patient was brought to the Emergency Room by his son. He had complained that his throat was hurting. He had fallen on the ice at the IAAP and hit his head quite hard one week previously. In the more remote past the patient had undergone cardiac catheterization for apparent coronary insufficiency. He was being treated for asthma and hypertension. (Cl. Ex. 1)

Following the autopsy, Dr. Zimmerman's anatomic diagnoses were:

1. Coronary atherosclerosis with narrowing;
2. Focal fibrosis of left ventricular myocardium;
3. Rheumatic myocarditis, intermediate stage;
4. Rheumatic valvulitis, inactive;
5. Hypertrophy of left ventricular myocardium, severe;
6. Hypertension (clinical diagnosis);
7. Acute congestion of viscera;
8. Bronchial asthma (clinical diagnosis);
9. Hyaline thickening of basement membranes of bronchi and bronchioles, due to asthma, severe;

(Cl. Ex. 1)

Dr. Zimmerman found no evidence of injury to the scalp, skull or brain. The report attributes death to acute myocardial infarction. (Cl. Ex. 1) The death certificate certified by Dr. Anderson on March 5, 1982 indicates cause of death was acute respiratory distress due to acute epileptic seizure as a result of a traumatic brain concussion. (Cl. Ex. 3)

Dr. Anderson testified that he changed his initial diagnosis of heart attack after reviewing the rhythm strips of heart activity at the emergency room and after receiving more information from the family. (Tr., p. 99) Dr. Anderson stated that the decedent's incontinence, rigidity, and clenched jaw, as well as the blood gases results, were associated with seizures. (Tr., pp. 100-101) Dr. Anderson stated that decedent had been in for a checkup four to six months previously and was doing well. Dr. Anderson received periodic reports from the cardiology clinic that was treating the deceased's blood pressure and allergy problems. (Tr., pp. 94, 111-112) Dr. Anderson stated that the deceased had hypertension, asthma and a heart murmur. (Tr., pp. 115-116) Mr. Kersh also had sickle cell trait which Dr. Anderson believed was not significant to the loss of the left ventricular function. (Tr., pp. 118-119) Dr. Anderson was of the opinion that microscopic examination should have been made of the pons and medulla areas of the brain. (Tr., pp. 121-122)

Dr. Zimmerman testified that redness and bulging of the eyes was related to asphyxial death, as was clenching of the jaw. (Tr., pp. 39-40) There was no other evidence of convulsive seizure. (Tr., p. 44) Dr. Zimmerman did not believe the heart activity revealed by the rhythm strips excluded a heart attack. He reported that tachycardia or fibrillation can correct itself spontaneously, and that a spasm of the artery can produce secondary rhythm changes. (Tr., pp. 26-28) Dr. Zimmerman stated that he examined the medulla and pons areas of the brain, which control respiration, and found no evidence of damage. (Tr., pp. 45-50, 64) In a rebuttal to Dr. Anderson's conclusions from the circumstances surrounding the death, Dr. Zimmerman reported:

> The circumstances surrounding Mr. Kersh's demise are important. Mr. Kersh's final and fatal illness began at home presenting itself as <u>pain in the throat</u>. The pain was so severe that he asked to be taken to the hospital. With pain of this apparent severity one would expect to find some abnormality in the neck or throat at autopsy; however, the neck and throat were examined in detail and there was no demonstrable abnormality. Pain from a heart attack, on the other hand, is frequently referred to the neck as well as to other body sites distant from the heart (Cecil, Textbook of Medicine, Fifteenth Edition, page 1230).
>
> Support for the position that Mr. Kersh died from a convulsive disorder secondary to a head injury is elusive. There was no evidence at autopsy of a head injury. There is nothing in Mr. Kersh's recent history to suggest that he suffered from a head injury other than that he complained of headaches at times. This symptom, standing alone, is unconvincing as evidence of a head injury severe enough to incite a fatal convulsive seizure. Headaches are a common sign or symptom of many minor illnesses. They are common in patients with high blood pressure, a condition for which Mr. Kersh was being treated, and headaches are also a side affect of Metaprel inhalation which Mr. Kersh used to control his asthma.
>
> Muscular rigidity and twitching are not uncommon in the process of dying from sudden deprivation of oxygen to the brain, whether the lack of oxygen is due to failure of the heart, to sudden obstruction of the breathing passages or due to some other mechanism. It was noted that Mr. Kersh's jaw was tightly clenched and that his arms were rigid when he was in the emergency room; this is perhaps not improperly referred to as a convulsion, which is a term with broad medical meaning. However, under these circumstances muscular rigidity is not unexpected, and without supportive evidence it is not indicative of <u>prior</u> brain damage.
>
> Most importantly, Mr. Kersh's final and fatal illness did not <u>begin</u> as a convulsive disorder. There is no indication that any of the several physicians attempting to resuscitate Mr. Kersh considered a convulsive disorder while they were treating him. There is no historical evidence that Mr. Kersh had convulsions until he reached the emergency room at which time he apparently already had irreversible brain damage due to lack of oxygen. The direct and circumstantial evidence that Mr. Kersh died from a heart attack appears to override any other conjecture. (Cl. Ex. 5)

Dr. Zimmerman stated he had performed between 1500 - 2000 autopsies and had supervised another 3000 - 5000 while teaching forensic pathology at the University of Iowa. (Tr., pp. 60-61)

APPLICABLE LAW

The claimant has the burden of proving by a preponderance of the evidence that the injury of January 24, 1982 is causally related to the death on which she now bases her claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

ANALYSIS

The issues on appeal arise from the finding of the deputy that the medical evidence fails to establish that Sam Kersh died as a result of brain trauma incurred in a work-related injury. Claimant contends that insufficient consideration was given by the deputy to the evidence favorable to claimant's position, primarily the testimony of Dr. Anderson, who was Mr. Kersh's doctor and treated him in the hospital emergency room.

The record substantiates the following: On Sunday, January 24, 1982 while at work, Mr. Kersh fell and hit his head. He saw a plant EMT that night with a complaint of a headache and was given aspirin. The technician found no visible signs of cuts or swelling when he examined Mr. Kersh's head. The next day, the deceased followed a normal schedule; he took his wife shopping, ate an evening meal with his family, and worked a full shift. He complained of pain in his arm and a headache on Monday and again on Tuesday. By Tuesday afternoon Mr. Kersh appeared unwell and had a greyish color. That night he complained of a burning pain in his throat and was having difficulty breathing. He was rushed to the hospital where he collapsed and died. An autopsy was performed the following day. On the basis of his examination of the deceased, the pathologist attributed death to a heart attack. Dr. Anderson concluded that death was caused by a brain concussion resulting from the fall at work.

Medical experts can and do disagree on the inferences and conclusions that may be drawn from the same set of facts and circumstances. In this case, however, the opinions of Dr. Anderson are based on an assumption that has no support in the evidence; that Mr. Kersh suffered a brain injury.

Dr. Anderson formed his diagnosis after considering the deceased's complaints of headache following the fall; the symptoms of seizure in the emergency room; and the presence of some heart activity after Mr. Kersh collapsed. The record does not indicate whether Mr. Kersh normally experienced headaches, but Dr. Zimmerman has reported that headaches are common in patients who suffer high blood pressure and in asthmatic patients who use a Metaprel inhalor. Mr. Kersh was being treated for both hypertension and asthma, and he used an inhalor to facilitate breathing. Dr. Zimmerman has also testified that the muscle rigidity and red, swollen eyes evinced by the deceased in the emergency room were attributable to asphyxia following respiratory failure. The pathologist points out that Mr. Kersh's illness did not begin as a convulsive disorder. Dr. Zimmerman believed that the presence of heart activity in the emergency room did not exclude a heart attack, and found sufficient evidence of coronary atherosclerosis and fibrosis of the left ventricular myocardium to conclude that Mr. Kersh's death resulted from acute myocardial infarction.

Finally, and most significantly to claimant's contention of death due to head trauma, Dr. Zimmerman found no evidence of trauma-induced injury to either the scalp, skull or brain of the deceased. Although Dr. Anderson has taken issue with the lack of specificity in the pathology report of the brain, Dr. Zimmerman's testimony as to the examination sufficiently establishes the credibility of his findings.

FINDINGS OF FACT

1. On January 24, 1982 the deceased, Sam Kersh, fell while working for defendant employer.

2. Mr. Kersh told the plant EMT he had struck his head and complained of a headache.

3. The technician found no signs of cuts or swelling on the head.

4. Mr. Kersh completed his shift and worked again the following night.

5. On January 26, 1982 Mr. Kersh was taken to the hospital with complaints of throat pain. He was experiencing breathing difficulties.

6. Mr. Kersh collapsed and died at the hospital.

7. An autopsy was performed on January 27, 1982.

8. No trauma to the skull or brain was indicated.

9. The deceased suffered from coronary artherosclerosis and focal fibrosis of the left ventricular myocardium.

10. Sam Kersh died as a result of an acute myocardial infarction.

11. The heart attack was not causally related to his employment.

CONCLUSIONS OF LAW

WHEREFORE, claimant has failed to sustain her burden of proof that the deceased's fall of January 24, 1982 is the cause of the death on which she now bases her claim.

THEREFORE, the proposed decision of the deputy is affirmed.

ORDER

THEREFORE, it is ordered that the claimant take nothing as a result of these proceedings.

That each party shall bear their own costs as contained in Industrial Commissioner Rule 500-4.33.

Signed and filed this 25 day of July, 1984.

	:	A P P E A L
vs.	:	
	:	D E C I S I O N
CHAMBERLAIN MANUFACTURING CORPORATION,	:	
	:	FILED
	:	
Employer,	:	AUG 27 1984
Self-Insured,	:	
Defendant.	:	IOWA INDUSTRIAL COMMISSIONER

By order of the industrial commissioner filed June 27, 1984 the undersigned deputy industrial commissioner has been appointed under the provisions of §86.3, Code of Iowa, to issue the final agency decision on appeal in this matter.

Defendant appeals and claimant cross-appeals a review-reopening decision.

The record on appeal consists of the transcript; claimant's exhibits 1 through 17; and defendant's exhibits A, B, and C, all of which evidence was considered in reaching this final agency decision.

Neither party filed briefs.

The result of this final agency decision will be the same as that reached by the hearing deputy.

The review-reopening decision awarded 78 3/7 weeks of healing period at the rate of $183.82 per week and awarded 85 weeks permanent partial disability at the same rate, as well as certain medical and hospital benefits.

According to the pre-hearing order, the issues to be heard were (1) Whether there was a causal relationship between the injury and the subsequent disability, (2) If so, the extent of the healing period and permanent partial disability, and (3) "85.27."

The treating doctor found a causal relationship between the work and the resulting condition and he found a permanent partial impairment. His opinion was taken by the hearing deputy over that of the examining physician, which seems to be the proper measure in this case. The record shows that the hearing

deputy thoroughly reviewed the record as it related to industrial disability and made a correct finding. Therefore, the result reached by the review-reopening decision will be retained, but the findings of fact and conclusions of law are those of the undersigned.

FINDINGS OF FACT

1. Claimant hurt himself at work for the employer on October 31, 1980 when he was pushing loaded cases down a conveyor. His pain was in the low back.

2. Claimant was treated for his low back condition by P. Thomas McGarvey, M.D., by Thomas F. Thornton, Jr., M.D., and by John R. Walker, M.D.

3. Dr. Walker recommended surgery for a herniated lumbar disc, but claimant refused to have such surgery.

4. Claimant was also examined by Richard F. Neiman, M.D.

5. Considering the conflicting opinions of Drs. Walker and Neiman and Gillman, claimant is found to have a moderately severe permanent partial impairment.

6. Claimant was 27 years of age at the time of the hearing and his work background included general labor. He finished the 11th grade of high school.

CONCLUSIONS OF LAW

Claimant sustained an injury which arose out of and in the course of his employment on June 27, 1984.

Said injury resulted in a permanent partial disability to the body as a whole for industrial purposes of seventeen (17) percent.

Claimant is entitled to a healing period of seventy-eight and three-sevenths (78 3/7) weeks.

ORDER

WHEREFORE, defendant is hereby ordered to pay healing period benefits unto claimant for a period of seventy-eight and three-sevenths (78 3/7) weeks at the rate of one hundred eighty-three and 82/100 dollars ($183.82) and to pay permanent partial disability weekly payments unto claimant at the same rate for a period of eighty-five (85) weeks, accrued payments to be made in a lump sum, with statutory interest from January 26, 1984.

Defendant is further ordered to pay the following medical and hospital bills:

T. F. Thornton, Jr.	$ 45.00
J. R. Walker, M.D.	813.00
P. Thomas McGarvey, M.D.	25.00
Schoitz Hospital	1,592.56
Richard Neiman, M.D.	85.00
Mercy Hospital	448.00

Costs are charged to the defendant in accordance with Industrial Commissioner Rule 500-4.33 and shall include an expert witness fee of one hundred fifty dollars ($150) payable to John Walker, M.D.

Defendant is ordered to file an activity report within twenty (20) days from the date below.

Signed and filed this 27th day of August, 1984.

GARY L. KEYS,	:	
Claimant,	:	FILE NO. 654811
vs.	:	REVIEW -
CHAMBERLAIN MANUFACTURING CORPORATION,	:	REOPENING
Employer, Self-Insured, Defendant.	:	DECISION

FILED
JAN 26 1984
IOWA INDUSTRIAL COMMISSIONER

This is a proceeding in review-reopening brought by Gary L. Keys, the claimant, against Chamberlain Manufacturing Corporation, his employer and holder of a valid certificate of exemption as contemplated by section 87.11, Code of Iowa, under the Iowa Workers' Compensation Act by virtue of an admitted industrial injury which occurred on October 31, 1980 resulting in a period of temporary total disability of eight and one-seventh weeks at the agreed weekly rate of $183.82 with the claimant returning to gainful employment on December 29, 1980.

This matter was heard in Waterloo, Iowa on June 17, 1983 and considered as fully submitted at the conclusion of the hearing.

Based upon the undersigned's notes, the record in this matter consists of the oral testimony of the claimant, Fanny Keys, his mother, and John Seaggins; claimant's exhibits 1-17; defendant's exhibits A, B and C, together with the evidentiary depositions of John Walker, M.D. and Richard Neiman, M.D.

The issue is the nature and extent of claimant's disability, if any.

There is sufficient credible evidence contained in this deputy's notes to support the following statement of facts:

Claimant, single, age 27, began his employment activities for the defendant employer in February 1980 as a tap machine operator. Claimant described his work activities as requiring him to insert a finished shell into a box and as these cases of shells are filled he is required to push them down a roller conveyor. Shortly after commencing this activity, claimant began to experience low back discomfort in March and August of 1980. (Defendant's exhibit C) On October 31, 1980 while attempting to push three or four cases of shells down the conveyor, claimant developed sharp low back pain. Confusion exists in this record as to the exact day of this occurrence; however, the memorandum of agreement filed by the defendant employer admits that an injury did occur and did arise out of and in the course of claimant's employment.

Claimant began to lose time from work based upon the findings of Thomas McGarvey, M.D. (Claimant's exhibit 2)) Dr. McGarvey felt the need for an orthopedic consultation and Dr. Edward J. Sitz reported his findings, in part, as follows: (Cl. ex. 1)

> Office visit: The patient returns as requested. He says that the prescription bothered his stomach and he only took 2 or 3 of them. I still feel that his symptoms are basically those of muscular low back strain with no evidence of nerve root irritation. I feel that he can return to work now and he is given a slip for a RTW as of tomorrow, December 20, Tuesday. The patient mentions that he isn't due to return until next Monday as there is a holiday break but I date RTW as of tomorrow anyway, December 30. He should use Bufferin if the Norgesic bothers his stomach and he's to continue to use local heat for the muscular symptoms of the low back. RTO prn.

Claimant returned to work January 5, 1981 without restrictions and began to experience pain upon work activity. Defendant sent the claimant to Thomas F. Thornton, Jr., M.D., who indicated that an orthopedic examination should be undertaken. (Cl. ex. 4) This apparently was not done.

Claimant resigned his position on January 30, 1981.

Claimant was next seen by John Walker, M.D., who reported on July 17, 1981, in part, as follows: (Cl. ex. 3)

> OPINION: This patient has a very, very acute low back situation. There are some congenital anomalies which are not causing his pain, but contributes to it, of course, because a back like this just doesn't stand up well under heavy work. I believe that this man is probably going to end up having surgery on his low back unless some marked improvement can be obtained through conservative therapy. He should definitely be hospitalized and treated with traction and physical therapy and a complete conservative regime before anything is attempted, however.
>
> At this point, he is 100% disabled for any work. As far as the cervical spine is concerned, he has

probably sprained his neck pushing these heavy objects and this is not a big factor. It would seem to me that perhaps the Chamberlain doctors should get ahold of this man and try to treat him and get him well, however, I will let you decide what is best for the patient as far as all are concerned.

Claimant commenced this proceeding on August 20, 1981 following a period of hospitalization in July ordered by Dr. Walker, who saw the claimant on an irregular basis during late 1981 and early 1982. (Cl. ex. 13)

Dr. Walker, following an April 19, 1982 examination reported, in part, as follows: (Cl. ex. 3)

From what I see of his examination today, I don't see how at 27 years of age he is going to go through life with this type of a back with no more motion and with this much pain and discomfort. I don't think that we have carried out full treatment measures and I think that surgery is a very genuine probability in the low back region. For this reason, I believe that the 8% permanent, partial disability at this time does not stand up and should be retracted.

In the meantime, I have given him an appointment to return to see me in two months and he may call sooner than this if he has any suggestions.

In his deposition Dr. Walker indicated that he recommends a myelogram to confirm his opinion that claimant "has a midline herniated lumbar disc with sciatica in both legs now." (Deposition page 13, line 18)

Claimant has refused this operative procedure. (Depo. p. 15, l. 23) Dr. Walker concluded that surgical intervention would reduce claimant's impairment from 28 percent to 20 percent should the claimant choose to undergo surgery. (Depo. p. 16, ll. 16 to 24)

Indicative of the medical problems presented in Dr. Walker's testimony: (Depo. p. 17, ll. 1-5)

A Well, I believe that he has a disc problem, and because of the instability and congenital anomaly he needs a fusion of L-4, L-5 and the sacrum. And this I think would get him out of what I consider to be the bad trouble that he seems to be in now and put him into an employable range, I believe.

In November of 1982, Richard Neiman, M.D., an Iowa City neurologist, reported his findings to the defendant as follows: (Def. ex. A)

I apologize in not getting back to you in regard to the studies on Mr. Gary Keys. The EMG studies performed on October 6, 1982, revealed no evidence of ruptured disc. The radiologist thought there might be some mild encroachment as far as the lateral recesses at L5-S1. I have carefully looked over the CT scan and in fact have shown this to one of my senior orthopedic consultants, Dr. Webster Gelman. It is our mutual opinion that the CT scan of the spine is absolutely negative. At the present time, I do not think this patient has anything more than a mild strain of the back. I think he should go back to work. The figure of 30% disability for him is absolutely absurd. There is no way that he would qualify for this level of disability. I would suggest he return to work, perhaps to a job which requires less vigorous lifting, however, I think he could certainly handle a weight restriction of 35-50 pounds.

The claimant has the burden of proving by a preponderance of the evidence that the injury of October 31, 1980 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

In applying the foregoing legal precepts to the matter at hand, it is clear that the claimant has established that a portion of his current lumbar abnormality is traceable to the industrial episode under review.

Based upon his rather passive activities since this episode, together with his demeanor during the hearing, it is apparent to the undersigned that this claimant lacks motivation. It is further clear that this claimant has a preexisting spinal abnormality which has been aggravated by this industrial accident.

While a claimant is not entitled to compensation for the results of a preexisting injury or disease, the mere existence at the time of a subsequent injury is not a defense. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756 (1956). If the claimant had a preexisting condition or disability that is aggravated, accelerated, worsened or lighted up so that it results in disability, claimant is entitled to recover. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812 (1962).

When an aggravation occurs in the performance of an employer's work and a causal connection is established, claimant may recover to the extent of the impairment. Ziegler v. United States Gypsum Co., 252 Iowa 613, 620, 106 N.W.2d 591 (1960).

In light of the foregoing, it is found that the claimant has a functional impairment of 12 percent to the body as a whole chargeable to the episode of October 31, 1980.

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

In applying the foregoing legal principles to the case at hand, it is concluded that the claimant has an industrial disability of 17 percent to the body as a whole.

Claimant's healing period requires determination. Claimant is required to provide supportive medical evidence in corroboration of his allegation that he is unable to perform acts of gainful employment.

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

Accordingly, it is found that claimant was unable to work beginning on July 17, 1981 and continuing until November 8, 1982 at which time Dr. Neiman suggested a return to work.

Claimant's medical expenses incurred during 1981 and 1982 are casually related to the injury and are found to be the responsibility of the defendant, with the exception of the charges of Thomas E. Dahl, D.O., whose December 1980 treatments overlapped the care being offered by the defendant.

WHEREFORE, after having seen and heard the witnesses in open hearing and after taking into account all of the credible evidence contained in this record, the following findings of fact are made:

1. That this agency has jurisdiction of the persons and the subject matter.

2. That the claimant sustained an admitted industrial injury on October 31, 1980.

3. That in addition to the eight and one-seventh weeks of entitlement previously paid, claimant is entitled to a healing period from July 17, 1981 until November 8, 1982 or 78 3/7 weeks.

4. That claimant's rate of weekly entitlement is $183.82.

5. That the claimant has a preexisting spinal abnormality which was aggravated by the industrial accident.

6. That as a result thereof, claimant has a functional impairment of 12 percent to the body as a whole chargeable to this defendant.

7. That claimant's industrial disability is found to be 17 percent to the body as a whole.

8. That claimant's medical expenses remain unpaid.

WHEREFORE, IT IS ORDERED that the defendant pay the claimant a healing period of seventy-eight and three-sevenths (78 3/7) weeks at one hundred eighty-three and 82/100 dollars ($183.82) per week beginning on July 17, 1981 together with statutory interest from the date due payable in a lump sum.

IT IS FURTHER FOUND that beginning on November 8, 1982 defendant is ordered to pay the claimant an eighty-five (85) week period of permanent partial disability at the weekly rate of one hundred eighty-three and 82/100 dollars ($183.82) together with statutory interest. Past due payments are payable in a lump sum.

Defendant is furthered ordered to pay the following medical expenses:

T. A. Thornton, Jr.	$ 45.00
J. R. Walker, M.D.	813.00
P. Thomas McGarvey, M.D.	25.00
Schoitz Hospital	$1,592.56

Richard Neiman, M.D.	85.00
Mercy Hospital	448.00

Costs are charged to the defendant in accordance with Industrial Commissioner Rule 500-4.33 and shall include an expert witness fee of one hundred fifty and no/100 dollars ($150.00) payable to John Walker, M.D.

Defendant is ordered to file an activity report within twenty (20) days from the date below.

Signed and filed this 26 day of January, 1984.

IOWA INDUSTRIAL COMMISSIONER

STATEMENT OF THE CASE

Defendants appeal from a proposed review-reopening decision wherein claimant was awarded permanent partial disability benefits and medical costs.

The record on appeal consists of the transcript of the review-reopening proceeding, claimant's exhibit 1, defendants' exhibits A through C, and the briefs and filings of the parties on appeal.

ISSUE

The sole issue on appeal is whether chiropractic expense incurred by claimant after August of 1981 are chargeable to defendants.

REVIEW OF THE EVIDENCE

The parties stipulate that the applicable rate of compensation is $245.05 per week, and that medical costs at issue are fair and reasonable. (Transcript, page 2)

Claimant is a 37 year old married man with one child. He has nine years of formal schooling and a GED which he obtained while in the navy. (Tr., pp. 5-7) Claimant's previous work experience has been in general labor and truck driving. He served in the navy as a machinist's mate and worked for ten years on the kill floor and in offal packing for Iowa Beef Packers. (Tr., pp. 8-12) When he left the packing plant, claimant joined a labor union and received various construction job assignments through the union hall. He began working for defendant employer on June 20, 1981. (Tr., pp. 12-14) Claimant testified his job was to tend the bricklayers. His duties included providing the bricklayers with blocks, equipment and mortar. Claimant stated he moved blocks weighing approximately 20 pounds each from one part of the building to another. (Tr., pp. 14-15) On July 20, 1981, claimant was building a scaffolding for the bricklayers. As he moved a six foot section of steel, he twisted his back. (Tr., p. 18) Claimant testified he suffered a sharp pain in the middle of his back above his belt. He reported the injury to his supervisor and then worked for the next several days. (Tr., pp. 18-19) Claimant stated the condition worsened until he could barely walk. On July 23, 1981, he went to St. Luke's Medical center and was x-rayed. The emergency room record notes claimant complained of pain in the upper lumbar region. X-rays of the lumbosacral spine were normal, and rest, heat and massage were advised. (Claimant's Exhibit 1) Claimant saw James D. Smith, D.C., on July 24, 1981, complaining of pain in his lower back with standing or strain. Dr. Smith diagnosed the complaint as a sprain of the lumbar spine and initiated chiropractic treatment. (Cl. Ex. 1) Dr. Smith's records indicate claimant received 16 treatments in July and August of 1981. (Cl. Ex. 1) Claimant testified that the chiropractic treatments relieved his pain. (Tr., p. 20) In August of 1981 claimant was referred by defendants to Albert D. Blenderman, M.D., an orthopedic surgeon. (Tr., p. 21; Defendants' Ex. C, p. 2) Dr. Blenderman examined claimant on August 24, 1981 and reported:

> At first when he had his mid-lumbar spine pain, he says the discomfort was only in the midline of the lower back and gradually started radiating anteriorly to go into the groin area. Now, however, he says the groin pain has subsided, but he does have a little pain radiating around the crest of the pelvis to the front of the lower abdomen, although this discomfort is mild in degree and getting better.
>
> However, he says he is still unable to move the back normally because of pain and he says he still has a moderate degree of discomfort. The discomfort is always located in the mid-lumbar region as yet and does not go into either leg.
>
> On physical examination the patient is a rather short, stocky individual, who has limitation of motion on flexion, lateral bending right and left and hyperextension. He bends forward to 45 degrees, then complains of discomfort in the mid-lumbar area, mild in degree. Any effort to go further produces increased discomfort in the mid-lumbar region. In addition, the patient states it gives a tight pulling sensation in the lower back.
>
> He bends to the left and right about 15 to 20 degrees, then complains of mid-lumbar spine pain, but no leg pain.
>
> He has no muscle spasm in the back, but complains of pain on pressure over the 2nd, 3rd and 4th lumbar vertebrae; though he has no pain on palpation over the muscles on either side of the midline at these levels.
>
> He has no pain on sacroiliac stress and no pain on palpation in either sciatic notch.
>
> Straight leg raising to 90 degrees produces a tight pulling sensation in the lower back, but no leg pain or back pain. The patient's reflexes are normal and sensation is normal on both lower extremities.
>
> All muscles appear to be functioning normally on both lower extremities.
>
> Miltiple x-rays of the lumbar spine were taken here in our office on this date.
>
> These x-rays are considered within normal limits, there being no evidence of recent or old fracture, no evidence of disc narrowing and no evidence of a pedicle defect or other bony defect in the lower back.
>
> DIAGNOSIS: LUMBAR LIGAMENT STRAIN IN THE RECOVERY PHASE.
>
> Discussion: As far as treatment is concerned, I would feel that the patient would benefit by use of some back exercises.
>
> I think it is a matter of time before the patient can return to his usual job, but at the present time do not feel he can return to the heavy-duty lifting that is involved, unless the company can put him back on some type of very light work - where lifting not to exceed 25 or 30 pounds is required. Even this amount of lifting should not be repetitive throughout the entire day. (Cl. Ex. 1)

Dr. Blenderman advised hot tub soaks and exercises. He saw claimant on September 14, 1981 and noted that claimant complained that the back pain was worse and now extended up to the mid-thoracic area. Dr. Blenderman stated there was no evidence of disc herniation and recommended the use of a high Taylor corset as a back brace. (Cl. Ex. 1) Claimant testified that he asked defendant employer for another doctor as he felt Dr. Blenderman was not helping him. (Tr., p. 22) On September 8, 1981 claimant had been notified by defendant insurer that further care by Dr. Smith was unauthorized. (Def. Ex. A) Following claimant's request for a different doctor, he was referred to William P. Isgreen, M.D., a neurologist. (Tr., p. 22; Def. Ex. A) Dr. Isgreen evaluated claimant on September 30, 1981 and reported:

> Examination of the musculoskeletal system shows a man who arises from a chair in a somewhat stiff fashion. However, once he gets going, he walks without undue problem. He gest [sic] on his heels and his toes without difficulty. I can detect no weakness in any of the muscle groups. There is no loss of coordination. There is no evidence of atrophy.
>
> The myotatic responses are symmetrical in the arms. They are asymmetric at the knees. The right knee jerk is simply not as active as the left. It is active and it is there, but it's not as active as its brother on the left. Both ankle jerks are present and equal. The toes are downgoing.
>
> Examination of the dorsal and lumbar spine shows some point tenderness at the mid-dorsal area. There is diffuse tenderness in the lumbar area. Straight-leg raising is acceptable to 90°.
>
> DISCUSSION:
>
> Curiously enough I do find a very mild defect in the reflexes with the right knee jerk a little less than the left knee jerk. I did this several times and rather carefully, and even the patient and his wife noticed the difference.
>
> It could be that the L-3 root has been compromised mildly. I don't get that story out of him though. However, he is tired of sitting around and having pain. I really don't blame him, and I would be tempted to put him in the hospital and in addition to a myelogram get an EMG and certainly an MMPI.
>
> IMPRESSION:
>
> Low back strain with mildly abnormal neurological examination. (Def. Ex. A)

On November 3, 1981, Dr. Isgreen reported that the results of the EMG and MMPI were normal and that claimant had no neurological evidence of impairment. (Def. Ex. A) Claimant continued to be treated by Dr. Blenderman in October and November of 1981. On November 23, 1981, Dr. Blenderman released claimant from his care and reported the following conclusions:

> He still has a multiplicity of complaints, namely - pain in the lower thoracic region rediating around the rib cage and then going down into the groin region bilaterally, pain in the lower back with an aching sensation going into the back of both legs and an occasional sensation of numbness and tingling in the legs. He says he cannot do any work because of the discomfort in the back and the legs. He says that even if he goes shopping with his wife and stays up for several hours he has increased pain in the areas described above.
>
> The other day he said he tried to wash and wax his car and this put him in bed for three days.
>
> His examination this date reveals pain on palpation all the way from the lower thoracic through the lower lumbar region on pressure in the midline, as well as over the adjacent muscles throughout this area.
>
> He also says he has mild discomfort on palpation in both sciatic notches.
>
> Straight leg raising to 70 degrees intensifies the lower back pain and produces an aching sensation in the posterior legs, expecially the one being raised. Reflexes and sensation, however, are normal.
>
> Range of motion of the back is minimally limited on flexion, extension or lateral bending right and left. However, all maneuvers, according to the patient, give pain in the areas previously described.
>
> The patient thinks that over a lengthy period of time the discomfort in his back is somewhat better than when I first saw him, though not all that much better. I told the patient I had nothing further to offer from an orthopedic standpoint. All of his tests have been found to be within normal limits and he has had the benefit of a second opinion from Doctor Isgreen, who is unable to account for the patient's discomfort.
>
> He has had various medications, none of which have seemed to materially improve his condition.
>
> The patient wants to know what he should do if he continues to have his pain and also wants to know how he is going to live if he does not have a job to return to, since the company has already left Sioux City and he has no other means of making any money, other than his disability benefits.
>
> I told him that this was a very definite problem for him, but unfortunately, I cannot get him a new job, nor can I continue his benefits indefinitely. I told him, therefore, that I would give him a disability rating of 7 percent of the spine.
>
> I further suggested that he should contact Vocational Rehabilitation in South Dakota in an effort to gain some type of retraining. He has had a 12th-grade education and should therefore be rather easily retrained for some type of office work or sales work, which he should be able to carry out without too much difficulty.
>
> The patient asked if the insurance carrier would send him to someone else and I told him I had no knowledge as to whether they would or would not do this, but I would mention it in my report and he could contact the insurance carrier about this. However, I told him that he had already had two opinions, we have not been able to find anything conclusive and would doubt that another opinion would give much further information; though if the insurance carrier wished to pursue this further, I certainly had no objection to them referring him to another physician of their choice.
>
> We are therefore DISCHARGING the patient as of 11-23-81.

Claimant testified that following his discharge by Dr. Blenderman, he continued to suffer pain in his back which was increased by any physical labor he attempted at home. (Tr., p. 27) Dr. Smith's billing records indicate claimant resumed chiropractic treatments on November 30, 1981 and continued weekly care under Dr. Smith through April 26, 1983. The records reveal an unpaid balance of $485.00 as of the April 1983 date. (Cl. Ex. 1) Claimant testified that his temporary compensation benefits were terminated in November or December of 1981. (Tr., p. 22) After Dr. Blenderman suggested vocational rehabilitation, claimant visited the rehabilitation office in Yankton, South Dakota. He underwent testing and took some basic education courses in March 1982 to prepare for computer training. In August 1982 claimant entered a two-year course of study in computer programming at Western Iowa Technical School. (Tr., p. 25) At the time of the hearing, claimant had completed one year of that program. He testified that the vocational rehabilitation office paid his tuition and transportation expenses. Claimant stated he had not received compensation benefits from defendant insurer for his rehabilitation training. (Tr., p. 25) Claimant testified he was able to go to school in August of 1982 as he was paid a lump sum for 20 weeks by defendant insurer. (Tr., p. 26)

In May of 1983 claimant was once again evaluated by Dr. Isgreen, who noted claimant was seeing a chiropractor for the pain he experienced. Dr. Isgreen found no evidence of neurological impairment and recommended a lumbar CT scan. (Def. Ex. A) On June 1, 1983, Dr. Isgreen reported the CT scan revealed evidence of mild degenerative disc disease at several levels. Dr. Isgreen did not believe the condition was trauma associated. (Def. Ex. A) In June of 1983, claimant was again examined by Dr. Blenderman who also noted that claimant had been under the care of a chiropractor. Dr. Blenderman reported that x-rays of the thoracic and lumbar spine revealed scoliosis and spurring in the thoracic spine area. The CT scan indicated bulges at L4-5 and L5-S1, and Dr. Blenderman believed the bulges represented a spondylosis or some degenerative change in the disc. (Cl. Ex. 1) In June of 1983, claimant also consulted Horst G. Blume, M.D., a neurosurgeon, who reported the results of claimant's examination by his partner, a Dr. Rojas.

> There is evidence of spondylosis and spondylarthrosis in the thoracic spine by x-ray, which was already present in 1981, so as far as the pain in the thoracic spine is concerned, this is definitely an aggravation of a pre-existing condition; however, no arthritic or spondylotic changes were seen in the lumbar spine x-rays so we can make the presumption that the low back pain is also directly related to the accident sustained but there was no pre-existing condition that we know of.
>
> It was Doctor Rojas' impression that the patient could not go back to his former occupation as a heavy construction worker but may become a candidate for re-training for light activity. You asked in regard to the extent or rating of any permanency: the patient has a disability to the body as a whole of 8-10% temporary, but it seems that this may become permanent since the accident relates back to 1981 and no significant improvement in his condition

has been obtained. (Cl. Ex. 1)

Claimant testified that prior to his work-related injury he had only childhood diseases and pneumonia. He had a physical examination just before taking the job with defendant employer and had no physical problems. Prior to his injury he did body work on cars and refinished furniture for a hobby. He also did the handy work for his mother and his mother-in-law. (Tr., pp. 15-17) Claimant stated he was no longer active in his hobbies, and his wife now did all the work around the house. He has constant back pain and does not do much bending or lifting. (Tr., pp. 28-30)

Ann Kincaid, claimant's wife, testified that claimant no longer did the yard work or heavy scrubbing. She stated claimant doesn't roller skate or ride his bicycle now. Mrs. Kincaid noted that claimant's walk was different, and he has put on weight. (Tr., pp. 33-34)

APPLICABLE LAW

Section 85.27, Code of Iowa, provides: "The employer, for all injuries compensable under this chapter or chapter 85A, shall furnish reasonable surgical, medical, dental, osteopathic, chiropractic, podiatric, physical rehabilitation, nursing, ambulance and hospital services and supplies therefore and shall allow reasonably necessary transportation expenses incurred for such services."

Industrial Commissioner Rule 500-4.33 states in relevant part:

> Proof of payment of any cost shall be filed with the industrial commissioner before it is taxed. The party initially paying the expense shall be reimbursed by the party taxed with the cost. If the expense is unpaid, it shall be paid by the party taxed with the cost. Costs are to be assessed at the discretion of the deputy commissioner or industrial commissioner hearing the case unless otherwise required by the rules of civil procedure governing discovery.

ANALYSIS

This appeal arises from a proposed decision filed December 30, 1983 in which the claimant was awarded compensation benefits based upon a finding of 15 percent permanent partial disability as a result of a July 20, 1981 work-related injury. The prior issues of causation and extent of disability, as well as vocational rehabilitation benefits have not been renewed on appeal, and the deputy's findings are incorporated into this ruling.

Defendants contend on appeal that claimant is not entitled to payment for the cost of Dr. Smith's chiropractic treatment after August of 1981. Defendants maintain that such treatment was clearly unauthorized and cannot be construed as emergency medical treatment since it continued from November of 1981 to August of 1983.

Under the provisions of section 85.27, Code of Iowa, the employer is obligated to furnish reasonable medical services to the injured employer. Defendants had initially paid for chiropractic treatment by Dr. Smith, and terminated authorization of Dr. Smith's care only because they had designated Dr. Blenderman as the treating physician. When Dr. Blenderman discharged claimant from his care in November of 1981, four months after the injury, he did not report that claimant was ready to resume his regular work duties or that no further medical treatment was indicated. He did report to defendants that claimant continued to suffer debilitating pain; that he could do nothing further for claimant; and that claimant was seeking referral for further medical care. There is no indication in the record that defendants at that time or during the following 16 months offered claimant alternative medical services although they knew or should have known through the reports of Dr. Blenderman that claimant believed he was in need of further medical assistance for his pain. It was only after claimant's treatment had been abandoned by Dr. Blenderman that claimant returned to the care of Dr. Smith. The record substantiates that claimant continued to experience back pain which limited his activities during 1982 and 1983, a period for which claimant has been awarded permanent partial disability benefits. Claimant received some relief from this pain through chiropractic treatment as he made commendable effort to gain new vocational skills. The evidence supports a finding that claimant is entitled to the costs of such care. Claimant has submitted an unpaid bill from Dr. Smith in the amount of $485.00 which covers treatment from November 30, 1981 to April 26, 1983. Such amount was stipulated as fair and reasonable and is chargeable to defendants.

FINDINGS OF FACT

1. Claimant is a 37 year old married man with one dependent.

2. Claimant has a GED.

3. Claimant's previous work experience was in the areas of general labor and truck driving.

4. Claimant incurred a back injury on July 20, 1981 while working for defendant employer.

5. Claimant received chiropractic care from Dr. James Smith through August of 1981.

6. Defendants referred claimant to Dr. Albert Blenderman in August of 1981 and terminated authorization of care by Dr. Smith after August 1981.

7. Dr. Blenderman treated claimant for pain in the thoracic and lumbar spine region until November 23, 1981 at which time he discharged claimant from his care.

8. Claimant continued to suffer back pain which was causally related to his July 1981 work injury.

9. Claimant discussed his concern for continuing medical treatment with Dr. Blenderman.

10. Defendants did not offer claimant alternative medical services after his discharge by Dr. Blenderman.

11. Claimant returned to the care of Dr. Smith in November of 1981 and received weekly chiropractic treatments for relief of his back pain.

12. Claimant has been engaged in a vocational rehabilitation program since March of 1982.

13. Claimant is entitled to healing period benefits from July 20, 1981 to November 24, 1981.

14. Claimant is entitled to compensation benefits based upon a finding of 15 percent permanent partial disability.

15. Claimant is entitled under the provisions of section 85.27, The Code, to payment of chiropractic expenses incurred between November 30, 1981 and April 26, 1983.

16. The applicable rate of compensation is $245.05 per week.

CONCLUSIONS OF LAW

WHEREFORE, it is found:

Claimant has established that his injury of July 1981 is the cause of the disability on which he now bases his claim.

Claimant is entitled to healing period benefits from July 20, 1981 to November 24, 1981.

Claimant is entitled to permanent partial disability resulting from his injury of July 20, 1981 of 15 percent.

Claimant is entitled to payment of expenses incurred in chiropractic treatment.

THEREFORE, the proposed decision of the deputy is affirmed.

ORDER

THEREFORE, it is ordered:

Defendants are to pay claimant additional permanent partial disability benefits for seventy-five (75) weeks at a rate of two hundred forty-five and 05/100 dollars ($245.05) per week to commence November 24, 1981.

Defendants are to pay accrued amounts in a lump sum.

Defendants are to pay chiropractic costs of Dr. Smith in the amount of four hundred eighty-five dollars ($485.00).

Defendants are to pay interest pursuant to Iowa Code section 85.30 as amended.

Defendants are to pay costs pursuant to Industrial Commissioner Rule 500-4.33.

Defendants are to file a final report when this award is paid.

Signed and filed this 13 day of July, 1984.

ROBERT C. LANDESS
INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

LAVERNE KREUTZER,	
Claimant,	
vs.	FILE NO. 706776
JOHNSON GAS APPLIANCE COMPANY, INC.,	R E V I E W -
Employer,	R E O P E N I N G
and	D E C I S I O N
IOWA NATIONAL MUTUAL INSURANCE COMPANY,	
Insurance Carrier, Defendants.	

INTRODUCTION

This is a proceeding in review-reopening brought by LaVerne Kreutzer, claimant, against Johnson Gas Appliance Company, Inc., employer, and Iowa National Mutual Insurance Company, insurance carrier. Claimant seeks further benefits based upon the injury which occurred on April 7, 1982. Claimant's rate of compensation is $232.62 per week as established by the memorandum of agreement on file and by the stipulation of the parties.

The hearing commenced May 25, 1984 at the Iowa County Courthouse in Marengo, Iowa. Claimant appeared in person with his attorney, Ronald W. Wendt. Defendants appeared through their attorney, Robert M. Jilek. The case was considered fully submitted upon conclusion of the hearing.

ISSUES

The issues presented by the parties at the time of hearing are a determination of the nature and extent of any disability which claimant may have which is causally related to the injury. Also in issue is an assessment of the costs of the action. The parties stipulated that claimant's healing period was terminated by a return to work on October 4, 1982. Based upon the Form 2A, which is in the agency file of this case, it appears that claimant has been paid benefits for a permanent partial disability of 28 percent of the arm. The primary issue in this case is a determination of whether claimant's disability should be measured industrially or as a disability to a scheduled member. The evidence upon which the issues must be resolved consists of the testimonies of LaVerne Kreutzer, Beverly Kreutzer, Tom Davis, Paul Saylor and Beryle Brown. Also admitted into evidence are claimant's exhibits 1 through 21, of which 1 through 16 are exhibits to the deposition of Fred J. Pilcher, M.D., which is exhibit 21. Also in evidence is defendants' exhibit A. Defendants' objection to the results of the CYBEX testing is overruled. The same appears to be a diagnostic and evaluative device commonly used by the medical profession, even though its results may be less than perfect.

REVIEW OF THE EVIDENCE

LaVerne Kreutzer testified that he is presently 64 years of age and was 61 years of age at the time the injury occurred on April 7, 1982. He stated that he is married and has no dependents other than his spouse. He related that he completed his formal education at the eighth grade level. He described his work history as including work as a stockboy in a drugstore, welding, operating a bulldozer and making cigarette lighters before commencing employment with Johnson Gas in 1946. While with this employer he has worked in the machine shop operating a punch, drill press and other machines. He has also worked as a seam welder, placed firebrick in furnaces, mixed cement and worked in the packing and shipping department. He described most of the positions as heavy work which required lifting in the range from 35 pounds up to as much as 300 pounds. He is presently assigned to the assembly department where he works testing burners.

Claimant stated that prior to his injury he could lift heavy weights and objects, as much as 200 pounds, without assistance and denied having any problems with his back, arms, legs or neck. He related that his only medical problem was high blood pressure which was controlled by medication. He stated that prior to the injury he could perform every job at his employer's place of business and, over the years, had worked in every department.

Claimant stated that the injury occurred when he was using a staple gun while working in the shipping department. He described pushing down to staple the lid of a box when he moved the gun off the edge of the box and fell to the floor landing with his left hand on the gun. He stated that when he hit the floor it felt as if he had torn everything from his fingers to the back of his left shoulder blade.

Claimant stated that he reported the incident to his foreman and other supervisors who suggested to him that it was merely a sprain. He stated that he kept working and worked for approximately two months using only his right arm. He described experiencing continuous pain running from the back of his shoulder down to his hand. Claimant stated that when he awoke on June 10, 1982 his whole arm was black and blue. He reported the same to the office at work and was seen by Fred J. Pilcher, M.D., that same day.

Claimant stated that at that time his bicep muscle was in a big ball by the elbow. He reported having surgery on June 29, 1982 and exhibited a scar on his shoulder approximately four inches in length running vertically from the armpit. He reported making gradual improvement until February, 1983 when he experienced severe pain and consulted Dr. Pilcher. After consulting the doctor, it was determined that the surgical staple used to repair the arm had pulled loose but that further surgery was not adviseable.

Claimant testified that he returned to work October 4, 1982 and has continued to work since. He related that he can use his left arm only as a guide and that he continues to experience pain in his arm and shoulder. He reported a burning sensation below the shoulder and stated that the pain runs from the back of the shoulder to the elbow when he uses the arm. He demonstrated the ability to raise his left arm to an angle of approximately 45 degrees from his body when the elbow is held straight and to nearly 90 degrees if the elbow is bent. He demonstrated the ability to move his left hand to approximately the belt line in the middle of his back.

Claimant testified that his present job as a tester would normally involve lifting as much as 40 pounds but that another worker does that lifting for him. He occasionally performs other work which involves handling weights in the range of 15 pounds. He confirmed that the employer has not requested that he perform tasks which are beyond the medical restrictions and confirmed that he receives help from other workers when needed.

Claimant testified that he presently earns $9.83 per hour and that he was earning $9.62 per hour at the time of the injury. He confirmed that he has been classified as a tester for 15 years and is performing many of the same duties now as he performed prior to the injury. He stated that he is right handed and denied the occurrence of any other injury to his arms or shoulders. Claimant stated that he enjoys working and would not be satisfied with staying home. He stated that he plans to continue working until age 70, the mandatory retirement age at his place of employment. He stated that he has no plans to retire and has not applied for social security benefits.

Claimant testified that since the injury he has tried but has been unable to play golf. He stated that he can fish although it is difficult to do so. He reported that he cannot start the lawnmower at home and that he even uses his right hand to turn on the turn signals in the car when he is driving.

Claimant identified exhibits 17, 18 and 19 as bills which he has paid in the prosecution of this case.

Beverly Kreutzer was called to testify. She had not been listed as a witness and defendants' objection to allowing her to testify was sustained. Her testimony was taken as an offer of proof but is not considered in this decision.

Thomas Davis testified that he is a general laborer at Johnson Gas where he has been employed for 27 years. He related being acquainted with claimant and having worked with him occasionally under varied circumstances. He stated that before claimant's injury, they worked in the same area and were within sight of each other. He confirmed that over the years claimant had performed practically every job in the place, some of which required heavy lifting. He stated that since the injury claimant favors his left arm noticeably and requires help when lifting. He related that claimant makes no complaints and rarely requests help. He described claimant as a hard worker who seems to enjoy working and, that prior to the injury, he was very strong for his age and size.

Davis confirmed that the employer encourages the employees to help each other as needed and that there has been no adverse action taken against claimant as a result of his reduced work capacity or need for assistance.

Paul Saylor testified that he has worked at Johnson Gas for 22 years, is acquainted with the claimant and has observed the claimant occasionally for the last 16 or 17 years. He stated that prior to the injury claimant was a "go getter" and did not exhibit any signs of weakness or difficulty in working. He related observing claimant pull a box of parts which weighed approximately 400 pounds.

Saylor stated that claimant now requires help on many occasions although he is reluctant to request help. He stated that claimant tries to work as he did before and does not complain about his condition. He agreed that the workers at the facility are encouraged to help each other.

Beryle Brown testified that he has been employed at Johnson Gas for approximately 18 years and that he has been claimant's supervisor over the past several years. He confirmed that it is the general policy of the company to encourage the employees to help each other, particularly with heavy lifting as was described by Davis and Saylor. Brown confirmed that claimant generally does not request help and that he has assisted him on occasion. He stated that claimant is now assigned to the same job as before the injury and that claimant's wage rate has not been adversely affected by the injury. He confirmed that since the injury claimant has obvious difficulty using his left arm and

that prior to the injury such difficulties did not exist.

Brown testified that claimant is a good worker, well motivated and likes to get the job done and done properly. He stated that he is as aggressive now as before the injury but that his limitations do slow him down. He also agreed that there are now jobs in the facility which claimant is physically unable to perform.

Exhibits 1 through 16 are a number of medical reports from Dr. Pilcher. The reports relate claimant's treatment including the circumstances of the injury consistent with claimant's testimony and initial evaluation of 18 percent permanent impairment of the upper extremity which was equivalent to 11 percent of the whole man as shown in exhibit 5. Exhibit 6 relates discovery that the staple had become dislocated. Exhibit 9 shows his reluctance to perform a second surgery. In exhibit 12 Dr. Pilcher opines that claimant has a 28 percent impairment of the upper extremity which converts to 17 percent impairment of the whole man. Exhibits 1 through 16 contain a continuing discussion upon the issue of whether claimant's injury is limited to the arm or whether it includes his shoulder.

Claimant's exhibit 21 is a deposition of Dr. Pilcher which was taken February 28, 1984. In the deposition, at the pages indicated, Dr. Pilcher explains the actual location of the injury which claimant suffered and the results of that injury. They may perhaps be best summarized as stating that claimant had degenerative changes in the acromium clavicular joint which caused him pain, that the injury itself was located in the bicep muscle tendon at a point where the tendon and the muscle join near the upper portion of the humerus. The testimony in the deposition further reflects that the injured tendon attaches to the scapula at the upper end and around the elbow at the lower end. The doctor relates that a loss of motion in the shoulder is a result which normally follows from an injury of the type claimant suffered although there is no actual injury to the shoulder itself. In the deposition the doctor made the following statements:

> I reviewed his X-rays and it showed that he did have some degenerative changes or some arthritis if you will, over the A.C. joint, acromium clavicular joint, more so when compared with the assymptomatic right side and he was tender in that area.
>
> ...
>
> I feel that his discomfort at that time was partially related to his shoulder joint, the acromial clavical joint and the sub acromial bursa. I could in no way absolutely say it has any direct relationship with the biceps tendon.

(Deposition page 17, lines 1-6 and 12-17)

> ...It's a big operation, you have to work down into the arm. And to get normal motion after an operation like that would not be expected. You would expect near normal motion. So in that respect, he lost motion from the biceps tear and the subsequent surgery.

Q. And we are referring to the motion in the shoulder itself?

A. Right.

Q. When you said earlier that when you performed this surgery, part of the surgery was in the shoulder, could you explain specifically where in the shoulder the surgery occurred and why it was necessary to have surgery in this area of the shoulder?

A. The biceps tendon hooks around the elbow and goes up the upper arm and across the shoulder joint and has basically two places it hooks in, and they are both on the shoulderblade but it was torn free from the long head. That is, the section that goes up over the joint was torn free.

Now, did I not operate in the joint itself. I stayed out of that completely, but in order to do the surgery, to retrieve this tendon which had migrated or slipped down into the arm, you have to dissect away a fair amount of tissue just to get to it. It's hard to find because it goes down inside.
Dep., p. 22, ll. 14-25 and p. 23, ll. 1-16)

A. Actually, the tendon turns into the biceps muscle and as I mentioned in the operative report, one of the things that made it hard to even treat is, it had torn near the musculo-tendinous junction, and it didn't tear really up here. It tore more down where the tendon turns into muscle.

Q. And where would that be located, can you tell us? Were you pointing to it?

A. It would be the upper one third of the humerus.

Q. So actually when we are looking at the humerus, being the bone between the elbow and the shoulder joint, about one third down from the shoulder joint towards the elbow is where this is torn?

A. Oh, I'm sorry, it would be -- well, that would be about right. Maybe one fourth.

Q. But definitely on the humerus bone or arm section and not up into the shoulder section?

A. Oh, no, nowhere near the shoulder.
Dep. p. 38, ll. 8-25)

A. Well, I think the main component of his -- the main reason Laverne Kreutzer had a loss range of motion in his shoulder was because he had a biceps tendon rupture. The other thing is he had these underlying conditions, the acromial clavicular joint arthritis, which he said never bothered him before. The arthritis is only mild. It's worse on the other side and it's all relative, but his age, I mean you can blame him for being as old as he is, as far as that goes.

He would not tolerate immobilization as well as a younger person. I just don't feel that his arthritis, if you want to call it that, or his abnormality in the acromial clavicular joint has that much to do with lost motion in the shoulder. He hadn't hurt it, he was tender over it many times, but he had had that for years. That didn't just occur in a year, that has been there for many, many years.

Q. If the issue is, and I'm not so sure it is, I'll preface the question with that, if the issue is whether or not any injury he suffered at work extends beyond the shoulder joint itself, in your opinion, was there any injury work related which extended beyond the shoulder joint of this particular patient?

A. No.

Q. Whatever injury he has was either in the biceps or the arm or the shoulder joint itself and stops at the shoulder joint?

A. Those are the injuries, right.

Q. And nothing included in the clavicular area or the back area or the neck area?

A. No (Indicating). He came in with the biceps tendon rupture, that was his injury. Absolutely, no doubt about it, that was the injury that he had.
(Dep. p. 47, ll. 6-25 and p. 48, ll. 1-17)

I don't know how he is doing but you can't operate on a shoulder of a man sixty-two years old who has had a biceps tendon rupture, who had it fixed, who is immobilized, who goes through the physical therapy and not lose motion in his shoulder.

I mean, I wish we could. And I don't know, I don't know if you want to be a devil's advocate, but he may have not had any better motion in his shoulder prior to hurting the biceps tendon, I don't know.

I never saw the man here. I'm speaking probabilities here. Anything is possible. He could get hurt going to therapy, he would need other physicians' records and talking to Laverne, but he told me he never had any trouble with his shoulder but I can't isolate the humerus from the shoulder joint because the humerus is part of the shoulder joint.

Q. And so what we are talking about is ball and socket again, the ball being the humerus, that's what you are saying was involved because of the loss of motion and the socket itself?

A. The humerus did not lose motion. The humerus is a bone that sits in the arm. The shoulder lost motion.

Q. Thank you, that's more accurate.

A. See, the humerus has no motion by itself. Okay, you have to have -- the humerus is one half of the shoulder joint, maybe that's what we need. But I guess that's all I can say, the humerus lost no motion, all right? It's the shoulder that controls the motion because the humerus is one half of the shoulder joint.

If we didn't have the humerus, there would be no motion at all, no shoulder joint either, see.

Whatever you apply to the upper humerus, as far as motion of the humerus, has to relate to the shoulder joint. The lower end relates to the elbow. If it was the elbow, it would be easier to deal with.

...

Q. Is the shoulder joint a part of the shoulder?

A. Yes.

Q. And in your letters referring to the injury in this case when you used the term upper extremity, did you mean for that term to include not only the arm but also the shoulder?

A. The only time I really used the upper extremity in those words, as I recall, was when I gave him a permanent disablity rating and I have to apply that according to the texts, the books that we have. We do not have a category of shoulder impairment as such.

It relates to the upper extremity so you know, the upper extremity in the evaluations deal with the humerus and the shoulder joint.

Q. Is the condition to Mr. Kreutzer's shoulder a permanent condition?

A. Yes.
(Dep. p. 49, ll. 3-25, p. 50, ll. 1-18 and ll. 22-25, and p. 51, ll. 1-14)

APPLICABLE LAW AND ANALYSIS

The claimant has the burden of proving by a preponderance of the evidence that the injury of April 7, 1982 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

At page four of his deposition Dr. Pilcher notes that he was aware that claimant's condition was a "workman's [sic] compensation related injury". Although the history related in some of the exhibits refers to lifting rather than the fall claimant described at hearing, it is apparent that the tear of the bicep tendon is the result of an injury which the claimant suffered at work. There is no evidence in the record to the contrary.

The primary issue in this case is a determination of whether claimant's disability is to be measured as disability to a scheduled member or if the same is to be measured industrially. Section 85.34(2)(m) states: "The loss of two-thirds of that part of an arm between the shoulder joint and the elbow joint shall equal the loss of an arm and the compensation therefor shall be weekly compensation during two hundred fifty weeks." Section 85.34(2)(u) states: "In all cases of permanent partial disability other than those hereinabove described or referred to in paragraphs "a" through "t" hereof, the compensation shall be paid during the number of weeks in relation to five hundred weeks as the disability bears to the body of the injured employee as a whole." It should be noted that the statute speaks in the terms of "the loss of" and not in the terms of "an injury to". The phrase "the loss of" is construed to mean the loss of the use of whatever member is involved. An injury to the shoulder is an injury to the body as a whole. Alm v. Morris Barick Cattle Co., 240 Iowa 1174, 38 N.W.2d 161 (1949). In Alm the injury was to the collar bone.

An injury to a scheduled member which, because of after-effects (or compensatory change), creates impairment to the body as a whole entitles claimant to industrial disability.

An injury is the producing cause; the disability, however, is the result, and it is the result which is compensated. Barton v. Nevada Poultry Co., 253 Iowa 285, 110 N.W.2d 660 (1961); Dailey v. Pooley Lumber Co., 233 Iowa 758, 10 N.W.2d 569 (1943).

If a claimant contends he has industrial disability he has the burden of proving his injury results in an ailment extending beyond the scheduled loss. Kellogg v. Shute and Lewis Coal Co., 256 Iowa 1257, 130 N.W.2d 667 (1964).

This case differs, however, from Kellogg in that Dr. Pilcher has medically confirmed that the loss of motion in claimant's shoulder joint is related to the injury to the bicep tendon which occurred in claimant's arm. In his deposition he also indicates that the impairment of the shoulder is permanent. In Barton the injury or trauma was to the foot; however, a circulatory ailment which resulted was held to require that the disability be measured industrially. In Daily there existed as a result of a fracture of the femur a compensatory tilting of the pelvis and curvature of the spine. Claimant has degenerative changes in his acromium clavicular joint but Dr. Pilcher is unwilling to relate those to the injury to the bicep tendon as shown at page 20 of his deposition. There is no medical evidence in the record which shows that any alteration of claimant's body occurred beyond the shoulder joint. The range of motion upon which the impairment was determined was actually the motion of the arm measured at the point of the shoulder joint. The strength testing which was performed actually measured the strength with which the upper arm moved in the shoulder joint. The definition of the scheduled member begins at the shoulder joint. It is found and concluded that claimant's impairment does not extend into the body as a whole and that his compensation should be measured under the provisions of section 85.34(2)(m) of the Code of Iowa. Dr. Pilcher imposed an impairment rating of 28 percent of the upper extremity. Such appears reasonable under the record in this case and will be adopted.

The costs of this proceeding as shown in exhibits 17, 18 and 19 are proper except that the fee for the deposition should be limited to $150.00 in accordance with section 622.72 of the Code of Iowa and Industrial Commissioner Rule 500-4.33(5). The resulting total of reimburseable cost is therefore $351.90. This case involves an extremely close question of law and the costs will be assessed against the defendants under the provisions of Industrial Commissioner Rule 500-4.33 even though their defense of this proceeding was successful.

FINDINGS OF FACT

1. Claimant is a resident of the State of Iowa and his place of employment at the time of injury was in the State of Iowa.

2. Claimant was injured on April 7, 1982 when he fell and tore his bicep tendon.

3. Following the injury claimant was medically incapable of performing work in employment substantially similar to that he performed at the time of injury from June 11, 1982 through October 3, 1982, both dates inclusive, when claimant returned to work with his employer.

4. As a result of the injury claimant suffered a permanent partial functional impairment of 28 percent of his left arm.

5. The injury claimant suffered was located at a point where the bicep tendon joined the bicep muscle near the upper one-third of the humerus.

6. The injury caused a loss of motion and loss of strength at claimant's left shoulder.

7. The injury did not cause any structural change which extended beyond his arm.

8. The loss of motion and strength from which claimant suffers is permanent.

9. As shown by the Form 2A filed July 28, 1983, claimant has been paid for a 28 percent permanent partial disability of the left arm.

CONCLUSIONS OF LAW

This agency has jurisdiction of the subject matter of this proceeding and its parties.

Claimant has failed to prove that the injury he sustained on April 7, 1982 extended beyond his arm and into his body as a whole. Claimant's disability is therefore properly evaluated as a scheduled member disability under the provisions of section 85.34(2)(m) of the Code of Iowa.

Claimant is entitled to receive 70 weeks of compensation for permanent partial disability at the rate of $232.62 per week commencing October 4, 1982.

The amount of costs which may be reimbursed to claimant are $351.90.

ORDER

IT IS THEREFORE ORDERED that defendants pay claimant seventy (70) weeks of compensation for permanent partial disability at the rate of two hundred thirty-two and 62/100 dollars ($232.62) per week commencing October 4, 1982. Defendants shall receive full credit for all amounts previously paid.

IT IS FURTHER ORDERED that defendants pay any portion thereof which has not been previously paid in a lump sum together with interest pursuant to section 85.30 of the Code of Iowa.

IT IS FURTHER ORDERED that the costs of this proceeding in the amount of three hundred fifty-one and 90/100 dollars ($351.90)

are assessed against defendants, the same to be paid to claimant in accordance with Industrial Commissioner Rule 500-4.33.

IT IS FURTHER ORDERED that defendants file a final report within twenty (20) days from the date of this decision.

Signed and filed this 30th day of July, 1984.

MICHAEL G. TRIER
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

THOMAS LAMBORN, Claimant, vs. COHRON & SONS, INC., Employer, and WESTERN FIRE INSURANCE, Insurance Carrier, Defendants.	:	File No. 604280 A P P E A L D E C I S I O N

FILED
JUL 20 1984
IOWA INDUSTRIAL COMMISSIONER

STATEMENT OF THE CASE

Claimant appeals from a proposed decision in review-reopening wherein claimant was denied further healing period and permanent partial disability benefits. The deputy found that claimant was not entitled to benefits pursuant to section 86.13, Code of Iowa.

The record on appeal consists of the transcript of the review-reopening proceeding, claimant's exhibits 1 through 10 inclusive, defendants' exhibit 1, and the briefs and filings of the parties on appeal.

ISSUES

Claimant states the issues as:

> The claimant's injury and disability, caused by this work-related incident extends into and beyond the right hip joint. As a consequence the extent of claimant's disability is determined under the terms of §85.34(2)(u) and the concept of industrial disability as defined by the Iowa Supreme Court is applicable.
>
> As a direct and proximate result of the injury of September 10, 1979, Thomas Lamborn has sustained an industrial disability of substantial proportions.
>
> The claimant's gross weekly wage should include the value of the "on the road lodging" which the employer furnished claimant.
>
> The defendants acted without reasonable or probable cause or excuse in failing to pay weekly compensation benefits based on a disability extending into the body as a whole.

REVIEW OF THE EVIDENCE

The parties stipulate that defendant insurer has paid benefits for a 40 percent permanent partial disability of the lower right extremity. (Transcript, page 7) The parties further agree that portions of the deposition of claimant taken on March 18, 1983 may be used as a part of the evidence in the review-reopening proceeding. (Tr., pp. 130-131)

Claimant was 45 years old at the time of the hearing. He is married and has one dependent child. (Tr., pp. 15-16) Following graduation from high school, claimant worked as a general laborer and served four years in the navy as a radio man. (Tr., pp. 16-17) He then worked in construction and as an electrical linesman for two utility companies. Claimant testified his work involved climbing poles and heavy lifting. (Tr., pp. 19-21) He worked as an electrician in home wiring until 1979, when he went to work for defendant employer. Claimant stated he was hired for general labor in bridge construction around May 1, 1979. (Tr., pp. 22-23) He worked on projects in Bridgewater, Wapello, and Oskaloosa. Claimant testified that when he worked on a project that wasn't within commuting distance of his home, he would stay in campers provided by the employer. Claimant explained that employees working away from home worked four and a half days and could quit just before noon on Friday in order to have a longer weekend at home. (Tr., pp. 23-25) On September 10, 1979 claimant was working for defendant employer in Marengo. His duties included carpentry and electrical work and required the lifting of weights up to 150 pounds. (Tr., pp. 25-26) While working, claimant fell through the decking of the bridge to the ground. He was taken to Marengo Hospital and from there transferred by helicopter to Methodist Hospital in Des Moines. (Tr., pp. 25-26)

Claimant was diagnosed as having suffered a subtrochanteric fracture of the right hip. On September 11, 1979 an open reduction and internal fixation of the femoral fracture was performed by Ronald K. Bunten, M.D., an orthopaedic surgeon. (Claimant's Exhibit 1) Claimant spent ten days in the hospital and was discharged on crutches. (Tr., p. 28) His progress was followed by Dr. Bunten, who noted on May 16, 1980:

> He is progressing slow with endurance. He uses a cane most of the time. Not having much pain but
>
> Examination shows he walks with a mild antalgic gait unsupported, much better with the cane in the opposite hand. He measures one inch short spine to malleolus. There is no fixed flexion deformity with good rotation and further flexion to beyond 120 degrees. No unusual tenderness is noted.
>
> Two views of the right hip show further healing and mild varus position which is stable. Hardware looks satisfactory.
>
> He will do some flexion, abduction, and extension exercises for the hip muscles and continue working on endurance and weight bearing. I don't think he will be likely able to return to vigorous construction work activity in the several months ahead, but we will reassess in two months. (Cl. Ex. 1)

Dr. Bunten continued to see claimant periodically and on December 10, 1980 reported:

> He continues limited in his endurance in ability to carryout [sic] ambulatory activities. He works some pulling and assisting with fence post removal, but after about 2-3 hours had to rest. Most of his discomfort seems centered on the lateral aspect of the hip where there is some tenderness over the hardward [sic]. He has a short leg limp, but has an antalgic component when unsupported. He does much better with a cane or crutch in the opposite hand.
>
> Films of the hip were not obtained today. The old films were reviewed and the fracture appears satisfactorily healed.
>
> I think he might be improved with removal of hardware and details were discussed. Arrangements were made to carry this out on January 6, 1981, at Methodist Hospital. (Cl. Ex. 1)

Testifying by deposition, Dr. Bunten stated that the hardware consisted of a Smith-Peterson nail, a Thornton side plate with screws, and a wire affixed to the upper part of the femur. (Cl. Ex. 10, p. 7) On January 6, 1981 Dr. Bunten performed surgery to remove the hardware. On June 24, 1981 he discharged claimant from his care. (Tr., p. 51) Dr. Bunten's final report states:

> He continues to have a limp and some discomfort on the lateral aspect of his thigh. He may be some improved with hardware removal. He continues to use a cane in the opposite hand for endurance. He

is unable to lift and carry items that are heavy, more than just a few steps because of weakness and limp in the right leg.

Examination shows that he has an external rotation short leg type of gait which is better with a cane in the opposite hand. He is not wearing his lift today, but generally does so. He is about 1½" short. His range of motion about the hip is only mildly restricted and his range seems painless.

Films of the hip in two views shows [sic] the fracture to remain soundly healed without the hardware. There is no evidence of arthritic change in the hip. There is a mild varus present.

I am not sure why he isn't doing a bit better. I expected him to have a better gait and better function. I think he probably has reached his maximum improvement. I would rate his lower extremity as 40% impaired, but I think he is 100% industrially disabled by the condition of his left leg. I think he would be a candidate for Vocational Rehabilitation and training for sedentary sorts of work activity. (Cl. Ex. 1)

Dr. Bunten testified that claimant may have suffered injury to the muscles of the femur and pelvis.

Q. Now, you have mentioned in the course of Mr. Hanssen's examination that some of the muscles that may have been injured along with the fracture had attachments in the pelvis as well as, I assume, in the femur, is that right?

A. Yes.

Q. Now, with regard to those muscles, I was not clear from your testimony before whether you were deducing that there had been injury to the muscular structure or whether you were describing your observations as to the muscular structure. Could you clarify that for me?

A. I think I was deducing principally, knowing something about the magnitude of these injuries, that there almost has to be injury and bleeding and subsequent scarring in the surrounding muscles. I don't think I have any specific information learned at the time of his operative treatment. I think some of his restricted motion, his external rotation posturing and so on might be evidence of some scarring and restricted flexibility due to scarring in these muscle groups. (Cl. Ex. 10, pp. 17-18)

Dr. Bunten did not find evidence of physical impairment to the pelvis itself.

Q. Did you find any physical impairment to the pelvis?

A. None that I would specifically assign to the pelvis, no.

Q. Did you find any physical impairment to the head of the femur or the socket of the pelvis?

A. None that I would assign to the joint surface, no.

Q. Or did you find any physical impairment to the ligaments or cartilage or other soft tissues surrounding the head or socket?

A. No.

Q. Did you find any injury to the tendons or ligaments or muscles or other soft tissues except those injuries which you indicated were in the area of the fracture, that is, the area of the upper part of the femur?

A. No. Except I think he has restricted motion about the hip and I think that's in part due to the injuries of the soft tissues in the area of his injury. (Cl. Ex. 10, pp. 20-21)

On May 6, 1983 claimant was examined by Thomas B. Summers, M.D. (Cl. Ex. 5) Dr. Summers found weakening and atrophy of the right thigh. He noted that claimant limped when walking and used a cane for support. Dr. Summers reported: "He states he has continued to have pain in the right hip. The pain becomes more intense and severe the longer he is upright. Weight bearing also aggravates the pain and discomfort. He states that numbness extends into his back and at times into his neck."

Dr. Summers noted that the contour of the lower spine was normal and that claimant could bend well in all directions. (Cl. Ex. 5)

CLINICAL IMPRESSIONS: 1. Status post-traumatic inter-trochanteric fracture involving the right femur and with resulting deformity, as narrated above.

2. Post-traumatic arthropathy, secondary to #1.

3. Myofacial strain, lumbar, secondary to #1.

DISCUSSION: The injury and resulting deformity, pain and discomfort do involve primarily the right lower extremity.

There is clinical evidence of proximal muscle weakness involving the right lower extremity and particularly the abductor muscle group, that is the gluteus medius muscle group. The various muscle groups which serve to execute functional movement of the thigh on the pelvis, at the hip joint level, do originate in and about the region of the corresponding hemipelvis. Anatomically, this must be considered a part of the torso or trunk and not structures of the limb, per se. Not unlikely, the distress in the lower back which Mr. Lamborn refers to as a 'numbness' is that of a myofascial strain and is secondary to the abnormal posture brought about by the fracture and resulting deformity including the shortening of the right lower extremity.

Insofar as loss of motion for the right hip joint is concerned, the impairment of the right lower extremity is approximately 30%. Other conditions or disabilities must be considered, however, including the pain and discomfort, the consequent shortening of the right lower extremity and resulting gait disturbances, the strain on the lumbar spine and so on. For this reason, it is my feeling that the functional impairment of the body taken as a whole is approximately 25%. (Cl. Ex. 5)

Claimant testified he can only walk two to three blocks before he incurs pain in his leg, hip and lower back. (Tr., p. 32) He can stand for up to an hour, and can sit for an hour to an hour and a half. Claimant stated he usually sits for a half an hour and then changes position by standing or walking around. (Tr., pp. 32-34) Claimant stated he had driven himself from his home in Fontanelle to Des Moines for the hearing, a distance of 65 miles. (Tr., p. 50) He testified he is aware of the jobs available in his community and does not believe he could physically handle them. He has not considered relocating as he owns his own home, and his wife works at a local medical clinic. (Tr., pp. 37-39) He testified he had contacted one employer a couple of years ago to inquire about light work. (Tr., pp. 54-55) He has not made inquiry into any kind of training programs. (Tr., p. 60) Defendant employer's supplemental information report indicates that at the time of injury, claimant's gross weekly wage was $226.15. Claimant has been paid 93 2/7 weeks of healing period benefits and 88 weeks of permanent partial disability compensation.

Patricia McCollum, a registered professional nurse and job development specialist, testified she made an employability assessment of claimant in September of 1982. (Tr., pp. 73-75) In her report of September 27, 1982, Ms. McCollum stated that claimant had transferrable skills in communications, electrical work and mechanics, all of which could be developed. (Cl. Ex. 6) Ms. McCollum testified claimant was cooperative at his interview but expressed feelings of hopelessness with regard to what he could do. (Tr., p. 81) Ms. McCollum stated that she was aware of employment opportunites in claimant's area and that opportunities were generally limited. She did not find any work available in Greenfield, Corning or Creston that claimant could do. (Tr., pp. 84-92) Jobs within claimant's physical limitations paid minimum wages. (Tr., p. 92) Ms. McCollum believed aptitude and interest testing needed to be done before she could recommend an educational program for claimant. (Tr., p. 93)

At the request of defendants, Roger Marquardt, director of North Central Rehabilitation Service, prepared a vocational evaluation of claimant based in part on the reports of Drs. Bunten and Summers and of Patricia McCollum. Mr. Marquardt also interviewed claimant on July 22, 1983. (Def. Ex. 1) Mr. Marquardt reported that claimant has knowledge in basic electrical current and wiring and could utilize his skills for sedentary work in small appliance repair, bench assembly and wirework. Claimant could also work as an electrical production inspector. The entry level wage averages $5.50 an hour. Mr. Marquardt stated that availability of this work is limited in claimant's residential area. (Def. Ex. 1) If claimant does not utilize his electrical skills, unskilled, light work in his area would pay approximately $3.60 an hour. Mr. Marquardt estimated that claimant's former job in bridge construction now pays approximately $6.20 per hour. (Def. Ex. 1)

A stipulation of evidence, signed by the attorneys for claimant and defendants, was filed on January 11, 1984. The stipulation states that Keith Harlan, vice-president of defendant employer, if called as a witness, would testify that small mobile trailers were provided for lodging of employees who worked at out of town construction sites. Employees were not required to use the trailers. After claimant left the employ of defendant employer, the use of the trailers was discontinued and employees received $20 a week for lodgings. It is not stipulated that the value of the lodging is allowed to be included in gross weekly earnings for rate computation purposes.

APPLICABLE LAW

The claimant has the burden of proving by a preponderance of the evidence that the injury of September 10, 1979 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

An injury to a scheduled member which, because of after-effects (or compensatory change), creates impairment to the body as a whole entitles claimant to industrial disability. Barton v. Nevada Poultry Co., 253 Iowa 285, 110 N.W.2d 660 (1961). Dailey v. Pooley Lumber Co., 233 Iowa 758, 10 N.W.2d 569 (1943).

An injury is the producing cause; the disability, however, is the result, and it is the result which is compensated. Barton, 253 Iowa 285, 110 N.W.2d 660; Dailey, 233 Iowa 758, 10 N.W.2d 569.

Section 85.34(2)(o), Code of Iowa (1979) states: "The loss of two-thirds of that part of a leg between the hip joint and the knee joint shall equal the loss of a leg, and the compensation therefor shall be weekly compensation during two hundred twenty weeks."

Section 85.61(12), Code of Iowa, provides: "'Gross earnings' means recurring payments by employer to the employee for employment, before any authorized or lawfully required decuction or withholding of funds by the employer, excluding irregular bonuses, retroactive pay, overtime, penalty pay, reimbursement of expenses, expense allowances, and the employer's contribution for welfare benefits."

ANALYSIS

Claimant contends in his first issue on appeal that his disability extends into and beyond the right hip joint. Under the provisions of section 85.34(2)(o), The Code, a loss extending into the hip joint is compensated as a loss to a scheduled member. Therefore, claimant's burden is to show an impairment which extends into the body beyond the juncture of the femur and the pelvis.

Dr. Bunten, an orthopedic specialist and the treating physician, has testified that the fracture to the femur was sustained below the intertrochanteric line, which is an area below the head and neck of the femur. Dr. Bunten has also testified that he found no evidence of impairment to the pelvis or of damage to the ligaments, tendons and muscles beyond the fracture area. Dr. Bunten speculated that other muscle groups may have been damaged by the injury, and if damaged, could be a contributing factor in claimant's restricted motion, but conceded that the only injury to soft tissue he had observed was limited to the area of the fracture in the upper part of the femur.

Dr. Summers, who saw claimant once for purposes of evaluation, determined a 25 percent impairment of the body as a whole. Dr. Summers confined claimant's loss of motion in the lower extremity to the hip joint but included a lumbar strain in his impairment rating, based upon claimant's complaint of "numbness" in his lower back and neck. Dr. Summers' only objective findings with regard to the lumbar spine were that the contour was normal and claimant could bend well in all directions. There is no medical testimony as to the nature of claimant's numbness or to its limiting effects, if any, on claimant's ability to engage in physical activities. Absent evidence that claimant is physically restricted by the numbness he reports, no finding of disability that extends to the body as a whole is possible. The deputy's finding that claimant is entitled to benefits based on a 40 percent permanent partial impairment of the right lower extremity is accepted as correct.

Since claimant's injury represents a scheduled loss, this decision does not reach the question of extent of industrial disability.

Claimant asserts in his third issue that claimant's gross weekly wage should include the value of the lodging provided by defendant employer. The statement of Keith Harlan indicates that lodging was made available to the employees should they choose to use it. Under the definition of gross earnings as provided under section 85.61(1), The Code, such lodging could not constitute recurring payment for employment and the value of such lodging may not be computed as gross earnings. Claimant's rate of compensation, as found by the deputy, is $144.78 per week.

Claimant's last issue on appeal addresses the failure of defendants to pay compensation benefits based on a body as a whole disability. Claimant demands application of the penalty provisions of section 86.13, The Code. Since defendants have already paid the benefits due for healing period and permanent partial disability compensation, the penalty provision is not applicable.

FINDINGS OF FACT

1. Claimant was injured on September 10, 1979 while working for defendant employer.

2. Claimant has sustained a subtrochanteric fracture of the right leg.

3. Claimant underwent surgery for an open reduction and internal fixation for the femoral fracture.

4. Claimant continued to suffer pain and walked with a limp due to a shortened right leg.

5. On January 6, 1981 surgery was performed to remove the hardware in the upper part of the femur.

6. Claimant continued to limp and had discomfort in the thigh.

7. On June 24, 1981 it was medicaly indicated claimant had reached maximum improvement.

8. Claimant has an impairment of 40 percent of the lower right extremity.

9. Claimant has been paid 93 2/7 weeks of healing period benefits for the work-related injury.

10. Claimant has been paid 88 weeks of permanent partial disability compensation based on a 40 percent loss to the lower right extremity as a result of the work-related injury.

11. Defendant employer provided trailers for overnight lodging to employees who worked away from home.

12. The value of the lodging may not be included in gross earnings as contemplated under section 85.61(12), Code of Iowa.

13. Claimant's rate of compensation is $144.78 per week.

14. Defendants have already paid all benefits due claimant.

CONCLUSION OF LAW

WHEREFORE, it is found:

Claimant sustained a permanent partial disability of forty percent (40%) to the lower right extremity. Claimant is entitled to ninety-three and two-sevenths (93 2/7) weeks of healing period benefits from September 10, 1979 to June 24, 1981. Claimant is entitled to an additional eighty-eight (88) weeks of permanent partial disability benefits. The applicable rate of compensation is one hundred forty-four and 78/100 dollars ($144.78) per week. All healing period benefits and disability compensation due claimant have been paid. Claimant is not entitled to benefits as provided under section 85.13, Code of Iowa.

THEREFORE, the proposed decision of the deputy is affirmed.

ORDER

THEREFORE, it is ordered that the claimant shall take nothing further from these proceedings.

The costs of this action are taxed to defendants pursuant to Industrial Commissioner Rule 500-4.33.

Signed and filed this 20 day of July, 1984.

FILED

AUG 30 1984

IOWA INDUSTRIAL COMMISSIONER

By order of the industrial commissioner filed June 27, 1984 the undersigned deputy industrial commissioner has been appointed under the provisions of §86.3, Code of Iowa, to issue the final agency decision on appeal in this matter. Defendants appeal from an adverse review-reopening decision.

The record consists of the transcript; claimant's exhibits 1 through 6; and defendants' exhibit 1, all of which evidence was considered in reaching this final agency decision.

The outcome of this appeal decision will be the same as that reached in the review-reopening decision.

Neither side filed briefs.

The hearing deputy ruled that claimant had sustained a permanent and total disability as a result of her injury of February 14, 1978. The issues for resolution in the review-reopening decision were (1) whether there is a causal relationship between the injury and the disability; (2) the nature and extent of such disability; and (3) whether certain medical expenses should be paid. (The record shows that all medical expenses sought were paid after the hearing.)

The medical evidence by Dr. Jones and Dr. Summers was unrebutted as to the causal relationship, and their opinions showed claimant had a serious impairment. Claimant has a limited education and her experience has been in factory work and as a shirt press operator, precisely the types of work that her permanent partial impairment would prohibit. At this time, her employment horizons are totally limited. As her problems have persisted since early 1978 and show little likelihood of improvement, one agrees that an award of permanent and total disability under §85.34(3) is appropriate.

The findings of fact, conclusions of law and order of the review-reopening decision are adopted herein.

FINDINGS OF FACT

1. Claimant was employed by defendant employer on February 14, 1978.

2. Claimant was injured while working on February 14, 1978.

3. Defendants filed a memorandum of agreement concerning a February 14, 1978 injury.

4. Claimant sustained an aggravation of a preexisting carpal tunnel condition on February 14, 1978.

5. Claimant's injury now extends into the body as a whole.

6. Claimant is permanently and totally disabled as a result of the February 14, 1978 injury.

7. Claimant entered into a prior agreement for settlement of this case.

8. Claimant's condition has worsened since the approval of the agreement for settlement.

CONCLUSIONS OF LAW

1. Claimant was employed by defendant employer on February 14, 1978.

2. Claimant sustained an injury arising out of and in the course of employment on February 14, 1978.

3. Defendants will be ordered to pay unto claimant $167.74 per week of permanent total disability compensation during the period of claimant's disability.

ORDER

IT IS THEREFORE ORDERED that defendants pay unto claimant permanent total disability compensation at the rate of one hundred sixty-seven and 74/100 dollar ($167.74) per week commencing February 15, 1978 during the period of claimant's disability.

Defendants are to receive credit for compensation already paid.

Interest shall accrue on this award pursuant to §85.30, Code of Iowa, from May 3, 1984.

Costs of this proceeding are taxed against defendants.

A claim activity report shall be filed upon payment of this award.

Signed and filed this 30th day of August, 1984.

IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This matter came on for hearing at the offices of the Iowa Industrial Commissioner in Des Moines on October 26, 1983 at which time the record was closed.

A review of the commissioner's file reveals that an employer's first report of injury was filed on February 17, 1978. A memorandum of agreement was filed March 27, 1978 calling for the payment of $167.74 in weekly compensation. This case became a contested case proceeding which eventually was resolved when an agreement for settlement was filed. Roughly a year of healing period compensation was agreed to and claimant was paid permanent partial disability based upon an 18 percent loss to the body as a whole. The agreement was reviewed and approved by the commissioner on August 21, 1980. The record consists of the testimony of the claimant; claimant's exhibit 1 through 6; defendants' exhibit 1; and all filings submitted prior to this time.

ISSUES

The issues for resolution are:

1) Whether there is a causal relationship between the injury and the disability;

2) The nature and extent of disability; and

3) Whether certain medical expenses should be paid.

REVIEW OF THE EVIDENCE

Claimant was employed by AMF Lawn and Garden on February 14, 1978. On that date she sustained an injury arising out of and in the course of her employment. Claimant was found to have aggravated a preexisting bilateral carpal tunnel syndrome. Claimant was awarded healing period through January 30, 1979. Claimant's injury was found to be permanent. Claimant later settled the case on an agreement that she was disabled to the extent of 18 percent of the body as a whole.

Claimant, age 60, testified she has lived in Des Moines her entire life. She testified that she now weighs 128 pounds, having weighed 148 pounds prior to the injury. Claimant attributes her weight loss to decreased food consumption in reaction to pain. Claimant testified that she left school in the eleventh grade in 1939 to care for her sick mother. Claimant became employed by the National Youth Administration for a short while. She then became employed at the Iowa Packing Company as a packer, bone cutter and butcher. Claimant was employed by Iowa Packing from 1942 through 1948. Claimant was paid piece work in addition to an hourly wage. Claimant went to work for Clean Towel and Uniform and worked as an inspector for about two years. Claimant took a cut in pay to 68 cents an hour. In 1950 claimant became employed at New Monarch Machine as a machine operator. Claimant was given a short on-the-job-training orientation. Although claimant could not recall her exact earnings, she does recall that she made more money than before. Claimant quit in about 1957 to become employed at her husband's restaurant business. Claimant went back to the Clean Towel business in 1959 and became a shirt press operator. In October 1966 claimant went to work for defendant employer until February 1978 when she was injured.

Claimant was an assembly line worker to start and was a parts chaser at the time of her injury. Her duties included ordering parts and keeping sufficient parts in the work area for production workers. Claimant testified that she had taken minimal time off work for the births of her four children. Claimant was struck by a crane. Claimant testified that her chief complaints were with regard to her arms, shoulder and back.

The previous decision in this case reveals that claimant was treated by Albert L. Clemens, M.D., who in turn referred claimant to Robert C. Jones, M.D., who performed operations on claimant's wrists for the carpal tunnel problem. Dr. Jones referred claimant to be examined. The record reveals that claimant also had a number of prior medical problems. The record indicates that claimant had seen Dr. Jones about six months before she had her injury. However, Dr. Jones indicated that the injury at work was responsible for the aggravation of the carpal tunnel syndrome. Dr. Jones thought claimant had also sustained a spinal strain. A bilateral carpal tunnel release was conducted in April 1978. At the hearing of this matter on October 26, 1983 claimant indicated that the hands, arms and shoulders bothered her more after the February 1978 injury than before.

Claimant had her first hearing on this matter in June 1979. She testified that she partook in physical therapy thereafter. Dr. Jones referred claimant to Dr. Dubansky, an orthopedist, but the bill was not paid by the insurer. The matter was the subject of dispute and the employer's representatives agreed to pay for treatment. In September 1982 claimant went to a pain center, but was not treated. Claimant then received physical therapy from Ina Hellwig, a physical therapist. Claimant testified that the neck problems are far worse at this time than those she experienced prior to the injury. Claimant testified that she did not have neck limitations prior to the injury.

Claimant testified that she now has more severe pain in her shoulders than she had before the injury. Claimant testified that she could lift her arms before the injury, and that she could not do so now. Claimant testified that she was having problems with her lower back after the injury, but that the pain remained about the same.

Claimant testified that she has to have someone assist her in a number of routine household tasks. She testified that a daughter and a grandchild live with her now to help her with these tasks.

Claimant indicated that Dr. Dubansky's bill was eventaully paid. Dr. Blessman's bill was paid after the hearing of this matter.

The depositions of Dr. Jones and Thomas B. Summers, M.D., were received into evidence in this case.

Dr. Jones testified that he saw claimant on November 19, 1979 at which time claimant was complaining of wrist pain with a decrease in range of motion. Claimant's hand position had become frozen. There was a decreased range of motion of both shoulders.

On January 30, 1979 claimant complained of low back pain and pain in both legs. Claimant's upper arms and shoulers were bothering her. Dr. Jones asked claimant to see an orthopedist in order that claimant's back, hand and arm problems could be treated.

Claimant saw Dr. Jones again in April 1979 with basically the same symptoms and Dr. Jones testified that he referred claimant to see Marvin Dubansky, M.D., an orthopedist. Dr. Jones placed claimant on an anti-inflammatory medication. Dr. Jones did not see claimant again until November 1979 when claimant complained of pain in the wrist with a decreased range of motion. She was unable to close her fingers on either hand. Claimant never saw Dr. Dubansky because the insurer would not pay for services rendered by Dr. Dubansky.

Claimant saw Dr. Jones again in January 1980 when claimant was complaining of pain in both arms and shoulders. She had both frozen hand and shoulder syndrome. Dr. Jones continued to treat claimant and he testified that claimant had a partial clawhand of both hands and that claimant was in need of treatment to increase the range of motion of her shoulder.

Dr. Jones indicated that the delay in obtaining or seeking physical therapy itself was worsening the claimant's condition. He felt that claimant had a permanent physical impairment both for contracture of the shoulder and the hands. Dr. Jones testified that claimant never was able to work after the prior decision in this case. Dr. Jones indicated that there was a causal relationship between the injury and the condition. Dr. Jones thought claimant was still disabled. In a letter of July 8, 1980 to claimant's former counsel, Dr. Jones indicated that he thought that claimant's permanent impairment was 25 percent of the body as a whole.

On cross-examination, Dr. Jones indicated that the shoulder and arm problems were caused by the carpal tunnel syndrome. He thought that physical therapy would help claimant's condition. He stated that claimant had had frozen shoulder before but that the condition worsened following the 1978 injury. Dr. Jones testified that his testimony was at variance with an earlier statement that the shoulder condition was not worsened by the injury. Dr. Jones thereupon stated that he would stay with the deposition testimony that the shoulder problems were aggravated by the injury.

Claimant has also been examined by Thomas B. Summers, M.D., on three occasions. Dr. Summers is a neurologist and his first examination was conducted on December 29, 1976 for the purposes of social security disability. Claimant was also examined by Dr. Summers in 1979. Claimant's counsel first directed his questions to the July 14, 1983 examination. Dr. Summers noted flexion contractures involving all fingers of the right hand at the proximal interphalangeal level. The metacarpo-phalangeal joint of the right was bulbous. There was flexion contracture of the metacarpo-phalangeal joint of the right thumb. Flexion contractures involving the middle finger, ring finger and little finger of the left hand at the proximal interphalangeal joint level were observed. Both hands were held in a claw-like fashion. The hand grasp or hand grip is from 10 to 25 percent of normal on either side. Flexion and extension of the forearms at the elbow was normal. There was a restriction of motion at the shoulder joint level at either side. Abduction of the arms could only be conducted through an angle or arc of only 30 degrees. Dr. Summers made the following diagnosis:

1. Lumbar radicular syndrome, lower lumbar, chronic, severe.

2. Acroparesthesiae, upper extremity, bilateral, post-traumatic, severe.

3. Digital flexion contractures of both hands, secondary to #2.

4. Post-operative status referable to the cervical spine for surgical treatment in the form of cervical interbody fusion in the past, as narrated above.

5. Emotional depression, reactive type.

6. Arthropathy, shoulder joint, bilateral, chronic.

Dr. Summers indicated as follows concerning causation:

A. It was my feeling or my opinion that as a result of the accidental injury which occurred on or about February 14, 1978, Mrs. Leeper had developed various medical conditions or disorders. It was my feeling that in comparison with her physical status almost four and a half years ago that her course had been one of progression, and actually her disability had increased significantly.

Dr. Summers then expressed the basis of his opinion.

Q. Can you state the basis or the reason for this opinion, sir?

A. Yes, sir. At the time of my examination here on July 15, 1983, I did find evidence of severe stiffness and limitation of motion in the shoulder joint on either side. In addition, there was a deformity involving the fingers and thumbs of both hands. Her fine dexterity or finger coordination was severely impaired.

It was my feeling that she did have stiffness or what we in the medical profession refer to as contractures involving the fingers and thumbs.

And in addition, there was evidence of emotional

depression; and she herself quite frankly indicates that because of her many problems emotionally, depression has plagued her throughout the years. And she is quite honest about it and is aware of this.

Dr. Summers thought at that time claimant could perhaps be examined by a physiatrist as a candidate for extensive physical therapy. Dr. Summers observed that in 1976 and 1979 claimant had displayed weakness in her hands and difficulties using her hands, but that this condition had worsened considerably by 1983. He stated that there was a significant change in claimant's condition from 1979 to 1983. He was of the opinion that claimant was totally disabled. Dr. Summers thought that the delay in physical therapy added to claimant's disability.

On cross-examination, Dr. Summers indicated that his contact with the claimant was confined to examination only. Dr. Summers did not make a specific rating as to physical impairment.

APPLICABLE LAW

1. Section 85.3 and 85.20, Code of Iowa, confer jurisdiction on this agency in workers' compensation matters.

2. By filing a memorandum of agreement it is established that an employer-employee relationship existed and that claimant sustained an injury arising out of and in the course of employment. Freeman v. Luppes Transport Co., 227 N.W.2d 143 (Iowa 1975). This agency cannot set this memorandum of agreement aside. Whitters & Sons, Inc. v. Karr, 180 N.W.2d 444 (Iowa 1970).

3. Section 85.26, Code of Iowa, provides that an award for payments on agreement for settlement may be reopened within three years of the last payment of compensation.

4. In Meyers v. Holiday Inn of Cedar Falls, Iowa, 272 N.W.2d 24 (Iowa App. 1978) the court of appeals held that the commissioner would award increased compensation when no physical change of condition was present. The court cited Gosek v. Garmer and Stiles Co., 158 N.W.2d 731 (Iowa 1975).

5. While a claimant is not entitled to compensation for the results of a preexisting injury or disease, the mere existence at the time of a subsequent injury is not a defense. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756, 760-761 (1956). If the claimant had a preexisting condition or disability that is aggravated, accelerated, worsened or lighted up so that it results in disability, claimant is entitled to recover. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812, 815 (1962).

6. Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

ANALYSIS

Based on the foregoing principles, it is found that claimant has established her claim. The record clearly shows that claimant had some permanent partial disability at the first hearing as was noted in Deputy Jackwig's award of healing period benefits. Claimant, however, entered into an agreement for settlement in August 1980. Claimant argues that a denial of needed physical therapy has worsened claimant's condition. Claimant also argues that claimant's preexisting carpal tunnel problem was aggravated to such an extent that a subsequent series of events commenced which lead to a hand-arm-shoulder situation as addressed by Dr. Jones and Dr. Summers.

Defendants, on the other hand, indicate that the claimant's sought-after medical treatment was not causally connected to the injury but rather to deterioration in the claimant's makeup due to the aging process.

This record indicates that both Dr. Summers and Dr. Jones think that there is an aggravation of a preexisting condition. The important fact in this case which separates this particular finding from other cases is that the opinions were arrived at independently.

The doctor's opinions also indicate that claimant's disability is serious. The case, though, was settled earlier on the basis of 18 percent of the body as a whole. Although the prior opinion in this case inferred that claimant's recovery might be scheduled (i.e., to two arms) the record indicates to me that claimant's injury is to the body as a whole because the injury extends beyond the arms. Dr. Jones refers to a yet-to-be-named orthopedist for treatment of her condition. Dr. Jones stated that claimant has been "at least" entitled to temporary total disability since the injury. Dr. Summers indicates that claimant's condition has worsened and that claimant is totally disabled.

Considering this record and based upon my personal observations, the finding will be made that claimant sustained a permanent and total disability because of the aggravation of the preexisting condition. This case is held to fall within the exception noted in Meyers in the respect that claimant's condition failed to improve, and in fact deteriorated since the time of the settlement. All medical expenses sought were paid after hearing.

FINDINGS OF FACT

1. Claimant was employed by defendant employer on February 14, 1978.

2. Claimant was injured while working on February 14, 1978.

3. Defendants filed a memorandum of agreement concerning a February 14, 1978 injury.

4. Claimant sustained an aggravation of a preexisting carpal tunnel condition on February 14, 1978.

5. Claimant's injury now extends into the body as a whole.

6. Claimant is permanently and totally disabled as a result of the February 14, 1978 injury.

7. Claimant entered into a prior agreement for settlement of this case.

8. Claimant's condition has worsened since the approval of the agreement for settlement.

CONCLUSIONS OF LAW

1. Claimant was employed by defendant employer on February 14, 1978.

2. Claimant sustained an injury arising out of and in the course of employment on February 14, 1978.

3. Defendants will be ordered to pay unto claimant $167.74 per week of permanent total disability compensation during the period of claimant's disability.

ORDER

IT IS THEREFORE ORDERED that defendants pay unto claimant permanent total disability compensation at the rate of one hundred sixty-seven and 74/100 dollars ($167.74) per week commencing February 15, 1978 during the period of claimant's disability.

Defendants are to receive credit for compensation already paid.

Interest shall accrue on this award pursuant to section 85.30, Code of Iowa, from the date of this decision.

Costs of this proceeding are taxed against defendants.

A final report shall be paid upon payment of this award.

Signed and filed this 3RD day of May, 1984.

Claimant,	:	REVIEW -
vs.	:	REOPENING
JOHN MORRELL & COMPANY,	:	DECISION
Employer,	:	FILED
Self-Insured,	:	AUG 4 1984
Defendants.	:	IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in review-reopening brought by Gary Leonard, claimant, against John Morrell & Company, a self-insured employer, for the recovery of further benefits as the result of an injury on June 2, 1982. Claimant's rate of compensation as indicated in the memorandum of agreement previously filed in this proceeding is $264.83. A hearing was held before the undersigned on May 30, 1984 at Storm Lake, Iowa. The case was considered fully submitted at the conclusion of the hearing.

The record consists of the testimony of the claimant, Francis S. Conway, M.D., Sandra Leonard, and Dennis Howrey; claimant's exibits A and B; and the deposition of David L. Hoversten, M.D., and John J. Dougherty, M.D., and the deposition exibits attached thereto.

ISSUES

The issues presented by the parties at the time of the pre-hearing and the hearing are whether there is a causal relationship between the injury and the disability upon which the claimant bases his claim and the extent of temporary total or healing period and permanent partial disability benefits to which he is entitled.

On June 11, 1984 claimant filed a motion to reopen the record in this proceeding for the purpose of submitting additional evidence concerning the employment of claimant. Having reviewed the request, it is apparent that the additional evidence sought to be admitted by the claimant is not material to this proceeding and the request is therefore denied.

EVIDENCE PRESENTED

The claimant in this proceeding testified in his own behalf. He was observed to have moved slowly and cautiously and appeared to be in considerable discomfort throughout the proceeding.

Claimant testified he is 37 years of age, married and father of two children ages 11 and 12. He stated that he lives in Emmetsburg, Iowa, and that his wife is employed as a school teacher there. Claimant revealed a long work history beginning with odd jobs and construction work in high school and continuing until June 2, 1982. He stated that he began his employment with defendant in 1967 at the starting wage of $3.50 per hour.

Claimant stated that he served two years in military service in the United States Navy during 1968 and 1969. He denied that he had obtained any special training in the military though he did act as a barber for six months. Claimant stated that he received an honorable discharge and returned to work at John Morrell & Company in 1970. He stated that he worked in the pork plant there until it was closed in May 1982. When the pork plant was closed, claimant was transferred to the beef plant. He advised that because of the transfer he was at the bottom of the seniority list at the beef plant.

Claimant described his job at the beef plant as "lugging" beef. He said that this job required him to carry as much as 175 to 240 pounds of beef on his back to load it into a truck. He stated that he would carry about three sides of beef per minute. Claimant described the job as both difficult and demanding in terms of the amount of physical labor required. He had been working at this job for about one week before he received an injury on June 2, 1982. Claimant explained that the injury occurred when a side of beef was dropped on to his back before he was ready to carry it. He stated that the sudden weight on his back caused him to flex backwards, but he was able to keep the beef from falling to the floor. Claimant said he was able to place the beef into the truck but he felt severe pain in his back and began to get dizzy. He immediately reported the incident to his foreman and went to the plant personnel office. He revealed that it was necessary for him to receive assistance to get to the personnel office.

Claimant testified that he was sent to a chiropractor by the company for an examination. Claimant stated that when he arrived at the chiropractor's office he thought he was close to passing out because of the pain and, since the doctor was not in, he lay down for awhile. He said that he was awakened by the doctor who then proceeded to take x-rays. The doctor did some massage to claimant's back and sent him home with the advice that he should return the next day to start work. Claimant testified that he did return to work the following morning and had been there a short time when the chiropractor called the plant and requested that claimant return to see him. Claimant advised that he returned to the doctor who stated that he had seen a spot in the lower vertebrae in claimant's back and that the doctor did not feel he was competent to treat the problem. The chiropractor recommended that claimant see a specialist in orthopedic medicine, David L. Hoversten, M.D. Claimant said he went to see Dr. Hoversten on June 4, 1982. Claimant testified that he was examined by Dr. Hoversten and x-rays were taken. He was advised by the doctor that he had a fracture of his vertebrae. He stated that the doctor prescribed Codeine and some other medication as well as rest.

According to the deposition of Dr. Hoversten, claimant's x-ray demonstrated an unusual fracture of the posterior elements of the L4 vertebrae. Dr. Hoversten said claimant's condition could also be described as spondylolisthesis of the posterior bony body of L4. It was Dr. Hoversten's testimony that he believed claimant would best benefit from rest, a corset and pain medications.

Dr. Hoversten went on to testify that he saw claimant again on July 14, 1982 at which time claimant demonstrated a very tender spot to the left of the low back area and told him that his pain was worse when he was lying in bed or when he was wearing the corset. Dr. Hoversten testified that he continued to prescribe rest. Claimant indicated that he continued to suffer pain throughout this period of time.

Dr. Hoversten testified that he again saw claimant on August 27, 1982. At that time Dr. Hoversten felt it was unclear as to whether the fracture was healing as he had hoped and suggested to claimant that a CAT scan be obtained. Dr. Hoversten advised that a CAT scan was obtained and that it demonstrated the persistent fracture line as well as significant degenerative facet changes on the left and right side at two levels; L4 and L5. He explained that the facet changes were an indication of a deterioration of the function of claimant's spine. He opined that the findings of the CAT scan were consistent with the type of injury described and received by the claimant. Dr. Hoversten testified that he continued to monitor claimant's condition seeing him again in November 1982, March 1983, September 1983, January 1984, and April 1984.

It was Dr. Hoversten's opinion that claimant would respond best to conservative treatment because the location of the injury did not lend itself to surgical repair. His reasoning was that the injury was located in an area which is by its nature unstable and that surgical repair would most likely be unsuccessful. Dr. Hoversten said he did attempt to determine claimant's suitability for a surgical procedure by having him fitted with a polypropylene brace which often reveals an individual's likely success with a spinal fusion. He advised that this was done in January 1984 and by April of 1984 it had become apparent that claimant was not a good candidate for surgical repair. Dr. Hoversten did not believe that claimant would ever be able to return to the type of work he had been doing for John Morrell & Company and suggested that it would be necessary for claimant to be significantly rehabilitated. Dr. Hoversten opined that claimant's injury had resulted in a physical impairment to his body as a whole of approximately 30 to 35 percent.

Claimant testified that he had a strong desire to obtain additional education and rehabilitate himself in order to become a productive member of society. Claimant advised that he has not been employed since June 2, 1982 even though he did return to work for a few days in January 1984 in an effort to determine whether or not he could perform a job at John Morrell & Company. Claimant stated that although the job did not involve lifting considerable amounts of weight, it did involve bending and twisting and he was not able to perform the job. In addition to not being able to work, claimant testified that his activities had been greatly reduced since the injury. He stated that he used to play golf, tennis, fish, and hunt but was no longer able to do any of these activities. Claimant said that he owns about 40 acres on which he used to raise cattle but is not now able to do so because he cannot care for their needs. He indicated that he still attempts to help around the house by doing the dishes and cooking and occasionally engages in some restricted gardening activities. He stated that he has a riding lawnmower and has attempted to mow the lawn but the vibration of the machine causes him severe pain. Claimant went on to testify that at the present time he is always suffering from pain which is aggravated by even minimal activity; that he is subject to very sharp and intense pain from some types of movement; that if he sits for longer than a half of an hour or so he will suffer pain when he gets up; and that although he continues to take pain medication it has not relieved him of the discomfort.

Claimant testified that he has checked with the local community college concerning possible educational courses to improve his employability and find a vocational position which would not require physical labor. Claimant stated that it was his intention to enroll at the community college the week of the hearing in this matter.

Sandra Leonard testified that she has been claimant's wife for 13 years. She advised that prior to his injury claimant was a very active individual and was involved in a considerable amount of physical activities. She stated that after his injury claimant has been forced to considerably restrict his activities because of constant pain. She revealed that claimant has difficulty sleeping, walking and playing with the children. She stated that she and claimant had discussed his future since the injury and both believe that education was the best course of action to follow. Along these lines she advised she has checked

for claimant at the community college about enrollment at that facility.

Dennis Howrey testified that he is the personnel manager at John Morrell & Company and has been so for the past six years. He stated that he knew claimant prior to the injury and has followed his medical progress since the injury. Mr. Howrey testified as to the efforts of the company to find a suitable position that the claimant could fill. He stated that claimant was placed as the storeroom clerk when he returned in January of 1984, which was the lightest type of employment available at the John Morrell plant. He described claimant as an excellent employee dedicated to and concerned about his employer.

John J. Dougherty, M.D., testified that he examined claimant on May 10, 1984 at the request of defendant's counsel. Dr. Dougherty obtained a history from the claimant and examined portions of the medical record of Dr. Hoversten. Dr. Dougherty testified that he was uncertain as to whether or not claimant's present back condition was the result of a single traumatic experience or the result of an aggravation of a preexisting congenital defect. According to the deposition and deposition exhibit 1, which is a report from Dr. Dougherty to defendant's counsel, Dr. Dougherty was apparently under the impression that claimant did not see Dr. Hoversten until August 27, 1982. Dr. Dougherty's report seems to indicate that he placed significant value on this mistaken assumption. Dr. Dougherty did, however, find that claimant was presently suffering from a 10 to 15 percent permanent impairment of his body as a whole as a result of the back condition. He noted that there were few objective findings upon which an impairment rating could be based since claimant's chief complaint involved pain and not restriction of motion. Dr. Hoversten likewise noted in his deposition that there were a limited number of objective findings with respect to claimant's physical impairment. Dr. Dougherty did state that the physical impairment rating that he gave would be greater in the event that the back condition arose from a single incident rather than an aggravation of a preexisting condition or repeated trauma.

The record reflects that claimant was examined in Mayo Clinic in Rochester, Minnesota, on at least one occasion by Patrick J. Kelly, M.D., a specialist in orthopedic surgery. He had been referred to the Mayo Clinic by Francis Conway, M.D., claimant's family physician. Dr. Kelly examined the claimant on April 18, 1983. He obtained a history from the claimant which was consistent with claimant's testimony at trial. Dr. Kelly suggested that claimant may be a candidate for a tranverse process fusion from L4 to L5. He felt, however, that claimant must clearly understand that he would not be able to return to heavy labor and that claimant would best benefit from vocational rehabilitation.

Francis Conway, M.D., testified that he is claimant's family physician. He has been treating claimant and his family since approximately 1963. He stated that he had seen claimant on occasion prior to 1982 for colds, flu and minor illness; he had never treated claimant for any type of back pain.

Dr. Conway stated that he saw claimant on June 6, 1982, at which time claimant related to him the incident which occurred at work on June 2, 1982. The doctor said he did not recall the specific treatment that he prescribed at that time. He indicated that he has continued to see claimant for his back pain and has prescribed muscle relaxers, pain pills and physical therapy at the direction of Dr. Hoversten. Dr. Conway revealed that claimant is presently taking medication for pain and insomnia. Dr. Conway testified that he was uncertain as to whether or not claimant's condition was permanent, but indicated that claimant would be in need of medical treatment for some time in the future.

APPLICABLE LAW

The claimant has the burden of proving by a preponderance of the evidence that the injury of June 2, 1982 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

An employer takes an employee subject to any active or dormant health impairments, and a work connected injury which more than slightly aggravates the condition is considered to be a personal injury. Ziegler v. United States Gypsum Co., 252 Iowa 613, 620, 106 N.W.2d 591 (1960), and cases cited.

A finding of impairment to the body as a whole found by a medical evaluator does not equate to industrial disability. This is so as impairment and disability are not identical terms. Degree of industrial disability can in fact be much different than the degree of impairment because in the first instance reference is to loss of earning capacity and in the later to anatomical or functional abnormality or loss. Although loss of function is to be considered and disability can rarely be found without it, it is not so that an industrial disability is proportionally related to a degree of impairment of bodily function.

Factors considered in determining industrial disability include the employee's medical condition prior to the injury, after the injury, and present condition; the situs of the injury, its severity and the length of healing period; the work experience of the employee prior to the injury, after the injury and potential for rehabilitation; the employee's qualifications intellectually, emotionally and physically; earnings prior and subsequent to the injury; and age, education, motivation, and functional impairment as a result of the injury and inability because of the injury to engage in employment for which the employee is fitted. Loss of earnings caused by a job transfer for reasons related to the injury is also relevant. These are matters which the finder of fact considers collectively in arriving at the determination of the degree of industrial disability.

There are no weighting guidelines that are indicated for each of the factors to be considered. There are no guidelines which give, for example, age a weighted value of ten percent of total, education a value of fifteen percent of total, motivation - five percent; work experience - thirty percent, etc. Neither is a rating of functional impairment entitled to whatever the degree of impairment that is found to be conclusive that it directly correlates to that degree of industrial disability to the body as a whole. In other words, there are no formulae which can be applied and then added up to determine the degree of industrial disability. It therefore becomes necessary for the deputy or commissioner to draw upon prior experience, general and specialized knowledge to make the finding with regard to degree of industrial disability. See Birmingham v. Firestone Tire & Rubber Company, II Iowa Industrial Commissioner Report 39 (1981); Enstrom v. Iowa Public Services Company, II Iowa Industrial Commissioner Report 142 (1981); Webb v. Lovejoy Construction Co., II Iowa Industrial Commissioner Report 430 (1981).

ANALYSIS

There would appear to be little doubt regarding the question of causal connection between the injury of June 2, 1982 and the disability from which claimant is presently suffering. Dr. Dougherty may indeed be correct that claimant has a congenital defect in the lumbar region of his back. The fact that he may have had a congenital defect, however, would in no way bar his recovery under the facts of this case. It is clear that even if we assume that claimant was suffering from a congenital defect, the congenital defect in no way affected claimant's ability to earn income. The aggravation which occurred on June 2, 1982 was material and severe. The record clearly shows that claimant was not suffering from any sort of back pain prior to the injury nor had any sort of back problem manifested itself in this individual. As a consequence, claimant is entitled to recover for the aggravation of any preeixsting condition which he may have had. Certainly claimant's back was not broken before June 2, 1982. Thus, whatever disability claimant is suffering is compensable under the Iowa Workers' Compensation Act because of the injury he received at work on June 2, 1982. The real issue in this case is what is the extent of claimant's disability?

Claimant's injury is to the body as a whole, therefore he has sustained an industrial disability. There are a number of factors which relate to an industrial disability which include the functional impairment, claimant's experience and background and his ability to rehabilitate himself. In the instant case, claimant's treating physician, Dr. Hoversten, found that claimant's functional impairment was somewhere in the neighborhood of 30 to 35 percent of the body as a whole. Dr. Dougherty found considerably less functional impairment; however, he admitted that if claimant's injury arose out of a single incident that the impairment rating he gave would be higher. In addition, it is clear from Dr. Dougherty's testimony that he was unaware of the fact that claimant had sought immediate medical attention for his back injury. It is apparent then that Dr. Dougherty based his opinion on inadequate, or at least uncertain, factual information. Under the facts of this case it is clear that greater weight must be given to the treating physician because of his greater knowledge of the claimant and of the factual background under which the impairment arose.

The functional impairment suffered by this claimant is to such an extent that it is clear that he will no longer be able to engage in heavy physical labor. This is made abundantly clear by the employer and claimant's attempt at reemployment in January of 1984. The employer placed claimant in the least physically demanding job available in their plant. Although claimant gave a sincere and valiant effort to perform the job, he was unable to do so because of continued pain in his back. Dr. Hoversten allowed claimant to fill this position on an experimental basis to determine whether or not he could in fact perform a job for the defendant. He was unable to do so. Clearly the claimant is forever barred from manual labor.

It is apparent that claimant is a dedicated employee. His

employer indicated complete satisfaction with claimant's performance prior to his injury of June 2, 1982. These attributes make claimant an attractive candidate for employment in some area in which he can perform. The problem, of course, is that claimant is at the present time untrained in any area other than manual labor. Fortunately, this individual has demonstrated a strong desire to rehabilitate himself and appears to have the capability of so doing. He appeared at the hearing neat, well dressed and attentive. He is an intelligent individual who could no doubt succeed in academic training. He indicated at the hearing that it is his desire to further his education. Since there is little, if anything, in claimant's background which gives him transferrable skills, it is apparent that if he is to return as a productive member of society it is imperative that he expand his education.

In addition to claimant's intellectual ability to pursue further education, his age is such that additional education is a very real possibility. Certainly it would appear that claimant's emotional condition would be greatly improved by a serious rehabilitation program. He appears well motivated to pursue such a program.

In summary, claimant is a 37 year old high school graduate with a prior work history limited almost entirely to manual labor. His present medical condition is such that he can no longer earn a living as a manual laborer. He has been blessed with sufficient mental faculties to be able to rehabilitate himself and obtain an education which would eliminate the need for him to physically exert himself to any significant degree. It is apparent that he will probably suffer from some back pain throughout the remainder of his life although his physicians have indicated that, with time, the pain should reduce itself to some extent. With sufficient education claimant would probably be able to obtain wages similar to those which he earned with defendant. Weighing these factors in this case, claimant has demonstrated an industrial disability equal to 55 percent of the body as a whole.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

1. Claimant is married and has two children.

2. Claimant is 37 years old and has completed a high school education.

3. Claimant is an intelligent and well motivated individual.

4. On June 2, 1982 claimant suffered an injury to his back while at work.

5. As a result of his injury, claimant was off work from June 3, 1982 through January 13, 1984.

6. As a result of his injury, claimant suffered a permanent impairment to his back equal to 30 to 35 percent of his body as a whole.

7. Claimant cannot return to work as a manual laborer.

8. Defendant has no job available which claimant can perform.

9. Claimant needs to and wants to rehabilitate himself by a post high school education.

10. Claimant's rate of compensation is $264.83.

11. Claimant has suffered an industrial disability equal to 55 percent of the body as a whole.

CONCLUSIONS OF LAW

WHEREFORE, IT IS CONCLUDED:

On June 2, 1982 claimant receied an injury arising out of and in the course of his employment.

There is a causal relationship between claimant's injury of June 2, 1982 and his industrial disability of fifty-five (55) percent.

Claimant's rate of compensation is two hundred sixty-four and 83/100 dollars ($264.83).

Claimant is entitled to healing period benefits from June 3, 1982 to and including January 13, 1984.

ORDER

IT IS THEREFORE HEREBY ORDERED:

Defendant shall pay unto claimant healing period benefits for eighty-four and two-sevenths (84 2/7) weeks at the rate of two hundred sixty-four and 83/100 dollars ($264.83) and permanent partial disability benefits for two hundred and seventy-five (275) weeks at the same rate, accrued payments to be made in a lump sum together with statutory interest. Defendant shall be given credit for any benefits previously paid.

IT IS FURTHER ORDERED that the costs of this action are taxed to the defendant.

Defendant is to file an activity report upon completion of this award.

Signed and filed this 17th day of August, 1984.

STEVEN E. ORT
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

MARK McCORMACK, Claimant, vs. SUNSPROUT, Employer, and GENERAL CASUALTY COMPANIES, Insurance Carrier, Defendants.	:	File No. 722209 A R B I T R A T I O N D E C I S I O N FILED JUL 26 1984 IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This matter came on for hearing at Cedar Rapids, Iowa on November 17, 1983. The record was closed at that time.

A review of the commissioner's file reveals that an employers first report of injury was filed on January 17, 1983. No other filings were made. The record consists of the testimony of the claimant, Joe Seiter, Jean Lukavasky, and Jerry Wegmann; the depositions of Joe Seiter and Warren N. Verdeck, M.D.; claimant's exhibits 1 through 9; and defendants' exhibit 1.

ISSUES

The issues for resolution are:

1) Whether claimant sustained an injury which arose out of and in the course of employment;

2) Whether there is a causal relationship between the alleged injury and the disability;

3) The nature and extent of disability;

4) The rate of compensation;

5) Claimant's entitlement to medical benfits; and

6) Whether claimant is entitled to be paid additional

compensation pursuant to the last unnumbered paragraph of section 86.13, Code of Iowa.

STATEMENT OF THE EVIDENCE

Claimant, age 26 at the time of hearing, is married and presently employed by United Parcel Service. He is a high school graduate with about two years of community college. Claimant testified that he lost interest in college and dropped out. Claimant's first employment was with a retail tire outlet right after high school. He had worked there part time while he was in high school. Claimant described his duties as anything from light mechanical work to delivery work. In about 1973 claimant became employed by Nash Finch in Cedar Rapids for about a year. Claimant unloaded trucks and drove a forklift. Claimant then became employed by United Parcel Service (UPS) on a part-time basis. Claimant was a preloadeer who sorted parcels into trucks to be delivered in the Cedar Rapids area. Claimant testified that he would be required to lift fifty pounds and move this weight as far as twenty to thirty feet. Claimant trained for a driving position. In May 1983 claimant started in a driving position and was working as both a driver and a preloader on an as-needed basis. At the time of hearing claimant was a full-time employee.

Claimant testified that since 1975 he has also worked for a gas station and a discount store on a part-time basis. In late 1979 claimant testified that he became employed by Sunsprout. Sunsprout is involved in the production and distribution of alfalfa sprouts. Claimant testified that he was a general employee at first and later became a truck driver. Claimant testified that he routinely pushed weights of sixty to seventy pounds and lifted weights not exceeding 100 pounds. Claimant described his duties with regard to the maintenance of the vehicle. Claimant stated that he was required to check the oil in the truck refrigeration unit, which sat atop the truck cab. Claimant testified that when he did this chore his feet would be about eight feet above the ground.

At this point claimant testified that he had had knee problems prior to November 1981. He also testified that he had been seeing a chiropractor intermittently. Claimant described being hospitalized in 1974 following an automobile accident. Claimant testified that he was paid $12.92 per hour by UPS in November 1981. He worked twenty to twenty-five hours per week. Claimant testified that he made $14,000 as an employee of UPS in the year before November 1, 1981 and $2,000 from Sunsprout during that period. Claimant testified that he devoted between fifty and sixty hours a week to his employment at Sunsprout when he started. At the same time, claimant was working at UPS. Claimant's boss at Sunsprout, Joe Seiter, would direct the number of hours to be worked. Claimant was married July 25, 1980 and claimant took several months off as an employee of Sunsprout. When he wanted to return to work at Sunsprout, he contacted Mr. Seiter and was rehired. He then worked about 25 hours a week.

Claimant testified that he was to drive to Iowa City and the Quad Cities from Cedar Rapids on November 2, 1981. Claimant worked a "full" day of four to five hours at UPS. Claimant had gone to work at UPS at 3:00 a.m. or so and reported to Sunsprout at about 9:00 a.m. Claimant climbed on top of the truck to start the refrigeration unit and check the oil. Claimant, while so doing, fell to the ground. He remembers waking up after he fell from the truck. Mr. Seiter was kneeling next to claimant. Claimant was taken to the hospital where he was complaining of a headache and pain in the occipital area.

Physical examination showed tenderness in the lower lumbar paraspinal muscles. Straight leg raising was negative bilaterally. There was tenderness in the left gluteal region and left paraspinal region. X-rays of the lumbosacral spine showed the vertebral to be well aligned. X-rays were negative also for the skull and the cervical spine. Claimant was diagnosed as having a minor head injury and a cervical and low back strain. Claimant was released from the hospital that day. He testified that he returned to work to pick up his car and went home. Claimant felt discomfort in his back and his head hurt.

Claimant testified that on the following morning he went to work at UPS and completed his work day of four and a half hours. Claimant worked only an hour for Sunsprout. Claimant testified that he worked about nine hours total for each employer the balance of the week. Claimant testified he felt very sore during this period.

Claimant testified that he retained an attorney (a different attorney than he who represented claimant at the hearing), who sent claimant to David C. Naden, M.D., an orthopedic surgeon. The records revealed that claimant had first seen T. C. Munger, D.C., on five occasions. At the end of this regimen, claimant was still complaining of minor left sacroiliac pain. Claimant was examined by Dr. Naden on March 12, 1982. Dr. Naden noted that claimant had problems in the dorsal upper lumbar area prior to the injury in question. Dr. Naden indicated that claimant described the pain as being in the left lower back which was in a different location than previous complaints noted by claimant. Claimant also noted pain going down the left lower extremity. Claimant indicated that he had difficulty walking and numbness on the bottom of his left foot.

Physical examination revealed that claimant only had about 20° of forward flexion. Lateral bending was five or ten degrees at most. There was no hyperextension. Disc crests were level. In the sitting position, straight leg raising is positive on the left at about fifty or sixty degrees, accentuated with dorsiflexion of the foot. Dr. Naden thought claimant had definite weakness of the extensor hallicus longus on the left. The strength was only 25 to 50 percent of the right. X-rays revealed claimant to have four lumbar vertebrae. Dr. Naden indicated that claimant had a herniated nucleosis pulposis at the L4, 5 level with nerve root encroachment of L5 on the left. Claimant did not seek further treatment from Dr. Naden immediately following this examination.

Claimant testified that from the time he saw Dr. Naden he never got any better or any worse. Claimant testified that he has modified his activities and that he has slept on the floor. He indicatd that he now works differently in that he squats even for the slightest lifting job. He testified that he gave a statement to the insurer following the injury.

On cross-examination, claimant initially indicated that he took off from his job at Sunsprout for his honeymoon. Claimant characteristically worked part time. Claimant admitted that he gave the statement which was received into evidence. Claimant testified that after he had engaged current counsel he was sent to see Warren N. Verdeck, M.D., a Cedar Rapids orthopedist. Claimant testified that the job at UPS paid more than the job with Sunsprout. Claimant testified that he left Sunsprout voluntarily in order to become a full-time driver with UPS. Claimant agreed that when he returned to Sunsprout he averaged about $4.37 an hour for an eleven to twelve hour week. Claimant testified that he is making more money totally since he quit with Sunsprout. Claimant testified that he has back problems which interfere somewhat with his duties at UPS. Claimant testified that the average weight he lifts is about twenty pounds. Claimant agreed with the proposition that the job working for UPS is better than being in a similar position with Sunsprout. Claimant testified that the only time he missed on account of the injury at Sunsprout was that missed on the date of the injury pursuing hospital care. Claimant candidly admitted seeking chiropractic care prior to the injury.

Joseph Seiter was the president of Sunsprout at all times material hereto. He outlined that claimant had a spotty record as an employee because of alleged tardiness and lax paperwork procedures. Mr. Seiter explained that he took claimant to the hospital because claimant was complaining of dizziness and upset stomach.

On cross-examination, Mr. Seiter stated that claimant had made complaints of back pain prior to the injury and time when claimant could not perform his duties because of back complaints. The witness testified that claimant expressed no more or less complaints following the injury. The witness indicated that claimant missed no work following the injury. The claimant quit voluntarily in May 1982.

Jean Lukavasky is a UPS employee who started work with UPS as a preloader in May 1977. She testified that she worked with claimant from that time until claimant went to driving. The witness testified that weights of seventy pounds are not lifted that often in the preloader job with weights of fifty pounds being lifted about ten to twenty times an hour. The witness indicated that claimant and she conversed often and that she was told of the incident a couple of days after it happened. The witness did not recall the specifics of the conversation relating to the injury. The witness testified that claimant spoke of going to chiropractors and of having the need to have his back cracked. The witness testified that she, too, worked at Sunsprout and that claimant worked as much as everyone else. She indicated that claimant was more vocal in his complaints about his back.

Gerald P. Wegmann is a supervisor for UPS. He testified that claimant took no time off because of a back injury. He recanted the claimant's prior injuries. The witness testified that claimant was a very good employee and a willing worker.

Joe Seiter's deposition contained the revelation that claimant may have played semi-pro football (denied by claimant). Seiter revealed that claimant struck his head when he fell.

The record indicates that in 1981 claimant received $1,970.56 from Joe Seiter as wages and $15,089.79 from UPS. The record indicates that claimant's earnings from all employment between November 1, 1980 and November 1, 1981 was $16,821.35.

After claimant's initial examination by Dr. Naden, claimant was given a permanent partial disability rating of fifteen percent of the body as a whole as a result of the herniated nucleosis pulposis at the L4, 5 level and nerve root encroachment of L5 on the left. Dr. Naden also stated in a letter dated October 12, 1982 that claimant's injury was at a different place in his back. Therefore, he still felt that claimant had a new condition and not an aggravation. He stated that the cause of claimant's disability was the injury. Dr. Naden wrote a letter report and made the following statement:

> If this young man continues to show symptoms like he had in March of 1982 and also has corroborative evidence of a herniated disc, either by a Cat Scan or a myelogram, yes, he does have a herniated nucleosis pulposus in his lower back with a nerve root encroachment on the left and should probably have surgery. Surgery in a young person with a definitive disc like this usually is successful and they do improve. Therefore, if his condition has

remained status quo and he is still having problems like he had back in March of 1982 his PPD Rating would be somewhere around 17 1/2 to 20 percent. In other words, following a successful laminectomy, their disability usually lessens somewhat and is around 15%.

Claimant had been treated since 1974 by Dr. Munger, a chiropractor. Dr. Munger treated claimant five times after the November 1981 injury.

Claimant was seen by Warren N. Verdeck, M.D., a Cedar Rapids orthopedist, on April 11, 1983. Claimant continued to have some complaints of numbness in the bottom of the left foot. Physical examination revealed that claimant was able to reach over to about four inches from the floor. Lateral flexion was to about twenty degrees. The gait was normal. Heel and toe walking was performed well. Straight leg raising was negative bilaterally. Plantar responses were down. Sensory examination revealed some altered sensation to pinprick over the lateral and plantar aspects of the left foot. X-rays showed some unremarkable narrowing at the lower two disc levels. Claimant was seen again the week following an EMG. Dr. Verdeck did not feel that surgery was called for to correct the herniated disc at that time.

Dr. Verdeck testified in his deposition that the injury was the probable cause of symptoms (Verdeck dep., p. 14-15). Dr. Naden gave an impairment rating of three percent of the body as a whole (Verdeck dep. p. 13) which was restated on cross-examination (Verdeck Dep. p. 17).

APPLICABLE LAW

1. Sections 85.3 and 85.20, Code of Iowa, confer jurisdiction upon this agency in workers' compensation cases.

2. Claimant has the burden of proving by a preponderance of the evidence that he received an injury on November 2, 1981 which arose out of and in the course of his employment. McDowell v. Town of Clarksville, 241 N.W.2d 904 (Iowa 1976); Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

3. The claimant has the burden of proving by a preponderance of the evidence that the injury of November 2, 1981 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

4. Section 85.34(1) provides for a statutory healing period to be paid following an injury.

5. Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

6. The last unnumbered paragraph of section 86.13, Code of Iowa, states:

> If a delay in commencement or termination of benefits occurs without reasonable or probable cause or excuse, the industrial commissioner shall award benefits in addition to those benefits payable under this chapter, or chapter 85, 85A, or 85B, up to fifty percent of the amount of benefits that were unreasonably delayed or denied.

7. Section 85.36(10), Code of Iowa, provides in pertinent part:

> If an employee earns either no wages or less than the usual weekly earnings of the regular full-time adult laborer in the line of industry in which the employee is injured in that locality, the weekly earnings shall be one-fiftieth of the total earnings which the employee has earned from all employment during the twelve calendar months immediately preceding the injury.

ANALYSIS

Based on the foregoing principles, it is found that claimant has established his claim to permanent partial disability compensation and medical expenses. Claimant has failed to prove his entitlement to healing period compensation and additional compensation pursuant to section 86.13, Code of Iowa.

The facts of this case indicate that claimant was injured at a time and in a place where he was performing duties incidental to employment. The testimony of Dr. Verdeck gives us the finding that the injury was caused by the employment. Dr. Verdeck discounts a finding that the injury aggravated a preexisting condition. Since the injury was caused by the employment, it will be concluded that claimant's injury arose out of and in the course of his employment.

It will be concluded that claimant's injury caused permanent partial disability. This finding is supported by the testimony and writings of respected orthopedic surgeons. Because of this finding, the claimant would ordinarily be awarded healing period for the time missed from work, but he will not in this case since he lost no time. This is an example of the rare case where no healing period is awarded in a case of permanent disability.

Both Dr. Naden and Dr. Verdeck rate claimant's permanent disability to the body as a whole. Since this is so, claimant's injury must be evaluated industrially. The record amply shows the claimant's prior back problems which required treatment. One might also presume that claimant had intermittent back problems for which medical or chiropractic care was not sought. Claimant's injury was to his back, and claimant is employed in a position where the use of a back is a must. Claimant is young and has a good education. He is able to do his work and appears to "tough it out" and has earned the respect of his supervisors in this regard. He has, because of his motivation to get ahead, become employed in a better paying position. Claimant's injury is not so serious as to have caused surgery and an attendant loss of considerable lost time. Nevertheless, claimant has sustained a documented permanent partial disability because of the injury.

Considering the elements of permanent partial industrial disability, it will be found that claimant has sustained a permanent partial disability for industrial purposes of five percent of the body as a whole.

Claimant has alleged that the nonpayment of compensation entitles him to additional compensation pursuant to the terms of section 86.13, Code of Iowa. This section allows an additional benefit for those benefits unreasonably denied. I cannot find that the defendants' failure to pay workers' compensation benefits in the form of permanent partial disability compensation was unreasonable when there was no time lost or other occurrences that would alert a reasonable individual that some payment was due. The claim for additional section 86.13 benefits will be denied.

The intent of section 85.36, Code of Iowa, is to set the rate of weekly wages of an injured employee. It tries, within the limitations imposed by language, to get to a true and accurate gauge of an individual's weekly wage. Once this figure is obtained, the rate of compensation is derived. Defendants allege that section 85.36(6) should apply since claimant and all other employees worked similar hours. However, the evidence belies this since the claimant and another witness were both UPS and Sunsprout employees. The economics of the situation would indicate to me that an individual would have to supplement his income. The finding, therefore, is that claimant made less than the regular full-time employee, entitling him to have his gross weekly wage computed on the basis of section 85.36(10), Code of Iowa. Claimant earned $16,821.35 for the twelve months, indicating that his gross weekly wage was $336.00. Claimant is married and entitled to two exemptions. The rate of compensation is $204.44.

FINDINGS OF FACT

1. Claimant was employed by defendant Sunsprout on November 2, 1981.

2. Claimant was also employed by United Parcel Service on November 2, 1981.

3. Claimant fell from a Sunsprout truck while working on November 2, 1981.

4. Claimant lost no time from work with Sunsprout because of the fall except the time off on November 2, 1981 seeking necessary medical treatment.

5. Claimant sustained permanent partial disability to the body as a whole of five percent (5%).

6. Defendants' action in not paying permanent partial disability was not unreasonable.

7. Claimant incurred reasonable and necessary medical expense because of the injury.

8. Claimant is married and entitled to two tax exemptions.

9. Claimant's weekly wage was three hundred thirty-six dollars ($336.00).

CONCLUSIONS OF LAW

1. This agency has jurisdiction of the parties and the subject matter.

2. Claimant was employed by defendant Sunsprout on November 2, 1981.

3. Claimant sustained an injury arising out of and in the course of his employment with Sunsprout on November 2, 1981.

4. Defendants will be ordered to pay unto claimant twenty-five (25) weeks of permanent partial disability compensation at the rate of two hundred four and 44/100 dollars ($204.44).

5. Claimant will be denied additional benefits pursuant to

section 86.13, Code of Iowa.

6. Claimant will be awarded the following medical expenses:

St. Luke's Methodist Hospital	$186.00
Dr. Verdeck	103.00

ORDER

IT IS THEREFORE ORDERED that defendants pay unto claimant twenty-five (25) weeks of permanent partial disability compensation at the rate of two hundred four and 44/100 dollars ($204.44) per week.

IT IS FURTHER ORDERED that defendants pay the following medical expenses:

St. Luke's Methodist Hospital	$186.00
Dr. Verdeck	103.00

Interest is to accrue on this award pursuant to section 85.30, Code of Iowa, from the date payments become due.

Costs of this proceeding are taxed against defendants pursuant to Industrial Commissioner Rule 500-4.33.

Defendants are to file a final report upon payment of this award.

Signed and filed this 26th day of July, 1984.

FILED

SEP 28 1984

IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in arbitration brought by Bruce A. McCurry, claimant, against Speedway Scaffold Company, employer, and Wausau Insurance Company, insurance carrier, for benefits as a result of an injury on August 11, 1982. On June 26, 1984 this case was heard by the undersigned and was considered fully submitted at the conclusion of the hearing.

The record consists of the testimony of claimant, Robert Lewis and James T. Rogers; claimant's exhibits A through D and F; and defendants' exhibits 1 through 3. The objection to exhibit A-19 is overruled. Claimant's objection to defendants' post trial brief is overruled.

ISSUES

The issues presented by the parties at the time of the pre-hearing and the hearing are whether there is a causal relationship between the alleged injury and the disability on which claimant is now basing his claim and the extent of temporary total or healing period and permanent partial disability benefits to which he is entitled.

EVIDENCE PRESENTED

Claimant testified he is 37 years old, single, and the father of two children. He stated he is a graduate of high school, a four year veteran of the United States Navy from which he was honorably discharged, and has been vocationally trained as an ironworker. Claimant advised that he was employed as an ironworker for the defendant employer on the date of his injury, August 11, 1982. As an ironworker, claimant's duties included lifting up co 100 to 150 pounds and climbing on various gerdings, scaffolds and buildings.

Claimant said he was working for defendant employer on a project at Western Iowa Community College on the date of his injury. Claimant testified that he was working on a roof scaffold approximately 12 to 15 feet off the ground when he slipped and fell. Claimant was uncertain how the fall occurred and said he could not recall anything following the fall. Claimant stated he could only recall waking up in the hospital with a backache and headache. Claimant stated he has continued to suffer from back and head pain since the accident.

Claimant recalled that he had seen four or five different doctors since his injury of August 11, 1982, though he was most uncertain as to the type of treatment he received. He did indicate that some time after the accident he began to suffer from severe depression and other people told him that his personality was changing. As a result of these problems, claimant said he began to see Michael L. Egger, M.D. He stated that as of the date of the hearing he had been seeing Dr. Egger for over one year. Claimant said he is presently continuing on medication and continues to see Dr. Egger. He sated that he has not been able to return to work.

Robert Lewis testified that he is a construction laborer in the Council Bluffs area. He stated that on August 11, 1982 he was working for defendant employer at Iowa Western Community College. He stated that he knew the claimant and had known him for a considerable length of time prior to that date. He described the claimant as a good strong worker who had no difficulty in following the instructions given to him by the foreman. Mr. Lewis testified that on August 11, 1982 he and claimant were spreading four by fours on a scaffold. He advised that one of the boards split and claimant went through, falling approximately 12 to 15 feet. He stated that after claimant hit the ground a four by four fell and struck claimant on the top of the head. He stated that he last saw claimant approximately one year ago and at that time he was unable to observe any significant changes in the claimant's behavior.

James T. Rogers testified that he is employed by the Iowa Department of Public Instruction as a rehabilitation counselor. He outlined his professional credentials and work experience in the area of vocational rehabilitation. He stated that he became involved in claimant's situation as a rehabilitation counselor and referred him to Des Moines for an evaluation. Mr. Rogers indicated that there were three basic criteria which an individual must meet in order to qualify for rehabilitation benefits from the State of Iowa. Those three criteria are (1) the person must have a substantial disability which (2) causes a vocational disability and (3) the individual must be able to be rehabilitated into competitive employment.

Mr. Rogers stated that claimant was sent to Des Moines for an evaluation, the results of which were obtained on April 2, 1984. According to Mr. Rogers, the results of this test showed that claimant would not qualify for vocational rehabilitation services because of serious questions about his ability to be rehabilitated. These problems centered primarily on claimant's inability to remember schedules and instructions, significant problems with low back pain and poor results in the area of academic functioning. Mr. Rogers indicated that it was the opinion of the people in Des Moines that claimant would best benefit from a volunteer day care program. Mr. Rogers did not believe that claimant was employable at the time of the hearing.

Timothy C. Fitzgibbons, M.D., testified by way of deposition. Both parties stipulated as to the qualifications of Dr. Fitzgibbons to testify about the matters contained in the deposition. Dr. Fitzgibbons advised that he became involved in the claimant's treatment as a consulting physician. Claimant was first seen by an associate of Dr. Fitzgibbons on August 17, 1982 at Mercy Hospital in Council Bluffs. According to Dr. Fitzgibbons x-rays taken at Mercy Hospital failed to disclose any definite fractures to the claimant's back. Accordingly, claimant was treated in the hospital for back pain from August 11, 1982 until August 31, 1982. Dr. Fitzgibbons stated that the first time he personally saw the claimant was after his discharge on September 9, 1982.

Dr. Fitzgibbons stated that he performed a physical examination of the claimant on September 9, 1982 at which time he found a negative neurologic examination and negative straight leg raising which indicated that there was not a herniated disc in the claimant's back. He stated that the claimant was complaining at the time of persistent headaches which the doctor believed may have been attributable to a possible concussion. The doctor revealed that at that time he started the claimant on outpatient physical therapy at St. Joseph Hospital and prescribed medication to help control the pain. The diagnosis at that time was post traumatic back strain.

Dr. Fitzgibbons testified that the claimant returned to see him for a follow-up examination on October 12, 1982. The doctor stated that at the time claimant was still having trouble with his back but did not want to return to the hospital, so he continued on outpatient treatment. The doctor said that he saw the claimant again on November 16, 1982 at which time he was still suffering from back discomfort and headaches. The doctor said that claimant returned again on December 9, 1982 complaining of back discomfort and having even more trouble in standing up

straight. The doctor stated that he felt claimant may have been suffering from a herniated disc so he admitted him to St. Joseph Hospital on December 12, 1982.

The doctor advised that claimant's hospital treatment in December of 1982 consisted of extensive physical therapy from December 12 through December 18. Although a myelogram had been considered earlier, it was decided that claimant had made sufficient progress that a myelogram would not be of benefit. The claimant was discharged from the hospital on December 18 with an improved condition. Dr. Fitzgibbons said he next saw the claimant in January of 1983. At that time there was a physical examination although there were no x-rays. The claimant continued to complain of discomfort in the back and some pain in the right leg. The doctor again expressed his concern that claimant may have been suffering from a herniated disc. The doctor said he next saw the claimant on February 3, 1983 at which time he noted that claimant seemd to be depressed. He said the claimant was having difficulty with straight leg raising bilaterally and again decided that hospitalization might be helpful in arriving at a diagnosis. The doctor stated, however, that claimant's personal problems were of such proportion that it would be advisable to obtain a psychiatric evaluation prior to proceeding with a myelogram. Accordingly, the doctor referred claimant to Michael Egger, M.D. Dr. Fitzgibbons testifed that claimant was seeing Dr. Egger by the time Fitzgibbons saw him again on March 3, 1983. Because of persistent symptoms, it was decided that claimant should be admitted to the hospital and a myelogram performed. Dr. Fitzgibbons stated that the myelogram disclosed a minimal defect in the left side of the vertebral column at L4, 5 level. It was the doctor's opinion that the defect was not significant enough to justify surgical intervention in the claimant's case. He stated that although there is no way to determine for sure whether the defect was the result of the fall, Dr. Fitzgibbons did believe that it was likely that the bulging area was started by the accident. He did not believe the minimal defect which was observed in the myelogram was a true herniated disc.

Dr. Fitzgibbons testified that during claimant's hospitalization in December of 1982 a CAT scan was performed which failed to disclose any type of defect.

Dr. Fitzgibbons stated that the claimant's persistent pain over a period greater than six months was an indication that the claimant had in fact suffered a permanent disability. Dr. Fitzgibbons assigned a permanent impairment of five percent of the body as a whole as a result of the minimal defect and continued pain of the claimant. He made this assessment of disability on March 29, 1983. The doctor said he saw the claimant again in May of 1983 at which time he advised the claimant that he had probably reached maximum recovery and that there was little he could do to help relieve the pain. He recommended to the claimant that his best course would be to seek vocational rehabilitation and change his lifestyle.

Dr. Fitzgibbons testified that he last saw the claimant on May 16, 1983. He advised that the claimant was at that time complaining of discomfort in the lumbosacral area, but did not have specific neurologic complaints such as numbness or tingling in his legs or weakness. The doctor continued in his opinion that claimant's permanent disability was five percent of the body as a whole and indicated that the claimant should not do repeated lifting of objects weighing over 20 pounds.

Michael L. Egger, M.D., testified by way of deposition. Dr. Egger outlined his qualifications as an expert which included a medical degree from the University of Nebraska, psychiatric residency training at the University Medical Center in Omaha, two years active duty with the United States Navy as a psychiatrist, and board certification from the American Board of Psychiatry and Neurology. Dr. Egger also stated that he has been the author of a number of published articles and is the coauthor of one textbook on the medical dimensions of mental retardation. Dr. Egger also advised that he has been in the private practice of psychiatry for 10 years.

Dr. Egger stated that he first saw the claimant on February 6, 1983 upon referral from Dr. Fitzgibbons. At that time, Dr. Egger conducted an initial interview from which he drew the tentative conclusion that claimant was suffering from a severe reactive depression as a result of his injury of August 11, 1982. In order to obtain a full and complete psychiatric evaluation of the claimant, Dr. Egger admitted the claimant to Mercy Hospital in Council Bluffs on February 6, 1983. The claimant remained in the hospital until February 25, 1983. Dr. Egger advised that during that period of time the claimant was given a Minnesota Multiphasic Personality Inventory test and a Luria-Nebraska Neuropsychological Battery. He explained that the purpose of these tests was to determine whether or not claimant was suffering from a personality disorder or possibly from some form of organic brain damage. Dr. Egger stated that these tests were administered and interpreted by his associate, Dr. Gustavson, a psychologist.

Dr. Egger admitted that he was quite surprised that the Luria-Nebraska Neuropsychological Battery disclosed an organic brain syndrome from which the claimant was suffering. Dr. Egger said he was surprised because his initial contact with the claimant failed to disclose to him that any such problem existed. Dr. Egger conceded that on at least two different occasions he expressed the opinion that it would not be possible to determine the cause of claimant's organic brain syndrome; however, at the time of his deposition he opined that the condition was probably the result of claimant's injury of August 11, 1982. He based his argument for causation upon his belief that claimant would not have been able to function in the capacity which he had prior to the injury had the organic brain syndrome been present at that time. For example, he questioned whether the claimant could have successfully completed high school, whether he could have successfully completed four years of service in the United States Navy and whether he could have maintained the eye-hand coordination necessary to perform his job as an ironworker with this condition existing. Dr. Egger stated that much of his information concerning claimant's past performance came from the claimant and his mother. The doctor stated that he was aware of a number of problems claimant had had early on in his adult life such as fighting, shootings, threats and abusive behavior. He stated, however, that claimant's prior behavior did not alter his opinion about when the organic brain syndrome occurred.

Dr. Egger advised that following the hospitalization he continued to treat claimant with various antidepressant drugs and counselling. As a result, it was the doctor's opinion that claimant's condition had improved from the time he first saw him in February of 1983 to the time of his deposition in December of 1983. He did not believe that claimant's organic brain syndrome or the impairment caused thereby would improve and that it was in fact a permanent condition. The doctor opined that the impairment caused by the organic brain syndrome was 40 to 50 percent of the body as a whole. He did not believe that the claimant would be able to return to his former employment and that in the future his employment would be limited to simple repetitive tasks which would require a minimal amount of co-ordination and cognitive thinking. Dr. Egger summarized his statement of causation with respect to the claimant in a letter of May 2, 1983 when he stated:

> Following hospital treatment Mr. McCurry has been seen in my office on March 4, March 23, April 11, and April 27, 1983. He is due to be seen again in three weeks.
>
> Tofranil seemed to lose it's effect in controlling headaches and mood, and this was changed to Norpramin 200 mg. at bedtime with Mellaril 25 mg. used on an as needed basis for anxiety. Mr. McCurry reported yesterday that he was sleeping well and that his mood was fair with the Norpramin. He has completed testing at Iowa Western Community College fo Vocational Rehabilitation Program, but does not yet have the results of that. I anticipate he will continue under my care until depressive symptoms are well controlled and he is satisfactorily adjustment [sic] in Vocational Rehabilitation Program. As I stated in hospital summary, he is suffering from major depressive disorder, reactive type, as well as organic mental disorder. The depressive symptoms are directly related to his injury and forced inactivity secondary thereto. His personal problems are largely secondary also to the injury and forced inactivity rather than the depression being secondary to the personal problems. As I stated in my letter of March 8, 1983, I cannot state with certainty that the organic mental disorder is secondary to the injury sustained in his fall at work, however, the pattern of symptomatology and history strongly suggest that it is secondary to the injury. I assume you will forward this reply to Wausau Insurance Company as you did previously.

Charles J. Golden, Ph.D., testified by way of deposition. Dr. Golden's qualifications as an expert were outlined in his curriculum vitae which was attached to and incorporated in his deposition as exhibit 1. Dr. Golden received his Bachelor's Degree in 1971 from Pamona College in Claremont, California, and received a Master's Degree in 1973 from the University of Hawaii, Honolulu, Hawaii. In 1975 he received a Ph.d. from the University of Hawaii and conducted a post graduate degree in training at Hawaii State University in Honolulu, Hawaii. He served an internship in child and adult neuropsychology assessment and therapy. Dr. Golden is a licensed psychologist in the states of Iowa and Nebraska and is board certified as a professional neuropsychologist and clinical psychologist. Dr. Golden has been involved in considerable professional research including the development of the Luria-Nebraska Neuropsychological Battery. He has served on the faculty of the University of South Dakota, the University of Nebraska College of Medicine and presently holds the title of Professor at the College of Medicine of the University of Nebraska. Dr. Golden has written approximately 14 books dealing with neuropsychology and diagnoses of neuropsychological problems and published over 145 articles on essentially the same subjects.

Dr. Golden testified that he examined and evaulated the claimant on February 22, 23 and 24, 1984 at the request of the defendants. Prior to conducting the evaluation, he obtained the records of the claimant from Dr. Egger, reviewed claimant's high school record, contacted the claimant's most recent employer, interviewed the claimant's mother and the claimant. He stated that the following tests were administered to the claimant: (1) the Luria-Nebraska Neuropsychology Battery; (2) the Peabody Individual Achievement test; (3) the Millon Multiaxial Personality Inventory; (4) the Minnesota Multiphasic Personality Inventory and, (5) the Interpersonal Behavior Survey. Dr. Golden stated that as a result of these tests he reached the opinion that claimant was suffering from a mild neuropsychological impairment

and reactive depression. It was Dr. Golden's opinion that the neuropsychological impairment of the claimant was of long standing duration. In support of this position the doctor relied upon the results of the Luria-Nebraska test and his review of the claimant's history of poor academic performance and inappropriate social behavior. He believed that the neuropsychological impairment was equal to approximately eight to ten percent permanent impairment of the body as a whole. He did not believe the neuropsychological impairment was the result of claimant's accident and he did not belive that the claimant would suffer any permanent and psychological impairment as the result of the accident. He was of the opinion that claimant's reactive depression was a treatable condition.

APPLICABLE LAW

A personal injury contemplated by the Iowa Workers' Compensation Law means an injury to the body, the impairment of health or a disease which comes about, not through the natural building up and tearing down of the human body, but because of a traumatic or other hurt or damage to the health or body of an employee. Almquist v. Shenandoah Nurseries, Inc., 218 Iowa 724, 732, 254 N.W. 35 (1934).

The claimant has the burden of proving by a preponderance of the evidence that the injury of August 11, 1982 is the cause of the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 296, 18 N.W.2d 867 (1965); Lindahl v. L. O. Boggs Co., 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1956).

The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 383, 101 N.W.2d 167, 171 (1960). However, the weight to be given to the expert testimony is for the finder of fact, and the provision of evidence weight will be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 521, 133 N.W.2d at 870.

The finding of a causal connection must be based upon testimony or evidence that tends to establish the connection, or upon proper inferences that may be drawn therefrom, and cannot be predicated upon conjecture, speculation or mere surmise. Burt, 247 Iowa at 701, 73 N.W.2d at 737-38. Expert opinions, even if uncontroverted, may be accepted or rejected, in whole or in part by the industrial commissioner as the ultimate finder of fact. Sondag v. Ferris Hardware, 220 N.W.2d 903, 906 (Iowa 1974).

A claimant is not entitled to compensation for the results of a preexisting injury or disease. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756 (1956). However, if the claimant has a preexisting condition that is aggravated, accelerated, worsened, or "lightened up" by claimant's work activities which results in a disability, the claimant is entitled to compensation to the extent of the disability found to exist. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812 (1962); Yeager v. Firestone Tire & Rubber Co., 253 Iowa 369, 112 N.W.2d 299 (1961).

An employee who has suffered a permanent partial disability is entitled to compensation for a healing period beginning on the date of injury until the employee has returned to work, or when "it is medically indicated that significant improvement from the injury is not anticipated or until the employee is medically capable of returning to employment substantially similar to the employment in which the employee was engaged at the time of injury, whichever occurs first." Iowa Code Section 85.34(1) [as amended by enrolled Senate File 539, section 8 (1982)].

The Iowa Supreme Court has characterized healing period as "that period during which there is reasonable expectation of improvement of the disabling condition." Armstrong Tire & Rubber Co. v. Kubli, 312 N.W.2d 60, 65 (Iowa 1981) [citing Boyd v. Hudson Pulp & Paper Corp., 177 So.2d 331, 330 (Fla. 1965)]. Thus, the healing period terminates at the time the injured employee is restored as far as the permanent character of the injury will permit. Armstrong Tire & Rubber Co., 312 N.W.2d at 65.

ANALYSIS

The parties are in agreement that the claimant suffered an injury on August 11, 1982 when he fell from a scaffold at work. There is agreement that, at a minimum, claimant suffered a permanent partial disability of five percent of his body as a whole as a result of that fall. The five percent impairment is the result of chronic low back strain. The question in this case is whether the fall caused any other impairment other than the low back strain.

The record is clear that the claimant does suffer impairments to his ability to earn income for reasons other than chronic low back strain. The two primary impediments to his earning ability are the depression and the neuropsychological deficits. The experts disagree as to the cause of these problems. Dr. Egger is of the opinion that claimant suffered organic brain damage in the fall. He suggests the possibility that the claimant's depression is the result of the brain damage rather than a reaction to his back injury. Dr. Golden believes claimant's brain damage is of long standing duration and preexisted the injury of August 1982. He also finds claimant to be suffering from reactive depression.

Both of the doctors express the opinion that the depression is not a permanent condition. Although defendants contend that Dr. Golden testified that claimant's depression preexisted the August 1982 injury, such testimony is hard to find. Dr. Golden specifically stated that claimant was suffering reactive depression. (Exhibit C, p. 39 ll. 1-4)

Concerning the cause or origin of the claimant's organic brain disorder, the opinion of Dr. Golden will be accepted as being entitled to greater weight than Dr. Egger. Both Dr. Golden and Dr. Egger possess considerable experience and education in their fields. Dr. Egger's medical background adds little weight to his testimony however, because his diagnosis is not based upon medical findings; it is based upon the results of a psychological test. Dr. Golden being the author and designer of the psychological test employed, probably has greater expertise at interpreting the results. Also, the extent and degree of research into claimant's background by Dr. Golden is most impressive. Dr. Egger's personal contact with and knowledge of the claimant is offset by such extensive background investigation.

Although the defendants correctly state that Dr. Egger expressed the possibility that claimant's depression arose from the organic brain disorder, he is in fact merely stating a possibility. In addition, the doctor's opinion is based on his assumption that the organic brain deficits arose at the time of injury. This record supports the conclusion that the depression arose subsequent to and as a result of the injury. The expert testimony of both doctors, when considered as a whole and reconciled to the extent possible, disclosed that claimant suffers from reactive depression as a result of his injury. Further, that the reactive depression exacerbates an underlying personality disorder. Likewise, the personality disorder exacerbates the depression. When viewed in the context of the workers' compensation law, the conclusion must be that the injury to claimant's back caused the reactive depression. The reactive depression aggravated a preexisting organic brain deficit. As stated above, claimant is entitled to recover for disability which results from the aggravation of a preexisting condition. The materiality of the aggravation is apparent from the fact that prior to August 11, 1982 claimant was employed and employable and now he is not.

Since claimant has suffered a permanent partial disability at least to his low back, he is entitled to healing period benefits until the extent of permanent partial disability can be determined. In the instant case, claimant was still suffering from reactive depression at the time of Dr. Golden's evaluation. Since that evaluation claimant has continued to receive psychiatric counselling and antidepressant drugs. Both doctors indicated that claimant's depression would improve though Dr. Egger was less certain. Claimant has not returned to work, it has not been established on this record that there will be no significant medical improvement in his condition and it does not appear he can return to substantially similar employment. It is therefore clear that claimant continues in healing and that his compensation should continue until one of the three conditions of §85.34(1) are met. Only at that time could there be a valid assessment of his industrial disability.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

1. On August 11, 1982 claimant fell from a scaffold while at work.

2. As a result of the fall, claimant received a mild permanent impairment to his low back.

3. As a result of the fall and subsequent disability, claimant developed a reactive depression.

4. Claimant's reactive depression aggravates and is aggravated by a preexisting neuropsychological deficit.

5. Claimant's preexisting neuropsychological deficit is of long standing duration and is permanent.

6. Claimant is presently suffering from reactive depression.

7. Claimant's reactive depression is not a permanent condition.

8. Claimant has not returned to work and cannot presently engage in substantially similar work.

9. Claimant has not achieved maximum recovery from his injury of August 11, 1982.

10. Claimant's rate of compensation is $290.06.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

Claimant has proven by a preponderance of the evidence that on August 11, 1982 he received an injury arising out of and in the course of employment.

Claimant has proven by a preponderance of the evidence that he has suffered a permanent partial disability as a result of his injury.

Claimant has proven by a preponderance of the evidence that he has not returned to work; that it is not medically indicated that he can return to substantially similar employment; and, that it is medically indicated that his present condition may significantly improve.

ORDER

IT IS THEREFORE ORDERED that defendants pay unto claimant compensation at the rate of two hundred ninety and 06/100 dollars ($290.06) from August 11, 1982 until such time as one of the conditions of §85.34(1) are met.

Defendants shall pay the costs of this action.

Signed and filed this 24th day of September, 1984.

INTRODUCTION

This is a proceeding in review-reopening brought by Ronald D. McDonald, claimant, against Pulley Freight Lines, employer, and Carriers Insurance Company, insurance carrier, defendants, to recover additional benefits under the Iowa Workers' Compensation Act for an injury arising out of and in the course of his employment on November 5, 1981. It came on for hearing on July 30, 1984 at the office of the Iowa Industrial Commissioner in Des Moines, Iowa.

The industrial commissioner's file shows a first report of injury received November 18, 1981.

At the time of hearing the parties stipulated to a rate in the event of an award of $270.01.

The record in this matter consists of the testimony of claimant and Marian Jacobs; claimant's exhibit 1, a series of medical reports from James B. Worrell, M.D.; claimant's exhibit 2, a report from Dr. Worrell dated June 28, 1983; claimant's exhibit 3, reports from Stan Christensen, LPT; claimant's exhibit 4, reports from Christensen and Dr. Worrell; claimant's exhibit 5, medical information and a report from R. S. Rattray; claimant's exhibit 6, a report from Donald D. Berg, M.D. and from G. Brian Paprocki; claimant's exhibit 7, the deposition of Paprocki; claimant's exhibit 8, medical reports and a report from Carlos Chase; defendants' exhibit A, the curriculum vitae of Marian Shanley Jacobs; defendants' exhibit B, a report from Jacobs; and defendants' exhibit C, the deposition of claimant.

ISSUES

The issues in this matter are whether or not claimant is entitled to further temporary total, healing period or permanent partial disability benefits and whether or not the provisions of Iowa Code section 86.13 have been triggered.

STATEMENT OF THE CASE

Thirty-five year old married claimant, father of two children and a high school graduate, testified to beginning work experience as a material handler for a brick company. At the same time he had a laborer's job as a shaker removing sand from molds. After graduation from high school, claimant spent two and a half months as an assistant manager trainee before being drafted. He served nearly two years in the navy with two tours in Vietnam--one as a boatswain's mate and a second as a sonar technician standing watch on the scope. When he returned to civilian life he spent a year working for a loan company doing such things as closing loans, prospecting for loans and evaluating household goods as collateral. He left the loan corporation both because of managerial problems and because he wished to go to college.

Claimant went to college full-time under the G.I. bill. He then attended part-time for the next four or five years and did local trash hauling with a friend. Later he acquired some equipment for landscaping. He attained between ninety-five and one hundred and fifteen hours of college credit. He said that he needs one more course to obtain an A.A. degree. That course is accounting which he has attempted but failed.

Claimant's next employment was as a warehouseman--a job he held intermittently over the next three years. Initially, he dispersed furniture when drivers brought it in. He did some lifting, but he had assistance from another employee and special equipment. During this time he got a class one license to drive an eighteen-wheeler. He drove both intrastate and locally. He spent three months as a salesperson selling the services of a freight hauler. He served two months as a dispatcher, but he was told he was not working out. He improved his salary while he worked six months delivering local freight and loading and unloading materials weighing from ten to fifty pounds.

Claimant moved to another California location and took a job driving a three-axle dump truck and doing some cement mixing. This was a seasonal job and as claimant was last hired he was on layoff from time to time.

Claimant returned to Iowa where he was employed by defendant employer in August of 1981 as a driver driving out of Rock Island. Claimant attributed his many changes in employers to an attempt to better himself.

Claimant testified that he had a physical when he got out of the navy and each year to update his license to drive the truck.

Claimant recalled the circumstances of his November injury as follows: It was a Thursday. He was unloading an overweight trailer at the scales after having driven for about eight hours with catnaps. A path was made through the boxes so the weight could be taken from the nose. He moved the boxes by bending over and pulling them through his legs as he worked in a small space. The cartons which were unloaded contained bleach bottles and weighed sixty-five pounds. The truck was weighed three times before it passed. By that time he was feeling stiff and sore.

He took another load to Indianapolis with stops for food and catnaps. He did no lifting. He washed out his truck and got another load for Rock Island where he arrived on Saturday morning after sleeping in the cab of his truck.

He called the dispatcher and then his spouse to come get him. He had no prior back trouble. He could stoop, but he was unable to get back up. He saw the doctor and missed three weeks' work. He was released for light duty; but as there was none, he was told to take another two weeks off.

He drew compensation while he was not working.

On December 15, 1981 he returned to work as a driver. He was sometimes capable of doing the loading and unloading. At other times he hired help.

There was a layoff in March during contract negotiations and in this time he became accustomed to sleeping nights instead of on an irregular schedule.

He remembered his next back incident thusly: He had been on the road since Sunday night or Monday morning. He was asleep with his head on the passenger side in his truck parked by the roadside. He was startled by something. He pulled himself up by the steering wheel wrenching his back and feeling sharp pain which was the same back pain he had felt before. He continued to drive, but his lower extremities and buttocks began to feel numb. By Saturday afternoon, he felt "pretty rough." He used heat.

He reported back to work and did some relocating of trailers and then commenced doctoring with Dr. Hart over the next six weeks. He received workers' compensation. He was referred to Dr. Berg, an orthopedic surgeon, who treated him with medication

and who told him to do exercises and to lose weight. He had a myelogram.

Eventually, he was sent to Dr. Worrell in Iowa City whom he continues to see to the present.

Claimant reported that he was paid compensation until May 10, 1983. He understood that his compensation terminated at that time because he allegedly was not cooperating by losing weight.

Claimant agreed that he is better, but he did not think he could go back to the sort of work he was doing at the time of his injury. He is limited to lifting twenty-five pounds with no excessive bending or lifting and no repetitive bending, twisting or turning. His medications are Norge Forte and Elavil. Valium and Tylenol 3 are taken as he needs them. He said that he walks two miles a day and tries to swim for ten to thirty minutes five days a week.

Claimant indicated that he was sent by Paprocki, a vocational expert, to state vocational rehabilitation services where he saw a counselor named Carlos Chase with whom he has consulted about jobs. He underwent four days of testing in Des Moines. He acknowledged doing well on the tests and expressed the feeling he could complete college. He stated that he is writing for his transcript. He claimed that he has no funds to use to attend college. Claimant testified that he wishes to get into something business oriented, preferably sales and preferably in the Oskaloosa area. He thought he would be able to drive to work in a larger area, but he was not sure; and he felt that whether or not he could do the driving might be determined by the job he was driving to and from.

Claimant admitted he had been referred to a job by Jacobs, another vocational counselor, as a night watchman with a salary of $3.50 per hour. Claimant expressed the opinion he is capable of earning more money and the desire to have a job which will take him somewhere.

Claimant declared he is starving on the 1000 calorie diet. His weight is at 238 pounds. He estimated his normal working weight at from 225 to 230 pounds. He agreed that he had been told by Dr. Berg that weight loss would help his healing, but he related that Dr. Worrell did not think his weight was "substantially relevant" to his condition.

Claimant asserted that he would not be bondable because he had trouble with his credit when he lived in California.

Marian Jacobs, a vocational consultant with a master's degree from a rehabilitation specialist's program, testified to interviewing claimant to assess his post-injury earning capacity. Her procedure is to start by looking at the medical records to see what the employee's functional impairment is and what medical limitations have been placed on activity. She then interviews the employee to take an educational and work history to enable her to assess transferable skills. She also looks for skills obtained through avocations. She investigates the relevant labor market for jobs available in the geographic area. This investigation includes contacting local employers. She also visits Job Service and the local vocational counselor.

In making the determination of what claimant can do, Jacobs used restrictions of twenty-five pounds with no frequent bending or twisting and also considered what claimant said he was able to do. Claimant's self-placed limitations were an ability to walk up to two miles, to drive twenty-five to thirty miles, to lift up to thirty pounds and to bend and to stoop occasionally. Claimant told her of an inability to stand and to sit in one position for a long period.

As jobs claimant can do with his demonstrated skills and the limitations assigned by Dr. Berg, she listed manager trainee for a loan officer, driver's license examiner, Clerk IV with the Iowa Merit classification, and factory representative. As jobs coming within claimant's self-imposed limitations and using his demonstrated skills, she proposed route driver, sales representative, supervisor for a convenience store, security guard, painting helper or worker, support service supervisor or production worker. In discussion, she noted that a route driver delivering such items as potato chips or cookies would use sales skills and be engaged in a lighter job. She said that sales representatives often do not lift over twenty-five pounds. She explained that the position of security guard would be a means of getting claimant back to work and of establishing him with a company. This placement, she believed, might lead to other things.

Jacobs, who expressed the opinion that after initial training in a new field, claimant's post-injury earnings would equal his preinjury earnings as an over-the-road truck driver, pointed out that claimant could utilize a veterans preference or benefits available through JTPA. She also spoke of targeted job tax credit as an advantage to an employer hiring claimant.

As important aspects of claimant's experience, Jacobs looked to his loan company work, his keeping books and logs, his dealing with customers and his good communication skills. She anticipated claimant's returning to truck driving if his condition improves.

Jacobs acknowledged that if the security guard job at $3.50 were the only job claimant could do, he would have industrial disability.

G. Brian Paprock, vocational consultant who has a master's degree in vocational rehabilitation, met with claimant on April 22, 1983. In doing his evaluation of claimant, he considered claimant's age, education, past work, the diagnoses made by Dr. Worrell in his reports dated April 21, 1983, June 28, 1983, August 2, 1983 and August 19, 1983, and claimant's subjective complaints. He did not formulate an opinion regarding claimant's industrial disability as he thought claimant continued to undergo medical treatment, had no release to return to work and had not had specific restrictions or limitations assigned. He did believe that claimant would have industrial disability as he questioned claimant's ability to return to the level of physical exertion necessitated by his employment with defendant employer.

Paprocki had not seen reports from Dr. Berg, but he knew of his involvement in the case. He agreed that it would be significant if Dr. Berg felt claimant was going to recover and have no permanent impairment.

The expert assessed claimant's work experience as running the gamut from non-skilled physical labor to semi-skilled to very skilled and from heavy physically to very light or sedentary.

Paprocki at the time of his deposition found claimant's medical prognosis too undefined to allow conclusions regarding his employability. He said that when claimant is released for some kind of employment he will no longer be totally disabled because he has skills which will enable him to do work other than physical labor.

The consultant provided a supplemental report dated May 14, 1984 in which he suggested industrial disability of approximately twenty-five percent. Factors considered included good potential for learning and employment experience in other than physical labor positions. He anticipated the likelihood of direct job placement in the clerical or sales fields, but with a decrease in actual earnings.

Also included in the record is a summary of claimant's short-term evaluation from the state rehabilitation, education and services branch. Claimant was not able to solidify his vocational interests which changed almost daily during his testing.

Claimant was given a level II wide range achievement test which resulted in scores in the eleventh and twelfth grade range except in math. Claimant was given a Valpar drafting work sample. It was concluded that drafting was not a likely potential field due to claimant's level of math skills and also to his trouble maintaining concentration for quality and attention to detail. Math skills also were viewed as lowering the likelihood of claimant's succeeding in a computer occupation and his limited mobility as a hindrance to computer maintenance. Claimant did well on an accounting orientation test, a bookkeeping sample and the independent problem solving sample.

Claimant's verbal I.Q. was 111; his performance 104; and his full scale 108.

During the period claimant was being evaluated he complained of difficulty sleeping and of back pain.

Claimant was seen as vacillating between seeking training or finding immediate employment. Recommmended areas of employment pursuit were loan interviewer, loan application clerk, collection clerk, or skip tracer. With additional training, claimant was believed to have the capacity for being a loan officer or clerk. Claimant expressed interest in work as a real estate sales agent, appraiser or estimator.

Claimant's concern over his ability to work in the loan area because of his own financial difficulties was viewed as a job seeking skills problem which could be handled by helping claimant explain the situation, develop reasons for why it occurred and place stress on the skills he had obtained.

Donald D. Berg, M.D., saw claimant for evaluation on November 17, 1983 after not having seen him since December 1982 and found claimant "essentially about the same." Straight leg raising was negative; knee reflexes were present and equal. Range of motion in the back was 80 percent of normal. The doctor proposed that the only way for claimant to improve would be for him to lose weight. Claimant was placed on a 1000 calorie diet. The orthopedist thought that claimant could return to sedentary work, but not to manual labor because of his pain. Although the doctor was unable to say when it occurred and he stated that he would normally expect a six month healing time for a lumbosacral strain, he thought claimant had achieved maximum healing. The doctor wrote: "From this point on, I feel loss of weight will be the key factor for him and healing."

Dr. Berg saw claimant on December 29, 1983 at which time he was evaluated for back pain. The doctor wrote that claimant seemed to be improving although his flexibility was unchanged. Note was made of claimant's failure to lose weight. Claimant was advised not to do heavy lifting and to continue to lose weight and do the flexibility exercises.

In early January claimant was told to continue weight loss and to walk two miles each day and swim a half hour. Thirty degrees loss of flexion and ten degrees loss of extension were recorded. Lateral tilting was diminished by thirty degrees.

In a letter of May 7, 1984 Dr. Berg wrote: "I feel when he loses weight he probably will get well. Until he loses weight I do not feel he will." The doctor expressed the belief that claimant will be unable to do heavy lifting until his weight is decreased and his flexibility increased. He rated claimant's permanent impairment at five percent due to claimant's persistent loss of flexibility and muscle tightness in his spine. He proposed claimant would have no impairment should his weight be reduced.

In July Dr. Berg wrote that claimant's healing occurred in November of 1983. Claimant's restrictions included a twenty pound lifting limitation and a recommendation of no frequent bending or twisting.

James B. Worrell, M.D., saw claimant on December 29, 1982 and took a history of claimant's lifting heavy cases and carrying them to the truck in November of 1981. Claimant complained of severe lumbar pain radiating down both buttocks with pain into the right leg. Claimant said his pain was aggravated by riding in a car, sneezing or twisting.

On examination, straight leg raising was positive bilaterally at about 60 to 70 degrees. He was tender in the paraspinal muscles and over the spinous process of the lumbar area but not the buttocks. Claimant's right ankle jerk was diminished and claimant had a consistent decrease in pin perception over the lateral aspect of the foot. Claimant had good pulses and no sensory loss. There was a suggestion of an S1 radiculopathy on the right. Claimant's myelogram was interpreted as showing only a slight bulging at L4-5. Dr. Worrell suggested a CT scan and electromyography.

Electromyography was interpreted as essentially normal without changes great enough to diagnose an L5 radiculopathy. The CT scan also was normal. Claimant was referred for pain management.

When claimant was seen on March 8, 1983 he was using a TENS and doing stretching, abdominal and posture training exercises.

On April 6, 1983 Dr. Worrell wrote that "it would help if Mr. McDonald would lose weight but I do not think this is the entire basis for his problem." He subsequently wrote in a letter to claimant: "I would like to offer that you have been extremely cooperative in keeping your appointments and following up on your physical therapy program and have been attempting to lose weight. You are improving gradually and hopefully your situation will resolve here over time."

On June 28, 1983 Dr. Worrell wrote that claimant continued to be disabled by back pain. He also said that claimant should commence vocational rehabilitation.

On August 2, 1983 Dr. Worrell reported his diagnosis of severe back pain and right sciatica. He estimated treatment for claimant's permanent condition would require six to twelve months more. He declared claimant unable to work and suggested he avoid lifting, driving, bending and prolonged sitting.

On August 19, 1983 the neurologist reported that claimant was making headway on June 28; however, when he was seen on August 2 his symptoms had increased. The doctor's suggestion for treatment was to continue therapy and to provide analgesics and muscle relaxants.

When claimant was seen in October, he was again no better. Claimant was taking a large amount of Codeine and getting no relief from Feldene. The doctor put claimant through a series of tests to insure claimant's problem was not arthritis including a sedimentation rate, antinuclear antibodies, a CBC and a latex study. As those tests were negative, Dr. Worrell concluded he could offer only continued conservative management.

In a letter dated July 16, 1984 Dr. Worrell used the manual for orthopedic surgeons to reach a ten percent rating for claimant's syndrome of the lower lumbar area with persistent muscle spasm, rigidity and pain.

Stan Christensen, L.P.T., saw claimant on January 17, 1983 at which time claimant complained of central pain at L3, L4, muscle soreness adjacent to the central spine and frequent severe headaches. Claimant's pain was increased by working in cold areas, sitting, turning and bending. Pain was helped by standing up and moving around. Forward flexion to 60 degrees was guarded. Claimant was tight on forward flexion. Claimant's lumbar lordosis was moderately increased, his abdominal musculature weak and his mechanism for straightening from a bent position poor.

Good body mechanics were demonstrated to claimant and he was given a stretching program. A TENS was ordered.

Claimant was seen periodically from January apparently to April. Claimant was then seen in August at which time he was given a neuroprobe treatment which gave him good initial relief. A week later he returned with complaints of pain and of a poor sleep pattern. He was taking Valium. Christensen did not feel neuroprobe treatments could be effective as long as claimant was taking Valium.

APPLICABLE LAW AND ANALYSIS

The first issue to be decided is claimant's entitlement to additional temporary total or healing period benefits. As claimant will be found to have permanent disability, Iowa Code section 85.34(1) is applicable. It provides:

> If an employee has suffered a personal injury causing permanent partial disability for which compensation is payable as provided in subsection 2 of this section, the employer shall pay to the employee compensation for a healing period, as provided in section 85.37, beginning on the date of injury, and until the employee has returned to work or it is medically indicated that significant improvement from the injury is not anticipated or until the employee is medically capable of returning to employment substantially similar to the employment in which the employee was engaged at the time of injury, whichever occurs first.

Section 85.34(1) cited above lists three situations in which healing period can be terminated. Claimant has not returned to work. Claimant does not appear capable of returning to truck driving as he was doing at the time of his injury. Claimant's healing period will be terminated at the time he reached maximum medical recuperation.

When claimant was seen by Dr. Berg in November of 1983 his condition was found to be essentially the same as it had been in December of 1982. Claimant was treated by Dr. Worrell in the interim. In a letter dated November 17, 1983 Dr. Berg wrote that claimant could do sedentary work and that he had reached maximum medical healing.

In a letter dated December 8, 1983 Dr. Worrell determined that the only thing to be offered to claimant was continued conservative management. Although a report from Dr. Worrell indicates his expectation that claimant would have need of treatment for an additional six to twelve months, the receipt of medical care in and of itself is insufficient to extend healing period. Derochie v. City of Sioux City, II Iowa Industrial Commissioner Report 112 (Appeal Decision 1982) (District Court Appeal remanded for settlement).

Based on the medical evidence from Drs. Berg and Worrell, claimant will be found to have reached maximum medical recuperation on November 17, 1983, the date of Dr. Berg's evaluation.

The next issue to be decided is claimant's entitlement to permanent partial disability. As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

The industrial commissioner has said many times:

> Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 125 N.W.2d 251 (1963). Barton v. Nevada Poultry, 253 Iowa 285, 110 N.W.2d 660 (1961).
>
> A finding of impairment to the body as a whole found by a medical evaluator does not equate to industrial disability. This is so as impairment and disability are not identical terms. Degree of industrial disability can in fact be much different than the degree of impairment because in the first instance reference is to loss of earning capacity and in the later to anatomical or functional abnormality or loss. Although loss of function is to be considered and disability can rarely be found without it, it is not so that an industrial disability is proportionally related to a degree of impairment of bodily function.
>
> Factors considered in determining industrial disability include the employee's medical condition prior to the injury, after the injury, and present condition; the situs of the injury, its severity and the length of healing period; the work experience of the employee prior to the injury, after the injury and potential for rehabilitation; the employee's qualifications intellectually, emotionally and physically; earnings prior and subsequent to the injury; and age, education, motivation, and functional impairment as a result of the injury and inability because of the injury to engage in employment for which the employee is fitted. Loss of earnings caused by a job transfer for reasons related to the injury is also relevant. These are matters which the finder of fact considers collectively in arriving at the determination of the degree of industrial disability.

There are no weighting guidelines that are

indicated for each of the factors to be considered. There are no guidelines which give, for example, age a weighted value of ten percent of total, education a value of fifteen percent of total, motivation - five percent; work experience - thirty percent, etc. Neither is a rating of functional impairment entitled to whatever the degree of impairment that is found to be conclusive that it directly correlates to that degree of industrial disability to the body as a whole. In other words, there are no formulae which can be applied and then added up to determine the degree of industrial disability. It therefore becomes necessary for the deputy or commissioner to draw upon prior experience, general and specialized knowledge to make the finding with regard to degree of industrial disability.

See Birmingham v. Firestone Tire & Rubber Company, II Iowa Industrial Commissioner Report 39 (1981); Enstrom v.Iowa Public Services Company, II Iowa Industrial Commissioner Report 142 (1981); Webb v. Lovejoy Construction Co., II Iowa Industrial Commissioner Report 430 (1981).

Claimant's health seemingly was excellent prior to the development of back difficulties. Although he has not had surgical intervention, his back complaints have been persistent. He has been treated with a number of modalities. He continues to take medication including a drug for pain. He carries a permanent weight restriction, and it has been recommended that he not do frequent bending or twisting. Claimant has been paid a substantial healing period--well in excess of that routinely seen--and he is being awarded additional time by this decision.

Claimant is a young man with a long work life ahead of him. His education is good and he has potential for obtaining more education. Those factors lower his industrial disability. Asher v. Polk County, III Iowa Industrial Commissioner Report 19 (Appeal Decision 1982); Walton v. B & H Tank Corp., II Iowa Industrial Commissioner Report 426 (1981). He was concerned about his ability to work in the finance business because of his own financial background. The state evaluators viewed this concern as a job seeking skills problem which could be overcome.

Claimant has not returned to work. As a truck driver claimant had actual earnings that were substantial if he was working. In all likelihood, claimant will have to go through a period in which he earns a lesser amount. The permanent partial disability benefits he is being awarded should help sustain him in that time.

Claimant's job experience has been varied. As Paprocki pointed out, it runs the gamut from non-skilled physical labor to semi-skilled to very skilled and from physicaly heavy to very light or sedentary. Claimant claimed that the frequency with which he changed jobs was attributable to his hoping to better himself. On the one hand, claimant's past conduct has provided him with a number of transferrable skills. On the other hand, the repeated changes in employment have not given claimant the kind of solid work pattern and stability employers sometimes seek.

While claimant's behavior may be considered to show good motivation to improve himself, the undersigned has some question about claimant's ability to maintain a direction. He started in college to attain a degree. He eventually got off the standard path and began to take courses which interested him. Evaluators at the state rehabilitation facility observed claimant's difficulty in solidifying a vocational objective. Claimant has not attained a transcript from the California college to assist him or the vocational experts who have tried to help him.

Claimant's motivation also is evidenced by his inability to reduce his weight. Anyone who has ever had a weight problem can sympathize with claimant. However, both his doctors have pointed to the importance of losing weight and it seems his motivation to do so has not been a sustained one. See Cowell v. Insulation Services, Inc., III Iowa Industrial Commissioner Report 57 (Appeal Decision 1982).

Claimant was given a functional impairment by Dr. Berg of five percent which he proposed could be zero if claimant's weight were reduced. It is important to keep in mind that permanent means an indefinite and indeterminable period. Wallace v. Brotherhood of Locomotive Firemen & Engineers, 230 Iowa 1127, 1130, 300 N.W. 322, 324 (1941). Dr. Worrell, using the orthopedic guides, assessed an impairment rating of ten percent.

Vocational expert Jacobs found a number of jobs she felt claimant could do. State vocational evaluators also suggested several jobs.

Based on the Iowa case law, the findings of fact below and the discussion set out herein, claimant is found to have a permanent partial disability of 17 1/2 percent.

The remaining issue is whether or not the provisions of Iowa Code section 86.13 have been triggered. That section provides in pertinent part:

> If a delay in commencement or termination of benefits occurs without reasonable or probable cause or excuse, the industrial commissioner shall award benefts in addition to those benefits payable under this chapter, or chapter 85, 85A, or 85B, up to fifty percent of the amount of benefits that were unreasonably delayed or denied.

Claimant understood that his benefits were being terminated on May 10, 1983 because of his failure to cooperate in his treatment by losing weight. Both Drs. Berg and Worrell have directed claimant to lose weight. In April of 1983 Dr. Worrell wrote that losing weight would be helpful to claimant, but that his weight was not the sole reason for his difficulty. Defendants' position is somewhat understandable. It would seem that claimant would want to do whatever is necessary to recondition himself and to rid himself of the pain. However, in light of Dr. Worrell's letter of April 6 and of a subsequent letter indicating claimant has been cooperative, defendants' termination of benefits was unreasonable. See Eversoll v. Swift Dairy & Poultry Co., 32 Biennial Report of the Industrial Commissioner 206 (1975).

Section 86.13 gives the undersigned discretion to determine the degree of unreasonableness in that additional benefits up to fifty percent can be awarded. Overall, defendants' conduct is viewed as minimally unreasonable and an additional ten percent will be awarded to run from the date of termination, May 10, 1983, until November 17, 1983 when healing period ended. No additional benefits will be allowed on the award of permanent partial disability.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant is thirty-five (35) years of age.

That claimant is a high school graduate.

That claimant has between ninety-five (95) and one hundred fifteen (115) hours of college credit.

That claimant served for two years with the navy.

That claimant has work experience as a material handler, shaker, assistant manager trainee, loan collector/appraiser, trash hauler, warehouseman, truck driver and dispatcher.

That claimant commenced work for defendant employer in August 1981.

That claimant initially injured his back as he was unloading an overweight truck in November of 1981.

That claimant was paid weekly benefits from November 7, 1981 to December 14, 1981.

That claimant returned to work on December 15, 1981.

That claimant had a second back incident in May of 1982.

That claimant received workers' compensation payments until May 10, 1983.

That claimant reached maximum medical recuperation by November 18, 1983.

That claimant continues to take medication.

That claimant has not returned to work.

That claimant cannot return to the type of truck driving he was doing at the time of his injury.

That claimant has undergone rehabilitation through the state rehabilitation agency.

That claimant wishes to find a job that pays more than minimum wage and will provide him with an opportunity for advancement.

That claimant is on a 1000 calorie diet.

That claimant's current weight is two hundred thirty-eight (238) pounds.

That claimant needs to reduce his weight and increase his flexibility.

That claimant has a twenty-five (25) pound lifting limitation with a recommendation of no frequent bending or twisting.

That claimant has a functional impairment as a result of his back problems.

That claimant is having difficulty selecting a direction for his vocational rehabilitation.

That claimant has skills from past work which can be transferred to new employment.

That defendants' termination of claimant's benefits because of his failure to decrease his weight was unreasonable.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has established entitlement to healing period benefits through November 17, 1983.

That claimant has established entitlement to permanent partial industrial disability of seventeen and one-half percent (17 1/2%).

That claimant has established entitlement to additional benefits under Iowa Code section 86.13.

ORDER

THEREFORE, IT IS ORDERED:

That defendants pay unto claimant healing period benefits from May 10, 1983 through November 17, 1983 at a rate of two hundred seventy and 01/100 dollars ($270.01).

That defendants pay an additional twenty-seven dollars ($27.00) per week from May 10, 1983 through November 17, 1983 pursuant **to Iowa Code section 86.13.**

That defendants pay permanent partial disability benefits for eighty-seven and one-half (87 1/2) weeks commencing on November 18, 1983 at a rate of two hundred seventy and 01/100 dollars ($270.01).

That defendants pay amounts due and owing in a lump sum.

That defendants pay interest pursuant to Iowa Code section 85.30.

That defendants pay costs pursuant to Industrial Commissioner Rule 500-4.33.

That defendants file a final report when this award is paid.

Signed and filed this 29 day of August, 1984.

Judith Ann Higgs

JUDITH ANN HIGGS
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

THOMAS J. McDONOUGH,	:	File Nos. 661605
Claimant,	:	700318
vs.	:	ARBITRATION AND
DUBUQUE PACKING COMPANY,	:	REVIEW-
Employer, Self-Insured, Defendant.	:	REOPENING
	:	DECISION

These are proceedings in review-reopening and arbitration brought by the claimant, Thomas J. McDonough, against his self-insured employer, Dubuque Packing Company, to recover additional benefits and benefits under the Iowa Workers' Compensation Act as a result of injuries he sustained on May 12, 1979 and May 8, 1980 respectively.

The matters came on for hearing before the undersigned deputy industrial commissioner at the courthouse in Dubuque, Iowa on May 16, 1984. The records were considered fully submitted on that date but for written submission of an oral stipulation filed May 21, 1984.

An examination of the industrial commissioner's files indicates that a first report of injury was filed August 27, 1980 and a memorandum of agreement July 10, 1981 in file number 601605. No filings have been made in file number 700318.

The record in these cases consists of the testimony of claimant, of Robert Scott Cairns, M.D., and Luke Charles Faber, M.D.; and of claimant's exhibits A, B and C.

ISSUES

The issues to be resolved in file number 61605 are:

1) Whether a causal relationship between claimant's injury and his disability exists.

2) Whether claimant is entitled to benefits and the nature and extent of any benefit entitlement, including the issue of whether defendant is entitled to credit under section 85.38.

3) Whether claimant is entitled to payment of certain medical expenses under section 85.27.

These issues as well as the issue of whether claimant received an injury which arose out of and in the course of employment must be resolved relative to file number 700318.

REVIEW OF THE EVIDENCE

The parties stipulated that the rate of compensation as to claimant's May 8, 1979 injury is $262.50 and as to his May 22, 1980 injury is $270.00.

Claimant has received 28 weeks and 5 days of temporary disability and 26 weeks of disability styled as permanent partial disability benefits following the temporary disability benefits relative to his May 8, 1979 injury. Since May 1, 1982 claimant also has received monthly retirement disability benefits in the amount of $768.00 to which the employer contributed.

Claimant, Thomas Joseph McDonough, testified in his own behalf. Claimant was born May 18, 1935, is 5'9 1/2" tall and weighs 190 pounds. He stated he weighed 180 pounds at the time of his injuries. Claimant stated that on May 8, 1980 he was working on utility as a car storer. As such, he packed boxes of meat weighing between 10 to 100 pounds onto trucks. Claimant reports his right shoulder was sore at this time, and, therefore, he worked almost constantly with his left arm. He agreed that he had experienced problems with his left shoulder in 1968 but denied having any problems with that shoulder in May 1980. Claimant stated his pain began at approximately 2:30 p.m. He began his shift at 7:30 a.m. Claimant testified that he had to put 25 pallets of meat in each truck. The last seven pallets must be unloaded and repacked in the truck. To do so, claimant had to lift these boxes overhead and then push them forward with his left arm. He experienced a severe, sharp pain in his left arm which radiated down into his chest and arm. Claimant reports he thought he had had a heart attack and told a coworker to finish the job and went home. The pain in his left shoulder decreased, but claimant states he continued to experience pain and stiffness in his left shoulder which was very similar to his right shoulder pain. Claimant worked his full shift the next day. He stated he reported his problems to Mr. Conrady, a coworker, and Mr. Campbell, his supervisor.

Claimant saw Dr. Lockhart, a chiropractor, but his condition did not improve. Lockhart referred claimant to E. E. Herzberger, M.D., who diagnosed claimant's problem as two torn rotator cuffs, recommended surgery and referred claimant to Robert Scott Cairns, M.D. Dr. Cairns hospitalized claimant, but surgery was not performed. Claimant then saw Luke C. Faber, M.D., the company physician, who directed him to Julian G. Nemmers, M.D.

Dr. Nemmers apparently performed surgery on claimant's right shoulder. Dr. Nemmers released claimant to return to work with light duty restrictions on February 8, 1981. Apparently claimant was not offered work within the restrictions and was not allowed to return to work. He was given additional compensation but was informed by way of a letter that "anything from February 9, 1981 [counted] against [his] permanent partial disability." Claimant admits he lost no additional work time as a result of his left shoulder problems since these coincided with the time he was off work as a result of his right shoulder injury. Claimant reports that all his medical bills have been paid, but states he made approximately eighty round trips for physical therapy and doctor visits in 1980 at seven miles each.

Claimant reported that he can no longer bowl nor play baseball. He stated that he cannot raise his arm out at the side "with any strength" and that the first three fingers are numb on his right hand. He reported he has less pain in his right shoulder now than he had before surgery and that his left shoulder remains in constant pain. Claimant is right-handed and feels that for this reason the right arm problems create greater restrictions for him even though the condition of and use restrictions for the two limbs are similar.

Claimant was placed on disability retirement May 1, 1982 as a result of his rotator cuff problems. Claimant is allowed to earn $6,500 per year in addition to his disability. He stated he has sought other work but has been unable to find any for almost a year and a half. He attributed this to the requirement that he advise potential employers of his disability retirement. Claimant now works 22 hours per week at minimum wage as a security guard for Skowronek's Jewelry.

Claimant graduated from high school in 1953 and has no advanced formal training. He has worked at a utility company reading meters and as an unskilled laborer in a wood finishing factory. Claimant is well spoken and articulate.

On cross-examination, claimant admitted he did not report his 1980 injury to the company first aid department on his injury date but reiterated he told his foreman of his injury. Claimant admitted he served in the U.S. Army for six to eight years and did general supply duty which he characterized as including accounting and distributing supplies as per written or oral instructions. Claimant reported he received a pension of $768 per month; one-half of which is attributable to disability benefits and not to normal retirement benefits. Claimant admitted he had a sore arm every spring he played ball but stated he has not played ball for twelve years. Claimant expressed his understanding that Dr. Nemmers and his doctors in Iowa City have told him never to have his left shoulder operated on, but stated surgery had been necessary in the right shoulder

since it had gotten so much worse. Claimant denied his doctors told him his was a degenerative condition.

On redirect examination, claimant relayed that his arm "tingled" and swelled once from post-surgical mobilization, but denied that tingling was present when x-rays were taken in July 1980. Claimant stated he was examined by Dr. Mallapurdi who "called it a tunnel syndrome" and advised surgery. Claimant stated that Dr. Nemmers and his Iowa City Physicians advised against this. Claimant reported Dr. Faber has examined his shoulders for disability at the company's medical offices on at least one and possibly two separate occasions.

Robert Scott Cairns, M.D., was called by claimant. The doctor relayed that he first saw claimant in July 1980 on consultation from Eugene Herzberger, M.D. The doctor recited claimant's medical history and concluded by stating that arthrograms obtained by Dr. Herzberger revealed rotator cuff tears on both the left and right shoulder. In response to a hypothetical question that incorporated substantially the fact pattern of this case as claimant has reported such, the doctor opined that, assuming the facts of the hypothetical to be true (as to claimant), it was probable that the rotator cuff injury to claimant's left shoulder was caused by the act of lifting the box (from the pallet) and extending the box outward onto the pile of boxes (already in the semitrailer).

The doctor explained the following as regards rupture of the rotator cuff:

> Well, I believe that an entirely normal rotator cuff rarely ruptures. It requires massive trauma for an entirely healthy tendon to rupture. I think that as a consequence of aging in some individuals there's a consequence of external environmental factors such as occupational demands and so forth that given the right set of circumstances, the tendon will rupture. I think that the usual history and the usual cause is that some accident or untold event causes the tendon to rupture and while the tendon was not entirely healthy or normal to begin with, the precipitating factor was the lifting or the fall or what have you. So I guess in answer, it is probably truly a combination of things except for massive violence. (Trans., p. 19 ll. 11-24)

The doctor indicated that claimant's history of July 1980 records claimant's left shoulder injury as occurring five or six months earlier rather than two months earlier. On cross-examination, the doctor stated claimant gave no history as to what caused his shoulder symptoms. The doctor noted that a medical report from Iowa City gives a history much as claimant's hypothetical with sudden pain in the left shoulder after lifting.

The doctor evaluated both claimant's left and right shoulder. As to claimant's right shoulder, he found 95° abduction, 150° of forward flexion, normal extension, 4° external rotation, and 5° of internal rotation. Claimant was also tender over the ulnar nerve. The doctor concluded claimant had a 12 percent impairment of the upper right extremity or a seven percent body as a whole impairment as a result of his right shoulder condition. As to claimant's left shoulder, the doctor found 105° abduction, 150° of flexion, 30° of extension, 9° of external rotation, 25° of internal rotation. The doctor concluded claimant had a nine percent impairment of the upper left extremity or a five percent body as a whole impairment as a result of his left shoulder condition. The doctor explained that he uses objective criteria only and not an individual's complaints of pain or weakness when assigning an impairment rating. The doctor agreed that adding claimant's two separate body as a whole ratings would result in a 12 percent body as a whole impairment rating but indicated he was not altogether certain this would be the method for obtaining a body as a whole impairment rating under the standard impairment rating guides. The doctor agreed that he evaluated claimant for rating purposes after his right shoulder surgery.

Luke Charles Faber, M.D., testified in defendant's behalf. Dr. Faber reviewed exhibit A, the medical notations for defendant from the employer's first aid office from 1968 onward. He represented that at his direction all visits to the office by any employee for any reason are recorded. The doctor testified the records indicate claimant sought treatment for left shoulder pain on January 5, 1968, January 6, 1968, April 23, 1968, December 19, 1968, April 14, 1969 and that the records show claimant did not seek treatments for left shoulder pain in any year after 1969 including 1980 and 1981. The doctor further testified that the records show claimant first sought treatment of right shoulder soreness on March 22, 1977 which was diagnosed as biceps tendinitis for which claimant received diathermy on March 24, 1977. The doctor stated the records reflect claimant was next seen for right shouler problems on May 8, 1979. He was then seen on May 9, May 11 and May 14, 1979 and started on diathermy. Treatment continued throughout May into early June 1979 when claimant was taken off work (June 7, 1979) and referred to Dr. Nemmers. Claimant's last visit to the first aid office for 1979 is June 10, however. Claimant was next seen for his right shoulder on July 28 and 29, 1980 with subsequent visits on August 4 and 5, 1980 and either January 9 or February 9, 1981. The doctor stated he had a personal memory of claimant seeking treatment from him in the first aid office but had no recollection of treating claimant for a left shoulder condition. He noted that the record contains no reference to treatment of claimant for a shoulder condition around May 9, 1980. The doctor indicated an arthrogram of July 22, 1980 showed claimant has bilateral rotator cuff tears. He stated a myelogram of claimant's neck showed a lateral disc involving the interspace between the fifth and sixth vertebral bodies in the neck and a lumbar myelogram showed a herniated disc centrally between the fourth and fifth lumbar vertebrae and thickening or enlargement of the nuchal ligaments giving a posterior defect at the C-4 and 5, C-5 and 6, and C-6 and 7 interspaces. The doctor opined that the lateral disc symptom revealed could result in pain and stiffness. He stated the cervical myelogram was left-sided and opined this left side involvement could impair the function of claimant's shoulder and arm on that side. The doctor agreed that hypertrophied uncinate processes giving a posterior defect at the interspaces of C4 and 5, C5 and 6, and C6 and 7 could produce a tingling sensation or numbness in the hands and fingers. The doctor further opined:

> ...that the lateral disk involvement on the left side with impingement on the nerve roots that come out on 5 and 6 is very likely to present itself on the left side with numbness, tingling and inability to move that shoulder, arm. Pain, I think it unlikely although possible but unlikely that the hypertrophied uncinate processes and the anterior defects would manifest symptoms of that nature. (Trans., p. 100 ll. 1-8)

The doctor then expressed his belief that claimant's degenerative arthritis and spondylolysis was probably not contributing and probably had no relation to his symptoms. The doctor denied having ever made a disability evaluation or examination of claimant.

On cross-examination, the doctor represented that an intervertebral disc has a higher probability than a rotator cuff rupture of causing arm tingling because of the disc's proximity to the nerves.

Claimant's exhibit A is certain medical reports relating to claimant. Special note is given to the following: An August 27, 1982 letter report of Julian G. Nemmers, M.D., states that claimant had a repair of the rotator cuff and acromioplasty and division of the coracoacromial ligaments August 7, 1980 and was continuing to have some residual symptoms and physical findings in the right shoulder. Claimant had full range of motion in the right shoulder but weakness in abduction and flexion of the right shoulder and complaints of pain when strong downward force was applied on the right arm. He opined that claimant has a permanent impairment of not more than ten percent of the body as a whole as a result of his left shoulder disease and surgery. He noted claimant complained of an impingement in the left shoulder joint with a rotator cuff tear in the left shoulder and degenerative changes in the left acromioclavicular joint. He opined that claimant has an eight percent whole body disability as a result of his left shoulder disease. Notes of the doctor of February 11, 1981, May 27, 1981 and July 23, 1981 stated:

> 5-27-81: The more I talk with this man, the more I am convinced that his symptoms in the right arm are a result of the Sudeck's that came on following the shoulder surgery. He has good abduction of the shoulder, full and complete flexion and abduction but lacks only a little internal rotation. He is back working at the Pack doing any kind of job they ask of him. I told him to give this a summer of playing golf and using his arm and return next September and we would do a final disability evaluation. I believe there is some functional component in this patient. I do not believe it is a lack of motivation as much as it is a functional component. I do not believe that he tolerates pain or stress very well.
>
> 9-23-82: He talks about falling asleep while watching TV with his arms up behind his head and his right shoulder locks on him. He talks about holding his arm out in abduction and he gets a numbness down the medial aspect of the arm. He talks about a pain throughout his shoulder and his arm going dead on him. He talks about his medial elbow being sore and a numbness down into his medial and ring finger, etc. He has recently had an EMG by McKee and McKee gave him clearance and said it was normal for everything distal to the elbow but he could not test everything proximal.... The only possible thing that I know this could be is a thoracic outlet syndrome with pressure on the brachial plexus due to a fibrous band up in his axilla.

The exhibit also contains copies of the handwritten first aid office notes of the employer relative to claimant. Two 1980 entries, the dates of which are not ascertainable note claimant was seen for previous shoulders with referral to Dr. Nemmers.

Other entries in 1980 and 1981 refer to right shoulder only. An entry of 1982 refers to previous shoulders. An August 26, 1981 letter report of John McKee, M.D., states that claimant has a postive Tinel's and Phalen's signs (on the right) which suggests a carpal tunnel syndrome but that corroborating evidence of the syndrome was not found on the nerve conduction studies. In an April 29, 1982 report to Dr. Faber, Dr. Nemmers opines that claimant is permanently unable to perform any repetitious shoulder height or overhead work in his employment at Dubuque

Packing Company. General notes of Dr. Cairns, the first of which is dated December 17, 1982, indicate the doctor's impairment ratings as those he recited in his oral testimony.

Claimant's exhibit B is further medical and employment records relative to claimant. A Mercy Health Center discharge summary of July 25, 980 apparently of E. E. Herzberger, M.D., states in part:

> This 45-year-old patient was admitted to the hospital because of weakness of both shoulders, as well as of pain in the same location. The symptoms started in May of 1979 with the right shoulder and the symptoms in the right shoulder have persisted and then for the past three or four months they started in the left shoulder also. The patient has chiropractric [sic] treatments. He has not improved sufficiently on them and as cervical spine films showed cervical disc disease, he was referred for neurosurgical evaluation. In the hospital, the patient had a cervicaland [sic] lumbar myelogram which revealed the presence of significant cervical spondylosis and possible disc herniation at C5-6 on the left side, and in addition to this, he had also protrusion of the L4-5 intervertebral disc. As it was felt that the patient could have rotator cuff tear, bilateral arthrograms of the shoulder were done. These arthrograms showed the patient had indeed bilateral rotator cuff ruptures....

A clinical report of Nemmers of July 22, 1980 notes:

> The patient was off work for about nine weeks, then he returned to work. As he continued to have pain in his right shoudler he has tried to do his work mainly with his left arm using his left shoulder. He started having pain and numbness in the left shoulder also and has been seen again by Dr. Nemmers. Then however he went to a chiropractor and had chiropractic treatments. The left arm has been hurting mainly for the past 3-4 months. The pain is different than from the right side.

A consultation request and report of Dr. Cairns of July 25, 1980 states an impression of "bilateral rotator cuff tears (chronic)" after reciting the following history:

> HISTORY: This patient is a 45 year old white male Packing House worker who was working on the beef kill when apparently a heavy stomach dropped and he injured his shoulder. He had had some previous problems in his opposite shoulder and felt he probably needed a steroid injection. Because he did not like Dr. Faber's technique of steroid injection, he told Dr. Faber that he had aggravated an old baseball injury. He did this so that he would be referred to Dr. Nemmers who had injected him previously. Dr. Faber told him that since he was honest about how the injury occurred, he would take care of it himself and thus injected his shoulder. This apparently didn't work. He was kept off work for about five weeks and then was told that he had a rotator cuff tear and was referred to Dr. Nemmers. Dr. Nemmers examined him and felt that he probably did indeed have a rotator cuff tear but felt that perhaps another steroid injection would be indicated. He did inject him and again was off work and apparently improved. Dr. Nemmers discussed rotator cuff surgery with him at that time and apparently the statistics were grim enough that the patient became frightened at them. At any rate he returned back to work and tried to use his left shoulder. About 5-6 months ago he developed pain in the left shoulder. He ultimately saw a chiropractor who felt that he was having troubles in his 5th nerve root and referred him to Dr. Herzberger when his synptoms persisted. The patient currently complains of pain more in the left side than on the right. The pain on the left side was down the left arm somewhat.

A report of lumbar myelogram of July 22, 1980 concludes:

> 1. L4-5 central herniated disc.
>
> 2. Lateral disc involving the C5-6 intervertebral disc space with more involvement on the left side.
>
> 3. Hypertrophied uncinate processes producing both anterior defect and hypertrophic posterior nuchal ligament giving the posterior defect at the C4-5, C5-6 and C6-7.

A report of cervical spine x-ray of July 22, 1980 concludes:

> 1. Moderate amount of degenerative osteoarthritis.
>
> 2. Degenerative cervical spondylosis involving the C4-5 and C5-6.

A report of a right shoulder arthrograph of July 23, 1980 notes impression of rotator cuff tear at shoulder. A report of a left shoulder arthrogram of the same date notes an impression of bilateral rotator cuff tears of the right and left shoulder.

An October 14, 1981 summary report of the University of Iowa Hospitals and Clinics contains a history for claimant which states in part:

> [P]roblems all began approximately 4-5 years ago when he was working at a packing plant dumping bags and noticed a pain in his right shoulder. He continued working that day, however the next day he states that he could not abduct his right arm. He went to see the company doctor who injected cortisone which gave him no relief and he was off of work for 5 weeks giving the shoulder rest hoping that it would heal. He then went back to work and after 2 hours it was just as bad as it had been 5 wks. previously. He went to see another doctor who injected cortisone again and placed the patient in a right shoulder immobilizer for 5 wks. After this he went back to work and had the same problems he had had initially. Because he did not want to use his right arm or shoulder very much, he began over using his left arm and shoulder and one day while lifting a box he felt this sudden onset of left shoulder pain. His left shoulder gradually got worse and is now with bilateral shoulder pain. He went to see a chiropractor.

Claimant's exhibit C is a February 10, 1981 letter from Melvin Keibel, Dubuque Packing Company workers' compensation manager, to claimant. The letter states that the writer has concluded claimant's healing period has ended and further states:

> Since Dr. Nemmers has placed the restriction of "no work with your hands that is shoulder high or above"; and since we do not have any jobs that we can give you within this restriction at this time, I must stop your Worker [sic] Compensation payments as they relate to healing period.
>
> However, your injury has left you with a permanent disability to an extent not known at this time. I am, therefore, going to continue to send a check weekly to you that will be part of this permanent disability. When the degree of your disability is known, we will know for how long these weekly benefits will be paid.
>
> In the meantime, if there is work that you can do and are entitled to under the agreement between this company and your union, it will be offered to you.

APPLICABLE LAW AND ANALYSIS

Claimant allegedly has sustained two separate injuries. The issues raised in regard to each file will be discussed concurrently, however. As regards to file number 661605, a memorandum of agreement was filed, which memorandum conclusively established that claimant's right shoulder rotator cuff rupture arose out of and in the course of his employment. This issue remains for resolution as regards file number 700318, which concerns claimant's alleged left shoulder injury.

Claimant has the burden of proving by a preponderance of the evidence that he received an injury on May 8, 1980 which arose out of and in the course of his employment. McDowell v. Town of Clarksville, 241 N.W.2d 904 (Iowa 1976); Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

An employee is entitled to compensation for any and all personal injuries which arise out of and in the course of the employment. Section 85.3(1).

The injury must both arise out of and be in the course of the employment. Crowe v. DeSoto Consol. Sch. Dist., 246 Iowa 402, 68 N.W.2d 63 (1955) and cases cited at pp. 405-406 of the Iowa Report. See also Sister Mary Benedict v. St. Mary's Corp., 255 Iowa 847, 124 N.W.2d 548 (1963) and Hansen v. State of Iowa, 249 Iowa 1147, 91 N.W.2d 555 (1958).

The words "out of" refer to the cause or source of the injury. Crowe, 246 Iowa 402, 68 N.W.2d 63.

The words "in the course of" refer to the time and place and circumstances of the injury. McClure v. Union et al. Counties, 188 N.W.2d 283 (Iowa 1971); Crowe, 246 Iowa 402, 68 N.W.2d 63.

"An injury occurs in the course of the employment when it is within the period of employment at a place the employee may reasonably be, and while he is doing his work or something incidental to it." Cedar Rapids Comm. Sch. Dist. v. Cady, 278 N.W.2d 298 (Iowa 1979), McClure, 188 N.W.2d 283, Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

Claimant, at hearing, gave a history of favoring his right shoulder and arm following his original injury. He states that while loading meat boxes onto a semitrailer with his left arm, he raised a full meat box above his head and then shoved it across another box and then experienced extreme pain into his left shoulder and arm. A medical history recorded in claimant's records at the University of Iowa Hospitals and Clinics describes the onset of claimant's left shoulder difficulties in substantially the same matter. In response to a hypothetical question posed by claimant's counsel and incorporating a history like that given at hearing and contained in the hospital and clinic records, Dr. Cairns opined that if the facts were true, then the

left rotator cuff injury occurred as a consequence of the incident described. Regrettably, claimant's other medical histories do not refer to a specific incident which resulted in claimant's left rupture nor did claimant apparently report this injury to the company's first aid station. Claimant testified that he reported the incident to a co-worker and his supervisor. Defendant has not raised the affirmative defense of lack of timely notice of any left rotator cuff injury nor offered evidence, other than Dr. Faber's testimony regarding the first aid reports, refuting claimant's testimony in this regard. Also, claimant's other medical records do refer to claimant's favoring his right side and consequently developing left shoulder problems. Dr. Cairns, at hearing, explained the following regarding rupture of a rotator cuff:

> Well, I believe that an entirely normal rotator cuff rarely ruptures. It requires massive trauma for an entirely healthy tendon to rupture. I think that as a consequence of aging in some individuals there's a consequence of external environmental factors such as occupational demands and so forth that given the right set of circumstances, the tendon will rupture. I think that the usual history and the usual cause is that some accident or untold event causes the tendon to rupture and while the tendon was not entirely healthy or normal to begin with, the precipitating factor was the lifting or the fall or what have you. So I guess in answer, it is probably truly a combination of things except for massive violence. (Trans., p. 19 ll. 11-24)

The doctor's discourse is the mortar that cements together the tidbits of evidence painfully educed from various parts of the record in this case. The following scenario ensues: Claimant injured his right shoulder. Claimant began to favor that shoulder and extremity in his work and began to perform his work tasks left-sidedly insofar as possible. This resulted in stress to and weakening with apparent discomfort in claimant's left rotator cuff which then ruptured as a result of the lifting and shoving of the full meat boxes in the course of his work for the packing company. The cause or source of claimant's left rotator difficulties must be attributed to the weakening of his left shoulder as a result of favoring his right shoulder while doing his tasks for the employer. Thus, claimant preponderates on the issue of whether his left rotator cuff rupture arose out of and in the course of his employment.

We shall next address the issues of causal connection between claimant's injuries and his current disability.

Our threshold concern is whether a causal relationship exists between claimant's 1979 injury to his right shoulder and his current disability.

The claimant has the burden of proving by a preponderance of the evidence that the injury of May 22, 1979 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman, 261 Iowa 352, 154 N.W.2d 128.

Lamentably, neither claimant nor defendants directly raised the question of whether claimant's current disability is causally connected to his May 1979 work injury on either direct or cross-examination of either Dr. Cairns or Dr. Faber. It is apparent from the record as a whole including the medical histories recorded, and the medical treatment rendered, and disability assignments given claimant that claimant's May 22, 1979 work injury resulted in a rotator cuff tear and that claimant is disabled as a result of such tear. The weight restrictions assigned by Dr. Nemmers and claimant's own complaints of motion restrictions and pain following the incident substantiate the causal connection between the 1979 injury and claimant's right shoulder disability. Thus, claimant has established--although his evidentiary sketch was indeed drawn with a very broad pen--the requisite causal connection as regards that injury.

Questions remain as regards claimant's left shoulder disability, however. Several different physicians, two of whom have assigned disability ratings, also have diagnosed claimant's left shoulder condition as a rotator cuff rupture. Claimant, at hearing, characterized his pain and problems with his left arm and shoulder as similar to that in his right arm and shoulder. Claimant's lumbar myelogram of July 22, 1980 reveals a lateral disc involving the interspace between the C5 and 6th vertebrae bodies with more involvement on the left side. Dr. Faber opines that this disc involvement with nerve root impingement is very likely to present itself on the left side with numbness, tingling and inability to move the shoulder and arm. Thus, the question becomes whether claimant's disabling symptoms on the left result from his work-related rotator cuff rupture or from the condition found at the C5-6 interspace. It is concluded they result from his left cuff rupture. Claimant recited he did not have left arm tingling in July 1980. A thorough survey of claimant's medical records of that period also does not reveal reference to left arm tingling or numbness even though more reference are made to such symptoms on the right. These apparently are largely attributed to Sudeck's which claimant developed following his right rotator surgery. Dr. Faber's opinion is based on the possibility that the disc problem creates a nerve root impingement. But for the myelogram, no evidence of nerve root impingement is offered, however. As stated, claimant recites that his problems on the left are similar to those on the right. While this might suggest that claimant does, indeed, have tingling and numbness and loss of motion on the left, it also suggests it is more probable than not that claimant's left side symptoms have their origin in his rotator cuff rupture as do his right side symptoms. Claimant's lateral disc involvement is thus coincidental and not compelling to the resolution of this issue. Claimant's disabling symptoms on the left are found to result from his work-related left rotator cuff rupture.

The larger question of claimant's benefits entitlement remains.

An injury is the producing cause; the disability, however, is the result, and it is the result which is compensated. Barton v. Nevada Poultry Co., 253 Iowa 285, 110 N.W.2d 660 (1961); Dailey v. Pooley Lumber Co., 233 Iowa 758, 10 N.W.2d 569 (1943).

Claimant's disability to the shoulder is viewed as a disability to the body as a whole. Alm v. Morris Barich Cattle Co., 240 Iowa 1174, 38 N.W.2d 161 (1949).

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257.

In Parr v. Nash Finch Co., (Appeal decision, October 31, 1980) the Industrial Commissioner, after analyzing the decisions of McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (Iowa 1980) and Blacksmith v. All-American, Inc., 290 N.W.2d 348 (Iowa 1980), stated:

> Although the court stated that they were looking for the reduction in earning capacity it is undeniable that it was the "loss of earnings" caused by the job transfer for reasons related to the injury that the court was indicating justified a finding of "industrial disability." Therefore, if a worker is placed in a position by his employer after an injury to the body as a whole and because of the injury which results in an actual reduction in earning, it would appear this would justify an award of industrial disability. This would appear to be so even if the worker's "capacity" to earn has not been diminished.

For example, a defendant employer's refusal to give any sort of work to a claimant after he suffers his affliction may justify an award of disability. McSpadden, 288 N.W.2d 181.

Similarly, a claimant's inability to find other suitable work after making bona fide efforts to find such work may indicate that relief would be granted. Id.

Dr. Nemmers has opined that claimant has a ten percent permanent functional impairment of the body as a whole as a result of his right rotator cuff injury. Dr. Cairns has opined claimant has a seven percent body as a whole permanent functional impairment as a result of that injury. Dr. Nemmers opined claimant has a seven percent body as a whole impairment a result of his left rotator cuff injury. Dr. Cairns has opined the same produced a five percent body as a whole impairment. Claimant worked for over a year following his right shoulder injury. Only after his left shoulder problem developed was he referred to Dr. Nemmers for treatment of the right and subsequent treatment of the left. Dr. Nemmers placed work restrictions on claimant when he released him for work in 1981. The employer did not accommodate these, and claimant was returned to regular duty work March 23, 1981. On May 1, 1982 claimant was placed on retirement disability. Claimant sought other employment following his retirement. He reports he found none for approximately eighteen months and attributes this to the need to reveal his condition to potential employees. Claimant, at the time of the hearing had secured other employment as a security guard. He

works only twenty-two hours per week and earns only minimum wage. The record is unclear as to whether this is true because claimant may only earn $6500 per year above his retirement pension, or because claimant is unable to work more hours or because only twenty-two hours of work are available. Nevertheless, this represents a substantial reduction in actual earnings and tends to demonstrate that claimant's actual job opportunities and earning capacity were significantly diminished by his injuries. On the other hand, claimant is a high school graduate and is articulate and well-spoken. He is now middle aged and while he could receive training for a less physically demanding job, such is not nearly as feasible as it might be for a gentleman ten years younger than claimant. He appears well motivated and desirous of continuing gainful employment insofar as he is able to do so, however.

These factors all must be considered in assessing claimant's separate impairment ratings for his right and left rotator cuff injuries. Both Drs. Nemmers and Cairns give claimant a higher functional impairment rating as a result of his right shoulder injury. Yet, claimant continued working for more than a year following that injury albeit by favoring his right side. Furthermore, nothing in the record suggests that had claimant not subsequently injured his left shoulder, he would have been precluded from continuing work for his employer following surgical repair of his right cuff. Thus, it appears that claimant's right rotator cuff injury produced an industrial disability of fifteen percent. On the other hand, claimant's real difficulties appear to have developed subsequent to and as a consequence of his left cuff injury. It was only following such that claimant was unable to continue his job duties and the chain of e ents resulting in his present life station ensued. Thus, it must be concluded that claimant's greater disability results from that injury even though the actual physical impairment from such is less. When the factors are considered as a whole, it is concluded that injury produced an additional industrial disability of 22 percent for claimant.

Claimant's healing period remains at issue. Section 85.34(1) provides:

> If an employee has suffered a personal injury causing permanent partial disability for which compensation is payable as provided in subsection 2 of this section, the employer shall pay to the employee compensation for a healing period, as provided in section 85.37, beginning on the date of injury, and until the employee has returned to work or it is medically indicated that significant improvement from the injury is not anticipated or until the employee is medically capable of returning to employment substantially similar to the employment in which the employee was engaged at the time of injury, whichever occurs first.

A medical release of Dr. Julian Nemmers of March 18, 1981 releases claimant to return to his regular duties on Monday, March 23, 1981; thus, claimant's healing period for his right shoulder injury extends to such date. Claimant testified he missed no additional time for his left shoulder injury. Therefore, a healing period award for such injury will not be made.

Defendant raises the issue of entitlement to a credit against permanent partial disability benefits for the portion of claimant's retirement pension attributable to his disability retirement. One-half of claimant's pension of $768.00 is characterized as disability related. Section 85.38, The Code, speaks to benefits which should not have been paid or payable had rights of recovery existed under the Workers' Compensation Act and expressly states it does not apply to benefits which would have been payable even though a compensable injury occurred. No showing was made that claimant would not have received his disability retirement benefits were a compensable injury established. Therefore, defendant will not receive a credit against those amounts paid under the program.

Claimant seeks payment of certain medical travel expenses. Section 85.27 entitles him to such. Claimant testified he made in the vicinity of 80 seven mile round trips for physical therapy and six or seven seven mile round trips to see his doctor. The parties stipulated that any mileage rate would be paid at the 1980 rate. Claimant shall be paid for 602 miles of medical travel at that rate.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

Claimant sustained a right rotator cuff rupture arising out of and in the course of his duties for his employer on May 22, 1979.

Claimant sustained a left rotator cuff rupture arising out of and in the course of his employment on May 9, 1980 while lifting and shoving boxes of packed meat as he loaded a semitrailer for the employer.

Claimant had surgical repair of his rotator cuff in July 1980.

Claimant has not had surgical repair of his left rotator cuff.

Claimant has a lateral disc involving the interspace between the C5 and 6 vertebrae with more involvement on the left.

Claimant's complaints are of pain, discomfort, and restrictions of motion.

Claimant's physical discomfort and problems are similar on the right and the left.

Claimant's 1979 right shoulder injury is causally related to his current disability of the right shoulder and extremity.

Claimant's 1980 left shoulder injury is causally related to his current disability of the left shoulder and extremity.

Claimant is fifty (50) years old.

Claimant is a high school graduate.

Claimant has no other formal training but served as an inventory clerk in the U.S. Navy.

Claimant is well-spoken and motivated.

Claimant was released to work March 23, 1981 and returned to work at such time.

Claimant has received retirement disability since his May 1, 1982 disability retirement.

Dr. Nemmers opines claimant has a seven percent (7%) body as a whole functional impairment of his left shoulder and a ten percent (10%) body as a whole functional impairment of his right shoulder.

Dr. Cairns opines claimant has a five percent (5%) body as a whole functional impairment of his left shoulder and a seven percent (7%) functional impairment of his right shoulder.

Claimant sought work following his disability retirement. He found none for approximately eighteen (18) months.

Claimant is now working twenty-two (22) hours a week as a jewelry store guard at minimum wage.

Claimant worked for more than one year following his right shoulder injury.

Claimant's right shoulder injury produced an industrial disability of fifteen percent (15%).

Claimant's left shoulder injury produced an industrial disability of twenty-two percent (22%).

Claimant had eighty (80) seven (7) mile round trips for physical therapy related to his right shoulder injury.

Claimant made six (6) seven (7) mile round trips for medical treatment of his injuries.

Claimant incurred six hundred two (602) miles of compensable medical milage expense at the 1980 mileage rate.

Claimant receives three hundred eighty-four dollars ($384.00) in disability retirement pension. A showing is not made that these would not have been paid if claimant's condition were compensable under this act. Defendant is not due a credit for disability retirement pension paid claimant.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

Claimant has established that a causal relationship exists between his May 22, 1979 injury and his current right shoulder disability.

Claimant is entitled to further healing period benefits from February 9, 1981 to March 23, 1981.

Claimant is entitled to permanent partial disability of fifteen percent (15%) as a result of his May 22, 1979 injury.

Claimant has established that he received an injury on May 9, 1980 which arose out of and in the course of his employment.

Claimant has established that his May 9, 1980 injury is causally related to his current disability of the left shoulder.

Claimant is entitled to permanent partial disability of twenty-two percent (22%) as a result of his May 9, 1980 injury.

Claimant is entitled to payment of six hundred two (602) miles of medical mileage expenses at a rate of twenty cents ($.20) per mile.

Defendants are not entitled to a credit under section 85.38 for the portion of claimant's retirement pension which is retirement disability payment.

ORDER

THEREFORE, IT IS ORDERED:

Defendant pay claimant permanent partial disability benefits for seventy-five (75) weeks at the rate of two hundred sixty-two

and 50/100 dollars ($262.50). Defendant receives credit for twenty (20) weeks of permanent partial disability benefits already paid.

Defendant pay claimant permanent partial disability benefits for one hundred ten (110) weeks at the rate of two hundred seventy dollars ($270.00).

Defendant pay claimant additional healing period benefits at the rate of two hundred sixty-two and 50/100 dollars ($262.50) for the period from February 9, 1981 to March 23, 1981.

Defendant pay accrued amounts in a lump sum.

Defendant pay claimant mileage expenses in the amount of one hundred twenty and 40/100 dollars ($120.40).

Defendant pay interest pursuant to section 85.30 as amended.

Defendant pay costs of this action.

Defendant file a final report when this award is paid.

Signed and filed this 5th day of September, 1984.

HELEN JEAN WALLESER
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

JIMMIE Z. McGENNIS, Claimant, vs. BROWER CONSTRUCTION COMPANY, Employer, and CHUBB GROUP OF INSURANCE COMPANIES, Insurance Carrier, Defendants.	:	File No. 720406 A R B I T R A T I O N D E C I S I O N

INTRODUCTION

This is a proceeding in abitration brought by Jimme Z. McGennis, claimant, against Brower Construction Company, employer, and Chubb Group of Insurance Companies, insurance carrier, defendants, to recover benefits under the Iowa Workers' Compensation Act for an allegd injury of September 9, 1982. It came on for hearing on April 6, 1984 at the Woodbury County Courthouse in Sioux City, Iowa. It was considered fully submitted at that time. Claimant's request to offer additional evidence from Dr. Blume is denied. Industrial Commissioner Rule 500-4.31 does not permit the taking of evidence after the time of hearing.

The industrial commissioner's file contains a first report of injury received December 17, 1982.

At the time of hearing the parties stipulated that claimant was earning $9.26 per hour.

The record in this matter consists of the testimony of claimant; John Chicoine, D.C., Horst G. Blume, M.D., William Paul Isgreen, M.D., John Bunch, Terry Thiele, Jim Regenscheid, Jim Hawthorne, Chris Godbersen, Mary McGennis, and Thelma Wolf; claimant's exhibits 1 through 7, bills from Marian Health Center; claimant's exhibit 8, a bill from Robert C. Larimer,M.D.; claimant's exhibit 9, a bill from Woodbury Anesthesia Group; claimant's exhibit 10, a bill from Dr. Chicoine; claimant's exhibit 11, a bill from Robert M. Whiteside, oral surgeon; claimant's exhibits 12 through 15, receipts from Greenville Pharmacy; claimant's exhibit 16, a bill from R. J. P. McCarthy, D.C.; claimant's exhibit 17, a bill from Dr. McCarthy; claimant's exhibit 18, a bill from Dr. Blume; claimant's exhibit 19, a bill from Central Laboratory Facility; claimant's exhibit 20, a bill from Sioux City Chiropractic Association; claimant's exhibit 21, a report from Dr. Blume with bills dated February 16, 1984; claimant's exhibit 22, reports from Dr. Chicoine; claimant's exhibit 23, hospital records; claimant's exhibit 24, a letter from Dr. Blume dated June 10, 1983; claimant's exhibit 25, the curriculum vitae of Dr. McCarthy; claimant's exhibit 26, a report and bill from Dr. McCarthy; claimant's exhibit 27, the deposition of Dr. McCarthy; claimant's exhibit 28, a list of medical expenses and mileage; claimant's exhibits 29 through 31, x-rays; claimant's exhibit 32, a CT scan; claimant's exhibits 33 and 34, x-rays; claimant's exhibits 35 and 36, CT scans; claimant's exhibit 37, the curriculum vitae of Dr. Blume; claimant's exhibit 38, a report from Dr. Isgreen; defendants' exhibit A, answers to interrogatories; defendants' exhibit B, records from the Woodbury County District Court; defendants' exhibit C, a report from Alan W. Bronson, D.C.; defendants' exhibit D, a report from Dr. Blume dated July 14, 1981; defendants' exhibit E, a report from Dr. Blume dated October 6, 1981; defendants' exhibit F, a report from Dr. Blume dated June 10, 1983; defendants' exhibit G, a series of correspondence between the claimant and the Iowa Industrial Commissioner; defendants' exhibit H, a medical report from Dr. Katz; defendants' exhibit I, a report from Dr. Katz; defendants' exhibit J, an outpatient visit of November 13, 1982; defendants' exhibit K, reports from John J. Dougherty, M.D.; defendants' exhibit L, correspondence between claimant's counsel and defendants' counsel regarding medical treatment; defendants' exhibit M, an x-ray; defendants' exhibit N, payroll records; defendants' exhibit O, a report from Dr. Isgreen; and defendants' exhibit P, the deposition of claimant. Defendants' objections to claimant's exhibits were considered in weighing the evidence.

ISSUES

The issues in this matter are whether or not claimant's injury arose out of and in the course of his employment; whether or not there is a causal relationship between claimant's injury and any disability he may now suffer; whether or not claimant is entitled to temporary total, healing period or permanent partial disability benefits; and whether or not claimant is entitled to benefits under Iowa Code section 85.27. The defendants have raised the affirmative defense of notice.

STATEMENT OF THE CASE

Claimant's testimony is taken from that given at the time of hearing and that in his deposition. His answers to interrogatories also were offered.

Sixty-three year old married claimant, father of one child, testified to an eighth grade education. He has taken some adult education courses. He said that he has been a member of Laborers Local 427 since May 10, 1968. Claimant's only work in the prior nine months before beginning work for defendant was mowing up to thirteen yards once a week or every other week at a rate of $5 or $10 per lawn for a total during the year of $862.

Claimant indicated he worked for defendant employer in 1981 cleaning, sweeping and washing streets; tacking driverways; operating a roller; driving trucks; using a jackhammer and raising manholes. In 1982 he started work on September 8 and was sweeping driveways and picking up barricades.

Claimant explained his activities on September 9, 1982 and the circumstances surrounding his injury thusly: His first assignment was to sweep water off the streets. Then he cut weeds off the curb. He worked with another person taking pins off a truck. He had a sharp pain in his lower back and hip. He thought this "just only pointed up to the injury." He cleaned a curb for the curb machine. When he started uphill with John Bunch, he noticed he could not walk uphill because he would "always want to sit down" and "[i]t would always keep pulling me down." He told Bunch there was something "fishy," but neither asked for medical attention. The two were riding in one of defendant employer's trucks. He climbed on top of the sideboard. Terry Thiele told him to jump and he did. Thiele asked him if he hurt himself; and he replied, "Well, nothing hurts, so I must not have done anything." He felt discomfort in his back, legs and teeth. Claimant claimed that he first reported his injury to McKennah on September 13, 1982. McKennah looked for an accident report. When he could not find any forms, he said he would tell the office.

Claimant decided to go the chiropractor after work to see if he had been injured or if he was really suffering from old age. He said:

> The only way I could relieve it is pinch my hand over this one left leg and stand just like the pitcher in a baseball game leaned over up to about 30 minutes. Then it seemed like it would relieve itself. Then I could proceed on going to work again. (McGennis dep., p. 17 ll. 20-24)

He saw Dr. Chicoine, whom he had picked from the phonebook, on October 18, 19 and 20 and made an appointment to return on October 21; however, when he could not get excused by the foreman, he did not go back to the doctor. He did see Dr. Chicoine on November 1 and saw him for a series of times thereafter. He

thought overall he had missed six days of work because of his back during 1982. Claimant said that he took as high as nine Excedrin each day and experienced dizziness.

Claimant recollected pulling a cord in his arm when he was working for the railroad. He was first treated by Dr. Bronson and then by Dr. Dougherty who had him take physical therapy including heat treatments on his neck. Claimant said he was seen by Dr. Larimer who treated him for his sinuses with sulfa drugs which he thought later caused the mumps.

He had a cold and flu in November and he was confined to the hospital. Up until that point he worked each day he was asked to work. He took two aspirin at two hour intervals. He said that lighter duty such as using a broom to sweep or a blow hose or driving a truck did not bother him. Lifting heavy barricades or dragging a hose would trigger his pain. Liniment and a heating pad gave him relief.

Regarding giving notice to the company, claimant testified:

A. Outside of when I was told by the chiropractor to stay off the job, that's when I had brought attention to Regenscheid. And Regenscheid, why, he said, "You have to fill out an accident report." I said, "I had spoken to Stew two weeks ago, and he said he was going to get the papers to fill them out. But," I said, "he's been rushing here and rushing there, so I suppose he never" -- He says, "There isn't any file. So you come back tomorrow. And I'll get the papers, and you better make out an accident report."

Q. Did you do that?

A. Yes.

Q. All right.

A. And then two days later, why, Jim Hawthorne from Brower's, he said -- he's a safety man. He said that he had an accident report in his office. And he wanted to know any more details, how it actually happened, what came about. And I told him that I'd jumped from the truck. And he said -- Well, he said, "That's our biggest trouble down here at the plant. Everybody gets in a goddamn big hurry." And he said, "There's been a lot of injuries, and it still keeps on." He says, "I want to get away from this." He said, "I wanted to find out just how this came about," so --

Q. When did you talk to Hawthorne?

A. I think it was about the 3rd of November.

Q. What did you tell him?

A. I told him that I jumped from the truck and that I'd been under Dr. Chicoine's care. Of course, he said that he wished that I'd brought it to his attention around the 18th when I first went to Dr. Chicoine. And, of course, at that time he said that -- I asked him, I said, "Well, have you got a company doctor that I can take my treatments through?" And he said, "No, except Dr. Chicoine is a doctor." In fact, he said, "I think you'll be entitled to a week's compensation for being off and going to Dr. Chicoine."

So -- But then later on he made a deal with Dr. Chicoine that I could do light duty. And so he put me out, and that's when I caught the cold. The first day was warm on a Saturday afternoon. That wasn't bad. Sunday morning I'd had mittens. I changed the gloves. My feet got cold, and I was just about ready to go home. It was too daggone cold on Military Road. (McGennis dep, p. 27 ll. 5-25; p. 28 ll. 1-20)

Claimant recalled that later on when he was flagging a pickup truck hit his stop sign and the sign hit his cheek. After this incident he was told by Dr. Chicoine that he should see a dentist. He went to the hospital emergency room where he could not find a dentist. He was given an antibiotic and he also tried dry gin which he said cured his sore throat but which he later learned neutralized the antibiotic. He was subsequently hospitalized. He testified:

Q. Did Dr. Larimer tell you you had to have your teeth removed because of working outside?

A. No. He only told me that I'd had infection in my system.

Q. Your teeth were rotten?

A. Well, he was figuring. But later on he reiterated, he said, "Well, you didn't tell me you stood out in the cold and got chilled and caught the flu," so --

....

Q. Dr. Larimer's not a dentist, is he?

A. No, no.

Q. He didn't tell you that your problems with your teeth had anything to do with your work, did he?

A. Well, all he came to is that I'd caught cold; and that's what brought on the infection. He figured that, "You actually caught cold in your one cavity that you had in your tooth, see, and that's" -- (McGennis dep., p. 34 ll. 12-19; p. 35 ll. 12-19)

Claimant asserts that he asked his employer for medical help. He was sent to Dr. Dougherty whom he told of his discomfort which included low back pain and tingling numbness in the left foot. Claimant said he was unable to do things around the house such as lift garbage, mow grass, carry groceries or stand for more than thirty minutes. He reported Dr. Dougherty's saying that there was nothing further to be done. The doctor told him that he could go back to work. Thereafter, he reported to work in what he thought was February.

After he was seen by Dr. Dougherty, claimant went to his attorney to see about further medical care. At that point, he was referred to Dr. Isgreen. He made the same complaints to Dr. Isgreen as he had made to Dr. Dougherty. He asked for treatment, but Dr. Isgreen provided only an examination.

Claimant asserted that he continued to have trouble with his back and legs. He called Dr. Isgreen to try to get treatment. He was offered an appointment in May of 1984. He later acknowledged that he could have had an appointment on June 24. He denied that medication was prescribed until July 8, 1983. He found the medication ineffective. He sought advice from his attorney who told him he could consult a physician on his own at his own peril. Claimant agreed that the insurance carrier had told him he could go to Dr. Dougherty or Dr. Isgreen.

Claimant went to Dr. Blume and incurred bills.

On September 26 and 27, 1983 claimant worked at light duty with earnings of $6.50 per hour. When he filled out an application he wrote that he had a hernia and also listed bad pain in his back and legs. He was permitted to go on the job. On the second day he got in at 7:00 a.m. although he was supposed to be there at 5:00. He asked to be sent to the doctor. He was discharged.

Claimant expressed an inability to get himself into condition. If he tries to lift more than fifteen to twenty pounds, he has a sharp pain in his lower back and legs. Leg spasms and numbness come on if he stands too long. He gets pain in his hip and low back, and he must sit down. He will be bothered all day unless he can get a drug to keep his pain down. He estimated his ability to sit at ninety minutes (only forty-five minutes in a soft chair) and to stand without moving at forty-five minutes.

Claimant claimed that he has carried newspapers for his son since 1978. An auto is used to assist with delivery. For this work claimant and his son are paid a dollar per month per customer. Although he had made a claim against the paper for compensaton, he subsequently learned that he was an independent contractor. He said that no actual claim was acted upon.

Regarding the histories he gave to the doctors, claimant said that he would have supplied any information for which he was asked, but that if he was not asked he did not tell. He indicated that he had told Dr. Blume of past medical treatment and of straining his back in September of 1979. Claimant said that he told Dr. McCarthy he had no prior back trouble because he was healed. He explained his failure to tell Dr. Chicione because he had no prior back problems before going to work for defendant employer. He did not report the auto accident. He did not tell Dr. Chicoine about his teeth because the doctor did not ask.

As to his accident in February of 1981, claimant stated that he was waiting at an intersection when his car was struck from behind. Although he once speculated the car was traveling forty miles an hour, he later was told the speed was eight miles per hour. Claimant alleged that this incident was minor in that he remained able to work and was working by July 14, 1981. He testified that after he commenced working he had no complaints and his pain diminished to a degree that he was able to climb sixty-five feet in the air without trouble in his back or legs. His lawsuit relating to that matter is still pending. In spite of information from his doctors to the contrary, claimant insisted that the injury was only to his neck. He claimed that he still has headaches and that Dr. Blume continues to treat his neck. He admitted telling Dr. Blume of pain in his right leg, but he believed the doctor to be in error for recording low back or left leg pain. He did not understand at that time that he had either spondylosis or preexisting problems. Claimant asserted that Dr. Bronson was wrong in reporting his having muscle spasms in his low back because spasms occurred in his neck only.

Claimant recalled an incident in September of 1979 in which he climbed a tree, slipped down and landed on his seat. He hurt his buttocks and had pain and crippling in both his legs. He saw Dr. Bronson until he was healed. He denied treatment by Dr. Katz. He made a claim against the insurance carrier on his son's paper route.

He denied injury to his low back or any other ill-effect

after he slipped and fell in a parking lot. He was unable to remember back strain on each of four dates in September of 1979 or in June of 1980, but he recalled a back strain on September 9, 1979 when he was lifting paper bags. He said that he had sciatica for four months thereafter. He denied injury to his low back in January 1980. His recollection was refreshed as to a June 1980 incident.

Claimant saw Dr. Katz in December of 1981 and March of 1982.

Claimant acknowledged some exaggeration in a letter he sent to the industrial commissioner. He justified the exaggeration by saying he believed it would merit him better attention.

Claimant claimed that after his injury he first went to Dr. Katz. He did not list Dr. Katz in his answers to interrogatories--an omission which led him to say he was making no demand for any expenses with Dr. Katz except for a blood test. He claimed that Dr. Katz would not restrict his work.

Claimant testified that he missed October 18, 19 and 20 because of back and leg pain which he seemingly related to dragging a hose and using an air compressor. He alleged that the pain he had was stronger than in 1979 as that pain was over in four months.

Claimant made claim for the problem with his teeth because he jumped from the truck, worked in the cold and was slapped in the face by a sign. Claimant agreed that he had not seen a dentist since 1948 when one broke one of the teeth he was extracting. Claimant denied that he made no complaints of his back at the time of his hospitalization for his teeth. He asserted that he told the nurse of radiating pain. He said that he had asked for Dr. Blume at the time he was hospitalized, but he was given Dr. Larimer who did not call in a specialist and who said only good morning and goodbye. Claimant understood from Hawthorne that hospital bills would be paid.

As to his hospital admission in January of 1984, claimant said that a deputy industrial commissioner had refused to rule on whom his doctor should be. He admitted that he knew the insurance carrier would pay only if it were ordered to do so.

Claimant has received social security retirement benefits since February 1983.

John Bunch, who was in the back of the truck on September 9, 1982, testified that claimant did not tell of being injured that day, but that he learned of the injury later and told claimant to report to the foreman. He did not think the truck was eight feet tall, but he said it might be eight feet high if it were full. A measurement from the top of the box to the pavement would be six to eight feet.

Bunch said that everyone in the crew complained and that claimant complained no more than usual. He thought claimant had missed some work after his injury. As he recalled, the construction season ended late that year.

Terry Thiele, who was riding inside the truck carrying claimant and Bunch, estimated the distance from the top of the box to the pavement at seven or eight feet. He thought claimant jumped from a lift four to five and a half feet from the ground rather than the top of the truck. He asserted that claimant had been told where to get out rather than to jump. He recalled hearing something like the expression of air when claimant jumped. He asked claimant if he was okay and he believed claimant replied that he thought so.

Thiele believed claimant mentioned his teeth after the jump, but not his back. The witness did not know of claimant's missing work because of his back.

Jim Regenscheid did not recall prescriptions from Dr. Chicoine nor did he remember a slip from the doctor. He said that after someone is hurt a release is necessary before a return to work can be effectuated. He recollected trying to find out where claimant was and learning that claimant was seeing a doctor. He was told by Jim Hawthorne that claimant could do light duty. There was flagging to be done and claimant was called. He did not come in because he had an appointment. When he was next called, he did come to work and spent three days as a flagperson.

Regenscheid denied that he ever went to his truck for an accident report or that he gave claimant a report to fill out.

Regenscheid likewise denied that claimant had been refused employment because of his injury. Rather, he said, that the project was finished and he noted that after mid-November claimant drew unemployment. While he admittted he could have had a conversation with claimant in September of 1983, he denied having told him there was no work for a person with a bad back and legs.

Jim Hawthorne, who has been employed by defendant employer since May of 1979, testified to talking with Dr. Chicoine to see what claimant's condition was and to learning that claimant could do light work. Hawthorne stated that he first realized claimant was claiming injury on November 1.

The witness said claimant did not return to work after his hospitalization. In any event, the construction season ended the following Monday and it was mid-May or June before it started again.

Chris Godberson, friend of claimant's, testified to being told by claimant he had been hurt.

Mary McGennis, claimant's spouse, testified that claimant told her of his jump from the truck and she recalled his limping. She gave him a heating pad. She stated that he is unable to do heavy lifitng and that he continues to have trouble with his back and legs. She denied that claimant could shovel snow.

She also denied that claimant had low back problems before September 9, 1982.

Thelma Wolf, an employee of the Sioux City Journal, testified that claimant was paid insurance benefits for falls or lifting incidents on September 2, 1979; September 9, 1979; September 16, 1979; January 9, 1980; March 5, 1980; June 1, 1980; and December 15, 1981.

Payroll records show claimant worked 12 1/4 hours on the day of his injury and 11 hours the following day. In the next week he worked 33 hours. From September 19 to September 25 he put in 66 3/4 hours. The following week he had 45 1/2. In October he worked a total of 200 1/4 hours. The first week in November he labored 6 1/2 hours; the second 23. His last work was done on November 11.

Records from the Woodbury County District Court show claimant brought suit against Gary Nichols and R. H. Nichols for $50,000 resulting from injuries he suffered in an accident of February 16, 1981. In answers to interrogatories in that suit, he listed an injury of September 9, 1982 of a misaligned vertebra in the low back and a pinched sciatic nerve which resulted when he jumped down. He also reported an illness thusly: "November 1981--I froze on the job and caught a cold that turned into flu and infection set into teeth and was hospitalized." Claimant stated that the accident of February 16, 1981 gave him back and neck pain. This pain seemingly changed to the head, neck and ears. Claimant indicated that he was making claim for bodily injury, medical expenses, future medical expenses, permanent physical injury, loss of earnings, loss of income, future loss of earnings, future loss of income, and loss of future earning capacity among other things. Claimant described his accident thusly:

> My body was projected into seat and my head thrown back over seat. My reading glasses were on dash before being struck (not needed for driving) and afterwards they were on the shelf by the back window. I could not manipulate my hands to open the door and the defendant opened the door. He inquired why I did not come out of vehicle. I could smell alcohol on his breath. I replied my head and neck pains and and asked him to call the police. But he said he did not want the dummies here. He would show his credentials for me to write up. I got back in my car and drove it over so as not to block traffic. He drove his car into the parking lot.

Offered into evidence were a series of documents relating to an injury alleged to his hips and lower spine which occurred in September 1979. In a letter to the industrial commissioner dated December 27, 1980 claimant asserted that the injury "developed into sciatic nerve" necessitating daily treatments.

A statement from Aaron L. Katz, D.O., reports his treatment of a left sacroiliac subluxation which occurred on June 15, 1980.

Allen W. Bronson, D.C., examined claimant on February 16, 1981 and diagnosed a traumatic strain of the cervical and lumbar spinal regions complicated by residual muscle spasm and myofascitis. He treated the condition with manipulation, spinal intersegemental traction and high frequency diathermy. As of March 16, 1981 he was unable to determine if permanency would result.

Dr. Katz treated claimant on December 17, 1981 for a low back strain which resulted from an accident of December 16, 1981.

Records from the Marian Health Center show claimant was seen in the emergency room on November 13, 1982 with complaints of an infected tooth causing pain to his upper lip and the left side of his face as well as a headache. Claimant was given medication and instructed to apply hot packs to his face.

Claimant was admitted to the hospital on November 14, 1982 after he had been seen in the emergency room for an episode of facial cellulitis. Claimant's history was characterized as "rather indefinite," but he told of slipping, falling from a truck, and bruising his left hip in August; and he traced his facial difficulties to that incident. On examination, claimant had erythema and edema in the right malar area which was tender. His dental repair was described as atrocious with "no really functional teeth" and only occasional stubs and snags. He had a right inguinal hernia and three eschars with surrounding erythema on his left hip. Examination of the mandible and maxillae showed dissolution of the peridonal membrane with extensive caries. Reflexes and sensation in the extremities were physiological. X-rays of the left hip showed no evidence of fracture, dislocation of distructive process, but some traumatic arthritis was seen. There were three eschars on the left hip which were surrounded by erythema.

Claimant was started on medication. Later nine upper and seven lower teeth were excised with alveolectomies and removal of bilateral mandibular tori. Claimant's hip also was treated.

On November 16 claimant complained of low back pain radiating to his left hip. More specifically, on November 22 claimant complained of aching in his left leg which started from his ankle and went up the front of his leg to his thigh.

On December 7, 1982 Robert C. Larimer, M.D., expressed the opinion that claimant's hospitalization in November of 1982 was due to the infection in his teeth. He explained that claimant's burns were "very superficial and responded very quickly to simple therapy." He did not anticipate residual disability.

Claimant was placed in the hospital on January 30, 1984 because of back pain which was greater on the left than the right. Claimant was having low back pain from shoveling snow. Pain was in the right leg from the right buttock to the anterior thigh and posterior calf. A metrizamide CT scan and myelogram were done. There was lumbar disc pathology with bony hypertrophy of the posterior and superior vertebral bodies of L4/5 and L5/S1 with lumbar spinal stenosis at L4/5 and encroachment of the nerve root canal bilaterally with no filling of the nerve roots. The CT scan showed encroachment of the lumbar spinal canal at L4/5 particularly on the left with severe spinal stenosis as well as encroachment of the nerve root canal at the level of L4/5 with hypertrophy of the facet joint.

In addition to diagnoses relating to claimant's back acromegaley and varicose veins were diagnosed.

Claimant was seen on February 1, 1984 with heat and swelling under both eyes.

John Chicoine, D.C., first saw claimant on October 18, 1982 at which time claimant came to his office in an antalgic position. He was bent at the waist and holding his left leg. His spine was x-rayed. Pain was induced by extension, right and left rotation and left lateral flexion. Claimant told of a recent injury of September 9, 1982 when he jumped from a truck. He had no immediate pain, but the following day he had trouble walking.

On examination Dr. Chicione found marked muscle spasm of the left sacroiliac musculature, left hamstrings, gastrocemius and solaris muscles. There was a positive Lasegue's test indicative of a lumboscacral lesion. A positive Braggards' confirmed a positive Lasegue's for sciatic neuritis. The Trendelenburg showed weakness in the gluteus medius on the left. Fabere-Patrick showed restriction of the left hip. Positive leg lowering indicated disc compression at the lumbosacral joint. A neurological examination revealed a decrease in the patellar reflex. X-rays showed mild osteophytic spurring in the area of L4-L5. Claimant gave no history of any similar condition or of an accident.

Claimant was seen for thirty visits during which he was given chiropractic adjustment to increase motion, ultrasound and muscle stimulation therapy. It was the doctor's opinion that the fall out of the truck did cause a lumbar disc protrusion with pain down the left leg. He estimated claimant's permanent disability at fifteen percent of the whole person based on the AMA Guides. As claimant gave no history of prior problems, no portion of the rating was assessed to those. He charged $707 for his treatment of claimant. Those charges have been paid. He suggested that claimant will need two chiropractic adjustments each month for the remainder of his life.

Claimant was seen on March 29, 1984. His last visit prior to that time was April 11, 1983. At the time of the more recent examination the left patellar reflex was absent. There was loss of flexion. The Lasegue's and Fabere-Patrick produced pain. The absence of the patellar reflex was indication to the doctor that the nerve supply was shut off. The examiner was unaware of whether or not it had been absent before September 9, 1982. He admitted knowing whether or not the Fabere-Patrick was positive before September 9, 1982 would be important. The chiropractor operated on the assumption that the test had been negative.

Dr. Chicoine said that his usual practice is to get a history, but as claimant was in severe pain no really good past history was established. The witness did not think that a review of prior x-rays would have been helpful in determining claimant's prior condition. He claimed that often a disc will heal over; however, he acknowledged that a past disc injury sometimes will be evident on x-ray. He looked at an x-ray taken in his office on October 18, 1982 and said that lipping and osteophytic spurring were preexisting. He stated it was difficult to judge how long osteophytic changes had been present. He saw no suggestion of trauma from the prior six weeks. He agreed that a CT scan would provide a more refined reading.

John J. Dougherty, M.D., orthopedist, examined claimant on April 26, 1983 at which time claimant complained of lower back, left hip and left leg pain with difficulty walking around and standing. Claimant gave a history of falling eight feet from a truck and landing on his feet. He had no pain. The following afternoon when he attempted to pick up some heavy pins, he felt his knees were going to buckle. When he was shoveling mud he felt pain in his back and hip. The doctor also was told of the automobile accident in 1981. Claimant said both he hurt mostly his neck and not his back and that his back hurt as badly as his neck but that he got no treatment for it.

Claimant was observed to walk slowly without a limp. He was able to walk on his toes and his heels. Squatting bothered his back. Forward bending and extension bothered him. Claimant's right leg was shorter than the left. Claimant was tender over the greater trochanter. Straight leg raising was done bilaterally to 70 to 75 degrees. Hamstrings were tight. Sensation was intact in the lower extremities. There was posterior thigh tenderness on the right. Hip motion was decreased and abduction caused discomfort. There was tenderness in the low back on both sides.

X-rays were interpreted as showing in the dorsal spine an old kyphosis and an old wedging of several vertebrae with degenerative changes. There was a scoliosis to the right. There was some narrowing at L5/S1. There were sclerotic changes in the upper portion of L4, spurring at L3-4 and at L4-5. There was increased lordosis at L3-4. The left pelvis was down 3/8 of an inch. Early degenerative changes were seen in the left knee.

Dr. Dougherty made these diagnoses: lumbosacral sprain superimposed upon an increased lordosis with some degenerated discs and with some degenerative arthritis, a scoliosis to the left in the lumbar spine with an increased lordosis; increased kyphosis; old multiple wedged vertebra, with degenerative arthritis and a scoliosis to the right in the dorsal spine; slightly shortened right lower extremity; obesity; early degenerative arthritis of the medial joint compartments of both knees; bilateral tight hamstrings; and possible lumbar disc syndrome.

The doctor questioned whether any further treatment was needed, however, he proposed consideration of electromyography to see if there were changes suggestive of radiculopathy.

Dr. Dougherty thought claimant could work if there was a job available. He did not think claimant had permanent disability.

Claimant returned on June 3, 1983. He was able to heel toe walk and to squat "pretty good." He was able to forward bend almost to the floor. Right and left lateral bending was restricted. There was a minimal decrease in the reflex of the left knee. Claimant's Achilles also were decreased. Straight leg raising was to 75 to 80 degrees. The hamstrings were tight. He was tender in the posterior hip area on the left, in the left gluteus, and over the sacrum and coccyx. There was no reflex muscle spasm.

X-rays of the sacrum and coccyx looked "okay" although there was a questionable fracture of the distal sacrum and probably arthritis in the sacrococcygeal joint.

Horst G. Blume, M.D., first saw claimant on June 5, 1981 as a result of pain he was suffering from a car accident of February 16, 1981. Claimant reported his car's being struck in the right rear by another car traveling forty miles per hour. He had low back pain which was worse on the right than the left and which extended into the right buttock, hip and leg and to a lesser degree to the left leg. Straight leg raising on both sides was to 65°. The physician did not know that claimant had been to an osteopath and chiropractor prior to coming to him.

Claimant had a moderate kyphosis of the thoracic spine, some local tenderness at T11/12 and at L4/5 centrally and paravertebrally. Both iliosacral joints were tender to palpation. Lumbar x-ray showed spondylosis with no significant narrowing of disc interspaces. An MMPI disclosed no major psychological components. Among the doctor's impressions were post-traumatic low back pain with irritation of the lumbosacral nerve roots with no motor or sensory deficit except for a hemihypalgesia and hypesthesia on the left. The doctor suspected preexisting lumbar spondylosis-spondylarthrosis.

Claimant was seen on July 14, 1981 with complaints of low back pain with radiation to the right calf, neck pain and headaches. Some irritation of the ramidorsalis of the posterior nerve roots of the intervertebral joints from T3 to T7 on the left side was present. The doctor proposed a nerve block with Marcaine and Depo-Medrol to be followed by a denaturation procedure.

When Dr. Blume saw claimant on May 5, 1983, claimant gave a history of falling from a truck and landing on both feet. He had no pain immediately, but later when he was picking something up, he had sharp constant pain which was exaggerated by activity which went into both hips and legs, but not into his feet. He told the doctor that he had been to Dr. Chicione whose treatment had helped only temporarily.

On examination, Dr. Blume found localized tenderness in the cervical spine and the occipital area which he rated at 30 percent impairment of the cervical area. There was bilateral tenderness at L4/L5 and L5/S1. Straight leg raising produced pain on the left. Straight leg raising was accomplished on the right at 70 degrees with no pain. Motion of both hips was bilaterally impaired.

Dr. Blume expressed the opinion that the condition he saw on May 5, 1983 was a result of claimant's accident on September 9, 1982 which aggravated the preexisting low back and cervical spine condition. The doctor indicated he had reviewed the history of claimant's other accidents.

When claimant was seen on June 7, 1983, he complained of pain in the left leg in the area of the shin bone. He was more

tender on the left than the right. There was a sensory deficit in the lateral aspect of the leg. Straight leg raising on the right was to 75 degrees. There was no pain on the left. Claimant complained of a headache. A CT scan and myelogram were suggested to claimant.

In a letter dated June 10, 1983, Dr. Blume wrote: "I do believe that the accident on September 9, 1982, caused an aggravation of his low back condition because he had some low back pain with radicular pain into both legs after the accident on February 16, 1981, and at the present time the pain is mainly in the left leg."

On August 9, 1983 claimant reported no lower back pain, but muscle spasms three to four times a day. He experienced a pressure sensation over the low back and a burning and itching in his legs. Claimant spoke of left leg pain and a dullness over the anterior portion of the thigh. He had a headache in the back of his head. There was no back pain at 70 degrees. There was no indication that claimant needed surgery.

Claimant made similar complaints when he was seen on August 25, 1983. Straight leg raising was to 70 degrees on the left with pain on the anterior aspect of the right thigh and the posterior aspect of the right leg as well. There was no local tenderness in the iliosacral joint.

Approximately a month later claimant complained of pain in both legs and calves, trouble utilizing the strength in his legs, difficulty climbing, night pain radiating from his buttocks into his legs, low back pain, and pain and headaches with varying positions of the head. Findings remained the same.

Claimant's complaints were essentially the same in November.

On January 3, 1984 Dr. Blume reviewed claimant's history. Straight leg raising produced pain at 70 degrees on the left and at 60 degrees on the right. There was pain in the hip joint and local tenderness over the left buttock. Low back pain was concentrated on the right side. There was some sensory deficit in the S1 distribution in both legs. The left foot jerk was absent. There was mild tenderness on dorsiflexion of both feet. Claimant was told to have a CT scan and a myelogram.

Both were conducted on January 30, 1984. The myelogram, according to the doctor's letter of February 16, 1984, showed lumbar disc pathology with bony hypertrophy of the posterior superior vertebral bodies of L4-5 and L5-S1 with lumbar spinal stenosis at L4-5 and encroachment of the nerve root canal bilaterally with no filling of the nerve roots, especially at the level of L4-5. Findings in the cervical area included encroachment. The findings were related to bony hypertrophy and disc pathology. The CT scan showed encroachment at L4 on the left, severe spinal stenosis and some displacement of the cauda equina nerve root. There was also disc pathology with encroachment of the nerve root canal at the level of L5-S1 on the right. After these tests, Dr. Blume told claimant he would have to have a decompression and widening of the canal.

On a February 9, 1984 follow-up visit, claimant's main agonies were left leg and hip pain with a crawling sensation in the left leg. There was weakness in the left leg and claimant was dragging his left foot. He continued to complain of a headache and occasional confusion. There was a sensory deficit in his left foot and lower leg. There was bilateral impairment of claimant's hip joint.

Dr. Blume declared claimant disabled from working by his September 9, 1982 accident. He suggested that claimant not engage in strenuous physical activity.

Dr. Blume felt that claimant's condition worsened after September 9, 1982. He agreed that complaints of pain are subjective, but he pointed out that claimant's complaints have been quite constant with pain initially more on the right than on the left, then more on the left than the right after September 9, 1982 and now more on the right than the left again.

The doctor's charges were $1,375. He said that claimant would need to be seen every two to three months and would need medication to reduce pain. He might, at a later time, require surgery.

No pain medication was being prescribed for claimant. In 1981 an anti-inflammatory and a muscle relaxant were ordered.

The witness acknowledged the importance of an accurate history. Claimant had told him only of the February 16, 1982 auto accident but he knew that claimant fell out of a tree in 1979. He thought claimant's last work was November 12, 1982.

Dr. Blume has diagnosed a pituitary adenoma which is responsible for claimant's acromegaly.

William Paul Isgreen, board certified neurologist, saw claimant at the request of defendants' counsel on June 24, 1983 for evaluation and to provide whatever care might be needed. Although he told claimant he was willing to provide care, claimant did not return for any follow-up treatment.

Dr. Isgreen, who had independently reviewed other items in claimant's medical history, recorded a history from claimant of a fall from a tree which resulted in aching in his buttocks and legs; a fall on ice or in mud with discomfort for five months and the rear end accident which gave claimant a whiplash. Claimant told him of jumping off the truck on September 9, 1982, of having pain the next day which increased over time and flashed down the left leg and of working with varying difficulty until October 18 when he sought chiropractic treatment. Claimant's continuing to work was seen as significant in that the physician said one would ordinarily expect difficulty rather immediately.

Claimant complained of pain of an unpredictable nature which might come on as he was doing nothing or as he was walking. He was bothered by his left calf and thigh, but he was unaware of any weakness. He apparently was able to walk the three mile paper route and to mow lawns. He also spoke of trouble with his tooth and the burn on his hip. Claimant was taking Fiorinal 3 and Flexeril as well as Feldene on an erratic instead of a daily basis.

On examination, Dr. Isgreen found claimant "more worn" than the usual sixty-two year old. His higher cortical functions were appropriate. Cranial nerve examination was unremarkable. Volitional movement of the neck was limited laterally. There was decreased mobility of his spine. There was no evidence of muscle spasm. Straight leg raising was accomplished to ninety degrees bilaterally without pain and without radiation. There was no tenderness to percussion of the back. Claimant walked with a peculiar posture. Sensory examination resulted in non-physiologic findings. Reflexes were symmetrical but sluggish.

The neurologist found no evidence of physical injury to claimant as a result of his fall in 1982. Neither did he find a causal connection between claimant's complaints and his history. Rather, he viewed claimant's condition as one of a longstanding nature. He said that evidence of the fall of September 9, 1982 necessitating future medical care for claimant would be meager or nonexistent. He did not think any restriction on claimant's activity other than what common sense would dictate would be necessary. It was his experience that stenotic problems may respond either to activity or to non-activity. However, the physician agreed that pain in the back which claimant had would be compatible with the jump off truck. He thought that claimant's condition might or might not have been aggravated by the jump.

Dr. Isgreen concluded that claimant has degenerative changes, spondylitic disease and spinal stenosis resulting from progressive changes and giving the claimant the symptoms he experienced in his legs. The doctor felt that the cost of a myelogram was warranted in claimant's case and he had reviewed the myelographic findings. He seemingly agreed with the official interpretation, but he saw no thread to connect permanent impairment to the September 9, 1982 injury.

Dr. Isgreen reported calling claimant on July 9, 1983 and prescribing medication for him. He instructed claimant to let him know if the medication helped. He indicated he was willing to treat claimant, but with a condition such as clamant has not many treatments are helpful and the cooperation of the patient is important. He expressed an intent to try a different drug in the event the first preparation failed to help claimant.

As possible modalities of treatment for claimant, the doctor listed a steroid flood, physical therapy, a pain clinic or a TENS. He found claimant stoic about pain. He did not think that claimant was malingering and he believed that claimant legitimately hurts.

Dr. Isgreen approved testing done by Dr. Blume. He said that he made recommendations to those who sent claimant to see him, but not to claimant himself. His letter of June 24, 1983 suggests a CT scan, myelogram and an EMG.

The doctor found claimant's saying that he had pain was consistent with what could be seen on the CT scan; however, he cautioned that claimant did not get his present state through one incident. He noted that claimant worked for six weeks after his alleged injury.

John P. McCarthy, D.C., a diplomate of the American Board of Chiropractic Orthopedists, first saw claimant on September 21, 1983 at which time he complained of low back pain radiating to the front of the spine; a worse problem with his left calf; paresthia into the legs bilaterally and difficulty walking, squatting, sitting, pushing, pulling, or lifting. Claimant gave a history of jumping from the back of a truck and landing flat on his feet immediately experiencing pain in his back. The next day he had low back pain when he lifted a box of pins weighing 150 to 200 pounds. Claimant also told of previous back problems--a lumbar disc problem--for which he had sought chiropractic treatment. He reported sliding down a tree and landing on his buttocks in 1979 and an injury to his arm in 1974. The doctor understood that claimant had been released as cured from previous treatment.

Claimant told of being treated by Dr. Chicoine on October 18, 1982, returning to work, doing some pulling and having some pain in his legs. Claimant apparently initally was sent to Dr. McCarthy for the purpose of receiving a disability rating. No authorization was provided by the insurance carrier.

On examination, claimant was 5' 9 1/2" tall and weighed 231 pounds. His gait was slow and there was slight pelvic tilt to the right. Palpation of the spine produced tenderness in the right thoracic spine and also in the lower lumbar spine bilaterally. There was moderate spasm in the right thoracic spine. Thoraco-lumbar flexion was 65°. Thoraco-lumbar extension was 10°.

There was dull pain with all motions and sharp pain with left lateral flexion.

Neurologically, the patellar reflex on the left was diminished. The L2 and L3 lumbar and L3-L4 knee extensors were not quite normal. Deep palpation produced moderate pain into the lumbosacral area to the right calf and some discomfort on the anterior thigh and left calf. There was decreased sensation to vibration along the L3-L4 dermatome and a slight sensation change to temperature along the L3-L4 dermatome on the area down the front of the thighs. Straight leg raising was positive producing discomfort. Gaenslen's maneuver and Lasegue's also resulted in lumbar and low back pain respectively. Ely's test brought on bilateral anterior thigh pain.

In viewing claimant's x-rays, the doctor saw a disc derangement in the lateral flexion films. More specifically, he referred to a right spinous rotation away from concavity and toward convexity which was thought indicative of the fact that the motor unit between L3 and L4 was not functioning properly. A narrowing of the disc space on the right between L3 and L4 also was believed to be present. Degenerative changes were seen throughout the lumbar spine which the doctor said were of a duration of six months or very definitely could be as much as six years.

Dr. McCarthy diagnosed an initial acute traumatic sprain/strain complex of the lumbar spine with associated disc involvement resulting in lumbar spondolytic arthrosis with associated disc derangement and radiating neuralgia and bilateral radiating paresthesia. The chiropractor also concluded that the conditions he found were related to claimant's injury of September 9, 1982 and that claimant had not reached maximum medical improvement. Chiropractic manipulation in conjunction with physical therapy was commenced and continued to December 1, 1983. The doctor said that from the time of claimant's injury to his last treatment was sufficient healing time for a soft tissue injury. However, he did not find claimant responding to his treatment in a satisfactory manner and therefore referred him for further consultation and perhaps more aggressive therapy.

The doctor acknowledged the importance of an accurate history. He said that an inaccurate history would not necessarily change his opinion in claimant's case although it possibly could. He was not aware of claimant's being treated since 1981 by Dr. Blume, but he did know claimant was treated by Dr. Blume as a result of a rearend accident which he thought resulted in a whiplash or a cervical injury. He was unaware of a pending lawsuit. He did not know if claimant had any limitation of motion in the low back as a result of the 1981 injury. He was unaware that claimant had bilateral radicular pain in the lower extremities after his automobile accident of February 16, 1981 or that claimant had been hospitalized under Dr. Larimer's care. He did not know whether claimant was placed under any restrictions as a result of the accident. The doctor said that if claimant had parathesia into his lower extremities and trouble with squatting, lifting and bending, then there would be inconsistency in what he had been told by claimant.

Dr. McCarthy did not find claimant's complaint of pain from five to ten seconds at a time numerous times each day exceptional. He said that claimant's slumped posture, slow gait and right pelvic shift would be something of a longstanding nature and would not give rise to particular disability, but would indicate some spinal problems. He also thought the curvature of the thoracic spine seen on x-ray was an anatomical change due to time. He agreed that someone with claimant's history possibly could have had limitation of motion in his low back before September 9, 1982.

Two ratings were given, one at three percent and one at two percent. Sensory and muscle strength abnormalities were not included in the ratings which were based on L3-L4 limitation, a muscle strength abnormality and a depressed patellar reflex. In further explanation, he said:

> No, I am not saying that this disc derangement did not predate December 9, 1982. [sic] In my opinion more than likely this was there. It is the fact that this was activated and now is symptomatic and expressive is why it warrants an impairment rating. (McCarthy dep., p. 52 ll. 2-6)

Overall, his rating based on the AMA Guides was ten percent. He explained:

> A. I'm not talking heavy labor or anything. It's my opinion from the case hitory that I took, from the examination that I did and the findings that I was able to assimilate from what the patient has related to me that he became symptomatic and expressive of these problems after the accident of September 9th, 1982, and, therefore, the rating that I gave of ten percent whole man taking into consideration the ranges of motion and the disc derangement would reflect that.
>
> Q. And if your -- the history provided to you in respect to symptomatology course of treatment both before and after the alleged accident were materially incorrect, your opinion would accordingly be changed?
>
> A. My opinion could be changed, because it would demonstrate the difference in the residuals that I've just talked about. (McCarthy dep., p. 62 ll. 7-21)

A thermogram was done in September of 1983 which was interpreted as normal when one side was compared to the other. This indicated, according to the expert, no acute area of musculo-ligamentis involvement and no particular nerve fiber distribution involved.

Dr. McCarthy explained spondolytic arthrosis as being an abnormality of the joint facets. He referred to the actual disc derangement he found in claimant's spine as a dysarthria of the L3-L4 motor unit.

The doctor made a diagnosis of lumbar spondolytic arthrosis with associated disc derangement and radiating neuralgia.

Offered into evidence were a series of letters between claimant's various attorneys and defendants' counsel regarding claimant's medical care and examination.

The first letter of April 14, 1983 informs claimant's counsel defendants "will not be responsible for payment of any such examination or evaluation being undertaken prior to securing the necessary approval from the Industrial Commissioner's office."

A letter of May 10, 1983 from defense counsel notifies claimant's attorney that Dr. Dougherty is being authorized to provide care with appointments to be made by counsel. A copy of that letter was sent to claimant return receipt requested. The receipt was part of the evidence as well.

On June 6, 1983 claimant's counsel wrote to say Dr. Dougherty could do nothing for claimant and suggested that he be seen by Dr. Blume. Defendants then authorized an appointment with Dr. Isgreen.

A letter from claimant's attorney dated July 25, 1983 shows the parties were negotiating settlement and indicates claimant's desire to doctor only with Dr. Blume.

In an August 29, 1983 letter defendants' counsel expresses the understanding that Dr. Isgreen's office is prepared "to offer treatment to Mr. McGinnis [sic] to the extent that it is medically necessary or warranted."

On December 29, 1983 claimant's present counsel wrote for permission for claimant to be evaluated by Dr. Blume with the evaluation to include a myelogram, a CT scan, a blood test and other appropriate tests. In a response of January 5, 1984 defendants' attorney refused to authorize hospitalization for testing. He expressed the feeling that defendants had fulfilled their obligation under Iowa Code section 85.39.

APPLICABLE LAW AND ANALYSIS

The first issue to be determined is whether or not claimant's injury arose out of and in the course of his employment. In order to receive compensation for an injury, an employee must establish that the injury arose out of and in the course of employment. Both conditions must exist. Crowe v. DeSoto Consolidated School District, 246 Iowa 402, 68 N.W.2d 63 (1955).

In the course of relates to time, place and circumstances of the injury. An injury occurs in the course of the employment when it is within a period of employment at a place where the employee may be performing duties and while he is fulfilling those duties or engaged in doing something incidental thereto. McClure v. Union County, 188 N.W.2d 283, 286 (Iowa 1971).

In addition to establishing that an injury occurred in the course of employment, the claimant must also establish the injury arose out of employment. An injury "arises out of" the employment when a causal connection between the conditions under which the work was performed and the resulting injury followed as a natural incident of the work. Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

Our supreme court has stated many times that a claimant may recover for a work connected aggravation of a preexisting condition. Almquist v. Shenandoah Nurseries, 218 Iowa 724, 254 N.W. 35 (1934). See also Auxier v. Woodward State Hosp. Sch., 266 N.W.2d 139 (Iowa 1978); Gosek v. Garmer and Stiles Co., 158 N.W.2d 731 (Iowa 1968); Barz v. Oler, 257 Iowa 508, 133 N.W.2d 704 (1965); Olson v. Goodyear Service Stores, 255 Iowa 1112, 125 N.W.2d 251 (1963); Yeager v. Firestone Tire & Rubber Co., 253 Iowa 369, 112 N.W.2d 299 (1961); Ziegler v. United States Gypsum Co., 252 Iowa 613, 106 N.W.2d 591 (1960).

Claimant, who has admitted a tendency to exaggerate, gave histories with some variation. A conglomerate of testimony is that he experienced pain earlier in the day on September 9, 1982 and prior to his jump from the truck. Subsequent to the jump, he felt discomfort although the timing of that discomfort ranged from his saying it came on immediately to asserting it came on the following day after a lifting episode. After the incident claimant sought chiropractic treatments and took aspirin at two hour intervals. Claimant's first documented visit to a chiropractor occurred on October 18 when he saw Dr. Chicoine after working for ten and one-half hours.

Terry Thiele testified that he saw claimant jump from a truck and heard a sound that led him to inquire if claimant was all right.

Dr. Chicoine took a history of a jump from a truck. On

examination, he found marked muscle spasm in the left sacroiliac musculature and left hamstring. Dr. Blume took a history of a fall from a truck after which claimant landed on his feet and had no immediate pain. Later when he tried to pick something up he had pain into both hips and legs. Dr. Blume attributed the condition he found in claimant on a May 5, 1983 to an aggravation of his preexisting condition by the accident of September 9, 1982. Dr. Dougherty took a history of the September 9, 1982 fall with some variation. Dr. Isgreen took a history substantially like that given at other times. He was unable to say whether or not claimant's condition was aggravated by the jump from the truck. Dr. McCarthy was told of claimant's having immediate pain in his back after the jump. He also was informed of pain occurring the next day.

The record viewed as a whole supports the finding that claimant had an injury on September 9, 1982 which arose out of and in the course of his employment.

Defendants have raised the affirmative defense of notice. Iowa Code section 85.23 provides:

> Unless the employer or his representative shall have actual knowledge of the occurrence of an injury received within ninety days from the date of the occurrence of the injury, or unless the employee or someone on his behalf or a dependent or someone on his behalf shall give notice thereof to the employer within ninety days from the date of the occurrence of the injury, no compensation shall be allowed.

The Iowa Supreme Court in Reddick v. Grand Union Tea Co., 230 Iowa 108, 296 N.W. 800 (1941) set forth the rule for dealing with affirmative defenses. The opinion of the court in Reddick provided that once claimant sustains the burden of showing that an injury arose out of and in the course of employment, claimant prevails unless defendant can prove by a preponderance of the evidence an affirmative defense.

In DeLong v. Iowa State Highway Commission, 229 Iowa 700, 295 N.W. 91 (1940) the court recognized the industrial commissioner's treatment of notice. The commissioner, quoted in DeLong at 702-03, 92, wrote:

> that while the weight of the evidence is not entirely free from doubt, much of which may be due to lapse of time...we are of the opinion claimant sustained the burden of proof in that respect, but in this the question upon whom the burden of proof may rest is not free from doubt. We are constrained to believe that want of such notice is an affirmative defense and if that be true the burden of proof would rest upon the defendant.

The Iowa Supreme Court most recently dealt with notice in Robinson v. Department of Transportation, 296 N.W.2d 809, 811 (Iowa 1980) as follows:

> If the actual knowledge requirement were satisfied without any information that the injury might be work-connected, it should not be necessary to allege the injury was work-connected when giving the statutory notice. In fact, however, it is necessary to allege the injury was work-connected when giving notice. It logically follows that the actual knowledge alternative is not satisfied unless the employer has information putting him on notice that the injury may be work-related.
>
> The purpose of section 85.23 is to alert the employer to the possibility of a claim so that an investigation of the facts can be made while the information is fresh. See Knipe v. Skelgas Co., 229 Iowa 740, 748, 294 N.W. 880, 884 (1941). In view of this purpose, it is reasonable to believe the actual knowledge alternative must include information that the injury might be work-connected.
>
> This is the meaning which has been given the actual knowledge requirement under similar statutes in other jurisdictions. See, e.g., Bollerer v. Elenberger, 50 N.J. 428, 432, 236 A.2d 138, 140 (1967) ("The test is whether a reasonably conscientious employer had grounds to suspect the possibility of a potential compensation claim."). The principle is stated in 3 A. Larson, Workmen's Compensation § 78.31(a), at 15-39 to 15-44 (1976):
>
> > It is not enough, however, that the employer through his representatives, be aware [of claimant's malady]. There must in addition be some knowledge of accompanying facts connecting the injury or illness with the employment, and indicating to a reasonably conscientious manager that the case might involve a potential compensation claim.
>
> We hold that this principle applies to the actual knowledge provision of section 85.23.

Claimant testified that he spoke to both Regenscheid and Hawthorne. He thought he talked to Hawthorne on November 3, 1982, and indeed the first report signed by Hawthorne carries that date. Hawthorne's testimony was that he first learned claimant was claiming a work injury on November 1, 1982. Defendants had notice of claimant's injury and their affirmative defense must fail.

The very difficult question in this case is that of causal connection.

The claimant has the burden of proving by a preponderance of the evidence that the injury of September 9, 1982 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

An employer takes an employee subject to any active or dormant health impairments, and a work connected injury which more than slightly aggravates the condition is considered to be a personal injury. Ziegler, 252 Iowa 613, 620, 106 N.W.2d 591. An employee is not entitled to recover for the results of a preexisting injury or disease but can recover for an aggravation thereof which resulted in the disability found to exist. Olson, 255 Iowa 1112, 125 N.W.2d 251; Yeager, 253 Iowa 369, 112 N.W.2d 299; Ziegler, 252 Iowa 613, 106 N.W.2d 591.

At the outset the undersigned must say that in spite of some propensity for exaggeration and dramatization on claimant's part, she believes claimant has pain. The condition of his back is bad. However, the Iowa Supreme Court has said that administration of the Iowa Workers' Compensaton Act "cannot be made to depend on the whim or sympathetic sentiment of the current administration or presiding judge." Bulman v. Sanitary Farm Dairies, 247 Iowa 488, 494, 73 N.W.2d 27, 33 (1955).

Claimant himself evidenced a certain degree of insight into his condition when he said that he decided to go to the doctor to see if there were something wrong with him or if he were just suffering from old age. Dr. Isgreen described claimant as more worn than the usual sixty-two year old.

Claimant had several incidents with his back for which he received treatment prior to September 9, 1982. Claimant was paid insurance benefits for falls and lifting incidents in 1979 through 1981. Claimant had injury to his hips and lower spine in September of 1979. He was treated for a left sacroiliac subluxation in June of 1980. In February of 1981 after an automobile accident he was diagnosed as having traumatic strain of the cervical and lumbar region. Claimant stated in documents relating to a suit filed as a result of that accident that he had back and neck pain. In December of 1981 he was treated for a low back sprain resulting from an accident on December 16, 1981.

When claimant was seen by Dr. Blume in June following the February 1981 accident, he had low back pain which was worse on the right and which extended into the right buttocks and lower extremities. There was pain on the left to a lesser degree. He had a hemihypalgesia and hypesthesia on the left. The doctor suspected a preexisting lumbar spondylosis-spondylarthrosis.

After claimant's jump from the truck he continued to work with substantial hours of overtime.

Claimant was admitted to the hospital in November of 1982 at which time nine upper and seven lower teeth were excised with alveolectomies and removal of bilateral mandibular tori. Claimant did complain during the hospitalization of low back pain radiating into his left hip and of aching in his left leg. Claimant testified that he had not had dental care since 1948. Neither medical evidence from Dr. Larimer nor any other medical evidence in the file relates claimant's dental treatment and hospitalization to his claimed injury of September 9, 1982 or to any other work incident.

It must, of course, be kept in mind that an award of benefits cannot stand on a showing of a mere possibility of causal connection between the injury and the claimant's employment. An award can be sustained if the causal connection is not only possible, but fairly probable. Nellis v. Quealy, 237 Iowa 507, 21 N.W.2d 584 (1946). Questions of causal connection are essentially within the domain of expert testimony. Bradshaw, 251 Iowa 375, 101 N.W.2d 167. However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman, 261 Iowa 352, 154 N.W.2d 128.

While a claimant is not entitled to compensation for the results of a preexisting injury or disease, the mere existence at the time of a subsequent injury is not a defense. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756, 760-761 (1956). If the claimant had a preexisting condition or disability that is aggravated, accelerated, worsened or lighted

up so that it results in disability, claimant is entitled to recover. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812, 815 (1962). When an aggravation occurs in the performance of an employer's work and a causal connection is established, claimant may recover to the extent of the impairment. Ziegler., 252 Iowa 613, 620, 106 N.W.2d 591.

Claimant went to Dr. Chicoine in mid-October. Dr. Chicoine found muscle spasm of the left sacroiliac musculature and left hamstrings. He took no history of claimant's having prior problems. He noted that lipping and osteophytic spurring seen on x-rays were preexisting and he saw no suggestion of trauma in the prior six weeks.

Dr. Blume did not see claimant until May 5, 1983. He took a history of no immediate pain following a fall from a truck, but of pain later when claimant lifted something. That pain went into both hips and legs. Claimant had tenderness in the cervical area and in the low back. Dr. Blume testified at hearing that he felt claimant's accident of September 9, 1982 aggravated a preexisting low back and cervical condition. In a letter, however, he spoke of aggravation of only the low back. Over the course of claimant's treatment symptoms returned to the right side. Dr. Blume, who knew of some of claimant's prior injuries, declared it difficult to assess what percentage of impairment resulted from the accident of September 9, 1982 but that claimant did have permanent disability resulting from that accident.

Dr. Dougherty knew of claimant's automobile accident in 1981. Claimant told him both that he hurt mostly his neck and that he hurt his back as badly as his neck. He reported no treatment to the back. X-rays showed sclerotic changes in the upper portion of L4 and spurring at L3-4 and L4-5. Dr. Dougherty did not think claimant had a permanent disability.

Dr. Isgreen, a board certified neurologist who reviewed various items of claimant's medical history, examined claimant on June 6, 1983 at which time he was unable to find evidence of physical injury as a result of the September 9, 1982 fall. He could not connect claimant's complaints and his history. He concluded that claimant has degenerative changes, spondylitic disease and spinal stenosis resulting from progressive changes.

Dr. McCarthy knew of two of claimant's previous injuries and of what he thought was a whiplash. He determined that the conditions he found in claimant on September 21, 1983 were attributable to claimant's injury of September 9, 1982. The doctor thought claimant continued to be in healing period and he commenced treating him, but he decided by December that claimant was not responding. Dr. McCarthy acknowledged that at least some of claimant's problems were attributable to conditions of a longstanding nature and that a person with claimant's history could have had limitations before September 9, 1982. But, he believed that claimant's condition had been aggravated by the accident.

Claimant had back trouble well before September 9, 1982. Claimant had pain in his back and both lower extremities after his automobile accident in early 1981. Dr. Chicoine makes a causal relationship between the jump from the truck and a disc protrusion with pain down the left leg which accounted for permanent disability. The doctor related some of that percentage to the absence of the left patellar reflex. Dr. Blume noted a deformity in the patellar area on the right more than the left in July of 1981. There was spondylarthritic change in the left knee joint as well. In light of Dr. Chicoine's inaccurate history, little weight can be given to his testimony regarding causation.

Dr. Blume had some familiarity with claimant's prior condition and he makes a causal connection and finds some permanent disability resulting from the September 9, 1982 injury. That opinion, however, is counterbalanced by that of Dr. Dougherty who found no permanent disability and who did not see a need for treatment as well as by the opinion by Dr. Isgreen, a board certified neurologist, expected that if claimant's back problems were going to be attributable to the jump of September 9, 1982 they would have come on rather immediately. He found claimant's continuing to work significant. Dr. Isgreen felt that claimant has spinal stenosis and degenerative disease and he viewed the incident of September 9, 1982 as being "no more fateful than any other."

Dr. McCarthy, who saw claimant more than a year after his injury, relates the condition he found to the September 9, 1982 incident. After treating claimant for a time normally considered necessary for a soft tissue injury, claimant was referred for more aggressive therapy. Dr. McCarthy's testimony, like that of Dr. Chicoine, is clouded by what he did not know about claimant.

Claimant's burden is a preponderance of the evidence which means the greater weight of the evidence; i.e., the evidence of superior influence or efficacy. Bauer v. Reavell, 219 Iowa 1212, 260 N.W. 39 (1935). Claimant has not carried his burden of showing the disability he now suffers is causally connected to his injury of September 9, 1982.

Although claimant has not established entitlement to any permanent disability as a result of his injury, it is necessary to see whether or not he might be paid temporary total disability.

Iowa Code section 85.33(1) provides:

> Except as provided in subsection 2 of this section, the employer shall pay to an employee for injury producing temporary total disability weekly compensation benefits, as provided in section 85.32, until the employee has returned to work or is medically capable of returning to employment substantially similar to the employment in which the employee was engaged at the time of injury, whichever occurs first.

Dr. Chicoine treated claimant from October until April 11, 1983. There is no medical evidence as to whether or not claimant was able to work during that period, and there is evidence that he was working some portion of that time. Dr. Dougherty saw claimant late in April at which time claimant's symptomatology was primarily on the right instead of the left, and Dr. Dougherty thought claimant could work if a job were available. The record fails to establish claimant's entitlement to temporary total disability.

The remaining issue is whether or not claimant can be awarded benefits under Iowa Code section 85.27. That section provides in pertinent part:

> The employer, for all injuries compensable under this chapter or chapter 85A, shall furnish reasonable surgical, medical, dental, osteopathic, chiropractic, podiatric, physical rehabilitation, nursing, ambulance and hospital services and supplies therefor and shall allow reasonably necessary transportation expenses incurred for such services.

Defendants argue that medical care sought by claimant has been unauthorized. Defendants have not acknowledged liability for an injury in this case and in the absence of such an acknowledgement cannot control the medical care. That rule is well established by agency decisions. Barnhart v. MAQ, Inc., I Iowa Industrial Commissioner Report 16 (Appeal Decision 1981); Holbert v. Townsend Engineering Company, 32 Biennial Report of the Industrial Commissioner 78 (1975).

Claimant offered a number of bills at the time of hearing. Payment of $707 to Dr. Chicoine, which appears to have been paid, will be awarded. Mileage also will be awarded for thirty-two trips to Dr. Chicoine's office.

Bills from claimant's hospitalization in November 1982 will not be ordered paid. Claimant's treatment at that time was primarily for an infection in his badly decayed teeth. That diseased condition was unrelated to his injury of September 9, 1982. Whatever care was given to his hip burns was minor. For the same reason charges from Dr. Larimer, Woodbury Anesthetic Group and Robert M. Whiteside will not be allowed.

Dr. Isgreen, the doctor selected by defendants for both evaluation and treatment, suggested electromyography, a CT scan and a myelogram, and that suggestion agreed with testing proposed by Dr. Blume. Dr. Dougherty also mentioned electromyography. Charges relating to those evaluations will be ordered paid by defendants and include electromyography and nerve conduction velocity studies performed and interpreted by Dr. Blume and claimant's hospitalization in early 1984 at the Marian Health Center.

A charge for medication ordered by Dr. Isgreen will be allowed as well.

With the exceptions of the charges discussed above, those incurred after Dr. Chicoine ceased treating claimant in April of 1983 will not be allowed.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant is sixty-three (63) years of age.

That claimant has an eighth grade education.

That claimant has been a member of the laborers union for a number of years.

That claimant jumped from defendant employer's truck on September 9, 1982, landed on his feet and subsequently had back and leg pain.

That defendants' safety director knew claimant was claiming an injury in November of 1982.

That claimant's trouble with his teeth is not related to his injury of September 9, 1982.

That claimant had not had dental care since 1948 prior to November 1982.

That claimant was admitted to the hospital on November 14, 1982 at which time nine upper and seven lower teeth were excised.

That claimant was treated for a left sacroiliac subluxation in June of 1980.

That on February 16, 1981 claimant had injury to both his cervical and lumbar spine in an automobile accident.

That on December 17, 1981 claimant was treated for a low back strain resulting from an accident of December 16, 1981.

That claimant was admitted to the hospital in January of 1984 for testing and evaluation.

That claimant incurred expenses as a result of his hospitalization in January of 1984.

That claimant has pain.

That claimant has spinal stenosis and degenerative disease.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has established by a preponderance of the evidence an injury arising out of and in the course of his employment on September 9, 1982.

That claimant has failed to establish by a preponderance of the evidence a causal relationship between his injury of September 9, 1982 and any disability he now may suffer.

That claimant has failed to establish entitlement to weekly benefits.

That claimant has established entitlement to payment of certain medical expenses.

That defendants have failed to establish by a preponderance of the evidence the affirmative defense of notice.

ORDER

THEREFORE, IT IS ORDERED:

That defendants pay the following medical expenses:

Dr. Chicoine	$ 707.00
Headache and Pain Control Center, P.C.	185.00
Marian Health Center	1,880.26
Greenville Pharmacy	5.45

That defendants pay claimant mileage for thirty-two (32) trips to Dr. Chicoine's office.

That defendants pay costs of these proceedings including a seventy-five dollar ($75.00) report charge from Dr. McCarthy.

Signed and filed this 31 day of August, 1984.

JUDITH ANN HIGGS
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

TED M. McINTOSH,

Claimant,

vs.

LAUHOFF GRAIN COMPANY,

Employer,

and

AETNA LIFE AND CASUALTY CO.,

Insurance Carrier,
Defendants.

File No. 500982

A P P E A L

D E C I S I O N

FILED

AUG 17 1984

IOWA INDUSTRIAL COMMISSIONER

STATEMENT OF THE CASE

Defendants appeal from a proposed decision filed December 30, 1983 wherein it was determined in a bifurcated review-reopening proceeding filed February 11, 1983 that claimant's disability was to the body as a whole and he was entitled to have his impairment rated industrially. Appeal was earlier taken on this issue but was dismissed as interlocutory.

The record on appeal consists of the transcript of the January 24, 1983 proceeding; claimant's exhibits 1 through 11; defendants' exhibit A; and the briefs and filings of the parties on appeal.

ISSUES

Defendants state the issues as:

1. Whether there was substantial evidence to sustain the Deputy Industrial Commissioner's finding of fact that claimant sustained an injury to the body as a whole.

2. Whether the Deputy Industrial Commissioner erred in his conclusion of law that claimant is entitled to compensation for industrial disability.

REVIEW OF THE EVIDENCE

The parties stipulate that the applicable rate of compensation is $151.52 per week. It is further agreed that the healing period ended on August 18, 1981. (Transcript, page 5)

The first report of injury filed June 23, 1978 indicates that claimant suffered a broken left hip on June 21, 1978 while working as a loader for defendant employer. Claimant was admitted to Mercy Hospital that same day and was seen by James A. Cousins, M.D., an orthopedic surgeon. (Claimant's Exhibit 3) A diagnosis was made of a fracture of the neck of the left femur. Surgery to reduce the fracture was performed and four Knowles pins were placed across the fracture site. (Cl. Ex. 3) Dr. Cousins saw claimant in follow-up over the next four months and reported that on October 23, 1978, claimant was "limping considerably." His x-rays showed good early healing of the fracture. Dr. Cousins reported that on December 21, 1978 claimant had full range of motion without discomfort and no identifiable limp. (Cl. Ex. 3) Dr. Cousins' report indicates that claimant was warned that complications could result from the fracture.

> The prognosis of this type of injury has been explained to the patient from the beginning and he understands that with a fracture of this nature, the head of the femur occasionally looses its blood supply and during a period of eighteen months occasionally and sometimes two years, one can only then diagnose a "dead head". On his last visit, I reminded him of this and also pointed out that there was no evidence of this yet on the x-rays, but should he have any discomfort during the ensuing year, that he should come in for a check up x-ray. Also, if he got any stiffness or loss of motion during this same period, one would suspect the above problem and x-ray. (Cl. Ex. 3)

Claimant was seen by David W. Minard, M.D., an orthopedic surgeon, on April 3, 1979 with complaints of stiffness and aching pain in his left hip. (Cl. Ex. 4) Dr. Minard found a well healed fracture but made a guarded prognosis due to the likelihood of aseptic necrosis of the head of the femur. (Cl. Ex. 4) Claimant consulted Ronald K. Miller, M.D., an orthopaedic surgeon in October of 1980. Dr. Miller scheduled a bone scan and tomograms after x-rays revealed flattening of the dome of the femoral head and increased bone density, signs associated with avascular necrosis. (Cl. Ex. 5) The additional testing results led to a recommendation of a total hip replacement. (Cl. Ex. 10, pp. 9-10) The surgery was performed on November 11, 1980. (Cl. Ex. 10, p. 12) Dr. Miller described the procedure as removing the head, or ball, of the femur and implanting a prosthetic devise. A socket is then constructed in the acetabulum. (Cl. Ex. 10, p. 10) Dr. Miller explained:

> On the other side of the hip joint, what we do is we have to go in and if there is any cartilage remnants left in there, we have to scrape those out. And then once we get down to bone, we use a little round device like this (indicating) with cutters on it, which looks somewhat like a cabbage grater, and it's put on a piece of power equipment, put into the acetabulum. It rotates at a high rate of speed and just grinds out a perfect half-circle, and depending upon what size cup that you want to use, we can either use a smaller or larger or we actually have a third size -- there's actually five sizes of these. We can pretty much size them to the patient. Once we have reamed this and prepared it, then we make some large and small holes in here, put some glue in here, put a cup in, hold it and then it is essentially cemented in, in about ten minutes the cement is hardened.
>
> Q. What is the composition of the socket?
>
> A. It's what they call a high-density polyethylene. It's a very, very durable, very tough material. (Cl. Ex. 10, pp. 10-11)

Dr. Miller dismissed claimant from the hospital on November 18, 1980 and continued to see him in monthly follow-up. (Cl. Ex. 10, pp. 12-13) On July 28, 1982 Dr. Miller reported:

> With respect to Ted McIntosh, we would rate this as an injury to the leg. In view of the significance of the problem we would rate this as 100% disability to the leg. However, in view of the long term problems and complications, this gentleman probably should have a permanent impairment rating to total body. Impairment should be in the range of 50 possibly 70% depending upon the results of the implant and one thing or another. This would be either at the higher or lower number. (Cl. Ex. 9)

On November 15, 1982 claimant was examined by John L. Connolly, M.D., chairman of the orthopaedic department of the University of Nebraska Medical Center. Dr. Connolly reported:

> When I examined him he said he had occasional pain and shaking in the hip joint with long standing and felt the hip was still weak when he walked for long periods of time. He could walk without an aid but did have a slight Trendelenberg limp. He stood with his pelvis level and had essentially no leg length discrepancy. There was a well healed scar over the posterior lateral aspect of the left hip. No flexion contractures were evident and range of

motion on the left side was limited compared with the right, to 30 degrees less flexion and 15 degrees less rotation and abduction. He had very minimal discomfort on full range of motion in this hip joint. There is also evidence of atrophy of the thigh muscle. Decreased quadriceps strength on gross testing on the left side compared with the right.

In reply to your specific inquiry about the functional impairment; in my estimation, based on this man's relatively good hip function, is that he does have a loss of approximately 40% of hip function of funcion of the lower extremity and this would translate into approximately 20% overall functional impairment of his entire body. This is my best estimation of his residual problem based on standard assessment. (Defendants' Ex. A)

APPLICABLE LAW

Section 85.34(2)(o), Code of Iowa, 1977 provides: "The loss of two-thirds of that part of a leg between the hip joint and the knee joint shall equal the loss of a leg, and the compensation therefor shall be weekly compensation during two hundred twenty weeks."

The claimant has the burden of proving by a preponderance of the evidence that the injury of June 21, 1978 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

An injury to a scheduled member which, because of after-effects (or compensatory change), creates impairment to the body as a whole entitles claimant to industrial disability. Barton v. Nevada Poultry Co., 253 Iowa 285, 110 N.W.2d 660 (1961). Dailey v. Pooley Lumber Co., 233 Iowa 758, 10 N.W.2d 569 (1943).

An injury is the producing cause; the disability, however, is the result, and it is the result which is compensated. Barton, 253 Iowa 285, 110 N.W.2d 660; Dailey, 233 Iowa 758, 10 N.W.2d 569.

ANALYSIS

Defendants argue on appeal that claimant's injury entitles him only to compensation for a scheduled member. They contend he has failed to show that his disability extends beyond the loss of function of the left leg.

The statutory definition of a leg is the area below the "hip joint." Any point of involvement above the "hip joint" subjects disability determination to whole body consideration. It is the disability, not the injury, that is compensated.

Dr. Miller has testified that the surgical procedure to replace claimant's left hip joint involved constructing a new socket in the acetabulum. He describes the acetabulum as an area "on the other side of the hip joint," that is, a part of the pelvis. Because the surgical procedure resulting from the work injury involved an area which extends beyond the left extremity, claimant's impairment is to the body as a whole, and a determination of industrial disability was appropriate. As the other matters were not in dispute on this appeal they are adopted as part of this final agency decision.

FINDINGS OF FACT

1. On June 21, 1978 claimant suffered a work injury to the femoral neck of the left leg.

2. Deterioration of the femur head led to corrective surgery.

3. On November 11, 1980 Dr. Miller replaced claimant's left hip joint.

4. The surgery involved constructing a new socket in the acetabulum.

5. The acetabulum is an area of the body extending beyond the hip joint.

6. The surgical procedure has extended claimant's disability to the body as a whole.

7. As a result of the work injury claimant is entitled to compensation for an industrial disability.

8. Claimant had a healing period until August 18, 1984.

9. Claimant has not returned to work since his hip replacement surgery.

10. Claimant walks with a limp, uses a cane, cannot bend or stoop, has difficulty keeping his balance and has difficulty performing routine activities such as carrying groceries, walking and climbing stairs.

11. Claimant has completed seven grades of school.

12. Claimant has worked as a heavy laborer throughout his career and has received no specialized training other than on-the-job training.

13. Claimant has been depressed since his job injury.

14. Claimant is receiving social security disability benefits.

15. Claimant is 57, married and has two dependent grandchildren.

16. Claimant contacted the state vocational rehabilitation service and the service found claimant was not a good candidate for rehabilitation citing his age, lack of education, possible depression and his injury as factors in such decision.

17. Claimant has a functional impairment of 50 to 70 percent of the body as a whole.

18. Claimant traveled a total of 204 miles in seeking medical care.

CONCLUSIONS OF LAW

WHEREFORE, the decisions of the deputies are affirmed.

Claimant has established that his injury of June 21, 1978 is the cause of the disability on which he now bases his claim.

Claimant is entitled to healing period benefits from the injury date to October 7, 1981.

Claimant has sustained his burden of showing he has a disability to the body as a whole and is entitled to a determination of industrial impairment.

Claimant is entitled to permanent partial disability resulting from his injury of June 21, 1978 of seventy-five percent (75%).

Claimant is entitled to mileage expenses at the stipulated rate of twenty cents ($.20) per mile.

ORDER

THEREFORE, it is ordered:

That defendants pay claimant permanent partial disability for three hundred seventy-five (375) weeks at a rate of one hundred fifty-one and 52/100 dollars ($151.52) with those payments to commence October 7, 1981. Defendants are given credit for any amounts already paid.

That defendants pay any accrued amounts in a lump sum with interest pursuant to Iowa Code section 85.30 as amended.

That defendants pay claimant mileage expenses as set out in claimant's exhibit 13 totaling two hundred and four (204) miles at the stipulated rate of twenty cents ($.20) per mile.

That costs are taxed to defendants pursuant to Industrial Commissioner Rule 500-4.33.

That defendants file a final report when this award is paid.

Signed and filed this 17 day of August, 1984.

SECOND INJURY FUND OF IOWA,	:	D E C I S I O N
Defendant.	:	

FILED
JUL 25 1984
IOWA INDUSTRIAL COMMISSIONER

Claimant appeals from a decision denying him commutation of future benefits to be paid by the Second Injury Fund of Iowa.

ISSUE

May future benefits to be paid by the Second Injury Fund be commuted?

STATEMENT OF THE CASE

Claimant was adjudged permanently totally disabled by appeal decision dated July 19, 1982, and was awarded lifetime benefits. The first three hundred (300) weeks are payable by his employer, Wilson Foods, and the remaining benefits are payable by the Second Injury Fund (hereinafter "the Fund") commencing January 10, 1988. Claimant then petitioned to commute the future benefits payable by the Fund.

Claimant who has a seventh grade education and no additional training, testified to his preference for a commutation saying; "I prefer to have my money instead of - you know what I mean - waiting on it while I'm living, so if something would happen to me, my wife could have something, and I could put it in certificates or draw interest on it." Claimant acknowledged he had invested $20,000 in a certificate when he received $28,000. The remainder of the money was used for an Eastern trip, new clothes, helping out a daughter with her schooling, paying off some small bills and installing central air conditioning.

Claimant claimed that his house and cars are paid for and that he owes no money. He sometimes provides his children with money when they need it.

Claimant reported that he has "probably $7,000 in the credit union." Regarding plans for the money he wishes to get through the commutation, he has been anticipating investing about $40,000 at 9 3/4 to 9 1/2% interest.

Although claimant denied being treated by any doctor for physical problems, he complained that he can't walk very far or lift. Beginning in late 1980 claimant commenced receiving no pension from his former employer.

APPLICABLE LAW AND ANALYSIS

Commutations are governed by Iowa Code section 85.45, which provides, in relevant part, as follows:

> Future payments of compensation may be commuted to a present worth lump sum payment on the following conditions:
>
> 1. When the period during which compensation is payable can be definitely determined.
>
> 2. When it shall be shown to the satisfaction of the industrial commissioner that such commutation will be for the best interest of the person or persons entitled to the compensation, or that periodical payments as compared with a lump sum payment will entail undue expense, hardship, or inconvenience upon the employer liable therefor. (emphasis added)

The basis of commutation is set out in section 85.47 as follows:

> When the commutation is ordered, the industrial commissioner shall fix the lump sum to be paid at an amount which will equal the total sum of the probable future payments capitalized at their present value and upon the basis of interest at the rate provided in section 535.3 for court judgments and decrees. Upon the payment of such amount the employer shall be discharged from all further liability on account of the injury or death, and be entitled to a duly executed release, upon filing which the liability of the employer under any agreement, award, finding, or judgment shall be discharged of record. (emphasis added)

Iowa Code section 85.61(1) provides the definition of employer for purposes of the Workers' Compensation Act as follows: "'Employer' includes and applies to any person, firm, association, or corporation, state, county, municipal corporation, school corporation, area education agency, township as an employer of volunteer firemen only, benefited fire district and the legal representatives of a deceased employer."

Iowa Code section 85.64 discusses the Second Injury Fund in detail:

> If an employee who has previously lost, or lost the use of, one hand, one arm, one foot, one leg, or one eye, becomes permanently disabled by a compensable injury which has resulted in the loss of or loss of use of another such member or organ, the employer shall be liable only for the degree of disability which would have resulted from the latter injury if there had been no pre-existing disability. In addition to such compensation, and after the expiration of the full period provided by law for the payments thereof by the employer, the employee shall be paid out of the "Second Injury Fund" created by this division the remainder of such compensation as would be payable for the degree of permanent disablity involved after first deducting from such remainder the compensable value of the previously lost member or organ.

Iowa Code section 85.67 relates to the administration of the Fund:

> The treasurer of state shall be charged with the conservation of the assets of the second injury fund, and the collection of contributions to the fund. The attorney general shall appoint a staff member to represent the treasurer of state and the fund in all proceedings and matters arising under this division. In making an award under this division, the industrial commissioner shall specifically find the amount the injured employee shall be paid weekly, the number of weeks of compensation which shall be paid by the employer, the date upon which payments out of the fund shall begin, and, if possible, the length of time the payments shall continue. (emphasis added)

The Second Injury Fund is a unique entity created and financed by the Second Injury Compensation Act--Iowa Code sections 85.63 through 85.69--with a purpose of encouraging the hiring of handicapped persons by making the current employer responsible only for the amount of disability occurring under the employment as if there were no preexisting disability. Because the Fund is created by statute, the statute must be carefully examined.

"Employer" is very specifically defined by the law in section 85.61. The sections, 85.45 and 85.47, relating to commutations, as well as section 85.67, contain the word "employer." Definite terms cannot be broadened through indefinite construction. Brugioni v. Saylor Coal Co., 198 Iowa 135, 138, 197 N.W. 470, 471 (1924). As there is nothing in the Act establishing the Fund which speaks of commutation and as the Fund is not an employer, no commutation of benefits can be allowed.

Our neighboring jurisdiction of Illinois addressed the problem here presented in Moreland v. Industrial Commissioner, 47 Ill.2d 273, 265 N.E.2d 161 (1970). Moreland was permanently, totally disabled and entitled to benefits from the Special Fund. When Moreland petitioned for commutation of Special Fund benefits, his petition was denied by the commission on the basis that it had no jurisdiction to order a lump sum payment of Special Fund benefits. That decision was reversed by the circuit court. On remand the petition was denied on not being in the best interest of the parties and more specifically that granting the payment would deplete the Special Fund.

The Illinois statute makes reference to benefits awarded being paid on a monthly basis. It contains provisions similar to those in Iowa Code section 85.67. The Illinois Supreme Court determined that the limitations of the Special Fund controlled the general provisions. The relevant statutory provisions governing Fund are described by the court as follows:

> The provision of the Act which establishes the Special Fund provides: "It is considered always appropriate for the purposes of disbursements as provided in Section 8, paragraph (f), of this Act, and shall be paid out and disbursed as therein provided and shall not at any time be appropriated or diverted to any other use or purpose." (Citations omitted) As heretofore noted, paragraph (f) of Section 8, under which petitioner was awarded a pension, provides in part: "Such pension shall be paid monthly." Also, it further provides: "In its award the Commission or the Arbitrator shall specifically find . . . the date upon which the pension payments commence and the monthly amount of the payments. . . . The Treasurer shall 30 days after the date upon which payments out of this Special Fund have begun as provided in the award, and every month thereafter, mail to the injured employee, or at the option of the State Treasurer, to some bank in the county in which he resides for delivery to him, a check or draft payable out of the Special Fund, for all compensation accrued to that date at the rate fixed in the award. . . . The Special Fund is appropriated for the purpose of making payments according to the terms of the awards. (Citation omitted)

In rejecting a lump sum payment against Fund, the Illinois Court stated:

> We believe it is clear from the provisions above

that the Special Fund may only be disbursed according to the terms provided for awards under paragraph (f) of Section 8. With regard to petitioner's pension, the award necessarily provided for monthly payments. These specific limitations as to awards and payments of pensions from the Special Fund must be held controlling as against the general provision in Section 9 for lump sum payments (citations omitted). This is particularly true when it is considered that we must read the Act as a whole, and adopt the practical interpretation which was intended by the Legislature. (Citations omitted) The Special Fund is maintained by limited assessments against those employers liable for an award due to an employee's death or loss of a member (citation omitted). The Fund is designed to maintain a balance between $150,000.00 and $250,000.00; the balance is examined twice yearly, and the Funds' receipts cease whenever the balance reaches the maximum amount. (Citation omitted) As the Circuit Court noted in its opinion, the Fund would be rapidly depleted and unable to continue payments of pensions if lump sum payments were allowed. Further, we believe the policy of protecting the employee is better served by the interpretation we adopt, for it seems unlikely that the lump sum payment provision was intended to embrace the Special Fund, the payments from which are always made to totally disabled persons. . . . We therefore conclude that the Legislature did not intend in Section 9 to grant the Industrial Commission jurisdiction to consider petitions for lump sum payments of pensions from the Special Fund." (Emphasis added)

Although the Iowa legislature may not have been as specific as Illinois in indicating that Fund benefits are to be paid "monthly," it did specifically provide that payments could be made from the Fund only "after the expiration of the full period provided by law for the payments thereof by the employer." Iowa Code section 85.64. All other arguments cited by the Illinois Supreme Court including the purpose and method of financing the Fund are applicable to the Second Injury Fund of Iowa. Based on these considerations, the Illinois Supreme Court refused to imply a right to lump sum commutation against the Fund without specific legislative authority despite its application to employers.

Claimant argues that the reference to employer in section 85.45(2) is irrelevant as that subsection is not involved in this case. It is a part of section 85.45, however, which gives rights to employees under certain circumstances and to employers under certain circumstances. No rights are extended to the Second Injury Fund by this section. A fortiori no remedies against the Fund should be implied. The Second Injury Fund is a publicly held and administered fund part of the purpose of which is to make periodic payments to qualifying individuals so they will not become needy of other public welfare benefits. Periodic payment best insures this purpose.

Whether or not a commutation would be in the best interest of claimant is subject to question. At least one method of computation might not be in claimant's best interest in that commutation of the distal end of the benefits period would carry a heavier discount factor than ten percent.

By statute fund benefits are not payable until after expiration "of the full period provided by law for payments thereof by the employer." Conceivably if a commutation were possible, it might not be granted until those benefits come due in January of 1988.

FINDINGS OF FACT

1. Claimant is 62 years of age.

2. Claimant has a seventh grade education.

3. Claimant's children are grown.

4. Claimant has functional limitations of both upper and both lower extremities.

5. Claimant desires a commutation.

6. Claimant wishes the commutation to have money for his spouse, to invest, and to pay attorney fees.

7. Claimant is an adequate money manager.

8. Claimant owns his house and cars.

9. Claimant has money in a certificate of deposit in the credit union.

10. Claimant is not being treated by a doctor.

11. Claimant receives social security.

12. Claimant has been found permanently and totally disabled.

13. Claimant will commence receiving benefits through the Second Injury Fund Compensation Act on January 10, 1988.

14. The Second Injury Compensation Act contains no reference to commutations.

15. The Second Injury Compensation Act is not an employer as defined by Iowa Code section 85.61(1).

CONCLUSIONS OF LAW

That no commutation of benefits awarded under the Second Injury Compensation Act can be allowed to claimant.

The decision of the deputy should be affirmed.

ORDER

THEREFORE, it is ordered:

That claimant take nothing from these proceedings.

That defendant pay costs of the original proceeding pursuant to Industrial Commissioner Rule 500-4.33.

That claimant pay any costs of his appeal.

Signed and filed this 25 day of July, 1984.

ROBERT C. LANDESS
INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

SUSANO MEJORADO, Claimant, vs. CATERPILLAR TRACTOR CO., Employer, Self-Insured, Defendant.	:	File No. 438551 A P P E A L D E C I S I O N

FILED
SEP 28 1984
IOWA INDUSTRIAL COMMISSIONER

STATEMENT OF THE CASE

Defendant appeals from a proposed decision in review-reopening wherein claimant was awarded benefits based upon a finding of 36 percent industrial disability. The record on appeal consists of the transcript of the review-reopening proceeding; claimant's exhibits 1 through 5; defendant's exhibits A through C; and the briefs and filings of the parties. A motion to dismiss defendant's appeal was filed by claimant on June 8, 1984 and was denied by the industrial commissioner in a June 21, 1984 ruling.

ISSUES

The issues on appeal appear to be:

1. Whether or not claimant must show a change in condition for review-reopening consideration following the filing of a memorandum of agreement under Iowa Code section 86.13.

2. Whether or not the evidence supported a finding of an industrial disability of 36 percent of the body as a whole.

REVIEW OF THE EVIDENCE

The parties stipulate that August 21, 1975 is the date of original injury, and that January 1, 1982 is the commencement date for the additional permanent partial disability. The parties further agree that claimant's applicable rate of compensation is $160 per week. (Transcript, pages 3-5) Defendant's final report of claim activity filed April 28, 1980 indicates the date of last payment to claimant was April 21, 1980. Claimant's petition in review-reopening was filed on August 2, 1982.

Claimant was 53 years old at the time of the hearing. (Tr.,

p. 30) He is married and has two minor children. Claimant completed eight years of school and later took courses in welding and basic machine operation. (Tr., p. 28) His previous job experience included foundry and rout work in a machine shop. Claimant began working for defendant in 1967 on a radial drill. (Tr., pp. 28-29) He was later transferred to running a grinder and performed this work for four years. Claimant testified that his duties required bending and lifting tasks. (Tr., pp. 29, 37-38) Defendant's first report of injury filed August 28, 1975 indicates that claimant was operating the grinder when he was struck by a piece that flew out of the machine. The injury is described as a "[l]aceration of transverse cervical artery, vein and part of the brachial plexus." (Employer's First Report of Injury) Claimant testified the injury involved the nerves and muscles of the right side of his neck. Surgery was performed. (Tr., p. 30) As a result of the injury claimant no longer had the skill or use of his arm to do grinding work. (Tr., p. 38) When he returned to employment he was re-assigned to work in the tool crib. (Tr., p. 31)

In January of 1980 claimant was evaluated at the Industrial Injury Clinic with a chief complaint of pain and loss of strength in the right arm and hand. Claimant also complained of pain in the right and left shoulders. (Defendant's Exhibit B) The assessment report, compiled in part by J. C. Sarnecki, M.D., indicates that claimant's medical history included a home injury to the back in 1967. The pertinent results of the physical examination were reported as follows:

> Neck - reveals normal range of motion rotating right and left 75 degrees, forward to the chest, extension is 75 degrees and side bending of 40 degrees. He has a large, well healed scar extending from the inferior sternum up to the base of the neck where it goes off to the right and is well healed and nontender. His carotid pulses are good bilaterally and there are no bruits audible over the carotid pulses.
>
> Musculosketetal Examination: Brief, low back examination reveals normal gait, normal posture except for a small degree of right thoracic scoliosis. He has no abnormal tilt to the pelvis. He walks with a normal gait, walks on his heels and toes, can bend forward and touch his toes. Deep tendon reflexes are intact. Examination of the upper extremities reveals that he is right-handed and writes with his right hand. He has external rotation of the shoulders - right over left - 20/45, internal rotation 25/75, abduction at the shoulders is full bilaterally, adduction is full. Biceps circumference is 12 inches/12 inches.
>
> Forearm circumference is 10 1/4 inches/10-3/4 inches. There is decreased strength in the right biceps and in the supinators of the hand to go along with this. Grasp, wrist flexors and extensors are intact. The deltoid muscle strength was equal bilaterally. Internal rotators of the right shoulder are slightly weaker than the left but have good strength. External rotators are equal bilaterally at the shoulder. The supinators are distinctly weak on the right and active supination is limited to approximately 15 degrees while passive supination is at 75 degrees. The wrist extension on the right is slightly weaker than the left but has good strength. The biceps is perhaps the weakest muscle group but is still rated at a 4+ strength on the right compared to the left. Brachial radialis again is an active muscle group but is weaker than the opposite side. The biceps reflex is absent on the right, present on the left. Triceps is present bilaterally. Brachial radialis reflex is present on the left but not on the right. Right elbow supination is 75 degrees/90 degrees. Sensory examination reveals a hypesthesia of the thumb and index finger. The volar and radial aspect of the forearm up to the shoulder on the right, normal sensation on the left. Pulses and Adson test are normal.
>
> ....
>
> Chest X-rays were obtained on 1-8-80 and interpreted by R. F. Douglas, M.D. Radiologist. The patient has had a sternal-splitting chest incision with multiple wire sutures in place and there are multiple surgical clips in the lower right neck as well. The cardiovascular silhouette is normal and the lungs are clear.
>
> Cervical Spine films were obtained on 1-8-80 and interpreted by R. F. Douglas, M.D. Radiologist. The vertebra are in alignemnt [sic]. The bodies and processes appear intact. Disc spaces are preserved. The right transverse process of C7 is long but no true cervical rib formation is noted.
>
> Right Shoulder films were obtained on 1-8-80 and interpreted by R. F. Douglas, M.D. Radiologist. Views of the right shoulder show very minimal hypertrophic change from degenerative disease but no other abnormality is noted.
>
> Lumbar Spine films were obtained on 1-8-80 and interpreted by R. F. Douglas, M.D. Radiologist. The vertebra are in alignemnt [sic] with slight apparent tilt to the right. The posterior elements of L5 are somewhat rudimentary but otherwise the bodies and processes appear intact throughout the lumbar spine. The L4-5 disc space is a little thin with minimal hypertrophic change at this level. Minor hypertrophic changes are present at several other levels with no other abnormality noted. Thus in Dr. Douglas' opinion there are degenerative changes in the lumbar spine. (Def. Ex. B)

A 25 percent permanent partial disability was determined, and counseling for pain management was recommended. The degenerative arthritis found in claimant's shoulder and back was not believed to have been aggravated nor accelerated by the industrial injury. (Def. Ex. B) In February of 1983 claimant was examined by Richard T. Beaty, D.O., who reported that claimant had signs and symptoms of a possible herniated disc at L4-5, unrelated to the work injury. Dr. Beaty assigned a disability of eight percent to the lumbar spine. The doctor determined an impairment of 30 percent to the C-6 nerve root which involved the "upper extremity from the cervical spine to the tips of the fingers..." (Cl. Ex. 1)

In April of 1983 claimant was examined by Gay R. Anderson, M.D., who reported:

> We have a man who has sustained a significant injury to the right brachial plexus with an upper plexus injury with permanent deficits as evidenced by atrophy, weakness, sensory deficits which in turn lead to a reduction in co-ordination and sensory feedback and therefore loss of efficiency, both in terms of power and fine definitive movement. This produces both outright reductions in strength on the neuromuscular strength loss basis as well as deficits because of lack of normal sensory feedback. This is not readily visible on cursory inspection of this individual, but is quite evident on more detailed neurologic testing, as already mentioned.
>
> I have explained this to the individual and we have discussed some of the psychosocial factors involved, which are quite common after such an injury. I think he understands that it is human nature that others from time to time may take a dim view of his performance pattern in light of what they can see. Other [sic] the other hand, he was reassured he did have some deficits. (Def. Ex. A)

Dr. Anderson determined a permanent partial disability to the right shoulder of 25 percent.

Claimant testified he is now working in a different crib and is not required to do heavy lifting. He stated he is right handed and cannot pick up a gallon of milk with his right hand without using his left hand to assist. He is unable to rotate his palm upwards. (Tr., pp. 32-39) He stated his arm hurts and also gets numb. Drugs have been prescribed for the pain but he doesn't like to take them. (Tr., p. 34) Claimant stated he liked to do mechanical work but now finds it difficult to work on cars. (Tr., p. 35) He has applied for automotive work with defendant but was sent back to the crib job after a trial period in automotives. (Tr., p. 36)

Claimant has lifting restrictions of 20 pounds and has been told to ask someone to help him if he has to lift something heavy. (Cl. Ex. 4; Tr., p. 45) Claimant admitted he didn't like to ask for help from the other workers. (Tr., p. 47)

Loren Snyder, employee benefits supervisor for defendant, testified that letters are used to classify labor grade and pay, L representing the highest classification. Mr. Snyder stated that claimant's labor grade changed from G to D after his injury. Claimant's previous job as a grinder operator was a G grade and claimant's present work as a tool crib attendant is a D-2 grade. Mr. Snyder stated that in March of 1980 a G-2 earned $9.84 per hour and a D-2 earned $9.48 per hour. At the time of the hearing a G-2 earned $12.46 an hour and a D-2 earned $12.08. (Tr., pp. 6-12) The witness stated that the highest labor grade for a crib tool attendant is D-2. Prior to the injury, claimant, as a grinder operator, could have gone on to the highest level, L, if he met the qualifications and physical ability. (Tr., p. 13) Mr. Snyder recalled that the 31 percent figure of disability which was paid to claimant in April of 1980 was determined from the 25 percent disability reported by the Industrial Injury Clinic added to the percentage of wage differential between the G and D classification. Mr. Snyder stated claimant's foreman had reported claimant does work without prompting, knows his job and gives extra effort. (Tr., p. 17) Claimant has not had a promotion or increase in earnings for merit since March of 1980. (Tr., p. 12)

APPLICABLE LAW

Iowa Code section 86.13 provides:

> If the employer and the employee reach an agreement in regard to the compensation, a memorandum thereof shall be filed with the industrial commissioner by the employer or the insurance carrier, and unless the commissioner shall, within twenty days, notify the employer or the insurance carrier and

employee of his disapproval of the agreement by certified mail sent to their addresses as given on the memorandum filed, the agreement shall stand approved and be enforceable for all purposes, except as otherwise provided in this and chapters 85 and 87.

Iowa Code section 86.34 states in part:

Any award for payments or agreement for settlement made under this chapter where the amount has not been commuted, may be reviewed by the industrial commissioner or a deputy commissioner at the request of the employer or of the employee at any time within three years from the date of the last payment of compensation made under such award or agreement, and if on such review the commissioner finds the condition of the employee warrants such action, he may end, diminish, or increase the compensation so awarded or agreed upon.

A memorandum of agreement settles that an employment relationship existed at the time of injury and that the injury arose out of and in the course of employment, leaving open for adjustment the question of extent of disability. Freeman v. Luppes Transport Co., Inc., 227 N.W.2d 143 (Iowa 1975).

The modification of an award would depend upon a change in the condition of the employee since the award was made. Stice v. Consolidated Ind. Coal Co., 228 Iowa 1031, 291 N.W. 452 (1940).

The claimant has the burden of proving by a preponderance of the evidence that the injury of August 21, 1975 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

If claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

ANALYSIS

This appeal arises, in part, over the question of whether a memorandum of agreement constitutes "an agreement" such that a change of condition must be demonstrated by the claimant to support review consideration by this agency. Defendant contends that an agreement for settlement had been reached by the parties; defendant had paid claimant weekly benefits equivalent to a disability of 31 percent; and that the filing of the memorandum of agreement constituted the only formal requirement of an agreement within the meaning of Iowa Code section 86.13.

The filing of a memorandum of agreement, as the deputy correctly points out, is a unilateral action on the part of the employer which establishes that an employer-employee relationship existed at the time of the injury and that said injury arose out of and in the course of employment. Under the provisions of Iowa Code section 86.34, the industrial commissioner may, upon application, review the terms of the agreement if the benefit amount has not been commuted and the request for review is filed within three years of the date of the last payment of benefits.

By the filing of the memorandum, defendant has established solely that an employment relationship existed at the time of the August 28, 1975 injury and that claimant's injury arose from work activities. The extent of disability was not established. See Freeman, 227 N.W.2d 143 (Iowa 1975). Since claimant's weekly benefits have not been commuted and his request for review was timely, his application was properly before the deputy.

We come now to the question of change of condition as a contingency of review. Had there been an actual agreement for settlement between the employer and employee, in other words, a written instrument of agreement signed by both parties, a showing of change of condition by claimant would be required for a review-reopening proceeding. Equally, had the payment of benefits derived from an award determined by prior adjudication of his claim, a change of condition would have to be demonstrated to support a modification of that award. No settlement papers are on file with this agency and a benefit award based on a determination of disability has not been made by this agency. Therefore, the deputy's finding that a showing of changed condition was not a part of claimant's burden was correct.

Defendant's second issue on appeal contests the extent of industrial disability found by the deputy. Claimant, who is right handed, has incurred a severe injury to the upper right brachial plexus which has resulted in neurological impairment to the area between the cervical spine and the fingers of the right hand. Claimant suffers from pain and loss of coordination and gripping strength. Three doctors have determined an impairment rating of between 25 and 30 percent. Although defendant has commendably sought to provide claimant with light duty work that is within his physical limitations, claimant's labor grade classification, and earnings, have been downgraded since the industrial injury. Claimant's only areas of specialized training beyond eighth grade were welding and basic machine operation, both of which would require the manual dexterity and coordination in which claimant is now deficient. At age 53 with minimal formal education, he is not a likely candidate for successful vocational retraining. There is little doubt that as a result of his functional limitations, claimant's ability to compete for better paying positions has been impeded and his earnings potential diminished. In view of the foregoing considerations, the deputy's finding of 36 percent industrial disability was reasonable and just.

FINDINGS OF FACT

1. Claimant is 53 years old and has an eighth grade education.

2. Claimant is married with two minor children.

3. Claimant's only specialized training has been in welding and basic machine operation.

4. Claimant's previous work experience was in machine shop operations.

5. Claimant began working for defendant in 1967.

6. Claimant was operating a grinder on August 28, 1975 when he was injured.

7. Claimant incurred a serious injury to the right brachial plexus and underwent surgery.

8. Claimant has neurological impairment between the cervical spine and the fingers of the right hand.

9. Claimant suffers from pain and loss of coordination and strength of the right shoulder and right extremity.

10. Claimant is right handed.

11. Claimant has a permanent functional impairment of 25 to 30 percent of the right shoulder and right extremity.

12. At the time of the industrial injury claimant worked as a grinder in a G labor grade classification.

13. After the injury, claimant was re-assigned to a light duty position which has a D grade classification.

14. At the time of the hearing a D-2 earned $.38 less an hour than a G-2.

15. Claimant's ability to compete for a higher wage position is hindered by his functional impairment.

16. A memorandum of agreement was filed by defendant.

17. Claimant was paid weekly benefits totaling 31 percent of the body as a whole.

18. Claimant's benefits have not been commuted.

19. No settlement papers have been filed with this agency.

20. There has been no prior adjudication as to the extent of claimant's disability.

21. Claimant's applicable rate of compensation is $160.00 per week.

CONCLUSIONS OF LAW

WHEREFORE it is found:

That it is unnecessary for claimant to show a change of condition as his benefits have not been commuted and there has been no prior award or agreement for settlement.

That as a result of claimant's injury on August 21, 1975 he has a permanent partial industrial disability of thirty-six percent (36%).

THEREFORE, the decision of the deputy is affirmed.

ORDER

THEREFORE, it is ordered:

That defendant pay unto claimant permanent partial disability benefits at the rate of one hundred sixty dollars ($160.00) per week for an additional twenty-five (25) weeks commencing on January 1, 1982.

That defendant pay the accrued amount in a lump sum.

That defendant pay interest pursuant to Iowa Code section 85.30.

That defendant pay costs pursuant to Industrial Commissioner Rule 500-4.33.

That defendant file a final report in ninety (90) days.

Signed and filed this 28 day of September, 1984.

INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

EULIS MOAK,	:	
Claimant,	:	File No. 671044
vs.	:	
HOLMAN ERECTION CO.,	:	REVIEW -
Employer,	:	REOPENING
and	:	DECISION
THE HOME INSURANCE COMPANY,	:	FILED
Insurance Carrier, Defendants.	:	AUG 1 1984
		IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in review-reopening brought by Eulis Moak, claimant, against Holman Erection Co., employer, and Home Insurance Company, insurance carrier, defendants, to recover additional benefits under the Iowa Workers' Compensation Act for an injury arising out of and in the course of his employment on May 18, 1981. It came on for hearing on June 28, 1984 at the Bicentennial Building in Davenport, Iowa. It was considered fully submitted at that time.

The industrial commissioner's file contains a first report of injury received May 29, 1981. A final report shows the payment of fifty-seven weeks and six days of weekly benefits.

At the time of hearing the parties stipulated to a rate in the event of an award of $353.00. The conversion date for a change from healing period to permanent partial disability was alleged by claimant to be June 27, 1982.

The record in this matter consists of the testimony of claimant and of Carol Schmit; claimant's exhibit 1, the deposition of Thomas R. Lehmann, M.D.; claimant's exhibit 2, a series of medical and vocational reports; claimant's exhibit 3, a letter from Joy Magisana dated March 8, 1982; claimant's exhibit 4, an orientation manual for ironworkers; claimant's exhibit 5, a notice of decision from the Illinois Industrial Commission; defendants' exhibit A, the deposition of John E. Sinning, Jr., M.D.; defendants' exhibit B, the deposition of J. R. Lee, M.D.; defendants' exhibit C, records from a hospitalization of July 5, 1979; defendants' exhibit D, a letter from Thomas R. Lehmann, M.D., dated October 17, 1983; defendants' exhibit E, notes from physical therapy; defendants' exhibit F, notes from Dr. Sinning; defendants' exhibit G, a letter from Dr. Sinning dated May 17, 1983; defendants' exhibit H, a letter from Dr. Sinning dated May 10, 1982; defendants' exhibit I, a letter from Byron W. Rovine, M.D., dated February 22, 1982; defendants' exhibit J, a letter from Dr. Rovine dated January 26, 1982; defendants' exhibit K, a letter from Patick G. Campbell, M.D., dated January 20, 1982; defendants' exhibit L, a letter from Frank I. Russo, M.D., dated September 3, 1981; and defendants' exhibit M, a series of medical records. Objections made at the time of hearing were considered in evaluating the evidence.

ISSUES

The issues in this matter are whether or not there is a causal relationship between claimant's injury and any disability he now may suffer and whether or not claimant is entitled to permanent partial disability benefits.

STATEMENT OF THE CASE

Forty-eight year old married claimant who attended a vocational high school for three and one-half years and recently obtained a GED, testified to work experience in sales with vacuum cleaners and shoes while he was in high school. When he left high school, he worked in a box factory where he made boxes and labored as a shipping clerk. He had another shipping job before going into the service for four years. He functioned as a laborer mixing mortar for a time before going into ironwork. He is now a journeyman ironworker.

Claimant described the circumstances surrounding his injury on May 18, 1981 as follows: He arrived for his 8:00 o'clock shift at 7:30. He was doing detail work which involved welding and fitting up. At about 9:30 he was up sixty feet on a stairway on a beam eight to ten inches wide. He was working with a coemployee. It was necessary to lift a 400 pound beam so that it could be clamped and welded. He had lifted heavy things all his life. When he got the beam in the air, he felt pain in the middle of his back and down his legs which seemed like an explosion. He grabbed a diagonal beam. His coworker helped him to a platform and onto the stairway. He laid down for ten to fifteen minutes.

He told his supervisor about the incident at break time. He finished work which was light duty welding, but he had trouble going upstairs and moving his back.

When he got home his pain was down through his back and into his shoulders. He was up at 6:00 o'clock and had coffee. His spouse assisted him with dressing. He drove his truck to work where he talked to his steward and to the superintendent.

He has done no ironwork since May 18, 1981. He has seen a number of doctors including a chiropractor and a psychiatrist.

Claimant asserted that he has applied for employment at many places including department stores, auto parts shops, motor companies and fast food restaurants. He has been looking for sales work which he said vocational rehabilitation evaluations indicated would be a good choice for him.

Claimant has done twenty-seven hours of work twice a month to pay for his rent and food stamps. He described the work as light including such things as carrying messages, picking up papers and mowing lawns for fifteen to twenty minutes at a time. He did not feel he is in condition to do ironwork. He has tried to put on his ironworker belt, but he cannot walk far while he wears it. He estimated the weight of the belt at forty pounds. He said that he used to be able to lift in excess of 200 pounds. Now he can lift thirty-five or forty pounds if everything is just right. He indicated that to be able to do ironwork one must be able to climb and must be alert for the strenuous work which may necessitate constant bending. His rate of pay for ironworking was in excess of $16.00 per hour.

As to present complaints claimant listed pain in the middle of his back and into his buttocks and legs with some numbness. He asserted that he has sharp, shooting, excruciating pain down his legs which troubles his sleep. Lying in a curled position relieves his pain which is aggravated by stair climbing, twisting or prolonged sitting or standing. He alleged that he is unable to afford medical care at the present.

Claimant acknowledged having some trauma to his back and legs in 1979 and having surgery in April of that year to replace his aorta. He said that after this replacement the trouble with his legs and back cleared.

Claimant, who said that Dr. Chamany was the first physician to whom he was sent by his employer, testified that he told the doctor what had happened. He denied being told that he could return to light work and that when he said there was no light work, he was told to wait a week and then go back. He admitted having seen Dr. Willhite in March. He said that Dr. Lee gave him no instructions about working. He agreed that he had not told Dr. Sinning of the 1979 injury. He asserted that Dr. Sinning told him to discontinue physical therapy when it hurt him. He thought Dr. Lehamnn found trouble with his range of motion.

Claimant recalled meeting with Dr. Sinning and a rehabilitation

specialist. It was his understanding that Dr. Sinning was returning him to work of his choosing, and he denied being told he could return to work without limitations.

Carol Schmit, R.N., who was in April of 1982 employed by a private rehabilitation company, testified to monitoring medical care in industrial injury cases. Claimant was referred to her by the insurance carrier. She had an initial discussion with him on April 18, 1982 at which time she sought to reassure him about his back. Prior to that visit she had reviewed medical reports from the physicians involved in his treatment.

She said that claimant indicated to her that he wished a job paying more than $15.00 per hour and that he wished to go to Iowa City for back surgery.

Schmit accompanied claimant when he went to Dr. Sinning's office. She said that her goal was to be sure claimant understood that there was no organic injury to his back. She said that the doctor who placed no physical limitations on claimant suggested that claimant return to work or undertake a retraining program.

The witness who had not seen the medical reports from Dr. Lehmann said it would be possible to have pain without evidence of it on either x-ray or CT scan and that claimant was possibly experiencing subjective pain.

A decision from the Illinois Industrial Commission dated June 18, 1979 awarded temporary total compensation with the finding: "[T]hat the disabling condition is temporary and has not reached a permanent condition."

An orientation manual for the International Associaton of Bridge, Structural and Ornamental Iron Workers and a career brief regarding ironworkers were offered in evidence. The latter contains this discussion of personal qualifications:

> Because iron workers and riggers do considerable climbing, reaching, balancing, bending, and stooping, aspirants should be in good physical conditon. At least average strength and full use of their arms, legs, and back are required. They should also possess good balance and agility and be able to work at heights since they are required to work on high platforms, ladders, steel girders, etc. Good spatial and form perception, normal eyesight, and above average eye-hand-foot coordination are important traits.
>
> Emotional stability, good judgment, and a willingness to observe safety practices are necessary. These workers must also be able to follow oral and written instructions and work cooperatively with other members of construction crews.

In November of 1983 claimant enrolled for a complete vocational evaluation. Claimant's counselor found him unwilling to start at the bottom in terms of either seniority or pay. The counselor felt claimant should get into a work situation as opposed to pursuing formal training as there was concern over claimant's academic background and particularly his math skills.

Recommendation was made for claimant to seek work as an assembler or as a production machine operator. Claimant wished to look for work in sales and that desire was found feasible if he had an employer who would provide charts for math assistance.

Claimant's evaluators noted that claimant could sit for long periods when he was doing things he enjoyed. His tendency to moralize, rationalize, intellectualize and project was seen as possibly interfering with his ability to hold a job.

As a part of his evaluation a psychological profile was obtained. The Wechsler Adult Intelligence Scale was administered. Subtests in the verbal area were average except for arithmetic skills which was low average. Three of five of the performance subtests suggested high average capabilities including environmental awareness and the ability to differentiate essential from non-essential details; planning skills and the ability to follow sequential logic in interpreting social situations; and the ability to make use of parts--whole relationships in the assembly of familiar objects. His full scale I.Q. was 98.

Claimant ranked in the eightieth percentile on the Raven Standard Progressive Matrices.

An early medical report shows claimant was admitted to the hospital on July 5, 1979 for back and right lower extremity pain which began with an injury of April 9. He also reported a hospitalization for back pain and a fractured back sixteen years before.

William Hanigan, M.D., saw claimant in consultation and gave an impression of probable ischemic neuropathy involving the right sciatic nerve. He suggested a vascular surgery consult because he doubted a sciatic radiculopathy from cord compression.

Frank S. Willhite, D.C., saw claimant on March 2, 1981. Claimant's movement in the low back area was slow and deliberate and he complained of extreme tenderness in the low back particularly in the right sacroiliac area. Claimant gave a history of a fall in 1980 in which he landed on his right hip.

Claimant was described as "almost completely symptom free" when he was seen on May 20, 1981 and gave a history of being blown by a high wind as he lifted a heavy piece of steel. Pain radiated into his left hip and leg. Claimant then gave a history of a fall in 1963 that resulted in thirty-six fractures. Tenderness was found along the erector spinae muscles on both the right and left. Dr. Willhite diagnosed an acute traumatic subluxation strain and sprain of the sacroiliac joints with consequent effusion, splinting muscle spasms and sacral radiculitis and attending left extension sciatic neuralgia. He estimated claimant's healing time at from two to four months.

On August 7, 1981 Dr. Willhite wrote that claimant had an acute moderate contusion subluxation strain and sprain of the cervical spine with a consequential myositis and lower cervical radiculagia and an acute moderate subluxation strain and sprain of the sacroiliac joints with resultant effusion, splinting muscle spasm and radiculalgia. The doctor predicted that claimant would be unable to return to work until his pain subsided.

J. R. Lee, M.D., board certified orthopedic surgeon, saw claimant on June 25, 1981 at the request of an adjusting company. Claimant gave a history of injuring his back when he attempted to lift a diagonal beam and pulled a muscle resulting in both pain and numbness in both legs. Claimant was treated by Dr. Willhite, a chiropractor.

On examination, claimant's shoulders and pelvis were level. His spine was straight, but there was severe localized tenderness in the lower back. Claimant responded consistently with pain of a diffuse nature. Heel toe walking was normal. Claimant's back motion was somewhat restricted by discomfort. Claimant had tenderness in the lower lumbar area when he was percussed while lying on his stomach. The Faber test was normal which indicated to the doctor that no pain was coming from the hip joint.

Dr. Lee diagnosed a lumbar strain. He anticipated claimant's problem would resolve and claimant would not have any functional deficit.

John E. Sinning, M.D., board certified orthopedic surgeon, first saw claimant on August 26, 1981 in consultation with Dr. Chamany. Claimant gave a history of lifting a 400 pound girder on May 18, 1981 and feeling a sudden sharp tearing in his low back. He had gradually increasing pain and was seen by Dr. Chamany and by a chiropractor. He complained of pain present at all times and aggravated by any activity. The pain in his right leg went into his calf, but not his foot. Coughing and sneezing aggravated the pain. Claimant told the doctor of serious injuries in a fall in 1963. He did not speak of an injury in April of 1979 when he had back and right lower extremity pain.

Although claimant protected his back, his range of motion was normal. Straight leg raising was stopped at 70 degrees because of hamstring tightness. There was generalized tenderness over the back with some irritability of the muscles and some spasm which the doctor said was an indication of tightness in the muscle. Dr. Sinning reviewed x-rays and found them normal with no evidence of fracture or arthritis.

The doctor's impression was of a low back injury of a nonspecific nature. Claimant was sent to Dr. Russo for testing.

Frank I. Russo, M.D., saw claimant and reported his findings in a letter dated September 3, 1981. Claimant denied any significant previous problems with his low back. On examination, the doctor found mild tenderness over the spinous processes of the lower lumbar spine and some tenderness on palpation in the lumbar paraspinal muscles of the right sacroiliac. Range of motion was 75 percent of normal. Back complaints occurred with straight leg raising at 75 degrees on the left and 65 degrees on the right. Reflexes were symmetrical. Electromyography and nerve conduction were normal.

Claimant was next seen by Dr. Sinning on September 17, 1981 and referred to Dr. Campbell. He also was started on physical therapy.

Patrick C. Campbell, M.D., saw claimant on October 1, 1981 and found him suffering from a psychogenic pain disorder including a differential diagnosis of malingering. Apparently in light of claimant's condition appearing to improve and claimant's indicating that he was making progress, no psychiatric intervention was recommended. Dr. Campbell suggested that if improvement should not continue, intense psychiatric evaluation and treatment should be pursued.

Claimant returned to Dr. Sinning on October 15, 1981 and told the doctor physical therapy had been stopped. Claimant had pain with hyperextension of his back. Physical therapy was reinstated and claimant returned for reevaluation on October 29, 1981. Claimant told the doctor that his back was aggravated by lifting and by walking and that he had pain into his right leg. There was some limitation on bending to the left.

Dr. Sinning viewed claimant's myelogram and his CT scan as normal. He agreed that neither the myelogram nor the CT scan can show pain.

On January 14, 1982 claimant said that he had been trying to do some work and some lifting, but that he was having pain across his low back. X-rays were taken to enable comparison on flexion. On this examination Dr. Sinning thought claimant had reached a point of maximum recovery, but at the request of the

claimant he arranged for him to be seen by Dr. Rovine, a neurosurgeon.

Byron W. Rovine, M.D., reported his findings in a letter dated January 26, 1982. He reviewed the myelogram and CT scan and determined that there was nothing in either study which could be compatible with an extruded disc.

On examination claimant's left Achilles was only a trace. Dr. Rovine indicated "a number of factitious findings." The doctor did not find claimant's problems to be organic, but he was unable to determine whether claimant was malingering or whether his symptoms were on a functional or hysterical basis.

Dr. Rovine arranged for claimant to be seen by an internist for heart irregularities and asked him to undertake "a very mild postural exercise program." Zomax and Valium were prescribed.

Claimant was seen for follow-up at which time his complaints were essentially the same. Claimant's mild cardiovascular problems were not found related to or influenced by his back. Claimant's range of motion was normal. Claimant's reflexes were inexplicitly "virtually absent" in all extremities. Again, Dr. Rovine was unable to find clinical evidence of disc protrusion or radiculopathy. The doctor anticipated claimant's making a complete recovery.

When claimant saw Dr. Sinning on March 12, 1982 the doctor discussed with him reports from Drs. Campbell and Rovine. Claimant asked at this time for exploratory surgery. The doctor said his aim was to get claimant back to work and away from his disabled state.

Dr. Sinning obtained a further report from Dr. Campbell dated April 26, 1983 in which the doctor wrote: "It appears that Mr. Moak has a condition not attributable to a mental disorder, but a focus of attention and examination called malingering."

Dr. Sinning met with the rehabilitation specialist. He placed no restrictions on claimant's working and he found no functional impairment. He recommended that claimant either begin work or retraining.

Dr. Sinning saw claimant on May 11, 1983 and found good extension and strength. At claimant's request, arrangements were made for him to be seen in Iowa City as he retained an interest in having surgery. The orthopedic surgeon said that claimant was in the same physical condition in 1983 as he was in 1981. More specifically, note was made of the lack of nerve deterioration, atrophy in the legs, loss of reflexes and normal range of motion without stiffness. Claimant was able to do a "good prompt situp".

In spite of claimant's description to him of an inability to walk while wearing his ironworker's tool belt, Dr. Sinning believed claimant could return to work as an ironworker. He placed no restrictions on claimant, but on a form dated May 14, 1982 he indicated claimant himself could best determine his weight restrictions.

Dr. Sinning said that although claimant's history and claimant's complaints of pain were consistent, the inconsistency in claimant's case occurred when there was no objective evidence of something being wrong.

Thomas R. Lehmann, M.D., orthopedic surgeon who specializes in lower back pain, saw claimant on referral from Dr. Sinning. Claimant gave a history of low back pain coming on after claimant lifted a heavy iron beam. The pain was burning in nature and radiated down both legs being worse on the right than the left. The pain was worsened by walking, coughing and sneezing and decreased by lying on the side. The doctor did not recollect being told of a sudden sharp tearing pain, but he had a letter from Dr. Russo which so indicated.

X-rays, a myelogram and CT scan were reviewed. No evidence was seen of significant deformity, a surgical lesion, a herniated disc or significant bony stenosis. The doctor agreed that those tests would not show a muscle or soft tissue problem.

On examination, claimant had increased low back pain on bending backwards. There was no restriction on straight leg raising. Reflexes in the knee and ankle were equal on both sides which was consistent with claimant's not having a neurological problem. There was no abnormality in sensory testing.

Dr. Lehmann expressed the opinion that claimant had neither muscular nor neurological deficiencies. A five percent permanent partial impairment was assigned based on the doctor's "experience in making similar ratings in the past and the total evaluation of his history, his physical and his radiographic findings." Later the doctor seemed to agree that the rating also was attributable to pain and limitaton of extension of the spine. He acknowledged the rating was based on subjective findings. Dr. Lehmann was unable to rule out the possibility of claimant's problem being either real or psychological or that of a malingerer.

Dr. Lehmann assigned a fifty pound weight limitation and diagnosed chronic disabling low back pain of unknown etiology in a medical sense. Dr. Lehmann did not recommend that claimant return to ironwork nor did he recommend any further treatment.

APPLICABLE LAW AND ANALYSIS

The claimant has the burden of proving by a preponderance of the evidence that the injury of May 18, 1981 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

Claimant seemingly had severe injury to his back in the early 1960's. In 1979 he was hospitalized for back and right lower extremity pain. His Achilles reflex was diminished bilaterally at that time. Prior to his May 1981 fall, claimant had been getting chiropractic treatments for low back pain particularly in the right sacroiliac area.

When claimant was seen by Dr. Willhite after the incident of May 18, 1981, he complained of pain radiating into his left hip and leg. A diagnosis of trouble in the sacroiliac joints was made. A cervical problem was found later in the summer.

Dr. Lee, board certified orthopedic surgeon, found pain and numbness in both legs when he saw claimant in June. He diagnosed a lumbar strain and anticipated claimant's problem would resolve without a functional deficit.

By the time claimant was seen by Dr. Sinning in August, pain had moved to the right leg and into the calf, but not the foot. Claimant had normal range of motion and his troubles seemed to be attributable to muscle tightness. Claimant's x-rays were normal. Dr. Sinning started claimant on physical therapy and claimant stopped it. A myelogram and a CT scan were normal. Dr. Sinning has placed claimant under no restrictions and has found no impairment. On May 11, 1983 claimant's extension was found to be good.

Dr. Russo, physiatrist, did not know claimant had a prior history of back complaints. He found tenderness in the paraspinal muscles of the right sacroiliac. Electrical studies show no evidence of nerve or muscle damage.

One of the differential diagnoses made by Dr. Campbell, psychiatrist, when he saw claimant in October of 1981 was psychogenic pain disorder which he recommended treating with intensive psychiatric evaluation and treatment if claimant failed to improve.

Dr. Rovine, neurosurgeon, noted absence of the Achilles on the left and "a number of factitious findings." Claimant's range of motion was normal.

Dr. Lehmann, orthopedic surgeon, found limitation on extension which produced pain and he assigned an impairment rating.

Claimant's burden is a preponderance of the evidence which means the greater weight of evidence; i.e., the evidence of superior influence or efficacy. Bauer v. Ravell, 219 Iowa 1212, 260 N.W. 39 (1935).

Aspects of claimant's case are perplexing. His complaints of pain have been persistent. By not doing ironwork he is staying from a job which pays a high hourly rate. The sole medical evidence, however, which is supportive of his claim comes from an evaluating physician who saw claimant once and who found an abnormality which has not been present at other times. It is questionable whether or not Dr. Lehmann knew of claimant's prior back complaints.

While some weight can be given to the opinion of Dr. Lehmann, his testimony is outweighed by other medical evidence. Dr. Sinning vigorously has pursued every possible avenue in attempting to help claimant. Claimant has been sent to top notch practitioners in the area of physiatry, psychiatry and neurology. None of those doctors have found a condition related to claimant's injury which resulted in permanent impairment. Claimant has had extensive testing including electrical studies, a CT scan and a myelogram. None of those have revealed abnormalities. Claimant looks healthy and vigorous and has no nerve deterioration, atrophy in the legs or loss of reflexes.

Additionally, claimant had back and right lower extremity pain in 19 9 for which he was hospitalized. Before his fall in May, he had been undergoing chiropractic treatments. His initial treatment after the May incident was for complaints of his left hip and leg. Claimant's subsequent complaints have been of the right side.

Overall, claimant fails in carrying his burden of proving that his injury of May 18, 1981 is a cause of any disability he now may suffer.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant is forty-eight (48) years of age.

That claimant recently has obtained a GED.

That claimant worked as a salesperson while he was in high school.

That claimant's work experience before he commenced iron-

working was as a box maker, shipping clerk and laborer.

That claimant is a journeyman ironworker.

That claimant was injured on May 18, 1981 as he lifted a beam on his job site.

That claimant has done no ironwork since May 18, 1981.

That claimant continues to complain of pain in his back, buttocks and legs which is aggravated by activity.

That claimant underwent a complete vocational evaluation.

That claimant fractured his back in the early 1960's.

That claimant was hospitalized on July 5, 1979 for back and right lower extremity pain.

That claimant had chiropractic treatments for his low back and right sacroiliac pain in March of 1981.

That claimant was treated for pain radiating into his left hip and leg when he was seen in May of 1981.

That when claimant was seen by Dr. Sinning in August of 1981 pain was on the right side.

That electrical studies showed no evidence of nerve or muscle damage.

That claimant had a normal mylegram and normal CT scan.

That claimant has no nerve deterioration, atrophy in the legs or loss of reflexes.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has failed by a preponderance of the evidence to establish that his injury of May 18, 1981 is a cause of disability on which he now bases his claim.

ORDER

THEREFORE, IT IS ORDERED:

That claimant take nothing from these proceedings.

That defendants pay costs pursuant to Industrial Commissioner Rule 500-4.33.

Signed and filed this 1 day of August, 1984.

Judith Ann Higgs
JUDITH ANN HIGGS
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

ESTHER MONTEZ, Claimant, vs. HEINZ, USA, Employer, and LIBERTY MUTUAL INSURANCE COMPANY, Insurance Carrier, Defendants.	File No. 738212 A R B I T R A T I O N D E C I S I O N E 06

INTRODUCTION

This is a proceeding in arbitration brought by Esther Montez, claimant, against Heinz, USA, employer, and Liberty Mutual Insurance Company, insurance carrier, defendants, to recover additional benefits under the Iowa Workers' Compensation Act, for an injury arising out of and in the course of her employment on July 22, 1982. It came on for hearing on June 26, 1984 at the Bicentennial Building in Davenport, Iowa. It was considered fully submitted at that time.

The industrial commissioner's file shows a first report of injury received August 10, 1983.

At the time of hearing the parties stipulated that claimant's injury arose out of and in the course of her employment, that all medical bills have been paid, and that the rate of compensation in the event of an award is $199.58.

The record in this matter consists of the testimony of claimant; claimant's exhibit 1, a letter from F. Dale Wilson, M.D., dated December 2, 1983; defendants' exhibit A, a letter from William Catalona, M.D., dated July 18, 1983; defendants' exhibit B, a monthly report and bill from Dr. Catalona dated June 7, 1983; defendants' exhibit C, a monthly report and bill from Dr. Catalona dated March 28, 1983; defendants' exhibit D, a monthly report and bill from Dr. Catalona dated March 3, 1983; defendants' exhibit E, an operative report from August 3, 1982; defendants' exhibit F, a letter from Dr. Catalona dated August 12, 1983; defendants' exhibit G, a letter from Dr. Catalona dated October 17, 1983; and defendants' exhibit H, a letter from Duane A. Willander, M.D.

ISSUES

The issues in this matter are whether or not claimant is entitled to healing period benefits and permanent partial disability.

STATEMENT OF THE CASE:

Thirty-three-year-old right-handed claimant who is providing support for her three children, testified to being a high school graduate and spending a year at the art institute in Chicago where she studied commerical art. Her work experience prior to beginning work for defendant employer has been primarily as a sales clerk and secretary. Her work for defendant employer commenced in August of 1981.

She recalled the circumstances surrounding her injury on July 22, 1982 thusly: She was inspecting cans by using her hands to tear them down. She had taken a counter reading. As she was crossing the floor, she fell over a pallet and landed on her hands. She reported to her supervisor and then was sent to first aid where her hands and ankle were wrapped.

She then saw Dr. Catalona who also wrapped her hands. Later, on August 3, 1982, he did outpatient surgery on her right wrist. She was able to return to work on August 5, 1982 with a restriction for one-handed work. She was given a can sorter job in which she picked up one can at a time and inspected it for defects.

After about six weeks she was moved to cleanup and then to production.

In February of 1983 the cyst returned when claimant was working on the machine line pulling a bar to move cans into position. She saw Dr. Catalona again who put her back on light duty, drained her hand and then undertook a second outpatient surgery in June of 1983. After five days she was released to return to work. She was not to use her right hand.

174

She was placed back on can sorting which she did until the cans ran out in January of 1984. She then sorted lids until she hurt her shoulder. Because of restriction from the shoulder and hand, she was sent home and was not working at the time of the hearing.

Claimant currently complains of pain on the top of her hand

and wrist which comes on with constant use, lifting or heavy pressure and may last an hour or one or two days; swelling in the top of the hand from heavy use which may last a day; decreased grip and numbness with constant use which may last an hour or a day. She also claimed that she is bothered mentally by her inability to do things she used to do. She noted that writing causes pain. She takes no medication at present. She last saw Dr. Catalona a month and a half prior to the hearing for her shoulder. She denied any other injuries to her hands or shoulders.

Claimant has collected no unemployment.

Medical records show claimant underwent excision of a ganglion cyst on the dorsum of her right wrist on August 3, 1982. Dr. Catalona diagnosed claimant's condition as a strain secondary to hard use at work.

In January of 1983 claimant's cyst was back. It subsequently was removed on June 21, 1983. Claimant was to return to one-handed work on June 27, 1983.

On July 18, 1983 Dr. Catalona wrote: "She seems to have chronic irritation of her tendons by repetitive work which she is required to do. She may very well develop another ganglion cyst since this condition is chronic and very likely to recurrences."

In a letter dated August 12, 1983 Dr. Catalona wrote that claimant had no permanent impairment resulting from excision of the cyst.

When claimant was seen in September, she had very slight fine crepitus on finger flexion and extension. On September 16, 1983 Dr. Catalone noted: "Told her discomfort is related to repetitive use of her hand at work & that if she wishes complete relief she should consider chg. jobs."

F. Dale Wilson, M.D., general surgeon, saw claimant in December of 1983 and took a history of her fall and treatment by Dr. Catalona. Claimant complained of pain over the back of her hand and going up into her forearm, swelling with overusage, some numbness and tingling in the fingers, trouble lifting weight, loss of grip, and inablility to rotate the wrist. She also noted a decrease in activity.

On examination there was tenderness in the center of the scar over the tendons. Sensation was intact. Finger and elbow motions were satisfactory. With motion pain occurred over the dorsum of the wrist and in the extensor tendons of the second and third fingers. Dorsiflexion was 60°; palmar flexion was 65°; lateral movement in was 22°; lateral movement out was 32°; rotation in was 85°; rotation out was 65°. Finger motion, the pinch test and nerves were satisfactory. There was loss of grip strength on the right.

Dr. Wilson diagnosed residual tendonitis of the extensor tendons of the wrist with limited wrist motion and swelling and weakness of hand grip. As restrctions he suggested minimal weight lifting of one to two pounds, minimal push-pulling, minimal rotation, no jerking, and avoidance of repeated trauma. He recommended claimant's employment as an inspector.

Dr. Wilson rated claimant's "functional disability" at thirteen percent of which one and three percent were given to loss of motion in the right upper extremity, two percent to pain and seven percent to weakness in grip strength.

Duane A. Willander, M.D., board certified orthopedic surgeon, examined claimant on February 2, 1984 and took a history of claimant's falling and having a synovial cyst and then a second. Claimant told of moving a box with her left arm and then having pain in her left shoulder.

On examination there was minimal restriction of motion of the right wrist. There was palpable tenderness in the trapezius of the left shoulder and restriction of active motion. There was weakness in grip on the right. Ranges of motion in the right and left wrist were as follows:

	Right	Left
Flexion	60	75
Extension	70	80
Radial Deviation	25	30
Ulnar Deviation	60	60

Dr. Willander expressed the opinion that claimant's condition is not permanent and stationary and that rehabilitation be used to restore her grip and range of motion. Claimant was advised to continue use of her splint.

APPLICABLE LAW AND ANALYSIS

The two issues to be decided in this matter are claimant's entitlement to healing period and her entitlement to permanent partial disability benefits.

Iowa Code section 85.34(1) provides:

> If an employee has suffered a personal injury causing permanent partial disability for which compensation is payable as provided in subsection 2 of this section, the employer shall pay to the employee compensation for a healing period, as provided in section 85.35, beginning on the date of injury, and until the employee has returned to work or it is medically indicated that significant improvement from the injury is not anticipated or until the employee is medically capable of returning to employment substantially similar to the employment in which the employee was engaged at the time of injury, whichever occurs first.

Claimant had surgery on June 21, 1983. She was released for and did return to work on June 27, 1983. She is entitled to healing period for her time off work.

The right of a worker to receive compensation for injuries sustained which arose out of and in the course of employment is statutory. The statute conferring this right can also fix the amount of compensation to be paid for different specific injuries, and the employee is not entitled to compensation except as provided by the statute. Soukup v. Shores Co., 222 Iowa 272, 268 N.W. 598 (1936).

That a worker sustaining one of the injuries for which specific compensation is provided under the statute might, because of such injury, be unable to resume employment and because of his lack of education or experience or physical strength or ability, might be unable to obtain other employment, does not entitle him to be classed as totally and permanently disabled. Id. at 278, 268 N.W. 598.

Where the result of an injury causes the loss of a foot, or eye, etc., the loss, together with its ensuing natural results upon the body, is a permanent partial disability and is entitled only to the prescribed compensation. Barton v. Nevada Poultry Co., 253 Iowa 285, 290, 110 N.W.2d 660 (1961). The schedule fixed by the legislature includes compensation for resulting reduced capacity to labor and earning power. Schell v. Central Engineering Co., 232 Iowa 424, 425, 4 N.W.2d 339 (1942). The claimant has the burden of showing that his ailment extends beyond the scheduled loss. Kellogg v. Shute and Lewis Coal Co., 256 Iowa 1257, 130 N.W.2d 667 (1964).

Larson in 2 Workmen's Compensation, §58 at 10-28 (Desk ed. 1976) discusses the nature of scheduled benefits and points out that "payments are not dependent on actual wage loss" and that they are not "an erratic deviation from the underlying principle of compensation law--that benefits relate to loss of earning capacity and not to physical injury as such." The theory, according to Larson, is unchanged with the only difference being that "the effect on earning capacity is a conclusively presumed one, instead of a specifically proved one based on the individual's actual wage-loss experience."

The Iowa Supreme Court recently has reaffirmed the concept of scheduled member injuries in Graves v. Eagle Iron Works, 331 N.W.2d 116 (Iowa 1983).

Claimant continues to complain of pain, swelling, decreased grip and numbness. Dr. Catalona assigned no permanent impairment rating, but he noted that claimant's condition is chronic and likely to recur. Dr. Willander seemed to feel that the condition was not permanent because rehabilitation could restore claimant's grip and range of motion. It is important to keep in mind that permanent means for an indefinite and indeterminable period. Wallace v. Brotherhood of Locomotive Firemen & Engineers, 230 Iowa 1127, 1130, 300 N.W. 322, 324 (1941). Gardener v. New England Mutual Life Insurance Company, 218 Iowa 1094, 1104, 254 N.W. 287, 292 (1934). Claimant has not been receiving any physical therapy.

Both Drs. Wilson and Willander mentioned weakness, grip strength and loss of motion. The undersigned believes that claimant has some minimal impairment to her hand. Elam v. Midland Mfg., II Industrial Commissioner Report 141 (App. Dec. 1981). See Iowa Code section 85.34(2)(l). There is neither a lack of impairment as Dr. Catalona finds nor an impairment as high as that assessed by Dr. Wilson. Claimant will be awarded six percent of the hand or eleven and four-tenths weeks of permanent partial disability.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant is right-handed.

That claimant commenced work for defendant employer in August of 1981.

That claimant injured her right wrist when she fell on her employer's premises on July 22, 1982.

That claimant had an excision of a ganglion cyst on the dorsum of her right wrist on August 3, 1982.

That claimant returned to work at a one-handed job on August 5, 1982.

That claimant's cyst returned and was again removed on June 21, 1983.

That claimant was released for one-handed work on June 27, 1983.

That claimant's present complaints include pain, swelling,

decreased grip and numbness.

That claimant has loss of grip strength and minimal loss of motion.

That claimant has some permanent partial impairment to her hand.

That claimant is not working at the present time due to a combination of restrictions to both her hand and her shoulder.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has shown entitlement to healing period benefits from June 21, 1983 through June 26, 1983.

That claimant has established permanent partial disability to her hand in the amount of six percent (6%).

ORDER

THEREFORE, IT IS ORDERED:

That defendants pay unto claimant healing period benefits from June 21, 1983 through June 26, 1983 at a rate of one hundred ninety-nine and 58/100 dollars ($199.58).

That defendants pay unto claimant eleven and four-tenths (11 4/10) weeks of permanent partial disability at a rate of one hundred ninety-nine and 58/100 dollars ($199.58).

That defendants pay amounts due and owing in a lump sum.

That defendants pay interest pursuant to Iowa Code section 85.30.

That defendants pay costs pursuant to Industrial Commissioner Rule 500-4.33.

That defendants file a final report in sixty (60) days.

Signed and filed this 6 day of July, 1984.

JUDITH ANN HIGGS
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

RONALD E. MORTENSON,	:	
Claimant,	:	FILE NO. 704962
	:	R E V I E W -
vs.	:	R E O P E N I N G
JOHN MORRELL & COMPANY,	:	D E C I S I O N
Employer,	:	SEP 20 1984
Self-Insured,	:	
Defendant.	:	IOWA INDUSTRIAL COMMISSIONER

This is a proceeding in review-reopening filed by the claimant, Ronald E. Mortenson, against John Morrell & Company, his employer and holder of a certificate of self-insurance, as contemplated by section 87.11, Iowa Code, to recover additional benefits under the Iowa Workers' Compensation Act by virtue of an admitted industrial injury which occurred on April 2, 1982. This matter was heard in the courthouse at Storm Lake, Iowa on March 22, 1984 and was considered as fully submitted on April 19, 1984 commensurate with the filing of the defendant's brief and argument.

The record in this matter consists of the live testimony of the claimant, his spouse and Clarence Tuininga, together with the testimony of Dr. Charles B. Carignan, Jr., M.D., claimant's current attending physician, together with claimant's exhibits 1 through 5 and 8 through 11 inclusive. The answers to the interrogatories filed by the defendant are made a part of these proceedings as well as the evidentiary depositions of Albert D. Blenderman, M.D., Brian R. Ford, M.D., and Ronald L. Linscheid, M.D.

The parties stipulated that the claimant's weekly rate of entitlement shall be $247.74 per week in the event of recovery. The parties further stipulated that the transportation expenses incurred by the claimant will be paid and that the medical bills introduced by the claimant through his exhibits 8 through 11 are fair and reasonable.

There is sufficient credible evidence contained in the undersigned's notes to support the following statement of facts:

Claimant, 47 years of age, married with two dependent children, has been an employee of the defendant since 1966. Claimant testified that he underwent surgery for carpal tunnel syndrome at the Mayo Clinic in 1977 following a 1976 work related episode. This occurrence was handled under the group accident and health policy and the claimant accepted vacation benefits in substitution of his time away from work during the pendancy of his healing period following the 1977 surgery. Claimant also sustained a traumatic injury in 1979 resulting in a week's hospitalization.

Claimant became a patient of Allan Techacek, M.D., who released him to return to employment on September 26, 1982 at which point claimant's benefits for total temporary disability were discontinued. Defendant suspended operations at its plant during this time frame and sent the claimant to Brian R. Ford, M.D., who arranged for referral of the claimant to the Mayo Clinic where on December 9, 1982 Ronald L. Linscheid, M.D., performed a decompression of the median nerve in claimant's proximal forearm. Claimant was discharged as having reached a point of maximum recovery following the surgery on January 24, 1983. Claimant testified that he sought employment opportunities thereafter and accepted a position with a parking lot maintenance firm in Spirit Lake in March of 1983, but that he was unable to perform the work assigned due to the vibrations he experienced as a sweeper truck operator. Defendant reopened its operations in August of 1983 and, based upon seniority, claimant was recalled to resume employment which at the time of the hearing he was performing. Claimant testified that he has exercised his bumping privileges and seeks duties at the defendant's place of business that he is in a position to perform. Claimant finds that he is unable to clean the rails as part of his new duties as a member of the night clean-up crew due to the physical requirements of having to work overhead. Claimant further testified that since his surgery he has felt the need for additional medical care and has become a patient of Dr. Carignan. Defendant, in its brief, suggests that the claimant's claim for permanent partial disability is restricted to 10 percent of his right upper extremity. Claimant suggests that his disability extends into the shoulder entitling the claimant to consideration of an impairment to the body as a whole. Therein appears to be the cutting issue in this matter.

The evidentiary deposition of Dr. Brian Ford indicates that prior to surgery the claimant was having substantial difficulty with his right upper extremity. Dr. Ford makes no mention in his deposition or in his reports concerning neck or shoulder problems. However, the operating surgeon at Mayo Clinic, Dr. Linscheid, testified that complaints were made by the claimant concerning constant chronic pain in the shoulder area. Dr. Linscheid expressed the opinion that there was no impairment of the shoulder area.

Dr. Ford's assessment of a 32 percent impairment indicates the presence of some difficulty. Claimant's voluntary activities since his return to work and his attempt to seek lighter duty with the defendant accepting a 20 percent reduction in wages indicates to the undersigned that there does exist a chronic pain in his left shoulder. The testimony of Dr. Carignan who testified live and whose medical opinion is given the greater weight in these proceedings, based upon his physical findings, indicates a limitation of abduction and internal rotation resulting in a 15 percent functional impairment of the body as a whole. Dr. Carignan also testified that the claimant is on a regularly scheduled therapy program at the Dickinson County Memorial Hospital at his direction. It is apparent that the claimant requires this therapy so as to enable him to continue in his duties for the defendant employer.

The claimant has the burden of proving by a preponderance of the evidence that the injury of April 2, 1982 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

In applying the foregoing legal principles to the case at hand, it is clear that the claimant has sustained the burden of proof by establishing that his current medical abnormality is causally related to the work episode of April 2, 1982 which is under review. It is further clear, based upon the foregoing, that the claimant's disability extends up beyond his upper extremity and into the shoulder thereby requiring a determination of the claimant's impairment of the body as a whole.

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

The opinion of the supreme court in Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963) cited with approval a decision of the industrial commissioner for the following proposition:

> Disability * * * as defined by the Compensation Act means industrial disability, although functional disability is an element to be considered . . . In determining industrial disability, consideration

may be given to the injured employee's age, education, qualifications, experience and his inability, because of the injury, to engage in employment for which he is fitted. * * * *

This claimant, age 47, commensurate with his voluntary reduction of 20 percent in wages and in continuing his employment with the assistance of physical therapists has established that he has a functional impairment of 15 percent of the body as a whole. Based upon the foregoing legal principles, it is found that the claimant has sustained an industrial disability of 25 percent of the body as a whole. Therefore, after taking into consideration all of the credible evidence contained in this record into account, the following findings of fact are made:

1. That this agency has jurisdiction of the persons and the subject matter.

2. That the claimant sustained an admitted industrial injury on April 2, 1982.

3. That the claimant sustained a carpal tunnel syndrome in 1976.

4. That the claimant was hospitalized for a week due to trauma due to work connected trauma in 1979.

5. That the claimant has a functional impairment of 15 percent of the body as a whole.

6. That the claimant has, through his bumping privileges, sought and obtained lighter duty.

7. That claimant's voluntary change in employment duties has resulted in a 20 percent reduction in his wages. That the claimant has sustained an industrial disability of 25 percent of the body as a whole.

8. That the claimant was unable to perform acts of gainful employment from June 3, 1982 to and including January 23, 1983 for a period of 33 3/7 weeks.

THEREFORE, IT IS ORDERED that the defendant pay the claimant a period of temporary total disability beginning on June 3, 1982 and ending January 23, 1983 or a period of thirty-three and three-sevenths (33 3/7) weeks at the stipulated weekly rate of two hundred forty-seven and 74/100 dollars ($247.74). Defendant will receive credit for those voluntary payments previously made.

IT IS FURTHER ORDERED that beginning on January 24, 1983 defendant pay claimant a period of one hundred twenty-five (125) weeks permanent partial disability at the stipulated rate of two hundred forty-seven and 74/100 dollars ($247.74) together with statutory interest from the date due.

IT IS FURTHER ORDERED that the defendant pay the following medical expenses:

Kenneth D. Van Wyk, L.P.T.	$170.00
Dickinson County Memorial Hospital	92.00
Dr. C. B. Carignan, Jr., M.D.	151.00
Joe Borge Bak, D.C.	33.00

Costs in accordance with the Iowa Industrial Commissioner Rule 500-4.33 are charged to the defendant.

Defendant is ordered to file a current activities report in twenty (20) days from the date of this proceeding.

Signed and filed this 28 day of September, 1984.

HELMUT MUELLER
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

WILLIAM A. NUNEMANN, Claimant, vs. TONE BROTHERS, INC., Employer, and ST. PAUL FIRE AND MARINE INSURANCE COMPANY, Insurance Carrier, Defendants.	File No. 685768 A P P E A L D E C I S I O N

STATEMENT OF THE CASE

Claimant appeals from a proposed decision in review-reopening wherein claimant was awarded benefits based upon a finding of a five percent industrial disability. The record on appeal consists of the transcript of the review-reopening proceeding; claimant's exhibits 1 through 12, 14 through 18, and 20 through 23; the depositions of claimant, Robert J. Foley, M.D., and David J. Wilson, D.O. (a duplicate of claimant's exhibit 7); and the briefs and filings of the parties.

ISSUES

Appellant states the issues on appeal as:

1. An award of five percent industrial disability does not fairly compensate William Nunemann for the effects this injury has upon his earning capacity, and is not supported by the record.

2. The deputy industrial commissioner's finding of fact that William Nunemann has no permanent partial impairment is not supported by the record.

3. Strong policy considerations require that in arriving at an award of industrial disability, the deputy industrial commissioner must compensate the claimant fairly for the future and not simply for the present state of the injury.

4. It was error for the deputy industrial commissioner to unduly emphasize the fact that the employer retained William Nunemann in its labor force when arriving at the industrial disability award.

REVIEW OF THE EVIDENCE

The parties stipulate that the rate of compensation is $188.86 per week. (Transcript, page 3) They further agree that the wage differential between claimant's former and present jobs is $.62 less per hour. (Tr., p. 49)

Claimant was 56 years old at the time of the hearing. He is married and has three children. (Tr., p. 6) Claimant quit high school in the eleventh grade and has had no subsequent training or formal education. He served in the army with the paratroopers for two years and has worked primarily in general labor occupations that require lifting and physical strength. He has also worked as a cook and a rag processor in a woolen mill. (Tr., pp. 18-20) Most of claimant's previous jobs paid minimum wages. (Tr., p. 38) In February of 1970 claimant began working for defendant employer as a mill operator. (Tr., pp. 8, 21) Claimant testified his job was to assemble the mill parts, weigh the spice product, and pour it in the hopper for mixing or grinding. His duties included driving a forklift to move loaded bins of 1200-1300 pound weights from one point in the processing to another. (Tr., pp. 21-22) Claimant was the working foreman in the mill room and was responsible for overseeing the work and keeping talley reports. (Tr., pp. 34-35)

On October 29, 1981 claimant was loading bags of white pepper on the forklift. As he lifted a 180 pound bag to pour the pepper, he felt a pain on his right side in the groin area. (Tr., pp. 9-11) Claimant testified he finished pouring the bag and reported the injury to his foreman. He was then sent to the office and an appointment was made to see Robert J. Foley, M.D. (Tr., pp. 11-12) Dr. Foley's diagnosis was right inguinal hernia. (Foley Deposition, p. 4) Claimant then saw his own doctor, Richard W. Evans, D.O., and was admitted to Des Moines General Hospital on November 9, 1981. (Tr., p. 12; Claimant's Exhibit 14)

On November 13, 1981 a right inguinal herniorrhaphy was performed by David J. Wilson, D.O. (Cl. Ex. 14) Claimant was seen in followup through November and December of 1981 and was released to return to work on January 18, 1982. (Cl. Exs. 3, 14) Following examination by Dr. Foley, it was recommended that since claimant had suffered previous hernias, a permanent weight restriction of 50 pounds be imposed. (Cl. Ex. 9) Claimant's answers to interrogatories indicate he suffered a compensable double hernia injury in 1968 while working for a different employer. (Interrogatory #7) Claimant testified that he had

surgery following the injury and returned to his regular work duties without restrictions. (Tr., pp. 15-16) A work qualification form dated February 2, 1970 indicates claimant was examined for employment with defendant employer and was found to be physically qualified to work. (Cl. Ex. 22)

Claimant testified that he returned to his old job in the mill room in January 1982 but was told by his supervisors he could no longer do his former work due to the 50 pound weight restriction. (Tr., p. 23) Claimant was given a dexterity test and then told he would have to go on the line in the packing room. Claimant stated he made $.62 an hour less on the new job. (Tr., pp. 23-25) Claimant testified the fast, steady pace of the line caused pain in the area of the hernia, particularly with lifting and bending activities. (Tr., p. 26) He was again seen by Dr. Wilson in April of 1982 with a complaint of pain in the right inguinal area. (Cl. Ex. 3) Dr. Wilson believed the discomfort in the area was aggravated by long periods of standing or lifting and recommended that claimant be limited to light duties for an additional 30-60 days. (Cl. Ex. 3) Claimant testified he bid on a job as a logo labeler and has been working in the labeling department ever since. His duties involve labeling bottles and boxes, packing, and lifting boxes of between 30-60 pounds. (Tr., pp. 7-8, 27, 44) Claimant stated he had been satisfied with his old job and testified he would go back to milling but for the weight restriction. (Tr., p. 45) He bid on a forklift driving job, but there was a 110 pound weight restriction on it. (Tr., p. 28) Claimant stated that with the weight restriction placed on him, there were no better jobs he could do. (Tr., p. 45)

Dr. Wilson reported in February of 1983 that he was unable to determine a physical impairment rating on claimant:

> As you know, the guides to evaluation of permanent impairment, published by the American Medical Association and disability evaluation in the Social Security handbook for physicians, neither give guidance as to the area of inpairment [sic] rating. For this reason, I am unable to place a numerical value on the extent of Mr. Nunemann's physical impairment. However, I am aware of the fact that his job has required him to do a great deal of heavy lifting, and I can easily state that a second hernia such as Mr. Nunemann has suffered will significantly affect his ability to undertake this type of work. (Cl. Ex. 1)

Dr. Wilson noted that claimant had a previous inguinal repair, and the incidence of a recurring inguinal hernia increased the likelihood of future difficulties if claimant continued heavy lifting duties. Dr. Wilson recommended a permanent weight restriction of no more than 20-30 pounds of lifting. (Cl. Ex. 1) Dr. Foley testified by deposition that the two hernias claimant has experienced have contributed equally to his present restriction. (Foley Dep., p. 9) Dr. Foley found that claimant had no permanent defect other than "an increased likelihood of developing another hernia in the future should he continue to do heavy lifting." (Foley Dep., p. 10)

Claimant testified that since his October 1981 injury he is unable to do the work at home that he once did. He cited an example of now finding it difficult to change a tire because of the lifting involved. He also no longer chops wood for his fireplace. (Nunemann Dep., pp. 27-28) Claimant stated that when he has pain in the area of the injury, he takes Tylenol and hot showers after work and relaxes until the pain goes away. (Tr., p. 32)

APPLICABLE LAW

The claimant has the burden of proving by a preponderance of the evidence that the injury of October 29, 1981 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

An injury is the producing cause; the disability, however, is the result, and it is the result which is compensated. Barton v. Nevada Poultry Co., 253 Iowa 285, 110 N.W.2d 660 (1961); Dailey v. Pooley Lumber Co., 233 Iowa 758, 10 N.W.2d 569 (1943).

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

Industrial disability may be awarded in a case where the claimant has no apparent functional impairment but is precluded from performing his prior job, if the situation results in a probable reduction of earning capacity. Blacksmith v. All-American, Inc., 290 N.W.2d 348 (1980).

ANALYSIS

Claimant argues on appeal that his work injury has resulted in a permanent partial impairment. He contends that the lifting restrictions imposed as a result of the injury have resulted in decreased earnings and will impede future employment opportunities. In addressing this question, the distinction between impairment and disability must be noted. A permanent impairment is a medical condition resulting in a functional abnormality or loss, as determined by a physician. It is an objective measurement of function and does not consider factors of age, sex or employability. A permanent disability is not a purely medical condition but represents an actual or presumed reduction in ability to engage in employment because of impairment, which may or may not be combined with consideration of other factors.

In the instant case, there is no medical evidence of a functional impairment. Neither Dr. Wilson nor Dr. Foley determined that claimant was permanently physically impaired as a result of the hernia injury: Dr. Wilson was unable to assign an impairment rating to claimant, and Dr. Foley found no indication of a "permanent defect."

However, as a result of the work injury, lifting restrictions have been recommended, not because claimant is physically unable to lift, but as a preventative measure to subsequent reinjury. It was this restriction which caused the claimant to be transferred to other employment and formed the basis of the deputy's finding of industrial disability. The court in Blacksmith, 290 N.W.2d 348, indicated that the loss of earnings caused by job transfer for reasons related to work injury justified a finding of industrial disability. Because claimant should not lift in excess of 20-30 pounds, as recommended by the treating physician, he has been transferred to a light duty job which pays less than his former work in milling. Thus the lifting restriction has resulted in an actual loss of earnings for claimant, and an analysis of industrial disability factors is proper.

Claimant suggests that the fractional amount of this earnings loss (approximately eight percent) should translate into an equivalent percentage of industrial disability. Earning loss is only one factor considered in arriving at a rate of industrial disability. In determining the degree of disability, the deputy correctly weighed considerations of claimant's present job and wages, his age, education and work experience and found that claimant had incurred a five percent industrial disability. Claimant's contention that his award was decreased as a reward to defendant employer for providing work within claimant's lifting restrictions is a misconstruction of the effect of continued earnings upon compensation benefits. If, in a circumstance where there is no permanent functional impairment following a work injury, the employee continues to work and receive wages, the impact of the injury on the worker in terms of lost earnings is necessarily diminished, and the extent of the industrial disability is lessened. In that sense, the employer benefits from its efforts to retain the employee. Review of the language of the proposed decision finds the deputy's analysis of the factors in the claim to have been appropriate and without undue emphasis on the actions of defendant employer.

Claimant's final issue on appeal concerns the question of a compensation award that encompasses future events. Claimant has been fully and justly compensated for the disability as determined by the evidence presented. Should claimant incur subsequent injury due to work activities, or should he lose his employment as a result of his lifting restrictions, he may apply for the opportunity to present evidence in support of a change in his award. Claimant has asserted that employment termination by defendant employer after the expiration of Iowa Code section 85.26(2) is a realistic possibility. There is no evidence in the record to support this assertion, and benefits cannot be awarded on the basis of unsubstantiated predictions of employer conduct once the jurisdictional time period of this agency has elapsed.

FINDINGS OF FACT

1. Claimant is 56 years old and has completed ten years of formal schooling.

2. Claimant's work experience has been in minimum wage, general labor positions.

3. Claimant sustained a hernia injury on October 29, 1981 while engaged in work activity for defendant employer.

4. Claimant's injury was repaired and he returned to work.

5. Claimant had previously suffered a hernia injury while employed elsewhere.

6. Claimant has lifting restrictions of 20-30 pounds to prevent re-injury.

7. Claimant has no functional impairment as a result of the work injury.

8. Claimant was re-assigned to a light duty job within his lifting restriction.

9. Claimant's transfer resulted in an hourly wage loss of $.62.

10. Claimant has incurred a five percent industrial disability as a result of his injury and subsequent lifting restrictions.

11. Claimant's rate of compensation is $188.86 per week.

CONCLUSIONS OF LAW

WHEREFORE, claimant has sustained his burden of proof that he incurred a work-related injury which resulted in an industrial disability of five percent. Claimant has failed to sustain his burden of showing that he sustained a permanent impairment as a result of the work injury.

THEREFORE, the proposed decision of the deputy is affirmed.

ORDER

WHEREFORE, defendants are hereby ordered to pay weekly compensation benefits unto claimant for a period of twenty-five (25) weeks at the rate of one hundred eighty-eight and 86/100 dollars ($188.86) per week, accrued payments to be made in a lump sum together with statutory interest to begin as of the date of this decision.

Costs of this action are taxed against defendants.

Defendants are to file a final report upon completion of payments.

Signed and filed this 28th day of September, 1984.

IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in review-reopening brought by Kent Odekirk, claimant, against Wilson Foods Corporation, self-insured employer, defendant, to recover additional benefits under the Iowa Workers' Compensation Act for an injury arising out of and in the course of his employment on October 21, 1981. It came on for hearing on August 10, 1984 at the Iowa County Courthouse in Marengo, Iowa. It was considered fully submitted at that time.

The industrial commissioner's file shows a first report of injury received July 20, 1982. On August 10, 1982 a memorandum of agreement was received. A final report shows the payment of healing period benefits and weekly benefits totaling nine percent of the right upper extremity.

At the time of hearing the parties stipulated to a rate in the event of an award of $261.70.

The record in this matter consists of the testimony of claimant; claimant's exhibit 1, report expense from Leland G. Hawkins, M.D.; claimant's exhibit 2, medical report expense from David C. Naden, M.D.; claimant's exhibit 3, reports from John R. Walker, M.D., and James E. Crouse, M.D.; claimant's exhibit 4, a report with accompanying documents from Richard F. Neiman, M.D.; claimant's exhibit 5, medical records from Dr. Naden; claimant's exhibit 6, hospital records from an admission of January 4, 1982; claimant's exhibit 7, hospital records from a hospital admission of May 13, 1980; claimant's exhibit 8, a deposition of Dr. Walker; claimant's exhibit 9, report expenses from Dr. Walker; defendant's exhibit A, records from Dr. Hawkins; defendant's exhibit B, a report from Dr. Neiman; defendant's exhibit C, records from an electro-physiologic analysis; defendant's exhibit D, records from Dr. Naden; defendant's exhibit E, a report from Dr. Crouse; defendant's exhibit F, records from a hospital admission of January 4, 1982; and defendant's exhibit G, records from a hospitalization of May 13, 1980.

ISSUES

The sole issue in this matter is whether or not claimant is entitled to further permanent partial disability benefits.

STATEMENT OF THE CASE

Thirty-one year old right-handed married claimant, father of seven children who has completed high school and two years of college, commenced work for defendant on September 10, 1979. His first task was cutting out eyelids in the hog kill. He moved to cutting off tainted meat from condemned heads.

In May of 1980 he had surgery in his right wrist area which was performed by Dr. Naden, resulting in a W-shaped scar from his wrist about five inches up the arm and keeping him off work for five to six weeks. He was sent to popping kidneys--work which did not entail the use of a knife. His arm remained sore in this period.

In November of 1980 he began ham boning which he described as follows: Hams are on a conveyor. When a ham is taken off the belt, the fat is removed using a knife in the right hand. The ham is rolled over. The knife then is used to separate the ham into three pieces. After two weeks on ham boning claimant was shifted to skinning hams which he did off and on in alteration with ham boning depending on where he was needed.

He noted the beginning of trouble with swelling in his right forearm in the scar area. His elbow hurt. His hand began to go numb. He saw the company doctor who sent him to Dr. Hawkins who did an EMG. He returned to work but he continued to have numbness, pain and loss of grip.

Surgery was done on January 5, 1982. Subsequent to the operation he still had loss of strength, numbness and an inability to straighten his arm. After being off six months, he went back to ham boning which he was able to do. After a week's work, claimant entered the hospital for forty-two days of treatment for an unrelated condition.

When claimant returned to work he went to the sausage department where he helped pack bologna, hot dogs and lunch meat for four months. He was able to do this work and he was bothered only by heavy lifting. He tried to go back to ham boning, but he had trouble with his elbow and his grip gave out. Eventually, he was restricted from ham boning by his doctor. Claimant said he was having trouble with both reaching and straightening out his arm. It was necessary for him to move his entire body to reach.

Claimant was placed on the belly vat packing hams where he was to hang hams on a tree to be moved to the smokehouse. Claimant testified he was unable to do the work because he could not extend his arms; therefore, he was medically released from the department.

Claimant's next position was back on the kill floor removing tainted meat from condemned heads. He was able to do the work for a time, but he had pain in his elbow which shot to his hand and also to his shoulder. Additionally, he experienced numbness and weakness.

He moved to dropping bungs--work which he did from May of 1983 to November of 1983. He related: A hog comes down the conveyor. A knife with a ten inch blade is used to cut out the anus by making three cuts. Claimant felt weakness in the arm and elbow. Claimant was able to do the work when the chain was moving at a slower pace, but when it was speeded up, he was unable to keep pace.

Claimant asserted that he grew tired of being in pain all the time. In November of 1983 a job was posted in dry salt which claimant signed for. A majority of the time he is using a hose to clean up equipment to get it ready for government inspection each day. For a brief period each six months he trims beef, a job he attempts to avoid. Claimant expressed the feeling that he has a good job which he likes.

Claimant characterized his arm as fifty percent better; however, he still has problems with it when he uses it for strenuous work. He has numbness from his elbow up into his shoulder and down into his hand. He experiences loss of grip and loss of strength. He had none of these troubles before his elbow difficulties developed.

Claimant acknowledged ability to participate in some sporting activities including bowling with a tournament placement. Claimant claimed he bowls from his shoulder rather than his arm and that he does not bowl without pain.

Claimant differentiated between the examination he had by Drs. Walker and Hawkins. Dr. Walker was seen in November of 1983 at which time claimant was working at dropping bungs. Dr. Walker used instruments to measure both his motion and his strength. He took x-rays and spent forty-five to sixty minutes in his examination.

Dr. Hawkins saw him on February 27, 1984. He shook claimant's hand and inquired about his health. He held claimant's arm in

the air and told him he was going to take x-rays. Claimant estimated the time of his examination at three minutes. No instruments were used to measure motion. His reflexes were not checked. He denied that the doctor took the history shown in his notes and denied that they discussed his present job. Claimant was unable to remember what he had told the nurse. Claimant asserted that he was sensitive in his scar area at the time of Dr. Hawkins' examination.

David C. Naden, M.D., saw claimant on April 25, 1980 at which time he had tendonitis of the extensor tendon of the thumb, wrist and dorsum of the right forearm. The doctor recommended at that time moving claimant to a different job and waiting three to six months to see what happened.

Claimant returned on May 5, 1980 with redevelopment of inflammation of the synovial tissue of the extensor mechanism of the right forearm.

Claimant was admitted to the hospital on May 13, 1980 with significant swelling and crepitation with dorsiflexion and extension of the right thumb. There was inflammation of the extensor carpi radialis longus and brevis. Dorsiflexion and plantar flexion in the wrist were restricted. Dr. Naden performed a synovectomy and exploration of the dorsal wrist area and release of the first dorsal compartment fiberosseous sheath along with removal of an accessory tendon and septum.

Claimant was seen postoperatively and in early June he was placed in a splint. Claimant was released to return to work on June 23, 1980.

Dr. Naden saw claimant on November 2, 1981 following an acute flare-up of tendonitis. Claimant also complained of intermittent numbness in the ulnar distribution of the right hand. A different job was suggested.

On August 26, 1982 Dr. Naden evaluated claimant's impairment at five percent of the right hand. Claimant's wrist flexion was 40/80; his extension, 70/80; and his grip, 70 or 80/100. Claimant was mainly concerned at this time with loss of motion and weakness in his hand and wrist.

Leland G. Hawkins, M.D., saw claimant on November 25, 1981 at which time claimant reported having numbness in his right little and ring fingers for about a year, as well as a twenty pound grip differential between the right and left hand. He told the doctor of swelling in the area of his incision. On examination, no sensory loss was found. Claimant had good function of the tendons. Electromyography was ordered.

Claimant was found to have an ulnar neuropathy at the elbow level. Claimant was admitted to the hospital on January 4, 1982. The following day an anterior transposition with medial epicondylectomy was done.

Claimant was taken out of his sling in late January and started on elbow exercises in early February. Later biceps and triceps exercises were added. Claimant had continuing inability to straighten his elbow. X-rays were taken on March 26, 1982 which were interpreted as showing new bone formation like a myositis ossificans over the medial epicondyle.

When claimant was released for work, he was instructed to return to a job which would not require complete extension.

Claimant was referred for electrophysiology which was carried out on November 15, 1982. That testing was assessed as showing "[m]ild to moderate right ulnar neuropathy at elbow level without evidence for deterioration when compared to the prior study in December 1981, and with some evidence of improvement by EMG." A second interpretation was "[n]o conclusive evidence for right carpal tunnel syndrome with only one minimal abnormal value, namely the median distal motor latency."

In a letter dated December 7, 1982 Dr. Hawkins wrote:

> If you evaluate the function of loss of motion that he has in his elbow, the ossification over the medial joint line, you would obtain about a 5 percent disability on the elbow region and the ulnar nerve and then if you were to add the loss of sensation in the hand and weakness that the patient has, one would bring this loss up to about 11 percent of the extremity as measured at the elbow. This would be my disability rating for this patient.

Dr. Hawkins last saw claimant on February 27, 1984. He noted that claimant was working with a hose rather than a knife. He found full extension and flexion of the hand, full flexion of the upper extremity, a seven to ten degree deficiency in extension and full pronation and supination. His gross grip was equal and his reflexes were "fine." The doctor gave claimant a four percent permanent impairment rating for loss of motion which he increased ten percent to allow consideration of claimant's continued fatigue and sensitivity.

Albert R. Coates, M.D., saw claimant on February 14, 1983 for an evaluation. Claimant complained of difficulty extending his arm and weakness in the arm. Claimant was described as having fair intrinsic function, good sensation in the hand and forearm and mild diffuse weakness of grip and pinch on the right. Passive range of motion was 27 to 135 degrees in the right elbow and 0 to 62 degrees in the right wrist. Dr. Coates' rating was 14 percent of the right arm.

In a letter dated March 15, 1983 Dr. Coates explained that his "14 percent was a total impairment, hence any previous permanency that he [claimant] derived from this injury should be deducted from this."

Richard F. Neiman, M.D., examined claimant on July 6, 1983 and took a history of difficulty beginning as a lump in the forearm which was diagnosed as tendonitis and treated surgically. After that claimant had surgery for an ulnar nerve block. Claimant complained of numbness and weakness.

On examination, there was some weakness in the triceps. Dr. Neiman found no evidence of ulnar neuropathy or carpal tunnel compression.

John R. Walker, M.D., board certified orthopedic surgeon, saw claimant on November 3, 1982 and took a history of claimant's beginning to develop swelling in his right wrist, numbness in his right hand and swelling and numbness over the forearm in April of 1980. He reported that Dr. Naden removed a cystic type of lesion and rated claimant's permanent partial disability at five percent of his hand. Post surgery, claimant had worsening of the numbness and loss of grip. In October of 1980 claimant had trouble handling his knife.

In October of 1981 an EMG was done. An operation was performed in January of 1982 and thereafter claimant was unable to extend his arm. He had physical therapy post surgery. Claimant returned to work in the sausage department, but his elbow hurt with lifting and his whole hand began to get numb.

Claimant complained of an inability to fully straighten his elbow, swelling over his scar, frequent numbness in the right hand and poor grip on the right.

On examination, claimant's blood pressure was slightly elevated. The reflexes of the upper extremity were not physiological with the left triceps more active than the right. The Tinel sign was markedly positive which Dr. Walker said was a sign of nerve irritation. Percussion caused pain, numbness and tingling radiating down the forearm and into the hand. Claimant lost fifteen degrees of extension. His grip was 70 on the right and 110 on the left.

X-rays of the right wrist were normal. There was a calcification behind the medial epicondyle.

Dr. Walker concluded claimant had an ulnar nerve neuritis on the right and a residual problem with scarring in the area of the flexor tendon of the wrist in the forearm and above the wrist. The doctor assigned an impairment rating of 27 percent of the right upper extremity. The doctor prescribed vitamin B.

Claimant was seen on January 17, 1983 by Dr. Crouse who felt claimant had carpal tunnel syndrome and needed further surgery. Dr. Walker was unsure whether Dr. Crouse thought the nerve involved in the carpal tunnel was the median or the ulnar.

On November 2, 1983 claimant returned with complaints of an inability to straighten his right elbow, swelling over his incisional area, right elbow pain which increased with twisting and lifting or straining and increased numbness of the right hand. Claimant's numbness had increased and localized to two little fingers and the long finger on the right hand. Claimant reported quitting the ham boning operation.

On examination, claimant's grip was 64 on the right and 82 on the left. Claimant had minimal restriction of flexion and extension of his right wrist with subjective numbness in the ulnar aspect of the right hand. Tips of the ulnar fingers were numb and painful. Dr. Walker felt this was a little increase in the ulnar nerve problem. Claimant's reflexes had improved to the point where they were equal and active.

The physician raised claimant's impairment from 27 to 29 percent and agreed the increase was on the basis of subjective complaints. Dr. Walker suggested continuing vitamin B. He did not advise carpal tunnel surgery. He thought there was "very good possibility" that claimant had some entrapment of the median and possibly the ulnar nerve.

James E. Crouse, M.D., reported his findings in a letter dated January 17, 1983. Among claimant's complaints at that time were inability to fully extend the right elbow, discomfort in the medial aspect of the right elbow, numbness in the right hand, and weakness in the right upper extremity.

Claimant's elbow was tender. Range of motion was minus 28 degrees extension and 140 degrees flexion. There was tenderness in the area of the elbow scar. Grip strength was slightly decreased on the right. There was no atrophy; reflexes were brisk. Both the Phalen's and Tinel's were positive. There was swelling in the area of claimant's first surgery.

Dr. Crouse concluded a carpal tunnel release would relieve numbness in the hand and weakness of the grip. Using the orthopedic manual and based on limitation of elbow motion, tenderness about the elbow and numbness in the upper extremity, he assigned a rating of "approximately 15% of the upper extremity."

APPLICABLE LAW AND ANALYSIS

The sole issue in this matter is claimant's entitlement to permanent partial disability benefits resulting from his October 21, 1981 injury.

The right of a worker to receive compensation for injuries sustained which arose out of and in the course of employment is statutory. The statute conferring this right can also fix the amount of compensation to be paid for different specific injuries, and the employee is not entitled to compensation except as provided by the statute. Soukup v. Shores Co., 222 Iowa 272, 268 N.W. 598 (1936).

That a worker sustaining one of the injuries for which specific compensation is provided under the statute might, because of such injury, be unable to resume employment and because of his lack of education or experience or physical strength or ability, might be unable to obtain other employment, does not entitle him to be classed as totally and permanently disabled. Id. at 278, 268 N.W. 598.

Where the result of an injury causes the loss of a foot, or eye, etc., the loss, together with its ensuing natural results upon the body, is a permanent partial disability and is entitled only to the prescribed compensation. Barton v. Nevada Poultry Co., 253 Iowa 285, 290, 110 N.W.2d 660 (1961). The schedule fixed by the legislature includes compensation for resulting reduced capacity to labor and earning power. Schell v. Central Engineering Co., 232 Iowa 424, 425, 4 N.W.2d 339 (1942). The claimant has the burden of showing that his ailment extends beyond the scheduled loss. Kellogg v. Shute and Lewis Coal Co., 256 Iowa 1257, 130 N.W.2d 667 (1964).

Larson in 2 Workmen's Compensation, §58 at 10-28 (Desk ed. 1976) discusses the nature of scheduled benefits and points out that "payments are not dependent on actual wage loss" and that they are not "an erratic deviation from the underlying principle of compensation law--that benefits relate to loss of earning capacity and not to physical injury as such." The theory, according to Larson, is unchanged with the only difference being that "the effect on earning capacity is a conclusively presumed one, instead of a specifically proved one based on the individual's actual wage-loss experience."

The Iowa Supreme Court recently has reaffirmed the concept of scheduled member injuries in Graves v. Eagle Iron Works, 331 N.W.2d 116 (Iowa 1983).

Claimant's impairment is to his dominant extremity. He continues to complain of difficulty from his elbow up into his shoulder and down into his hand. He claims loss of grip strength.

In assessing the amount of claimant's permanent partial disability, it is necessary to decide what weight is to be given to the ratings of Dr. Hawkins, Coates, Walker and Crouse.

Dr. Hawkins might under some circumstances be entitled to greater weight because of his familiarity with claimant's condition over the course of his treatment. Dr. Hawkins did the more recent evaluation of claimant and his assessment was made after claimant moved to the dry salt area where he was working with a hose rather than a knife. The doctor's rating was ten percent.

Dr. Coates did an evaluation in which he measured both grip strength and range of motion. He arrived at a rating of fourteen percent and indicated that any previous permanency should be deducted.

Dr. Walker evaluated claimant on two occasions. His history was slightly inaccurate based on Dr. Hawkins' notes in that he thought claimant was kept in a sling for eight weeks and that physical therapy was not instituted until later. Dr. Walker first assigned 27 percent and later raised that to 29 percent. Dr. Walker used instruments to measure both grip and motion.

Dr. Crouse also made specific measurements in doing his assessment which yielded a fifteen percent rating based on the orthopedic guide with specific reference to limitation of elbow motion, tenderness about the elbow and numbness in the upper extremity.

Claimant at the time of hearing indicated his dissatisfaction of Dr. Hawkins' examination because it was more summary and was not done with instruments as Dr. Walker's was done. Dr. Hawkins was familiar with claimant's case and did not need to spend as much time in his evaluation. Dr. Walker, on the other hand, had a slight inaccuracy in his history. In balance, there are factors to recommend each impairment rating. Equal weight is being given the opinions of each of the four physicians. Giving equal weight to each rating results in a 15 3/4 percent rating to claimant's right upper extremity which entitles him to 39.375 weeks of permanent partial disability.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant is thirty-one (31) years of age.

That claimant is right-handed.

That claimant started work for defendant on September 10, 1979.

That in May of 1980 claimant had a synovecomy and exploration of the dorsal wrist area and release of the first dorsal compartment fiberosseous sheath along with removal of an accessory tendon and septum.

That on January 5, 1982 claimant had an anterior transposition of the ulnar nerve with medial epicondylectomy.

That claimant was taken out of his sling on January 27, 1982 and started on exercises.

That claimant has done various jobs since his surgery.

That claimant has been restricted from ham boning and from hanging hams.

That claimant's present job in dry salt entails use of a hose rather than use of a knife.

That claimant presently complains of numbness from his elbow up into his shoulder down into his hand and of loss of grip and of strength.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has established entitlement to permanent partial disability benefits for thirty-nine point three seven five (39.375) weeks as a result of his injury of October 21, 1981.

ORDER

THEREFORE, IT IS ORDERED:

That defendant pay unto claimant thirty-nine point three seven five (39.375) weeks of permanent partial disability benefits at a rate of two hundred sixty-one and 70/100 dollars ($261.70).

That defendant be given credit for amounts previously paid.

That defendant pay amounts due and owing in a lump sum.

That defendant pay interest pursuant to Iowa Code section 85.30.

That defendant pay costs pursuant to Industrial Commissioner Rule 500-4.33 including report expenses from Dr. Walker of forty-five dollars ($45.00) and from Dr. Hawkins of thirty-five dollars ($35.00).

That defendant file a final report in ninety (90) days.

Signed and filed this 11 day of August, 1984.

IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in review-reopening brought by Kent Odekirk, claimant, against Wilson Foods Corporation, self-insured employer, defendant, to recover additional benefits under the Iowa Workers' Compensation Act for an injury arising out of and in the course of his employment on March 6, 1980. It came on for hearing on August 10, 1984 at the Iowa County Courthouse in Marengo, Iowa. It was considered fully submitted at that time.

The industrial commissioner's file shows a first report of injury received April 16, 1980. On May 2, 1980 a memorandum of agreement was received. A final report shows the payment of healing period benefits and permanent partial disability of five percent of a right hand as well as the payment of medical expenses.

At the time of hearing the parties stipulated the rate in the event of an award should be $197.89.

The record in this matter consists of the testimony of claimant; claimant's exhibit 1, report expense from Leland G. Hawkins, M.D.; claimant's exhibit 2, medical report expense from David C. Naden, M.D.; claimant's exhibit 3, reports from John R. Walker, M.D., and James E. Crouse, M.D.; claimant's exhibit 4, a report with accompanying documents from Richard F. Neiman, M.D.; claimant's exhibit 5, medical records from Dr. Naden; claimant's exhibit 6, hospital records from an admission of January 4, 1982; claimant's exhibit 7, hospital records from a hospital admission of May 13, 1980; claimant's exhibit 8, a deposition of Dr. Walker; claimant's exhibit 9, report expenses from Dr. Walker; defendant's exhibit A, records from Dr. Hawkins; defendant's exhibit B, a report from Dr. Neiman; defendant's exhibit C, records from an electrophysiologic analysis; defendant's exhibit D, records from Dr. Naden; defendant's exhibit E, a report from Dr. Crouse; defendant's exhibit F, records from a hospital admission of January 4, 1982; and defendant's exhibit G, records from a hospitalization of May 13, 1980.

ISSUES

The sole issue in this matter is whether or not claimant is entitled to further permanent partial disability benefits.

STATEMENT OF THE CASE

Thirty-one year old right-handed married claimant, father of seven children who has completed high school and two years of college, commenced work for defendant on September 10, 1979. His first task was cutting out eyelids in the hog kill. He moved to cutting off tainted meat from condemned heads.

In May of 1980 he had surgery in his right wrist area which was performed by Dr. Naden, resulting in a W-shaped scar from his wrist about five inches up the arm and keeping him off work for five to six weeks. He was sent to popping kidneys--work which did not entail the use of a knife. His arm remained sore in this period.

In November of 1980 he began ham boning which he described as follows: Hams are on a conveyor. When a ham is taken off the belt, the fat is removed using a knife in the right hand. The ham is rolled over. The knife then is used to separate the ham into three pieces. After two weeks on ham boning claimant was shifted to skinning hams which he did off and on in alteration with ham boning depending on where he was needed.

He noted the beginning of trouble with swelling in his right forearm in the scar area. His elbow hurt. His hand began to go numb. He saw the company doctor who sent him to Dr. Hawkins who did an EMG. He returned to work but he continued to have numbness, pain and loss of grip.

Surgery was done on January 5, 1982. Subsequent to the operation he still had loss of strength, numbness and an inability to straighten his arm. After being off six months, he went back to ham boning which he was able to do. After a week's work, claimant entered the hospital for forty-two days of treatment for an unrelated condition.

When claimant returned to work he went to the sausage department where he helped pack bologna, hot dogs and lunch meat for four months. He was able to do this work and he was bothered only by heavy lifting. He tried to go back to ham boning, but he had trouble with his elbow and his grip gave out. Eventually, he was restricted from ham boning by his doctor. Claimant said he was having trouble with both reaching and straightening out his arm. It was necessary for him to move his entire body to reach.

Claimant was placed on the belly vat packing hams where he was to hang hams on a tree to be moved to the smokehouse. Claimant testified he was unable to do the work because he could not extend his arms; therefore, he was medically released from the department.

Claimant's next position was back on the kill floor removing tainted meat from condemned heads. He was able to do the work for a time, but he had pain in his elbow which shot to his hand and also to his shoulder. Additionally, he experienced numbness and weakness.

He moved to dropping bungs--work which he did from May of 1983 to November of 1983. He related: A hog comes down the conveyor. A knife with a ten inch blade is used to cut out the anus by making three cuts. Claimant felt weakness in the arm and elbow. Claimant was able to do the work when the chain was moving at a slower pace, but when it was speeded up, he was unable to keep pace.

Claimant asserted that he grew tired of being in pain all the time. In November of 1983 a job was posted in dry salt which claimant signed for. A majority of the time he is using a hose to clean up equipment to get it ready for government inspection each day. For a brief period each six months he trims beef, a job he attempts to avoid. Claimant expressed the feeling that he has a good job which he likes.

Claimant characterized his arm as fifty percent better; however, he still has problems with it when he uses it for strenuous work. He has numbness from his elbow up into his shoulder and down into his hand. He experiences loss of grip and loss of strength. He had none of these troubles before his elbow difficulties developed.

Claimant acknowledged ability to participate in some sporting activities including bowling with a tournament placement. Claimant claimed he bowls from his shoulder rather than his arm and that he does not bowl without pain.

Claimant differentiated between the examination he had by Drs. Walker and Hawkins. Dr. Walker was seen in November of 1983 at which time claimant was working at dropping bungs. Dr. Walker used instruments to measure both his motion and his strength. He took x-rays and spent forty-five to sixty minutes in his examination.

Dr. Hawkins saw him on February 27, 1984. He shook claimant's hand and inquired about his health. He held claimant's arm in the air and told him he was going to take x-rays. Claimant estimated the time of his examination at three minutes. No instruments were used to measure motion. His reflexes were not checked. He denied that the doctor took the history shown in his notes and denied that they discussed his present job. Claimant was unable to remember what he had told the nurse. Claimant asserted that he was sensitive in his scar area at the time of Dr. Hawkins' examination.

David C. Naden, M.D., saw claimant on April 25, 1980 at which time he had tendonitis of the extensor tendon of the thumb, wrist and dorsum of the right forearm. The doctor recommended at that time moving claimant to a different job and waiting three to six months to see what happened.

Claimant returned on May 5, 1980 with redevelopment of inflammation of the synovial tissue of the extensor mechanism of the right forearm.

Claimant was admitted to the hospital on May 13, 1980 with significant swelling and crepitation with dorsiflexion and extension of the right thumb. There was inflammation of the extensor carpi radialis longus and brevis. Dorsiflexion and plantar flexion in the wrist were restricted. Dr. Naden performed a synovectomy and exploration of the dorsal wrist area and release of the first dorsal compartment fiberosseous sheath along with removal of an accessory tendon and septum.

Claimant was seen postoperatively and in early June he was placed in a splint. Claimant was released to return to work on June 23, 1980.

Dr. Naden saw claimant on November 2, 1981 following an acute flare-up of tendonitis. Claimant also complained of intermittent numbness in the ulnar distribution of the right hand. A different job was suggested.

On August 26, 1982 Dr. Naden evaluated claimant's impairment at five percent of the right hand. Claimant's wrist flexion was 40/80; his extension, 70/80; and his grip, 70 or 80/100. Claimant was mainly concerned at this time with loss of motion and weakness in his hand and wrist.

Leland G. Hawkins, M.D., saw claimant on November 25, 1981 at which time claimant reported having numbness in his right little and ring fingers for about a year, as well as a twenty pound grip differential between the right and left hand. He told the doctor of swelling in the area of his incision. On examination, no sensory loss was found. Claimant had good function of the tendons. Electromyography was ordered.

Claimant was found to have an ulnar neuropathy at the elbow level. Cl imant was admitted to the hospital on January 4, 1982. The following day an anterior transposition with medial epicondylectomy was done.

Claimant was taken out of his sling in late January and started on elbow exercises in early February. Later biceps and triceps exercises were added. Claimant had continuing inability to straighten his elbow. X-rays were taken on March 26, 1982 which were interpreted as showing new bone formation like a myositis ossificans over the medial epicondyle.

When claimant was released for work, he was instructed to return to a job which would not require complete extension.

Claimant was referred for electrophysiology which was carried out on November 15, 1982. That testing was assessed as showing "[m]ild to moderate right ulnar neuropathy at elbow level without evidence for deterioration when compared to the prior study in December 1981, and with some evidence of improvement by EMG." A second interpretation was "[n]o conclusive evidence for right carpal tunnel syndrome with only one minimal abnormal value, namely the median distal motor latency."

In a letter dated December 7, 1982 Dr. Hawkins wrote:

> If you evaluate the function of loss of motion that he has in his elbow, the ossification over the medial joint line, you would obtain about a 5 percent disability on the elbow region and the ulnar nerve and then if you were to add the loss of sensation in the hand and weakness that the patient has, one would bring this loss up to about 11 percent of the extremity as measured at the elbow. This would be my disability rating for this patient.

Dr. Hawkins last saw claimant on February 27, 1984. He noted that claimant was working with a hose rather than a knife. He found full extension and flexion of the hand, full flexion of the upper extremity, a seven to ten degree deficiency in extension and full pronation and supination. His gross grip was equal and his reflexes were "fine." The doctor gave claimant a four percent permanent impairment rating for loss of motion which he increased ten percent to allow consideration of claimant's continued fatigue and sensitivity.

Albert R. Coates, M.D., saw claimant on February 14, 1983 for an evaluation. Claimant complained of difficulty extending his arm and weakness in the arm. Claimant was described as having fair intrinsic function, good sensation in the hand and forearm and mild diffuse weakness of grip and pinch on the right. Passive range of motion was 27 to 135 degrees in the right elbow and 0 to 62 degrees in the right wrist. Dr. Coates' rating was 14 percent of the right arm.

In a letter dated March 15, 1983 Dr. Coates explained that his "14 percent was a total impairment, hence any previous permanency that he [claimant] derived from this injury should be deducted from this."

Richard F. Neiman, M.D., examined claimant on July 6, 1983 and took a history of difficulty beginning as a lump in the forearm which was diagnosed as tendonitis and treated surgically. After that claimant had surgery for an ulnar nerve block. Claimant complained of numbness and weakness.

On examination, there was some weakness in the triceps. Dr. Neiman found no evidence of ulnar neuropathy or carpal tunnel compression.

John R. Walker, M.D., board certified orthopedic surgeon, saw claimant on November 3, 1982 and took a history of claimant's beginning to develop swelling in his right wrist, numbness in his right hand and swelling and numbness over the forearm in April of 1980. He reported that Dr. Naden removed a cystic type of lesion and rated claimant's permanent partial disability at five percent of his hand. Post surgery, claimant had worsening of the numbness and loss of grip. In October of 1980 claimant had trouble handling his knife.

In October of 1981 an EMG was done. An operation was performed in January of 1982 and thereafter claimant was unable to extend his arm. He had physical therapy post surgery. Claimant returned to work in the sausage department, but his elbow hurt with lifting and his whole hand began to get numb.

Claimant complained of an inability to fully straighten his elbow, swelling over his scar, frequent numbness in the right hand and poor grip on the right.

On examination, claimant's blood pressure was slightly elevated. The reflexes of the upper extremity were not physiological with the left triceps more active than the right. The Tinel sign was markedly positive which Dr. Walker said was a sign of nerve irritation. Percussion caused pain, numbness and tingling radiating down the forearm and into the hand. Claimant lost fifteen degrees of extension. His grip was 70 on the right and 110 on the left.

X-rays of the right wrist were normal. There was a calcification behind the medial epicondyle.

Dr. Walker concluded claimant had an ulnar nerve neuritis on the right and a residual problem with scarring in the area of the flexor tendon of the wrist in the forearm and above the wrist. The doctor assigned an impairment rating of 27 percent of the right upper extremity. The doctor prescribed vitamin B.

Claimant was seen on January 17, 1983 by Dr. Crouse who felt claimant had carpal tunnel syndrome and needed further surgery. Dr. Walker was unsure whether Dr. Crouse thought the nerve involved in the carpal tunnel was the median or the ulnar.

On November 2, 1983 claimant returned with complaints of an inability to straighten his right elbow, swelling over his incisional area, right elbow pain which increased with twisting and lifting or straining and increased numbness of the right hand. Claimant's numbness had increased and localized to two little fingers and the long finger on the right hand. Claimant reported quitting the ham boning operation.

On examination, claimant's grip was 64 on the right and 82 on the left. Claimant had minimal restriction of flexion and extension of his right wrist with subjective numbness in the ulnar aspect of the right hand. Tips of the ulnar fingers were numb and painful. Dr. Walker felt this was a little increase in the ulnar nerve problem. Claimant's reflexes had improved to the point where they were equal and active.

The physician raised claimant's impairment from 27 to 29 percent and agreed the increase was on the basis of subjective complaints. Dr. Walker suggested continuing vitamin B. He did not advise carpal tunnel surgery. He thought there was "very good possibility" that claimant had some entrapment of the median and possibly the ulnar nerve.

James E. Crouse, M.D., reported his findings in a letter dated January 17, 1983. Among claimant's complaints at that time were inability to fully extend the right elbow, discomfort in the medial aspect of the right elbow, numbness in the right hand, and weakness in the right upper extremity.

Claimant's elbow was tender. Range of motion was minus 28 degrees extension and 140 degrees flexion. There was tenderness in the area of the elbow scar. Grip strength was slightly decreased on the right. There was no atrophy; reflexes were brisk. Both the Phalen's and Tinel's were positive. There was swelling in the area of claimant's first surgery.

Dr. Crouse concluded a carpal tunnel release would relieve numbness in the hand and weakness of the grip. Using the orthopedic manual and based on limitation of elbow motion, tenderness about the elbow and numbness in the upper extremity, he assigned a rating of "approximately 15% of the upper extremity."

APPLICABLE LAW AND ANALYSIS

The sole issue in this matter is claimant's entitlement to further permanent partial disability benefits. Claimant previously has been paid for five percent of a hand.

The right of a worker to receive compensation for injuries sustained which arose out of and in the course of employment is statutory. The statute conferring this right can also fix the amount of compensation to be paid for different specific injuries, and the employee is not entitled to compensation except as provided by the statute. Soukup v. Shores Co., 222 Iowa 272 268 N.W. 598 (1936).

That a worker sustaining one of the injuries for which specific compensation is provided under the statute might, because of such injury, be unable to resume employment and because of his lack of education or experience or physical strength or ability, might be unable to obtain other employment, does not entitle him to be classed as totally and permanently disabled. Id. at 278, 268 N.W. 598.

Where the result of an injury causes the loss of a foot, or eye, etc., the loss, together with its ensuing natural results upon the body, is a permanent partial disability and is entitled only to the prescribed compensation. Barton v. Nevada Poultry Co., 253 Iowa 285, 290, 110 N.W.2d 660 (1961). The schedule fixed by the legislature includes compensation for resulting reduced capacity to labor and earning power. Schell v. Central Engineering Co., 232 Iowa 424, 425, 4 N.W.2d 339 (1942). The claimant has the burden of showing that his ailment extends beyond the scheduled loss. Kellogg v. Shute and Lewis Coal Co., 256 Iowa 1257, 130 N.W.2d 667 (1964).

Larson in 2 Workmen's Compensation, §58 at 10-28 (Desk ed. 1976) discusses the nature of scheduled benefits and points out that "payments are not dependent on actual wage loss" and that they are not "an erratic deviation from the underlying principle of compensation law--that benefits relate to loss of earning capacity and not to physical injury as such." The theory, according to Larson, is unchanged with the only difference being that "the effect on earning capacity is a conclusively presumed one, instead of a specifically proved one based on the individual's actual wage-loss experience."

The Iowa Supreme Court recently has reaffirmed the concept of scheduled member injuries in Graves v. Eagle Iron Works, 331 N.W.2d 116 (Iowa 1983).

Claimant testified that after his surgery he had soreness in his arm. Post surgery, he developed a condition which resulted in the anterior transposition of his ulnar nerve as well as a

medial epicondylectomy. Immediately prior to his first surgery, claimant's complaints were of inflammation in the synovial tissue of the extensor mechanism of the right forearm. The postoperative diagnoses for claimant's condition were synovitis of the extensor tendons of the right forearm and DeQuervian's disease. An incision was made in the forearm. The doctor worked in the area of the abductor to the thumb and extensor. Surgery also was done in the area of the extensor carpi radialis brevis and longus. Dr. Naden's final diagnoses were of "[s]tenosing tenosynovitis of the first dorsal compartment of the right wrist" and "[s]ynovitis of the extensor tendons of the dorsum of the right arm." Dr. Naden's evaluation included checking motion of the wrist and grip strength of the hand. Claimant's concern at that time, according to the doctor's notes, was loss of motion and weakness in the right hand and wrist. Dr. Naden's rating was to the hand.

This case is complicated by the subsequent development of trouble in claimant's right elbow. Although there is some evidence, for instance the location of the scar, that claimant has disability to his arm as a result of his March 6, 1980 injury, claimant's burden is a preponderance. The evidence does not allow a finding of impairment to the right arm as opposed to the right hand. As defendant has paid the five percent impairment found by Dr. Naden, no additional award can be made in this decision.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That is claimant is thirty-one (31) years of age.

That claimant is right-handed.

That claimant started work for defendant on September 10, 1979.

That prior to surgery claimant had inflammation of the synovial tissue of the extensor mechanism of the right forearm.

That in May of 1980 claimant had a synovectomy, an exploration of the dorsal wrist area and release of the first dorsal compartment fiberosseous sheath along with removal of an accessory tendon and septum.

That the postoperative diagnoses for claimant were synovitis of the extensor tendons of the right forearm and DeQuervian's disease.

That on January 5, 1982 claimant had an anterior transposition of the ulnar nerve and a medial epicondylectomy.

That claimant presently complains of numbness from his elbow up into his shoulder and down into his hand and of a loss of grip and of strength.

That when claimant was seen by Dr. Naden in August of 1982 his main concern was of loss of motion and weakness of his right hand and wrist.

That Dr. Naden assessed claimant's impairment to his hand.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has shown entitlement to permanent partial disability relating to his injury of March 6, 1980 of five percent (5%) of a hand and that amount has been paid by defendant.

ORDER

THEREFORE, IT IS ORDERED:

That claimant take nothing from these proceedings.

That defendant pay costs pursuant to Industrial Commissioner Rule 500-4.33 including the ten dollar ($10.00) fee for a report from Dr. Naden.

Signed and filed this 17 day of August, 1984.

JUDITH ANN HIGGS
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

ANTHONY E. PALMER, Claimant, vs. NORWALK COMMUNITY SCHOOL DISTRICT - LAKEWOOD ELEMENTARY SCHOOL, Employer, and EMPLOYERS MUTUAL CASUALTY COMPANY, Insurance Carrier, Defendants.	FILED AUG 3 1984 IOWA INDUSTRIAL COMMISSIONER File No. 482030 R E M A N D D E C I S I O N

INTRODUCTION

This matter was remanded by the Polk County, Iowa, district court to the industrial commissioner. Prior to that, a proposed agency decision awarded benefits to the conclusively presumed dependents of Dian Palmer, the deceased employee. On December 29, 1981, a final agency decision by the undersigned deputy industrial commissioner denied benefits for claimants because they had not shown a causal connection between the work and the death.

Claimants appealed to the district court and ther pplied for leave to present additional evidence, stating th r. Donald J. Tesdall would clarify his testimony about the causal relationship and that there was new evidence available to the medical community which was not available at the time of the hearing of October 1, 1980. A remand was ordered February 4, 1983 as follows:

1. That this cause is hereby remanded to the Industrial Commissioner for presentation of the evidence sought to be presented by the Petitioner's Application for Leave to Present Evidence.

2. That such evidence will be accepted by the Industrial Commissioner or other qualified person designated by him.

3. That upon presentation of such additional evidence, the Industrial Commissioner may either: (1) modify its prior decision by reason of such additional evidence, or (2) affirm its previous decision.

4. That in either event, the Industrial Commissioner shall file with this Court any such additional evidence as well as any modifications, new findings or decision.

5. That the Industrial Commissioner shall notify by mail, all parties involved of any new findings or dec.sion.

Once again under the provisions of §86.3, Code of Iowa, the commissioner appointed the undersigned deputy industrial commissioner to issue the final agency decision on appeal in this matter.

Defendants also moved to be allowed to present additional evidence, which motion was denied by the undersigned as not being included in the remand order. However, upon application to the district court, that court ruled in defendants favor as follows: "The Court, after reviewing the respective parties briefs, hereby sustains the Respondent's application to present additional to the extent that said evidence is to rebut any new evidence which the Petitioner introduces under Judge Bergeson's order granting the Petition [sic] application for leave to present additional evidence."

As a result of the foregoing, three depositions were taken: The discovery deposition of Dr. Donald Tesdall, the evidentiary deposition of Dr. Tesdall, and the evidentiary deposition of Dr. Alexander Ervanian. The record for this remand decision is considered to be the two evidentiary depositions (those of Dr. Tesdall of August 30, 1983 and of Dr. Ervanian of November 9, 1983) plus the exhibits attached to those depositions. Also, the original record has been reviewed, and the new evidence has been reviewed along with the original evidence, all of which has been considered in reaching this remand decision.

EVIDENCE PRESENTED

The facts and circumstances have been summarized in the past, but, in light of the new evidence, they should again be reviewed.

The deceased, Dian E. Palmer, was a lady 31 years old, married and with a family who did part-time custodial work at the employer's school. On November 29, 1977, she and her four-year-old son, Scott Palmer, went to the school where she

intended to do her work. She could not open the school doors and was angry because of that. She went on to the school grounds to lower the flag but died before doing anything else.

The only eye witness, four-year-old Scott Palmer, testified at the hearing when he was seven years old:

> [S]he tried--she went to try the front door-- Well, she opened--she tried to open the back door and that wouldn't work; and she tried to open the front and it wouldn't work.
>
> Q. Do you know why the back door wouldn't open?
>
> What did she try to do?
>
> A. She hit it with her-- She went like that (indicating' and hit it, and then she went to the front.
>
> Q. Now, did she put the key in the lock?
>
> A. Yes, she tried.
>
> Q. And she couldn't get it to turn; is that what happened?
>
> A. (The witness nodded affirmatively.)
>
> Q. Did she tell you at any time that she was hurt; that she felt bad?
>
> A. No, but she said she had pains.
>
> Q. When did she say that?
>
> A. When-- She said she wanted to go over to the flagpole and take it down; and after she hit it, she started getting pains.
>
> Q. After she hit what?
>
> A. That door.
>
> Q. Did she say where it hurt?
>
> A. (The witness nodded negatively.)
>
> Q. What did you do after you left the door?
>
> A. She got kind of dizzy and she hit the flagpole on her head and started walking over and she fell in the grass.
>
> Q. Then what did you do?
>
> A. Her purse was out in front of her and her glasses, and all that, and I stayed up there, and I had her purse on my stomach so no one would grab it if someone came.
>
> Q. Di you stay with her then?
>
> A. (The witness nodded affirmatively.)
>
> Q. Did someone find you later?
>
> A. No-- Yes. A little bit later my grandpa came up. (Tr., pp. 7-8 11. 7-25 and 1-15)
>
> Q. Scotty, did your mom get real mad at the door?
>
> A. Uh-huh.
>
> Q. I didn't hear what you said.
>
> A. Uh-huh. (Tr., p. 11 11. 9-12)

Donald Tesdall, M.D., testified that he is a diplomate of the American Board of Family Practice. (Dr. Tesdall's prior testimony was by deposition of January 23, 1981. References to Dr. Tesdall's testimony in the matter of this remand will be found in a deposition of August 30, 1983.) Dr. Tesdall testified (Dep., 7-12) as to decedent's problems with chest pain. The first complaint was on November 19, 1975 and was believed by Dr. Tesdall to be due to anxiety. Then, although Dr. Tesdall did not see her, she also complained of chest pain at the emergency room of Lutheran Hospital in Des Moines on November 23, 1975. Dr. Tesdall said that the diagnosis at that time was costochondritis (inflammation of the rib cartilage).

Dr. Tesdall again saw decedent for chest pains on December 1, 1976 at which time she was improved, however. She was hospitalized at Lutheran Hospital from January 27 to February 9, 1976 for nausea and vomiting. At that time the diagnoses were "probably duodenal ulcers, tension headaches and reactive depression." (Tesdall dep., p. 8 11. 20-21) Dr. Tesdall saw decedent again in August 1976 because of nausea, vomiting and occasional chest pain. She was hospitalized from November 10 to December 1, 1976 for depression, muscle contraction, headaches and acute gastritis. Dr. Tesdall again saw decedent on August 10, 1977 for depression and difficulty in sleeping. At that time, decedent was started back on antidepressants and had been referred to a psychiatrist. The medication was stated to be Elavil (Tesdall dep., p. 10 1. 15). Decedent was hospitalized again because of nausea and vomiting September 6 to 11, 1977. The diagnoses were "[a]bdominal pain and vomiting secondary to gastritis, mixed anxiety, distressive reactions, tension headaches, incomplete emptying of the bladder secondary to medication side effects." (Tesdall dep., p. 10-11 1. 25 and 1-3)

Dr. Tesdall saw decedent on October 24, 1977 for depression, headaches and abdominal pain and on November 1, 1977 "in the emergency room at Lutheran because of chills, shortness of breath and dry, non-productive cough. At that time she also complained of substernal chest pain with the coughing." (Tesdall dep., p. 11 11. 17-21)

Dr. Tesdall was extensively examined and cross-examined on the question of the cause of Dian Palmer's death. In essence, his testimony in the deposition of August 30, 1983 firmly shows that he was of the opinion that a causal relationship existed between Dian Palmer's work activities on November 29, 1977 and her death.

With respect to his prior testimony of January 23, 1981, he stated: "I felt the most likely reason for her death was coronary artery spasm which had triggered ischemia, which had triggered some type of electrical phenomena, which resulted in ventricular fibrillation." (Tesdall dep., p. 12 11. 21-14) He also stated with respect to his prior testimony: "I remember mentioning anger but having the possibility -- I stated that anger does increase adrenalin. It makes it more likely to get angina. That was my statement at that time on page 34." (Tesdall dep., p. 14 11. 9-12)

Dr. Tesdall was then asked "in retrospect," as to the cause for her prior chest pains: "Yes. I believe that she has had chest pain intermittently ever since 1975 and a lot of times those chest pains were associated with abdominal pains and I guess I probably passed them off as emotional rather than real, as far as organic basis." (Tesdall dep., p. 14 1. 24, p. 15 11. 16-20) Then, Dr. Tesdall was asked his present opinion as to the cause of death:

> A. I feel that she had coronary artery spasm resulting in ischemia resulting in ventricular fibrillation.
>
> Q. What was the ultimate result in your opinion of that ventricular fibrillation?
>
> A. I feel that the anger that she had of not being able to get into the school triggered the episode.
>
> Q. Doctor, based upon the Dian Palmer woman's history, your examination and treatment of her as her treating physician, do you have an opinion based upon a reasonable medical certainty as to the cause of the coronary artery spasm?
>
> A. Yes, sir. The anger I feel was the cause of the coronary spasm.
>
> Q. Again, Doctor, based upon Dian Palmer's history, your examination and treatment of her as her treating physician and your education and experience since the date of her death, do you have an opinion which you could express for us today based upon a reasonable medical certainty as to whether or not she suffered from coronary artery spasm prior to the date of her death?
>
> A. I believe she hadn't, but she had episodes of spasm which is called primzmetal, . . . (Tesdall dep., pp. 17-18 11. 22-25 and 1-21

On cross-examination, Dr. Tesdall conceded there was no objective evidence which would show a coronary spasm, arrhythmia or an ectopic beat and that the autopsy does not show a cause of death. (Tesdall dep., p. 27 11. 5-9 and p. 29 11. 4-9) Dr. Tesdall also assumed from his understanding of the facts that decedent complained of chest pain just prior to her demise. (Tesdall dep., p. 33 1. 8 and p. 34 1. 10)

Alexander Ervanian, M.D., a specialist in pathology and in nuclear medicine, testified on behalf of defendants. With respect to the cause of death, he testified:

> Q. Doctor, after reviewing the medical examiner's report, the depositions of Drs. Wooters and Lacsina, and the autopsy protocol, which was included, are you able to say, with reasonable medical certainty, the cause of death in Dian Palmer?
>
> A. No.
>
> Q. Why do you say that?
>
> A. There is no defined cause of death in that autopsy.
>
> Q. Apart from the autopsy, is there any way to say, with reasonable medical certainty, the cause of death in Dian Palmer?
>
> A. No.

Q. Do you have reasons for saying that?

A. Yes.

Q. What are your reasons?

A. Dian's death was not observed. We don't know the method of her clinical death. We have no clinical information on her, nothing in the autopsy to indicate how she died. (Ervanian dep., pp. 7-8 ll. 15-25 and 1-7)

He stated that Dr. Tesdall was "uncommonly certain that death was caused by coronary spasm. In order to buttress that viewpoint, he has given some articles in reference to it." (Ervanian dep., p. 9 ll. 19-21) With respect to those articles, which are a part of the record, Dr. Ervanian testified:

A. They were-- As a matter of fact, when I read these articles, they were quite to the contrary to what Dr. Tesdall said for a variety of reasons. He selected small portions out of some of these articles to indicate coronary spasm plays a role in sudden death. He totally ignored these articles in his testimony--those portions which talk about coronary spasm and indicate that coronary spasm, if it causes death, is always related to coronary atherosclerosis. The autopsy in this case clearly indicates this woman did not have coronary atherosclerosis. There are other areas of these articles that indicate the kind of patient who gets coronary spasm, symptoms associated with coronary spasm. None of these existed in the patient involved in this case, Dian Palmer.

Q. Was there any evidence at the time of autopsy, Doctor, of coronary atherosclerosis in Dian Palmer?

A. None. (Ervanian dep., pp. 11-12 ll. 19-25 and 1-11)

On cross-examination, Dr. Ervanian was asked about the possibility of pure coronary vasospasm, that is, without atherosclerosis. He testified that such vasospasm is rare but conceded that "rare" means a possibility. (Ervanian dep., p. 35 ll. 10-16)

Then, again testifying on cross-examination as to the cause of Dian Palmer's death, Dr. Ervanian testified:

Q. In the absence of atherosclerosis, is there any better cause of death known to you than the one that Dr. Tesdall expressed? Is there any more probable in your opinion?

A. God, I don't know. I just don't know. I really don't know because anything more probable or more likely--I don't have the remotest idea of why that patient died. I've been in that position more than once. I think most pathologists have been. There is a well known residue of cases that even after the most exhaustive examination you don't know why they died. Sometimes you're just stuck with that. (Ervanian dep., pp. 52-53 ll. 24-25 and 1-9)

ISSUES PRESENTED

Claimant states the issues:

I. The testimony of Dr. Alexander Ervanian, M.D. is not within the scope of the "limited remand" pursuant to IOWA CODE Section 17A.19(7).

II. The additional testimony of Dr. Donald J. Tesdall, M.D., conclusively establishes by a preponderance of the evidence that Dian Palmer's death arose out of, and in the course of her employment with the Defendant, Lakewood Elementary School.

APPLICABLE LAW

Section 17A.19(7), Code of Iowa, states:

In proceedings for judicial review of agency action a court may hear and consider such evidence as it deems appropriate. In proceedings for judicial review of agency action in a contested case, however, a court shall not itself hear any further evidence with respect to those issues of fact whose determination was entrusted by Constitution or statute to the agency in that contested case proceeding. Before the date set for hearing a petition for judicial review of agency action in a contested case, application may be made to the court for leave to present evidence in addition to that found in the record of the case. If it is shown to the satisfaction of the court that the additional evidence is material and that there were good reasons for failure to present it in the contested case proceeding before the agency, the court may order that the additional evidence be taken before the agency upon conditions determined by the court. The agency may modify its findings and decision in the case by reason of the additional evidence and shall file that evidence and any modifications, new findings, or decision with the reviewing court and mail copies of the new findings or decisions to all parties.

The remand order has been stated above.

Claimant must show that Dian Palmer's death was probably caused by the work; possible cause is not sufficient. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955); Ford v. Goode, 240 Iowa 1219, 38 N.W.2d 158 (1949) and Almquist v. Shenandoah Nurseries, Inc., 218 Iowa 724, 254 N.W. 35 (1934). Matters of causal relationship are essentially within the realm of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960). "The incident or activity need not be the sole proximate cause, if the injury is directly traceable to it." Holmes v. Bruce Motor Freight, Inc., 215 N.W.2d 296, 297 (Iowa 1974); Langford v. Kellar Excavating & Grading, Inc., 191 N.W.2d 667 (Iowa 1971). "A cause is proximate if it is a substantial factor in bringing about the result." Blacksmith v. All-American, Inc., 290 N.W.2d 348, 354 (Iowa 1980).

ANALYSIS

Claimant's first issue concerns the scope of the testimony of Dr. Ervanian, claimant arguing that Dr. Ervanian's testimony should not be allowed to "controvert the existing record." (Claimant's brief, p. 6) Defendants obvious purpose in eliciting the testimony of Dr. Ervanian was to controvert the testimony of Dr. Tesdall, and that seemed to be within the scope of the district court ruling which allowed defendants to present further evidence. Therefore, the evidence in the deposition has been taken as a part of the record and considered along with the other evidence in reaching this decision. Claimant's objection to the testimony on pages 9, 10 and 14 of the Ervanian deposition are hereby overruled.

The second issue recited by claimant encompasses most of the issue that occasioned this remand. The issue may be somewhat differently stated: Whether or not the evidence of Drs. Tesdall and Ervanian, when considered along with all the other evidence, should occasion a change in the prior decision of the undersigned. It should be said, first, that this is a case wherein one is basically dependent on the opinion of the experts. The learned articles which have been made a part of the record are informative, as far as they go, but it is the experts' opinions with respect to those articles, and otherwise, that determine the case.

Dr. Tesdall's new deposition is persuasive evidence and, standing alone, could turn the case in favor of the claimant. However, looking at the prior record, one sees that Paul From, M.D., a qualified internist, was unable to state a cause of death (From dep., p. 13 l. 18), and that Emanuel Lacsina, M.D., a pathologist and autopsy suregeon in this case stated that no single gross anatomic finding could explain the cause of death. (Lacsina dep., p. 4 ll. 7-9) Also, Richard Wooters, M.D., the Polk County medical examiner testified that the diagnosis of cardiac arrhythmia simply meant that the heart stopped because of a problem with electrical activity in the heart:

The cause of death that I listed on the death certificate was cadiac arrhythmia. In this particular case it was more of an exclusion--diagnosis by exclusion. In other words, the autopsy revealed no apparent anatomical cause of death. There were no signs of injuries. There was no obvious heart attack or brain hemorrhage, the things that one can--tangible, visible things that one can connect with a natural cause of death; therefore, I concluded by process of elimination that the cause of death was cardiac arrhythmia, which simply means that the electrical activity of the heart goes amiss and results in stoppage of the heart, and death. (Wooters dep., p. 6 ll. 1-12)

Further, Dr. Ervanian is firmly of the opinion that there was no causal relationship between the work and the death. Since, in the prior decision, one has already discounted the opinion testimony of Dr. Garfield, the psychologist, there are three pathologists and one internist all of whom firmly deny a causal relationship; on the other hand Dr. Tesdall believes that the relationship exists. Considering the array of expert testimony and the undoubted conclusion that the autopsy simply did not show the cause of death, one must find that no causal relationship exists.

One final point needs to be made. Dr. Tesdall stated that his opinion was at least in part based on the fact that decedent had chest pain (Tesdall dep., p. 33 l. 8). As Dr. Tesdall recognizes (Tesdall dep., p. 34 ll. 9-12), that history could only have come from the deceased's son, Scott Palmer. A thorough examination of the boy's testimony reveals that the deceased did not state the location of her pain. (Tr., p. 8 ll. 3-4) Of course, an expert's opinion which is based upon an incomplete history is not binding upon this deputy industrial commissioner. Bodish v. Fischer, Inc., 257 Iowa 516, 522, 133 N.W.2d 867 (1965). See also Musselman v. Central Telephone Co., 261 Iowa 352, 360, 154 N.W.2d 128 (1967). It seems that Dr. Tesdall was working with a very sketchy and incomplete history, as were all the other doctors. His assumption that decedent had chest pains before she died was unwarranted, especially in light of the fact that her medical history showed prior serious abdominal pains as well as chest pains.

Finally, claimant in his brief argues that where an employee is found dead in a place where he or she might reasonably be located because of the performance of his or her duties, there is a presumption that the death arose out of the employment. (Citations omitted) None of the parties to this case point out that the Iowa court has specifically rejected that doctrine. Sparks v. Consolidated Ind. Coal Co., 195 Iowa 334, 190 N.W. 593 (1922). See also Bushing v. Iowa R & L Company, 208 Iowa 1010, 226 N.W. 719 (1929). Thus, no presumption that the death arose out of the employment operates in claimant's favor.

Dian Palmer's death indeed was tragic and unfortunate, but claimant has the burden of proof to show a causal relationship between the work and the death and has been unable to do so in this case.

ADDITIONAL FINDING OF FACT

The evidence taken upon remand by the order of the district court shows that Dr. Tesdall was of the opinion a causal relationship existed between the work and the death of Dian Palmer, whereas Dr. Ervanian was of a contrary opinion.

Dr. Tesdall's opinion was based in part upon an erroneous assumption that decedent complained of chest pain before her death, whereas the record shows she only complained of pain.

When the testimony of Dr. Tesdall is compared to that of Drs. From, Ervanian, Lacsina, and Wooters, it is concluded the cause of the death of Dian Palmer is unknown.

CONCLUSION OF LAW

WHEREFORE, the previous decision of the undersigned deputy industrial commissioner is hereby confirmed.

Signed and filed this 3rd day of August, 1984.

Barry Moranville
BARRY MORANVILLE
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

HAROLD J. PERDUE, Claimant, vs. WAUSAU HOMES, INC., Employer, and WAUSAU INSURANCE COMPANIES, Insurance Carrier, Defendants.	:	File No. 447698 A P P E A L D E C I S I O N FILED JUL 27 1984 IOWA INDUSTRIAL COMMISSIONER

By order of the industrial commissioner filed March 8, 1984 the undersigned deputy industrial commissioner has been appointed under the provisions of §86.3, Code of Iowa, to issue the final agency decision on appeal in this matter. Claimant appeals from a review-reopening decision.

The record on appeal consists of the transcript; claimant's exhibits 1 through 7, inclusive; and defendants' exhibit 1 through 3, all of which evidence was considered in reaching this final agency decision.

The outcome of this appeal decision will be the same as that reached in the review-reopening decision.

ISSUES

A review-reopening decision ordered defendants to pay claimant for a 95 percent disability to the body as a whole for industrial purposes for a period of 475 weeks.

Claimant states the issues thus: "A. Issue one - Is the claimant permanently and totally disabled? B. Issue two - Has the healing period terminated?"

Defendants, who did not appeal, argue that the award should be reduced by 100 weeks. They also argue that claimant did not bring up the healing period issue in the hearing process and should be precluded from doing so now. Defendants' argument that the award should be reduced 100 weeks is a part of the overall issue of claimant's disability and will be considered as a part thereof. As for the healing period argument, although not brought up prior to the appeal, it will be considered briefly because the review for this final agency decision is de novo.

EVIDENCE PRESENTED

Claimant was injured on February 3, 1976 while working on a construction project. A wall weighing almost 1,000 pounds flipped over and struck claimant on the shoulder blades.

At the time of his discharge from the hospital on May 7, 1976, the final diagnoses were made: 1. Cauda equina lesion due to fracture dislocation of L-1, incomplete motor and sensory. 2. Neurogenic bowel and bladder. 3. Bladder stones.

Claimant has been treated at the Craig Hospital in Englewood, Colorado. The postoperative diagnoses of September 2, 1980 stated:

1. Fracture dislocation, T-12, L-1, status post Harrington Rod fixation and fusion.

2. Paraparesis [a slight degree of paralysis, affecting the lower extremities], L-4 last fully preserved motor segment with distal sparing and saddle anesthesia, L-3 last fully preserved sensory.

3. Neurogenic bladder, previously reported as being flaccid.

4. Neurogenic sphincter, previously reported as being hyperactive.

5. Status post suprapubic cystotomy.

On April 22, 1982, the Craig Hospital discharge diagnoses stated:

1. L-4 paraparesis with incomplete motor preservation of L-5 and S-1, secondary to fracture of T-12, L-1, 1976.

2. Neurogenic bowel and bladder, lower motor neuron type with suprapubic cystostomy.

3. Status post Harrington rod instrumentation and fusion with right iliac donor graft site.

The above summaries serve to show that claimant was seriously injured and continued to have grave difficulties.

Robert A. Hayne, a qualified neurosurgeon, testified that claimant could not perform "work requiring his walking about in a reasonable fashion, that type of work, would not be possible for him to carry out." (Dep., p. 15 ll. 3-6) Also, in a letter of January 13, 1983, Dr. Hayne stated that claimant has "a 100% industrial disability."

Robert J. Blommer, M.D., a qualified internist, testifed that he saw claimant on several occasions from 1976 onward and that he agreed with the neurological evaluation by Dr. Hayne. Dr. Blommer did not go so far as to say, however, that he agreed with Dr. Hayne's assessment of the disability. (Dep. p. 18 ll. 5-20)

Nancy Cobble, M.D., of the C.N.S. Medical Group of Englewood, Colorado, gave claimant an impairment rating of 79 percent and an "industrial" rating of 100 percent. (Letter, September 8, 1982) Further, the parties stipulated that if Dr. Cobble were called upon to explain the industrial rating "she would state that claimant is unable to return to the type of work claimant was performing at the time of his injury." (Claimant's exhibit 2)

Claimant returned to work for the employer, first as a wire letterer and then in quality control, which work continued until March 1, 1980 when the plant closed and left claimant without work. After a period of unemployment, claimant was employed by Job Service in October 1980, which involved working in an office. That job was terminated because funding was restricted by the Federal Government.

At the time of the hearing, claimant was employed as a production worker for Universal Rundle. He describes his work as follows: "I install whirlpool baths. They take what looks like a regular bathtub and they drill holes in it, and we hook up air lines and water lines to it to make a whirlpool out of it." (Tr., p. 57 ll. 1-4)

Three vocational experts testified that claimant was employable: Pat MacClean, a vocational counselor at Indian Hills Community College (Tr., p. 7 ll. 21-23), Paul Halferty, a consultant with the Rehabilitation Education Service Branch of the Iowa Department of Public Instruction (Tr., p. 114 ll. 8-14) and Patricia McCollom, who has her own company, Management Consulting Rehabilitation Services (Tr., p. 119 ll. 13-14).

Claimant's brief, pages 7-9, contains a good summary of claimant's version of his present condition:

He can walk with help. He uses a cane. He needs two canes, but gets by with one. He has braces on both of his ankles and legs which he wears all the time, except when he takes them off at night. He

has to sleep with his feet hanging over the edge of the bottom of the bed. He has crow's feet. His toes curl and his feet hurt all the time. Occasionally, he must have his legs and the bottoms of his feet massaged, which is done by his wife. The muscles tighten so badly. He has lost his sense of balance. It is difficult for him when he goes outside the house because there is nothing to grab hold of if he's going to fall. He drives a car with hand controls. He has no control of his bowels whatever. If he eats the wrong food, he could have a bowel movement in his clothes and never know it. Every night between 10 P.M. to midnight, he has to go through his bowel program. He puts on a rubber glove and takes a jar of vaseline and with his finger stimulates the muscle that opens. This is done by inserting the finger into the rectum. This will cause a bowel movement. This is the only time that his bowels move unless he has diarrhea. He carries a medical bag with him all the time in the car. He carries a catheter pack consisting of rubber gloves, vaseline, a 4-inch gauze piece to put around the catheter where it goes into his body. The bladder empties into a bag which is fastened to his leg. On one occasion, he ruptured the bag when he caught it on the desk and poked a hole into it. He had to go home to change it. This catheter goes right into his abdomen, right below the navel. There is an opening where this catheter goes into his body. It is inserted into the bladder and this is the way his bladder is emptied. This empties into the bag strapped onto his leg during the day. At night, he has a large bag that hooks on the side of the bed. It has to be emptied frequently. He is required to drink eight ounces or more of water an hour. If he drinks quite a lot of water, he has to change this bag about every 10 minutes. He is required to drink this large amount of water, so as to keep the bladder clean and prevent infection. He changes the catheter once a month, but sometimes as often as every two weeks. He has to drink so much water that it has gotten so it doesn't taste good. He always changes his catheter if he is going out of town, so things won't happen while he is gone. However, there are times when he just can't get it done. He gets very depressed. Before the accident, he was active, but he is not so anymore. He has pain and discomfort 24 hours a day. It is severe at times. Claimant's condition is worse in hot weather. He has to drink so much water that that is about all he gets done, is just drink. The hotter it gets, the worse it is. He has been warned against being burned because he doesn't have any sensation and can't tell if he is being burned. The same is true about cold. He never goes outside on a winter day, unless it's to get right into the car and go somewhere. He has to have the car warmed up. He can't feel the cold in his legs or feet. The doctors say that his feet could freeze and he would never know it. (Tr. p. 34-45)

APPLICABLE LAW

Claimant has the burden to prove the extent of his permanent disability. Olson v. Goodyear Service Stores, 255 Iowa 1112, 125 N.W.2d 251 (1963). Industrial disability is the reduction of earning capacity, not mere functional impairment. Such disability includes considerations of functional impairment, age, education, qualifications, experience and claimant's inability, because of his injury, to engage in employment for which he is fitted.

Section 85.34(1), The Code, states:

> If an employee has suffered a personal injury causing permanent partial disability for which compensation is payable as provided in subsection 2 of this section, the employer shall pay to the employee compensation for a healing period, as provided in section 85.37, beginning on the date of the injury, and until he has returned to work or competent medical evidence indicates that recuperation from said injury has been accomplished, whichever comes first.

When a disability or impairment can be determined, a disability award can be made; thus, healing period ends when no further improvement is anticipated. Thomas v. Knudson & Son, Inc., Ia. App., April 28, 1984, to be published per order of May 25, 1984.

ANALYSIS

It is clear from the above recited evidence that claimant received a very serious injury. Since he has received ratings of permanent impairment and there is no real evidence of any anticipated improvement, it is clear that the healing period has ended.

The award in the review-reopening decision clearly reflects that claimant is only somewhat able to work and that his possibilties are extremely limited. Although claimant is only 41 years of age, has a high school certificate, good experience, and good motivation to return to work, his severe functional impairment leaves him with a very insecure future.

It should be noted that the doctors' evidence which stated claimant was 100 percent industrially disabled invades the province of the industrial commissioner in that no foundation was laid for these doctors' expertise in vocational matters. That evidence, however, has some weight in that it underscores the seriousness of claimant's situation. The fact that claimant has vigorously attempted to regain a position in the work force and has succeeded is to his credit but cannot diminish the seriousness of the situation. The foregoing remarks show the high level of disability; however, claimant argues that the disability should be 100 percent for lifetime benefits.

As long as claimant is a productive member of the work force, he can hardly be classified as permanently and totally disabled. Therefore, it is concluded that claimant's disability is still partial. It is noted that claimant has since filed a review-reopening petition, claiming permament total disability and that he could not continue his prior work because of his injuries. That is an issue which must be decided on evidence presented at a later time. The only evidence before the undersigned deputy at this time is that taken at the hearing, which clearly shows claimant retained some industrial capacity. Considering everything, then, the permanent partial disability award of 95 percent (475 weeks) is proper.

FINDINGS OF FACT

1. While working for the defendant employer on February 3, 1976, a wall fell on claimant, severely injuring him.

2. Discharge diagnoses of April 22, 1982 show claimant's remaining physical problems:

> 1. L-4 paraparesis with incomplete motor preservation of L-5 and S-1, secondary to fracture of T-12, L-1, 1976.
>
> 2. Neurogenic bowel and bladder, lower motor neuron type with suprapubic cystostomy.
>
> 3. Status post Harrington rod instrumentation and fusion with right iliac donor graft site.

3. Claimant returned to work with the employer in 1977 and worked until 1980 when the local plant was closed. He was able to work for a time with Job Service of Iowa and at the time of the hearing was employed at Universal Rundle.

4. As a result of his injuries, claimant has a very serious permanent impairment.

5. In the matter of recuperation, claimant has got as good as he is going to get.

6. At the time of the hearing, claimant was 41 years of age and had a high school certificate. Claimant was in the Navy, managed a filling station, worked on the road gang of a railroad, and worked part-time in a truck stop. He was employed by the employer Wausau Homes in 1965 and eventually became a crew supervisor.

CONCLUSIONS OF LAW

On February 3, 1976, claimant sustained an injury which arose out of and in the course of his employment and which resulted in a permanent partial disability for industrial purposes of ninety-five (95) percent.

Claimant's healing period has ended.

The proper compensation rate if one hundred forty-seven dollars ($147) per week.

ORDER

WHEREFORE, defendants are hereby ordered to pay weekly compensation benefits unto claimant for a period of four hundred seventy-five (475) weeks at the rate of one hundred forty-seven dollars ($147) per week, accrued payments to be made in a lump sum together with statutory interest from January 25, 1984 in case any payments have not been paid.

Costs of this proceeding are taxed against defendants.

Defendants are to file a claim activity report upon payment of this award.

Signed and filed this 27th day of July, 1984.

D E C I S I O N

FILED

AUG 30 1984

IOWA INDUSTRIAL COMMISSIONER

By order of the industrial commissioner filed January 27, 1984 the undersigned deputy industrial commissioner has been appointed under the provisions of §86.3, Code of Iowa, to issue the final agency decision on appeal in this matter. Claimant appeals from an adverse arbitration decision.

The record consists of the transcript; claimant's exhibits A through L and N through S, and defendants' exhibits 1 through 5, all of which evidence was considered in reaching this final agency decision.

Claimant states the issue in her brief: "The hearing officer erred when he failed to give proper weight and consideration of the evidence in the determination of the claimant's total disability."

The decision by the hearing deputy is very thorough and well-reasoned. Therefore, the findings of fact, conclusions of law and order are adopted herein.

FINDINGS OF FACT

1. Claimant is a married female who was 59 years of age at the time of hearing.

2. On January 13, 1980, claimant was employed by Roger Bailey in his business of the 13th Street Inn.

3. On January 13, 1980 while leaving the employer's premises, she fell down a flight of stairs.

4. The immediately apparent injuries of claimant sustained consisted of a chipped tooth, skinned knees and pain in her lower extremities.

5. Claimant reported the fall to her employer the next regular work day.

6. Claimant continued to work until August, 1982 without losing any time from work attributable to the fall.

7. Claimant suffers from degenerative arthritis of her spine which was diagnosed in 1974.

8. Claimant suffers from adult onset diabetes, varicose veins and obesity which all pre-dated 1980.

9. Claimant's fall did not injure or materially aggravate the diabetes, obesity or varicose veins.

10. Subsequent to the fall, claimant began experiencing pain in her right ankle.

11. No identifiable impairment of claimant's right ankle has been identified except degenerative changes which are not shown to be related to the fall of January 13, 1980.

12. Claimant presently complains of pain in her left lower extremity and lower back.

13. Claimant suffered identifiable traumas in an auto accident and a fall in a bathtub.

14. Claimant has a protrusion of her L4-5 disc on the left which probably encroaches on the L5 nerve root.

15. Claimant is permanently partially impaired as a result of the impairment in her back.

16. No objective evidence exists which makes claimant's present back impairment more likely to be a result of her fall at work than a result of one of the other identified traumas, her normal day-to-day activities or the normal progression of her degenerative disease.

17. Claimant has difficulty accurately identifying the onset, source and severity of the various symptoms from which she presently suffers.

18. The opinion of Dr. Hayne concerning the cause of claimant's present back impairment is based upon what claimant related to him concerning the onset and severity of her symptoms.

19. Claimant's fall did result in an aggravation of her preexisting spinal degenerative arthritis.

20. The aggravation from the fall caused a temporary flare up of symptoms but has not been shown to have altered the nature or course of claimant's degenerative arthritis in any manner.

21. Claimant sustained temporary injuries in the fall which required medical care but did not sustain any permanent impairment or temporary disability as a result of the fall at work.

22. Medical care provided by Drs. Johnson, Stayskal, Sheldahl, Hughes and the care provided by Dr. Thomas on January 16, March 18 and September 4, 1980 were all for treatment of the injuries sustained by claimant in the fall at work. Such services were reasonably necessary and appropriate for the injuries sustained and the amount of the charges arising from those services is reasonable.

23. The services rendered by Dr. Hayne and Iowa Methodist Medical Center were primarily in the nature of evaluation and treatment for claimant's underlying degenerative arthritis. Accordingly, the services were not reasonably necessary for treatment of any injuries sustained by claimant in her fall at work.

24. Claimant's petition was filed Jauary 13, 1983.

CONCLUSIONS OF LAW

This agency has jurisdiction of the subject matter and parties of this proceeding.

On January 13, 1980, claimant sustained an injury arising out of and in the course of her employment when she fell.

The injuries sustained by claimant in the fall were temporary in nature and did not result in any permanent impairment or any permanent disability.

The charges incurred by claimant in receiving medical treatment for the injuries she sustained in the fall total the sum of $275.00.

Claimant did not lose any time from work in order to entitle her to temporary disability compensation.

Claimant is not entitled to permanent partial disability compensation.

This action was commenced in a timely manner and is not barred by any statute of limitation.

ORDER

IT IS THEREFORE ORDERED that defendants pay claimant the sum of two hundred seventy-five and no/100 dollars ($275.00) in accordance with section 85.27 of the Code of Iowa and any amount incurred by claimant for repair of her chipped tooth.

IT IS FURTHER ORDERED that defendants pay the costs of this proceeding consisting of the cost of service of the original notice, the reporting fees for depositions and an expert witness fee in the amount of fifty and no/100 dollars ($50.00) for the deposition of Dr. Hayne, and fifty-five and no/100 dollars ($55.00) for the cost of obtaining two medical reports in accordance with Iowa Industrial Commissioner Rule 500-4.33.

Signed and filed this 30th day of August, 1984.

MAR 20 1984

INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in arbitration brought by Ruby Pickard, claimant, against Roger Bailey, d/b/a 13th Street Inn, employer and Maryland Casualty Company, insurance carrier. Claimant's petition alleges that she sustained a compensable injury to the body as a whole on January 16, 1980 and seeks an award of permanent total disability, payment for an elevated toilet seat, chair and bed and all other available benefits which flow from a determination of a work-related injury. The evidence referred the claim to January 13, 1980.

The hearing commenced February 10, 1984 and the case was considered fully submitted at the conclusion of the hearing on that date.

The record in this proceeding consists of the testimony of Ruby Pickard, Nancy Kay Jones and Roger Bailey; claimant's exhibits A through L and N through S; and defendants' exhibits 1-5.

ISSUES

The issues are whether or not claimant sustained an injury arising out of and in the course of her employment; whether or not any such injury is causally connected to the disability which claimant alleges and the nature and extent of any such disability. Further issues are whether the action was timely commenced in view of Iowa Code section 85.26 and also whether or not the employer shall be held responsible for payment of the medical expenses incurred by claimant. It was stipulated that in the event of an award, the applicable weekly rate would be $90.76.

REVIEW OF EVIDENCE

Claimant testified that she was born December 16, 1924, is married, that she completed the ninth grade of school and had no other formal training.

Claimant testified that on Saturday evening, January 12, 1980, she was working her customary shift and that when leaving, a few minutes after 12:00 midnight on Sunday morning, she fell while going out the front door and landed "in a pile" on the sidewalk. She stated that she immediately suffered excruciating pain from the waist down, skinned her knees and lost her glasses. She further described her injuries to include a chipped tooth and stated that her hands were sore. She reported being very shook up and that she required assistance from the cook, David Pickett, who was there at the time she fell. Claimant testified that she knew she had fallen after 12:00 midnight which actually would have been Sunday morning because she looked at the clock when it was a few minutes before midnight and that she did a few other things before going outside, where she subsequently fell. Claimant stated that the steps belonged to the 13th Street Inn and that the sidewalk where she landed probably belongs to the city.

Claimant testified that she went to work on Tuesday, the next regular work day, as there was no one who could take her place. She testified that her employer did not have a sick leave policy and simply did not authorize absence from work for any reason.

Claimant stated that she had worked at the 13th Street Inn for more than 11 years and prior to that, had operated her own cafe for 11 years. She stated that all of her work experience was in restaurant and cafe operations. She described herself as the night manager at the 13th Street Inn and that her duties included keeping order, tending bar and locking up. She recalled her hours as starting at about 4:00 p.m. and running until closing which varied from 11:00 to 12:00 unless they were unusually busy. She related that after closing, she would clean up by vacuuming, scrubbing down the bar and floors and stocking up the coolers with beer for the next day. She related that this took approximately one hour.

Claimant testified that she first sought medical treatment from David L. Thomas, M.D., on what she believed was the Wednesday following the injury. She stated that she delayed seeking treatment because she felt that she would start feeling better, but that by Wednesday the pain in her back was still bothering her. Claimant then described a course of obtaining medical treatment and/or evaluation for her back pain which also included Edward C. Stayskal, D.C., O. Landis Johnson, D.O., E. W. Sheldahl, D.O., John W. Hughes, M.D., J. Watts, M.D., Austin Corbett, M.D., University Hospitals at Iowa City, Iowa, Mayo Clinic in Rochester, Minnesota and finally culminating with Robert A. Hayne, M.D. Claimant related that she called upon Dr. Hayne without referral from any other physician because the others could not tell her what was wrong.

Claimant testified that the pain in her back had continued to worsen after the fall over a period of time and that she treated it with aspirin and non-prescription medications. She related that in August, 1982, the pain in her back was shooting into her left leg and that bending to put things into the cooler at work caused excruciating pain. She stated that both Dr. Hayne and Dr. Corbett advised her against bending and recommended that she avoid anything which aggravated her back. Among the things she was to avoid were standing in one place or walking for very long. She related that she was not to lift anything other than her own weight or maybe up to 10 pounds if it did not pull on her back. Claimant stated that she still has pain from her back all the time and that she takes medication for the pain when she feels she needs it. She related that before seeing Dr. Hayne, she took as many as 20 aspirin per day and that she now uses extra-strength Tylenol and Ascriptin. Claimant presented a cane which she now uses in walking and states that she can no longer walk in the shopping center, dance or walk in general which were things that she formerly did. She stated that she cannot do the work which she formerly did at the 13th Street Inn.

Claimant stated that she feels her back problems are related to the fall because she felt good before the fall. She stated that she would have kept working and would not have retired until age 62 or later if it were not for her back problems. She stated that the only time she had any back pain prior to the fall was related to bladder infection and that such pain was different and in a different area.

Claimant testified that after the fall she continued to work full shifts every day she was scheduled until August, 1982 when she decided not to return to work after seeing Dr. Corbett during her vacation. Her back pain was the underlying reason.

Claimant testified that all the medical expenses contained in exhibit Q were incurred for treatment of her back and that all of her calls with Dr. Thomas were for her back and that her back pain was discussed on most visits although possibly not all. Claimant stated that her varicose veins were no problem until she fell and that when she saw Dr. Sheldahl prior to January, 1980, it was for pneumonia.

Claimant related that on January 7, 1981, she was a passenger in a pickup which was hit in the side by an oncoming vehicle and that the impact slid her over against her husband. She related being transported by ambulance to the hospital where she was seen and released. She stated that she had not commenced any litigation as a result of that accident.

Claimant related that while staying at the Holiday Inn in Rochester, Minnesota, she fell in the bathtub, scraped her back and banged her head behind the left ear. The motel management transported her to the hospital and x-rays were taken. She filed a claim against the motel and collected around $600.00.

In 1972, claimant related that she fell on the ice near the laundromat in Marshalltown and as a result of such, she filed a lawsuit and collected money which was essentially enough to pay her medical expenses. At that time, her name was Ruby Castell.

Claimant also related that in 1964 she slipped in the Hy-Vee Food Store for which she pursued a claim and received a settlement in an amount sufficient to pay her medical bills and some business expenses. At the time of that incident, her name was Ruby Frost.

Claimant also related an incident where she was struck in the head by a box of curtain rods in the Wards store for which she filed a lawsuit seeking $25,000, but that the suit was eventually settled for $600.00.

Claimant stated at the hearing that she was not seeking any compensation for the injury to her right ankle, only her back. Claimant also stated that the claim contained in exhibit 3 is reduced to the elevated toilet seat only and that she no longer seeks payment for a chair or bed. Claimant admitted that her employer had not complained about her job performance prior to the time she ceased working.

Nancy Kay Jones testified that she is 38 years old and the claimant's daughter. She related that she sees claimant almost daily and has since 1976. The witness stated that prior to January of 1980, claimant's primary hobby was walking at the shopping mall, but that since then, claimant has quit going out and around as frequently and that the change has occurred gradually. Jones stated that she and claimant's husband now do most of claimant's housework.

Jones also stated that she frequently visited at the 13th Street Inn when her mother worked there and that she noticed a difference in claimant's activities consisting primarily of reduced moving about in the establishment and having other employees do things which claimant formerly did herself.

Roger Bailey testified that he has owned the 13th Street Inn in Marshalltown, Iowa for eight years and that he was previously an employee of the Inn for 20 years. He described the Inn as a restaurant and tavern that serves beer but no other alcoholic beverages. He stated that he has known claimant for 20 or 30 years.

Bailey testified that the Inn was open Tuesday through Saturday from 8:00 a.m. until 11:00 p.m. and that he worked there daily arriving at approximately 7:20 a.m. and staying until approximately 6:30 or 7:00 p.m. He stated that claimant usually arrived by 4:30 p.m. and that he would see claimant at work five days each week during the times both were at the Inn. He described claimant's duties as consisting of operating the bar, register and overseeing the place.

Bailey stated that claimant did all work that was asked of her, made no complaints and that he did not notice any physical problems which slowed her work after the fall. He testified that he did not observe any difference in her work performance after January of 1980 from what it had been previously.

Bailey related that claimant had advised him that she had fallen on the next work day after the fall and that he reported it to his insurance carrier. He related that claimant described her injuries as to her knees, a chipped tooth and broken glasses. He stated that claimant never requested additional medical treatment nor presented any bills or claims for medical treatment. He stated that she said she was going to get her glasses and tooth fixed and assumed that she would go to a doctor if she felt she needed to see one.

Bailey denied ever telling claimant that she would lose her job if she missed work and stated that she could have a job if she came back. He was emphatic in stating that she was not fired.

Bailey also stated that he had no indication that claimant was not coming back to work after the August shutdown of the establishment until the day prior to reopening when her husband came in, gave him some keys, and told him that the claimant was in Iowa City and was going to lose a leg. Bailey later realized that the keys he received were not the proper ones and he called claimant's residence and was surprised when claimant answered. He stated that claimant's other daughter, Sandy, brought the correct keys in the next day and told him that claimant was going to have her leg taken off.

Bailey was questioned concerning whether or not claimant claimed a back injury at the time and he stated that if the first report of injury listed injuries to claimant's hip and back, that the only explanation he could give was that it must have been put there by the insurance agent.

Exhibit A is the report made by Joseph D. Hall, M.D., of the results of a March 8, 1983 CT scan of the lumbar spine. It notes bulging of the disc at the L3-4 level which he feels is not affecting the nerve roots and a herniation at the L4-5 disc on the left with possible encroachment on the L5 nerve roots.

Exhibit B is a report of David L. Thomas, M.D., dated January 26, 1982. He relates treating claimant for her fall commencing January 16, 1980. He declined to make a disability rating and stated that the injuries from her fall cannot be separated from her other disease processes. He related seeing claimant a number of times and that on several of these, she made no complaint regarding her back.

Exhibit C consists of the clinical notes made by Dr. Thomas in his treatment of claimant commencing with March 17, 1977 and running through an unidentified date in 1982. The last four pages of the exhibit were copied in such a manner that the month of some entries is not shown. Remarkable entries include the entry of November 26, 1979 which indicates low back pain which was diagnosed as a possible urinary tract infection and was treated with an antibiotic, apparently successfully. An entry of January 16, 1980 refers to claimant's fall at work and notes only abrasions of both knees.

An entry of January 22, 1980 relates a phone call with complaints of pain in both knees and back. It appears that a prescription for Equanil was issued. An entry dated December 31, 1979 relates a similar prescription.

On March 18, 1980 another complaint of generalized pain including claimant's low back is noted. Full range of motion of claimant's hips and knees is also noted. The diagnosis entered is degenerative arthritis and bursitis.

An entry dated April 24, 1980 indicates claimant has been feeling well lately with no complaints. In the intervening time until August 28, 1980, there is record of a series of treatments for a varicose vein in claimant's interior left thigh.

On August 28, 1980, claimant, by phone call, reported discomfort in her buttock and left leg since a fall. She was seen on September 4, 1980 in relation to the complaints.

An entry dated December 10, 1980 indicates claimant is feeling well and on December 15, 1980 claimant makes a telephone complaint of problems with her hips. On December 19, 1980, Dr. Thomas notes a phone call with Dr. Hughes noting tenderness over the sacroiliac joint.

An entry on January 8, 1981 noted an emergency room visit on January 7 with multiple contusions and strain.

An entry on the eleventh page of exhibit C identified as May 27, 1981 indicates low back pain which was treated with an antibiotic. An entry dated June 4, 1981, immediately following, notes on recheck that the low back pain has improved and claimant is feeling better. The subsequent entry dated December, 1981 shows claimant to be asymptomatic.

The entry of July 27, 1981 reports complaints of pain in claimant's right ankle since falling at the 13th Street Inn and a request for complete evaluation at Mayo Clinic. The diagnosis shown is arthritis of the right ankle and scheduling at Mayo Clinic.

An entry identified as (illegible) again notes arthritis in the right ankle with a diagnosis of degenerative arthritis in that ankle.

The notes list several entries dealing with claimant seeking opinions concerning claimant's vision problems with the first entry regarding such being dated July 11, 1977 as a referral to Wolfe Eye Clinic and continuing to an entry on the last page of the exhibit which follows the entry dated November 3, 1981. The entry dealing with the curtain rod box at Wards striking claimant is dated August 13, 1979 indicating that the box had struck her on that day.

The notes also reflect a continuing course of treatment for varicose veins with the first note dated April 12, 1979 and the last note of that condition being contained in the first entry on the last page of the exhibit.

Exhibit D is the report of Edward D. Stayskal, D.C., wherein he reports seeing claimant April 12, 15, 18 and 22, 1980. The report relates claimant's fall and complaints of pain from the waist down and across the shoulders. The x-rays taken reveal "a mild left rotaryscoliosis of the lumbar spine with compensatory curves of the thoracic and cervical spine, resulting in a balanced spine...". He related an abnormal positioning at the C7-T1 and mild lipping and spurring of the anterior portions of L2, 3 and 4. The range of motion was found to be within normal limits. The report relates that claimant seemed improved on April 18 but that on April 22 she complained of pain in her left leg and discontinued treatments. He relates charges of $109.00 for x-rays, $79.00 for the examination and adjustment of April 12 and three office calls at $10.00 each which computes to a total of $218.00. He opines that the fall could have caused "a commotio [sic] of the spinal column causing the lumbar and thoraco-cervical regions to become symptom expressive at that time and affecting the lower extremities." He declines to make any comments regarding current disability or future treatment.

Exhibit E is a report of John W. Hughes, M.D., dated December 19, 1980. The history relates the fall at work and a denial of radiating pain down either of claimant's thighs or legs. The examination indicates that claimant moves fairly easily and complains of discomfort over the area of the left sacroiliac joint. Straight leg raising is negative. X-rays were reviewed and showed no evidence of any significant traumatic episode.

Exhibit F is a report from Dr. Hughes dated January 29, 1980. The history relates the fall and examination shows claimant to move with ease. Straight leg raising is negative. The report states, "I find nothing about this patient which indicates she has done anything but skin up both of her knees in the fall, ..."

Exhibit G is a radiology report from Jeffrey H. Watters, M.D., dated February 20, 1983 which finds moderate spurring at the L3-L4 interspace anteriorally and to a lesser extent at other levels. The findings are those of early degenerative lumbar spondylosis. Exhibit H is a handwritten report from O. Landis Johnson, D.O. He relates claimant's fall at work and phlebitis in the left leg developing January 17, 1980. This course of treatment is shown as a number of osteopathic treatments with gradual improvement and reduced sciatic inflammation. It relates that as of February 2, 1982, claimant was still suffering from low back and ankle pain and that the Mayo Clinic reports arthritis in the ankle affecting circulation of the right ankle and leg. He relates that claimant is still under his care.

Exhibit I is a report of R. A. Hayne, M.D., dated February 21, 1983. The history relates the fall and complaints of continued low back pain extending into the left lower extremity. The pain is shown as constant. Strength and coordination of the lower extremities is shown as normal. Sensation is normal, station and gait are not remarkable. From those findings, he suspects a possible herniated lumbar disc at the L4-5 interspace on the left. Attached to that report as the second page is the EMG report. The report shows no evidence of lumbar radiculopathy but does indicate mild peripheral neuropathy.

Exhibit J is the deposition of Robert A. Hayne, M.D. In it, he relates that he saw claimant without a referral from any other physician on February 14, 1983, and that he admitted her to Methodist Hospital on February 20, 1983. He confirms that the EMG showed results within normal limits, that the spurring at the L4-5 interspace is indicative of degenerative arthritis and that the myelogram did not show any defect but that in approximately 20 percent of the cases where a herniated disc exists, the myelogram can fail to reveal that defect. He related that the CT scan demonstrates the outermost aspect of a disc and that claimant's CT scan revealed a protruded disc

between the fourth and fifth lumbar segments. Dr. Hayne related that encroachment of the L5 nerve would cause pain in the low back and lower extremity on the side of the encroachment, that the complaints of pain in claimant's back and right leg were consistent with a herniated disc as was tenderness over the sacroiliac joint. Dr. Hayne related that his final diagnosis was that claimant suffered from a protruded intervertebral disc at the L4-5 interspace on the left side. He related that straight leg raising tests are somewhat subjective but that most patients with a ruptured disc will have limitations on straight leg raising and that a negative result goes a long way towards negating a herniated disc. He states that it his opinion that there is a causal relationship between the onset of claimant's symptoms and the accident and also that the symptoms claimant described are related to the protrusion of the intervertebral disc at the L4-5 interspace with encroachment on the L5 nerve root. He further opines that claimant's fall aggravated the preexisting degenerative arthritis in her lumbar spine.

Dr. Hayne rated claimant as having a 20 percent permanent partial disability of the body based upon complaints of pain and the evidence on the computerized scan in the lumbar region of a protruded intervertebral disc at the 4th lumbar interspace

Dr. Hayne went on to relate that a hospital bed would be of no advantage to claimant and that the June, 1983 entry in Dr. Thomas' records appears to be a urinary tract infection which produces pain similar to the pain from a ruptured lumbar disc.

Dr. Hayne goes on to relate that a fall in a bathtub could cause a herniated disc as could an auto accident or even normal day to day activities.

Exhibit K is claimant's discharge summary from Methodist Medical Center which is merely cumulative of the previous reports of the normal EMG, normal myelogram and the x-rays showing degenerative lumbar spondylosis.

Exhibit L is the report of David L. Thomas, M.D., dated February 23, 1982. In it he relates that claimant has had underlying joint disease for many years and that he is confident that her hips and ankles were involved prior to her fall. He opines that the fall probably aggravated the arthritis but did not cause it. He relates that claimant has many problems and that it is difficult to say how much is from the degenerative arthritis and how much it was aggravated by the fall.

Exhibit N is the deposition of O. Landis Johnson, D.O. In it, he relates that he had not seen any x-rays of the claimant and provided symptomatic treatment. He had diagnosed claimant as having arthritis. Dr. Johnson opined that a fall would aggravate a preexisting arthritic condition. He further related that at the time he treated claimant, she had a sciatic nerve inflammation and that his treatment had extended from November 12, 1980 through April 4, 1982.

Exhibit O is a report of Robert A. Hayne, M.D., dated March 29, 1983. In it he notes that when he saw claimant on March 14, 1983 she stated that she felt she could "live" with the pain. Otherwise, it is cumulative of his deposition.

Exhibit P is claimant's deposition which was taken June 17, 1982. At page 44 she indicates that the only sources of pain she is concerned with are the pains in her right ankle and in her right hip. She indicates that about a week or two prior to taking the deposition, she changed from Dr. Thomas to Dr. Watts due to dissatisfaction with the way Dr. Thomas had handled her husband's referral to Mayo Clinic in August, 1981. She related that she had to cut her trip to Mayo short because of the failure to have an appointment for her husband and that she came directly home and "had it out" with Dr. Thomas. Pages 52 through 55 show some inconsistency regarding whether claimant "had it out" with Dr. Thomas in February, 1982 or in August, 1981. Claimant relates that she saw Dr. Sheldahl in Clemons right after the fall at work and that her husband had used him as a doctor previously.

Claimant related that in the collision of a little car with the pickup in which she was riding, that she bumped her head but sustained no other injuries of significance. She stated that it totaled out the other car and did about $1,200.00 of damage to the pickup. She related that there was no litigation concerning that accident. Claimant went on to describe her fall at the Holiday Inn in Rochester on August 26, 1981.

Exhibit Q consists of the medical expenses for which claimant seeks reimbursement.

Exhibit R consists of costs which claimant requests be assessed against defendants.

Exhibit S is handwritten records from University Hospitals in Iowa City, Iowa. They note that claimant expresses low back pain and right ankle pain. The history shows that claimant related her complaint to the fall at work and indicates that she related that in the fall she abraded both knees with a result of acute lower back pain. It relates that the knee pain slowly resolved over the following months but that the lumbar spine pain continued. The pain was characterized as a dull aching which extended into the buttocks and posterior thigh. In giving the history, claimant denied numbness or weakness and indicated that the back pain has recently become less prominent and better localized to the left lumbosacral area and that there is no longer a radicular quality. Claimant further related that the back pain has been overshadowed by right ankle pain which also manifested itself in 1981. The ankle pain is described as dull, aching and continuous but it becomes progressively worse with activity through the course of the day. The pain is associated with ankle swelling, discoloration and stiffness. Claimant denied any previous history of inflammatory arthritis in joints other than her right shoulder.

Physical examination showed a warm, tender, swollen right ankle with surrounding varicosities. Reflexes showed some abnormalities. In the impressions listed on the fifth page of the exhibit, it states, "No evidence that presenting symptoms aggravated or precipitated by trauma." The last page of the exhibit relates that the right ankle etiology is unclear but that traumatic etiology is doubtful. It further relates positive straight leg raising on the right, possible lumbar disc disease and an assessment that further evaluation would not be done in view of the mild nature of symptoms and lack of neurological deficits.

Defendants' exhibit 1 is the deposition of Scott B. Neff, D.O., which diagnoses claimant as having degenerative osteoarthritis in the lumbar spine. He found no neurological abnormalities and did not feel that claimant's right ankle and back pain were related directly or indirectly to the fall at work which she described to him. In referring to deposition exhibit E at page 4, Dr. Neff related that the CT scan is a relatively new invention and that if scans were done on 100 people who had no symptoms that 20 percent to 25 percent would show an abnormality. He related that the CT scan should not be relied upon without other clinical evidence. He related that numerous people have a bulging disc associated with the passage of time and as a result of the normal degenerative process. He related that degenerative disease occurs in everyone with passage of time. Dr. Neff stated that if an injury to the back occurs as a result of trauma, that the symptoms will usually begin within hours and if the disc has ruptured to the extent that it impinges on a nerve, that the patient will begin to complain of pain in the leg in 30 days. He stated that if a disc ruptures, the muscles become tight and stretching the nerve worsens the pain. A negative result from straight leg raising establishes that the nerve is not being stretched.

Dr. Neff indicated that there was no need for any of the three items listed in deposition exhibit G which are the elevated toilet seat, chair and bed. He felt that claimant had a five percent impairment of the body as a whole due to her back. Dr. Neff went on to relate that the degree of spondylosis he saw on claimant's x-rays would have taken 10 to 15 years to occur and that a fall could have aggravated the degenerative arthritis. He confirmed that an encroachment on the left L5 nerve root would result in pain in the buttock on the left side and that if the pressure were significant, the pain would radiate down the leg, below the knee, into the front part of the calf and to the inside of the foot.

His deposition included exhibits A-K. Deposition exhibits A and B are the records of Drs. Thomas and Hayne which had previously been referred to in this decision.

Deposition exhibit B contains five pages of records from Dr. Hughes which contain his office notes of January 29 and December 19, 1980 which are already in the record as separate exhibits. A report to Arthur Cloud, M.D., dated December 21, 1972 is included which indicates marked varicosities in both lower extremities and a situation in the nature of claimant making complaint of severe pain yet ambulating easily. The fifth page is a report from Dr. Hayne to Dr. Cloud dated December 8, 1964 wherein Dr. Hayne had seen claimant for a cervical strain.

Exhibit C is what appears to be a report from Michael J. Hogan, M.D., concerning claimant's evaluation at the Mayo Clinic in August of 1981. It discloses spinal x-rays with normal results.

Exhibit D is a report from Austin Corbett, M.D., addressed to J. Watts, M.D., dated September 6, 1982. It relates positive straight leg raising of the right leg at 70 degrees suggesting possible lumbar disc disease. Attached is a letter from Dr. Corbett to claimant's attorney dated November 1, 1982 wherein he states that he cannot attribute any of claimant's problems to her fall at work. Attached is also another letter to claimant's counsel dated November 12, 1982 stating that he did not direct claimant to cease work and again stated that he was not able to estimate the nature and severity of claimant's alleged disability.

Deposition exhibit F consists of several pages, the first of which is an x-ray report dated September 17, 1981 showing normal interspaces, no evidence of compression and some muscle spasm with splinting of the body to the right. Page two is an x-ray report dated November 15, 1972 which shows straightening of the lumbar spine but no evidence of fracture. Page three is an x-ray report dated August 8, 1974 which shows arthritic degenerative changes, osteoporosis and slight scoliosis to the right. Pages four through sixteen are the notes of claimant with Dr. Thomas and are essentially cumulative.

Exhibit G is a report of Scott B. Neff, D.O., dated June 2, 1983, which is consistent with his deposition in that he does not ascribe the bulging disc seen on the CT scan to the fall and finds her problem to be essentially degenerative disease due to age, chronic long term activity and obesity.

Exhibit H is a curriculum vitae of Scott B. Neff, D.O.

Exhibit I is a diagram showing nervation in the skin. Exhibit J is another copy of the report and charges from Dr. Johnson. Exhibit K is a copy of the letter which introduced claimant to Dr. Neff.

Defense exhibit 2 is a copy of the first report of injury.

Exhibit 3 is a request by claimant for the elevated toilet seat, chair and bed as prosthetic devices and medical aids.

Exhibit 4 appears to be receipts from Dr. Sheldahl covering the period of August 21, 28 and September 10, 1979. The person from whom payment was received appears to be Mrs. M. Pickard. The receipts seem to indicate that the payment was for osteopathic treatment.

Defendants' exhibit 5 is a copy of the original notice and petition filed in the Iowa District Court for Marshall County by claimant against Montgomery Ward and Company.

APPLICABLE LAW

Claimant has the burden of proving by a preponderance of the evidence that she received an injury on January 13, 1980 which arose out of and in the course of her employment. McDowell v. Town of Clarksville, 241 N.W.2d 904 (Iowa 1976); Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

The words "out of" refer to the cause or source of the injury. Crowe v. DeSoto Consol. Sch. Dist., 246 Iowa 402, 68 N.W.2d 63 (1955).

The words "in the course of" refer to the time and place and circumstances of the injury. McClure v. Union et al. Counties, 188 N.W.2d 283 (Iowa 1971); Crowe, 246 Iowa 402, 68 N.W.2d 63 (1955).

An employee is entitled to compensation for any and all personal injuries which arise out of and in the course of the employment. Section 85.3(1).

The supreme court of Iowa in Almquist v. Shenandoah Nurseries, 218 Iowa 724, 731-32, 254 N.W. 35, 38 (1934), discussed the definition of personal injury in workers' compensation cases as follows:

> While a personal injury does not include an occupational disease under the Workmen's Compensation Act, yet an injury to the health may be a personal injury. [Citations omitted.] Likewise a personal injury includes a disease resulting from an injury.... The result of changes in the human body incident to the general processes of nature do not amount to a personal injury. This must follow, even though such natural change may come about because the life has been devoted to labor and hard work. Such result of those natural changes does not constitute a personal injury even though the same brings about impairment of health or the total or partial incapacity of the functions of the human body.
>
> ....
>
> A personal injury, contemplated by the Workmen's Compensation Law, obviously means an injury to the body, the impairment of health, or a disease, not excluded by the act, which comes about, not through the natural building up and tearing down of the human body, but because of a traumatic or other hurt or damage to the health or body of an employee. [Citations omitted.] The injury to the human body here contemplated must be something, whether an accident or not, that acts extraneously to the natural processes of nature, and thereby impairs the health, overcomes, injures, interrupts, or destroys some function of the body, or otherwise damages or injures a part or all of the body.

The claimant has the burden of proving by a preponderance of the evidence that the injury of January 13, 1980 is causally related to the disability on which she now bases her claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman 261 Iowa 352, 154 N.W.2d 128 (1967).

While a claimant is not entitled to compensation for the results of a preexisting injury or disease, the mere existence at the time of a subsequent injury is not a defense. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756, 760-761 (1956). If the claimant had a preexisting condition or disability that is aggravated, accelerated, worsened or lighted up so that it results in disability, claimant is entitled to recover. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812, 815 (1962).

When an aggravation occurs in the performance of an employer's work and a causal connection is established, claimant may recover to the extent of the impairment. Ziegler v. United States Gypsum Co., 252 Iowa 613, 620, 106 N.W.2d 591, 595 (1960).

Compensation for aggravation of a pre-existing condition is limited to the extent of the aggravation and DeShaw v. Energy Manufacturing Company, 192 N.W.2d 777 (Iowa 1971).

The Iowa Supreme Court cites, apparently with approval, the C.J.S. statement that the aggravation should be material if it is to be compensable. Yeager v. Firestone Tire & Rubber Co., 253 Iowa 369, 112 N.W.2d 299 (1961); 100 C.J.S. Workmen's Compensation §555(17)a.

The limitation period of section 85.26 (1) does not begin to run until the employee discovered or in the exercise of reasonable diligence should have discovered the nature, seriousness and probable compensable character of the injury. Orr v. Lewis Central School District, 298 N.W.2d 256 (Iowa 1980).

Where no objection is raised, any variance between pleading and proof is waived and the matter is tried by consent. Iowa Rule of Civil Procedure 106; Holland v. Holland, 161 N.W.2d 744 (Iowa 1968); Buda v. Fulton, 157 N.W.2d 336 (Iowa 1968); Reserve Ins. Co. v. Johnson, 150 N.W.2d 632, 260, Iowa 740 (1967).

ANALYSIS

The first report of injury, exhibit 2, relates an injury date of January 12, 1980. Exhibit C, the notes of David C. Thomas, M.D., on the sixth page record the fall as occurring in the early a.m. of January 13, 1980. Claimant surely could not have anticipated any problem with the statute of limitations when she initially saw her doctor three days after she fell. It is therefore found that claimant sustained an injury on January 13, 1980. The petition was filed in this proceeding on January 13, 1982 and as such was timely filed within the provisions of section 85.26 (1) of The Code of Iowa.

Claimant's complaints revolve around alleged injuries to her lower back, varicose veins and right ankle. At the hearing, claimant stated that she was not seeking compensation based upon her right ankle. The report of Austin Corbett, M.D., dated September 6, 1982 and in the record as deposition exhibit D to Dr. Neff's deposition confirms the lack of any causal connection. No medical evidence exists which connects claimant's right ankle problems to the fall. Claimant has failed to establish any work-related injury to her right ankle.

A report of Dr. Thomas dated June 14, 1982 appears as deposition exhibit A-14 to the deposition of Dr. Neff. In that report, Dr. Thomas expresses his opinion that claimant's varicose veins existed prior to the fall and that the fall did not aggravate them. Reference to deposition exhibit F of that same deposition on page 6 by an entry dated June 17, 1975 notes the statement, "She does have rather marked varicose veins as in the past, but there is no indication of phlebitis at this time." There is no medical evidence in the record which relates any problem with claimant's varicose veins to her fall injury. The opinions of Dr. Thomas expressed in the June 14, 1982 report are adopted by the undersigned. Claimant suffered no work-related injury to her varicose veins.

The evidence is conflicting concerning whether or not claimant sustained an injury to her back on January 13, 1980. Such an injury could be an aggravation of preexisting degenerative arthritis or a new, separate and distinct injury to her back independent from degenerative arthritis.

Aggravation of a preexisting condition, like any other injury, can range in severity from a minor irritation with no long term effect to a major trauma resulting in permanent impairment.

The record clearly shows that claimant suffered from degenerative arthritis in her back long before the fall of January 13, 1980. Dr. Thomas explains her preexisting arthritis in his report dated February 8, 1982 which appears in the record as deposition exhibit A-12 to the deposition of Scott B. Neff, D.O. The x-ray report of Drs. Heise and Schultz dated August 8, 1974 which appears as deposition exhibit F-3 to Dr. Neff's deposition confirms the prior existence of the disease. Prescriptions for Butazolidan Alka, an anti-inflammatory arthritic medication appear in 11 of the 12 pages of clinical notes which comprise part of Neff deposition exhibit F. It would be highly unlikely for claimant to make the complaints which would result in the issuance of such a prescription if she were not then having arthritic pain.

Claimant has sought damages for a fall near a laundromat, for a slip in a grocery store, for a fall in the bathtub at a motel, and for being hit on the head by a box of curtain rods. She has previously made complaints which were excessive in relation to the objective clinical findings as shown in the report of John W. Hughes, M.D., and the report of Robert A.

Hayne, M.D., which appear in the record as deposition exhibits B-4 and B-5 of Dr. Neff's deposition. Claimant sought $25,000 from Montgomery Ward as shown by exhibit 5 alleging loss of vision when, in fact, she had only sustained minor injuries. Exhibit C clearly shows that claimant's loss of vision is the result of diabetes and that it pre-dated August 13, 1979, the date she was struck by the box of curtain rods. At the hearing, claimant testified that the fall in the bathtub in Rochester, Minnesota in August of 1981 resulted only in a scrape on her back, yet she sought damages from the motel for what she claimed at hearing to be a minor injury. It is difficult to believe that the motel would have paid $600.00 as compensation for a scrape on the back unless claimant were voicing complaints of a more serious injury.

The medical records in this case as a whole show claimant to have had frequent contact with various providers of medical care, sometimes seeing more than one simultaneously for the same condition without any coordination between the two providers. Claimant was seeing Dr. Thomas and concurrently seeing Edward C. Stayskal, D.C., at one point and Dr. Thomas and O. Landis Johnson, D.O., concurrently at another time. While apparently under the care of J. Watts, M.D., claimant referred herself to Dr. Hayne. Claimant has been evaluated through referrals to Mayo Clinic and University Hospitals. The first doctor to relate her back condition to the fall and the first doctor to affix a disability rating was Dr. Hayne in February, 1983. The record reflects that claimant has not sought further evaluation or treatment since. Dr. Hayne essentially confirmed the previous course of treatment and did not initiate any changes except for a change in pain medication. Claimant testified at the hearing that she called Dr. Hayne because she was in great pain, yet after being evaluated and rated by Dr. Hayne, she decided that she could live with the pain as is shown in exhibit O. Claimant appears to have difficulty identifying the onset of symptoms and the severity of her ailments.

A review of the exhibits in this case shows that x-rays have failed to show a herniated disc or other evidence of trauma at any time, only degenerative changes. It appears that the degenerative process has now progressed to the point of early spondylosis or fusion as shown in exhibit G. Early degenerative arthritis or spondylolysis is not to be confused with early spondylosis.

The second page of exhibit I reports nerve conduction studies performed February 22, 1983 which showed no evidence of lumbar radiculopathy, only a mild peripheral neuropathy affecting the back of claimant's calf and the outside of her foot.

Exhibit A is the result of the CT scan taken March 8, 1983 which states:

> There is generalized bulging of the disc at the L 3-1 level which does not appear to be impenging [sic] on the nerve roots. There is protusion of the L 4-5 disc on the left and to the neural foramen at the L 4-5 level. The fusion appears to be below the exit of the L 4 nerve roots. The herniation is noted to be just above the L 5 pedicle and probably encroaches on the left L5 nerve root. No definite evidence of other significant abnormality.
>
> Impression: Herniation at the L4-5 disc on the left with probable encroachment on the L5 nerve rootlets.

A report from Dr. Hayne, which appears in the record as exhibit K dated February 22, 1983 reads: "Lumbar spine X-ray showed marginal osteophytic spurring of the L-3, 4 interspaces anteriorly. These findings were those of early degenerative lumbar spondylosis. A myelogram was performed and this was a normal lumbar myelogram. An EMG of the lower extremities showed evidence of mild neuropathy. An EKG was normal."

Straight leg raising tests were performed by Dr. Hughes in January and December of 1980 and by Dr. Neff in June, 1983, all with negative results. In August, 1982, Austin Corbett, M.D., found a positive result on the right leg when he was examining claimant regarding her complaints concerning her right ankle. Such results are found in deposition exhibit D-1 to Dr. Neff's deposition and also on the last page of claimant's exhibit S.

A review of exhibits J and I leads one to conclude that there is no single test which can independently be relied upon to detect or negate a ruptured disc. Both doctors Hayne and Neff agree that surgery is not advisable for this claimant in view of her weight and diabetes. Their recommendations concerning limitation of claimant's activities due to her back condition are not greatly different.

Claimant fell on January 13, 1980 and had significant identifiable traumas on April 7, 1981 and August 26, 1981. An auto accident which totaled one vehicle and does $1200.00 of damage to another would require a significant impact. A fall in a bathtub which involves striking the back is also a significant trauma. Dr. Hayne stated at pages 49 and 50 of exhibit J that either of those two events, or even claimant's day to day activities, could rupture a disc.

Dr. Stayskal does not address the issue of permanent impairment and states the possibility of a relationship between the fall and claimant's back condition as he saw it in early 1980.

Dr. Johnson confirmed that arthritis can be aggravated by a fall but did not address claimant's degree of impairment or express an opinion concerning whether or not claimant's present ailments can be related to the fall on January 13, 1980.

Exhibit C is a report of Dr. Thomas dated February 23, 1982 in which he states:

> It is my opinion that Ruby Pickard has had underlying joint disease for many years. Although it was not specifically referrable to hips or ankles at that time, based on past experience I am confident that there was disease present prior to her fall. The injury probably aggravated the arthritis. I do not think that it caused the arthritis.
>
> Mrs. Pickard has many problems, all of which can aggravate the discomfort she feels in her body, specifically varicose veins, diabetes, and obesity as well as the degenerative arthritis. With a multifactorial problem it is difficult to say just how much is arthritis or just how much was aggravated by the fall.

Degenerative arthritis is a progressive disease which generally worsens with the passage of time. Claimant was taking Butazolidin prior to the fall. She continued to perform her regular job for more than two and a half years after the fall. Claimant's weight is a significant factor which probably increased the rate of degeneration of her disc and resultingly her symptoms. It appears that the fall probably did aggravate claimant's preexisting spinal degenerative arthritis. The extent of that aggravation is the true issue in this case.

Drs. Hayne, Neff, Thomas, Johnson, Corbett and Stayskal all recognize the possibility that claimant's fall may be a source of claimant's present symptoms. Only Dr. Hayne is willing to identify the fall as a probable cause of claimant's back condition.

The opinion of Dr. Thomas, claimant's treating physician, is given great weight in this proceeding. His opinion is corroborated by Dr. Neff. They specifically decline to relate claimant's present condition to the fall of January 13, 1980. The undersigned adopts their opinions. The opinion of Dr. Hayne is rejected as it is based upon an incomplete and incorrect history, highly dependent upon claimant's description of her symptoms and the onset of her symptoms, which have been found to be unreliable.

Claimant has failed to establish that the fall of January 13, 1980 is a cause of the back problem from which she now suffers. It is unnecessary to determine whether or not her disc is actually ruptured or the degree of her impairment and any resulting disability.

Claimant did, however, sustain a fall and is entitled to compensation in a form of payment of the medical expenses incurred in treating the injury she sustained in that fall. Claimant is entitled to payment for broken glasses, a chipped tooth and the medical care provided by Dr. Thomas for her knees. It is difficult to identify the precise point at which claimant ceased receiving medical treatment for the injury itself as opposed to her other medical conditions. Clearly, some of her medical care was prompted primarily by other medical problems and such are not compensable. Based upon the nature of the examination and treatment as well as the proximity and time to the date when claimant fell, it is found that the charges from Dr. Hughes, d/b/a Marshalltown Orthopedics, P.C., in the amount of $100.00; charges from Dr. E. W. Sheldahl in the amount of $32.00; and the charges from Dr. Stayskal in the amount of $109.00 were incurred in providing reasonable medical care for claimant's injuries. A review of the charges from Dr. Thomas when exhibit Q is compared with exhibit C shows that the only charges for care related to the fall were those entered January 16, March 18, and August 4, 1980. These total $34.00.

The charges from Dr. O. Landis Johnson in the amount of $160.00 covering the period of November 12, 1980 through April 4, 1982 and consisting of 14 osteopathic treatments appear, to be the last treatments which can rationally be related to an aggravation of claimant's degenerative arthritis arising from the fall of January 13, 1980. In actuality, the point at which the treatments ceased to be related to the fall and reverted to treatment of the underlying disease probably occurred at some point during that course of treatment but in the absence of a showing of such, the undersigned finds that treatment of the injury from the fall ran until claimant ceased treatment with Dr. Johnson.

The expenses incurred with Iowa Methodist Medical Center and Dr. Hayne have not shown themselves to be in the form of treatment for the fall and resulted only in treatment for claimant's underlying disease. In view of the remoteness from the time of the fall and the lack of a permanent impairment from the fall those charges are not the responsibility of the employer.

FINDINGS OF FACT

1. Claimant is a married female who was 59 years of age at the time of hearing.

2. On January 13, 1980, claimant was employed by Roger Bailey in his business of the 13th Street Inn.

3. On January 13, 1980 while leaving the employer's

premises, she fell down a flight of stairs.

4. The immediately apparent injuries claimant sustained consisted of a chipped tooth, skinned knees and pain in her lower extremities.

5. Claimant reported the fall to her employer the next regular work day.

6. Claimant continued to work until August, 1982 without losing any time from work attributable to the fall.

7. Claimant suffers from degenerative arthritis of her spine which was diagnosed in 1974.

8. Claimant suffers from adult onset diabetes, varicose veins and obesity which all pre-dated 1980.

9. Claimant's fall did not injure or materially aggravate the diabetes, obesity or varicose veins.

10. Subsequent to the fall, claimant began experiencing pain in her right ankle.

11. No identifiable impairment of claimant's right ankle has been identified except degenerative changes which are not shown to be related to the fall of January 13, 1980.

12. Claimant presently complains of pain in her left lower extremity and lower back.

13. Claimant suffered identifiable traumas in an auto accident and a fall in a bathtub.

14. Claimant has a protrusion of her L4-5 disc on the left which probably encroaches on the L5 nerve root.

15. Claimant is permanently partially impaired as a result of the impairment in her back.

16. No objective evidence exists which makes claimant's present back impairment more likely to be a result of her fall at work than a result of one of the other identified traumas, her normal day-to-day activities or the normal progression of her degenerative disease.

17. Claimant has difficulty accurately identifying the onset, source and severity of the various symptoms from which she presently suffers.

18. The opinion of Dr. Hayne concerning the cause of claimant's present back impairment is based upon what claimant related to him concerning the onset and severity of her symptoms.

19. Claimant's fall did result in an aggravation of her preexisting spinal degenerative arthritis.

20. The aggravation from the fall caused a temporary flare up of symptoms but has not been shown to have altered the nature or course of claimant's degenerative arthritis in any manner.

21. Claimant sustained temporary injuries in the fall which required medical care but did not sustain any permanent impairment or temporary disability as a result of the fall at work.

22. Medical care provided by Drs. Johnson, Stayskal, Sheldahl, Hughes and the care provided by Dr. Thomas on January 16, March 18 and September 4, 1980 were all for treatment of the injuries sustained by claimant in the fall at work. Such services were reasonably necessary and appropriate for the injuries sustained and the amount of the charges arising from those services is reasonable.

23. The services rendered by Dr. Hayne and Iowa Methodist Medical Center were primarily in the nature of evaluation and treatment for claimant's underlying degenerative arthritis. Accordingly, the services were not reasonably necessary for treatment of any injuries sustained by claimant in her fall at work.

24. Claimant's petition was filed January 13, 1983.

CONCLUSIONS OF LAW

This agency has jurisdiction of the subject matter and parties of this proceeding.

On January 13, 1980, claimant sustained an injury arising out of and in the course of her employment when she fell.

The injuries sustained by claimant in the fall were temporary in nature and did not result in any permanent impairment or any permanent disability.

The charges incurred by claimant in receiving medical treatment for the injuries she sustained in the fall total the sum of $275.00.

Claimant did not lose any time from work in order to entitle her to temporary disability compensation.

Claimant is not entitled to permanent partial disability compensation.

This action was commenced in a timely manner and is not barred by any statute of limitation.

ORDER

IT IS THEREFORE ORDERED that defendants pay claimant the sum of two hundred seventy-five and no/100 dollars ($275.00) in accordance with section 85.27 of The Code of Iowa and any amount incurred by claimant for repair of her chipped tooth.

IT IS FURTHER ORDERED that defendants pay the costs of this proceeding consisting of the cost of service of the original notice, the reporting fees for depositions and an expert witness fee in the amount of fifty and no/100 dollars ($50.00) for the deposition of Dr. Hayne, and fifty-five and no/100 dollars ($55.00) for the cost of obtaining two medical reports in accordance with Iowa Industrial Commissioner Rule 500-4.33.

Signed and filed this 30th day of March, 1984.

INTRODUCTION

Plastic Surgery Institute, P.C. [P.S.I.] appeals from a proposed ruling of the deputy filed April 17, 1984 wherein P.S.I. was found to lack standing as a party in a workers' compensation claim.

In response to an application for determination of reasonableness of medical fees filed by defendants in the above captioned action, Plastic Surgery Institute, P.C., alleged assignee of the injured worker's medical costs at issue, filed an appearance and initiated discovery proceedings. Defendants filed a resistance to and motion to quash notice of the taking of a deposition by P.S.I., partly on the basis that the treating physician(s) was not a party to the action. P.S.I. filed a response and on March 27, 1984 requested a ruling on defendants' resistance and motion to quash and on P.S.I.'s response.

APPLICABLE LAW

Section 85.20, Code of Iowa, provides:

The rights and remedies provided in this chapter, chapter 85A or chapter 85B for an employee on account of injury, occupational disease or occupational hearing loss for which benefits under this chapter, chapter 85A or chapter 85B are recoverable, shall be the exclusive and only rights and remedies of such employee, the employee's personal or legal representatives, dependents, or next of kin, at

common law or otherwise, on account of such injury, occupational disease, or occupational hearing loss against:

1. his or her employer; or

2. any other employee of such employer, provided that such injury, occupational disease, or occupational hearing loss arises out of and in the course of such employment and is not caused by the other employee's gross negligence amounting to such lack of care as to amount to wanton neglect for the safety of another.

Section 85.26(4) states: "No claim or proceedings for benefits shall be maintained by any person other than the injured employee, his or her dependent or his or her legal representative if entitled to benefits."

Iowa Industrial Commissioner Rule 500-4.35 provides:

The rules of civil procedure shall govern the contested case proceedings before the industrial commissioner unless the provisions are in conflict with these rules and chapters 85, 85A, 85B, 86, 87 and 17A, or obviously inapplicable to the industrial commissioner. In those circumstances, these rules or the appropriate Code section shall govern. Where appropriate, reference to the word "court" shall be deemed reference to the "industrial commissioner."

The burden rests upon the claimant to establish by a preponderance of the evidence the right to compensation. Webb v. Iowa-Nebraska Coal Co., 198 Iowa 776, 200 N.W.225 (1924).

The claimant must present sufficient evidence to prove a causal connection between the conditions which were the subject of medical treatment and the claimant's work injury. Auxier v. Woodward State Hospital-School, 266 N.W.2d 139 (Iowa 1978). Where there is no stipulation as to the reasonableness or necessity of medical services, the industrial commissioner may make a finding on the evidence as to whether the medical services were necessary. Polson v. Meredith Publishing Co., 213 N.W.2d 520, 525 (Iowa 1973).

The injured worker has the burden of proving his expenses. Upon so proving, he should be reimbursed and may then deal with his creditors for such expenses. A determination requiring payment of bills to parties owed rather than the worker could give rise to numerous collateral issues, particularly if reasonableness of the charges had to be determined. Boyer v. Service Distributors, Inc., 366 Mich. 319, 115 N.W.2d 101 (1962).

The injured worker is the only proper party plaintiff to sue for benefits. Bank of Jena v. Clark, 413 So.2d 281 (La.App. 1982).

An instrument assigning a workers' compensation award can vest in the assignee but does not confer any right to maintain an action against the employer or its insurance carrier. Rhea v. Park, 211 Tenn. 589, 366 S.W.2d 765 (1963).

The workers' compensation act is to be given liberal construction, but any authority to be given to a physician to proceed under the act against an employer for payment for services rendered an injured employee must come by legislative mandate, and cannot come by judicial interpretation. Wynne v. Pawtuxet Valley Dyeing Co., Inc., 224 A.2d 612 (R.I. 1966).

ANALYSIS

Appellant is a professional corporation seeking payment of medical costs incurred by Brian Poindexter, the injured worker. Appellant contends that Mr. Poindexter has executed a valid assignment of his workers' compensation medical benefits to the corporation, and it thus has an economic interest that renders it an indispensable party to the claim.

The dispute arises from a petition and accompanying application for determination filed by the employer and insurance carrier which questioned the reasonableness of medical fees which were submitted in conjunction with a work injury. A previously filed memorandum of agreement has established an employment relationship between Poindexter and Grant's Carpet Service, and that the injury arose out of and in the course of employment. The employer's final report indicates that healing period and permanent partial disability benefits have been paid.

It is established law that the claimant has the burden of proving his claim for benefits. By the filing of a memorandum of agreement, the injured worker is relieved of a showing that the injury was work related, but his burden of proving medical costs remains. If the injured employee seeks payment of medical benefits and the costs are in dispute, it is his responsibility, by statute, to initiate a proceeding which gives him the opportunity to prove his claim against the employer. He must show that the medical costs are causally related to the work injury and that they are reasonable and necessary. No party can make this showing for him, and the employer is under no obligation to render payment until the worker has sustained his burden.

In the instant case, no claim for medical payment has been filed by Brian Poindexter. Review of the applicable statutory provisions reveals no statutory authority which gives P.S.I. standing to proceed under compensation law directly against the employer. The Iowa Supreme Court in Brauer v. J. C. White Concrete Co., 253 Iowa 1304, 115 N.W.2d 702 (1962) ruled that a party who rendered medical or hospital services could assert a claim therefor before the industrial commissioner. The legislature acted with utmost celerity to overturn the holding of the Iowa Supreme Court in the Brauer decision in the session of the general assembly immediately after the filing of the decision. They enacted: "No claim or proceedings for benefits shall be maintained by any person other than the injured employee his dependent or his legal representative, if entitled to benefits." Acts of the Regular Session 60 GA (1963), Chapter 87, §3.

This provision remains in the law today in the same form (although with gender reference corrected) as Code of Iowa section 85.26(4).

Although appellant, like any creditor, has a financial interest in expediting a determination of payment due, such interest does not confer standing to participate in an action that has not properly been initiated or to attempt to relieve a potential claimant of his rightful burden of proof by initiating a discovery proceeding against the employer and the insurer. The deputy was correct in finding that P.S.I. is not a party to this action and has no standing to sue in claimant's name.

Incidental to this finding, it should be noted that the courts have generally denied the right of assignees to sue under workers' compensation statutes. The spirit and intent of the act is perceived as setting forth a relatively personal proceeding between the employee and the employer, and no provision is intended for outside parties, regardless of interest, to seek a remedy through compensation laws. Where assignability of payments has been at issue, the majority position in other jurisdictions has been to deny standing to a third party.

WHEREFORE, on the basis of the foregoing considerations, it is found:

1. That P.S.I. is not a party to this proceeding.

2. That the injured worker has not initiated a claim for the payment of medical benefits, and an application for determination of the reasonableness of medical fees is not properly before this agency.

THEREFORE, the decision of the deputy is affirmed. Further, the action commenced by the defendants is dismissed.

Signed and filed this 10 day of August, 1984.

IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in review-reopening brought by Loretta Kay Reyna, claimant, against John Deere Davenport Works, self-insured employer, defendant, to recover benefits under the Iowa Workers' Compensation Act for an injury arising out of and in the course of her employment on November 3, 1982. It came on for hearing on July 12, 1984 at the Bicentennial Building in Davenport, Iowa. It was considered fully submitted at that time.

A first report of injury was received on November 12, 1982.

At the time of hearing defendant acknowledged an injury to claimant's two feet on November 3, 1982. The parties agreed that the rate in the event of an award is $250.62.

The record in this matter consists of the testimony of claimant; claimant's exhibit 1, a letter from Robert W. Milas, M.D., dated August 10, 1979; claimant's exhibit 2, a letter from Dr. Milas dated August 17, 1979; claimant's exhibit 3, a letter from Frank I. Russo, M.D., dated August 14, 1979; claimant's exhibit 4, a note from Dr. Russo dated September 13, 1979; claimant's exhibit 5, a preadmission physical by Dr. Milas from September 1979; claimant's exhibit 6, a surgery report of September 28, 1979; claimant's exhibit 7, notes from defendant's medical department; claimant's exhibit 8, a weekly indemnity request form; claimant's exhibit 9, a disability notice; claimant's exhibit 10, a weekly indemnity request form; claimant's exhibit 11, an insurance form; claimant's exhibit 12, an insurance form; claimant's exhibit 13, notes from defendant's medical department; claimant's exhibit 14, notes from the medical department; claimant's exhibit 15, notes from Harold J. Jersild, M.D., from 1980; claimant's exhibit 16, notes from the medical department; claimant's exhibit 17, a letter from Marvin L. Skoglund, M.D., dated February 24, 1983; claimant's exhibit 18, office notes

from Dr. Skoglund; claimant's exhibit 19, a letter from Maud Karlsson, M.D., dated February 17, 1983; claimant's exhibit 20, notes from the medical department; claimant's exhibit 21, an inpatient admission record; claimant's exhibit 22, a readmission note from Dr. Skoglund; claimant's exhibit 23, a list of restrictions; claimant's exhibit 24, records from a hospital admission of November 3, 1982; claimant's exhibit 25, records from claimant's readmission on December 22, 1982; claimant's exhibit 26, a report from Barry Lake Fischer, M.D., dated July 7, 1983; claimant's exhibit 27, a letter and accompanying notes from Dr. Skoglund dated September 21, 1983; claimant's exhibit 28,a report from Irwin T. Barnett, M.D., dated September 16, 1983; claimant's exhibit 29, a letter with notes from Dr. Skoglund dated October 12, 1983; claimant's exhibit 30, a combined medical report and statement; claimant's exhibit 31, a letter from Dr. Skoglund dated December 7, 1983; claimant's exhibit 32, a letter from Dr. Fischer dated February 6, 1984; and claimant's exhibit 33, statement of payments from defendant. The parties filed briefs.

ISSUES

The issues in this matter are whether or not there is a causal relationship between claimant's injury and any disability she now may suffer and whether or not claimant is entitled to permanent partial disability benefits.

STATEMENT OF THE CASE

Forty-two year old married claimant, who commenced work for defendant on May 16, 1977, testified to having had disc surgery and as of November 1982 carrying a thirty-five pound weight restriction with instructions to lift with the knees. At that time she was able to do her work and to do overtime.

Claimant recalled the circumstances surrounding her injury of November 3, 1982 thusly: She was working the second shift. She was on a high rise. She had a box in her hand. One of her feet went through a pallet and a few inches to the floor. Her foot was caught. The other foot snapped. She fell hitting her knee and buttocks. She asked a coworker to call an ambulance. She lost consciousness. She was taken to the hospital where she was x-rayed. She decided it would be better for her to be hospitalized in Illinois. She was taken to a hospital there where she saw Dr. Skoglund who did surgery on her left foot and put casts on both legs.

She was off work until April 4, 1983 at which time she went back with special provisions made for an ambulance to pick her up, take her to her work station and then return her. She was to work with her feet elevated and to have handicapped parking. She worked, but she did no overtime.

On October 1, 1983 her left knee went out and she experienced bad pain. She had an arthrogram which was negative and then she started therapy. Dr. Skoglund continues to observe the knee. She returned to work on February 6, 1984 and she has been working steadily. She asserted that she has been unable to do overtime, but she did not know whether or not overtime had been available. Her current restrictions are no lifting, pushing or pulling over ten pounds; no excessive reaching, twisting or bending; and no prolonged standing or walking. She functions as as a crib attendant issuing supplies to other workers. Her wage is $11.72 per hour.

Claimant alleged that her condition changed beginning in January of 1984 in that she is having trouble with the way she walks and in that her upper back, lower back, tail bone and both legs and feet are bothering her. In addition to walking differently from the way she had before, she also sits differently. Her feet swell during the day and swelling is worse although her condition, she said, is the same as when she was last seen by Dr. Fischer.

She stated that she must have special shoes with a bar below the arch and special hose. She puts on the stockings before she gets out of bed. She is unable to wear tennis shoes or high heels although she had on a tennis-type shoe the day of the hearing. Her current medications are Dolobid and Parafon Forte.

Claimant declared her life very restricted. After she works forty hours she is troubled with swelling. She no longer skis, skates, gardens or dances. Company functions are not attended. She hires someone for portions of her housework.

Claimant reported a problem with Dr. Skoglund's being unavailable when she wishes to see him. She asserted that Dr. Skoglund had x-rayed her knee from the time of the accident.

Claimant acknowledged two surgeries to her left foot, one in 1981 and one in 1982 because of a plantar wart problem. She did not think she was under any restrictions as a result of these surgeries.

Beginning in February 1979 claimant was seen in the medical department for low back complaints with spasm on the left. Claimant was placed on light duty for a time. She spoke of her left knee "being floppy." In July of that year she complained of a sore left ankle with swelling and mild soreness in the right ankle as well. In August claimant voiced complaints of the sacral and paraspinous region which was diagnosed as a lumbosacral strain.

Following a laminectomy, claimant was released for work on January 3, 1980 with restrictions of no excessive bending or stooping and no lifting over forty pounds.

In February of 1981 she had a wedge osteotomy of the left fourth metatarsal. Later in the year she had pain in the right buttocks which radiated down her leg on one occasion and pain in the left buttocks which was aggravated by certain activity. Claimant was diagnosed as having low back pain with possible disc involvement, a cervical neck sprain and residual condition. Her weight limitation was reduced to thirty pounds.

Claimant continued to have back complaints into 1982 and also recounted tenderness over the bottoms of her feet after surgery. Early in the year her weight limitation was raised to thirty-five pounds. In March her ankle jerk was absent on the left. Two weeks of work were missed in April because of low back pain. Her ankle jerks were bilaterally equal at that time.

Claimant had additional surgery for the depressed metatarsal of her left foot in September of 1982. When claimant presented her return-to-work slip for November 1, 1982 she had been seen by Dr. Milas for her back only a few days before.

After her return to work in April of 1983 claimant continued to complain of swelling, particularly in her left ankle. In June claimant was walking with a limp. Her restrictions of no prolonged standing or walking over thirty minutes remained. She was to elevate her foot when sitting.

In a letter dated August 10, 1979 Robert W. Milas, M.D., referred to claimant's having lumbar pain radiating to the right lower extremity. Claimant's lumbar motion was moderately limited. One of the doctor's impressions was lumbosacral pain of unknown etiology. X-rays of the lumbosacral spine were normal. Dr. Milas thought claimant's complaints were of a muscular ligamentous nature and he recommended a physiatrist.

Claimant was seen by Frank I. Russo, M.D., who found deep tendon reflexes at the knees and ankles brisk and symmetrical. There was no gross muscular atrophy in the lower extremities. Electromyography and nerve conduction studies of the right lower extremity were normal.

Claimant was placed on outpatient therapy, but she continued to have complaints of pain radiating down the right lower extremity to the ankle. There was a slight decrease in the right ankle jerk. Electromyography was compatible with an S1 radiculopathy.

Claimant was hospitalized on September 19, 1979. A myelogram was done followed by a lumbar laminectomy at L5, S1.

Claimant was treated by Dr. Jersild in 1980 for cervical radiculitis.

Claimant was seen by Dr. Jersild in March of 1982 with low back complaints with radiation into her left lower extremity. Deep tendon reflexes of the ankle were dulled and there was mild sensitivity in the left sciatic notch. Straight leg raising was not restricted. Dr. Jersild thought claimant had an exacerbation of lumbar degenerative disc disease. Claimant appears to have returned to work on April 5, 1982.

Hospital records show claimant was admitted to the hospital on November 3, 1982 after a fall at work with a sprain of her right ankle, a trimalleolor dislocation and fracture of the left ankle. Open reduction of both the medial and lateral malleoli was undertaken. Claimant gave a history of prior laminectomy three years before, recurrent low back pain, and elevation of the fourth metatarsal.

Claimant had no tenderness to palpation in the sacrum, coccyx or lumbar spine. Straight leg raising was negative and claimant's sensory and motor functions were intact. Examination of the knee and hip were within normal limits. X-rays of the coccyx and and sacrum showed acute anterior angulation of the distal half of the distal sacral segment which was interpreted as representing either older or recent bone trauma.

Claimant returned to the hospital on December 22, 1982 for removal of the screw from the lateral aspect of her left ankle. No sensory deficit was found in either ankle.

By January 4, 1983 claimant had 75 percent motion in her right ankle and she was ready to start full weight bearing on both sides with support of crutches.

When claimant was seen at the end of February she had tightness in her left ankle and tenderness over the plantar aspect of the left foot where she had previously had plantar warts removed.

A month later claimant had full motion in the right ankle and motion 75 percent of normal on the left.

Claimant was seen in April after she had returned to work. Because of swelling in the left ankle, Jobst stockings were prescribed. The following month the doctor thought claimant should consider work with less walking or working only part of the day.

In July claimant had complaints of both her feet and her back. She had metatarsalgia in both feet with callus formation over the fifth metatarsal head. Back x-rays showed narrowing of the disc space at L4-5. Metatarsal pads and arches were ordered

for claimant's shoes. Range of motion on the next visit was full on the right and 85 percent on the left.

Approximately six weeks later claimant was complaining of pain in her buttocks, left hip and thigh and right leg cramps at night. X-rays showed degenerative arthritis in the lumbar spine. The left knee was normal.

When claimant was seen on October 12, 1983 she told the doctor of a blackout when she got out of bed. She complained of severe pain on the anteriolateral aspect of the left knee. An arthrogram was normal. Knee motion was full with no crepitation. Dr. Skoglund was unable to explain claimant's pain which he found to be a sprain syndrome. Claimant was provided with outpatient therapy, exercise and given Naprosyn.

In a letter of December 7, 1983 Dr. Skoglund provided the following ranges of motion: Right ankle dorsiflexion 0°, plantar flexion 45°; left ankle dorsiflexion 0°, plantar flexion 35°. He determined an impairment of seven percent in the right lower extremity and nine percent of the left lower extremity. He converted those to three and four percent of the whole person and then to fifteen percent of the whole person.

Barry Lake Fischer, M.D., examined claimant on June 11, 1983. He took a history of an injury to claimant's right ankle, a fracture to her left ankle and trauma to her back in a fall on November 3, 1982. Claimant's complaints were pain, soreness and stiffness over both sides of her lower back and pain into both legs; weakness in the left foot; and pain, soreness and stiffness in both ankles with swelling.

On examination claimant had bilateral lumbosacral and paravertebral tenderness and spasm to palpation and pressure which radiated to both sides and down the posterior aspect of both legs with bilateral sciatic radiation of spasm. There was tenderness to palpation and pressure over both ankles. There was swelling of the left malleolar area. Ranges of motion in the ankles were as follows:

	Normal	Right	Left
Flexion	35	35	20
Extension	10	10	5
Inversion	35	25	10
Eversion	10	5	5

Dr. Fischer concluded that claimant had permanent partial disability to both legs of 30 percent with additional industrial loss of 35 percent to the left foot and seven percent to the right.

Dr. Fischer saw claimant for reexamination on February 3, 1984. Her complaints were unchanged and she added pain in the left knee since the injury and pain, soreness and stiffness in the upper back. Dr. Fischer's findings regarding claimant's ankle were the same. He noted that a gait disturbance and loss of normal mobility in the ankle had led to a left knee syndrome. In addition to the rating he had previously given, he found disablity in the upper back with a cumulative injury of 40 percent of the whole person.

Irwin T. Barnett, M.D., reported the results of his examination in a letter dated September 16, 1983. Claimant gave a history of hurting both ankles and her left knee and buttocks. She complained of pain in the left knee and to the buttocks, both legs and lumbar spine and tail bone. She told of nerve damage to the right leg which had worsened since surgery. She told the doctor of swelling in both ankles which was worse on the left.

There was muscle spasm along the lumbar spinal musculature. The Achilles reflex was diminished on the right and absent on the left. The patellar reflexes were brisk and intact. There was some shortening of the right leg, swelling in the left knee and ankle and atrophy in the right knee cap and thigh. The doctor suspected chondromalacia in the knee.

Ranges of motion in the ankles were as follows:

	Normal	Right	Left
Inversion	35	30	10
Eversion	15	5	0
Plantar Flexion	15	5	0
Dorsiflexion	35	25	10

X-rays of the left knee showed soft calcification. X-rays of the left ankle showed a small fragment of bone at the distal end of the external malleolus. On one view a defect of the navicular tarsal bone was seen.

Among Dr. Barnett's diagnoses were residuals of a low back injury with bilateral sciatic nerve root irritation, residuals of a soft tissue ligamentous and cartilage injury of the left knee, a fracture of the left fibula involving the external and internal malleolus, a fracture of the fourth metatarsal, a defect in the upper surface of the navicular tarsal bone and residual of a soft tissue ligimentous injury to the right foot and ankle. He attributed the atrophy of the left calf and thigh to the claimant's favoring of the left leg.

Dr. Barnett concluded claimant "has a major loss of use of the man as a whole."

APPLICABLE LAW AND ANALYSIS

The first issue to be considered is one of a causal connection.

The claimant has the burden of proving by a preponderance of the evidence that the injury of November 3, 1982 is causally related to the disability on which she now bases her claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

Defendant seemingly does not seriously contest impairment to claimant's lower extremities. It is rather claimant's contention that impairment extends into the body which is the subject of dispute. As defendant points out, a doctor's recitation of history is not sufficient to prove medical causation.

Claimant was seen in defendant's medical department as early as February 1979 with back complaints which occurred periodically thereafter. She had a laminectomy and a weight restriction was imposed. She was seen for back complaints a few days prior to her November fall at which time she also spoke of left-sided back pains sometimes radiating toward the knee.

When claimant was hospitalized following the accident, she had no tenderness to palpation in her coccyx or lower spine. Straight leg raising was negative. Sensory and motor functions were intact. Claimant had a contusion of the buttocks and on November 12 had some pain in the left sacroiliac. On x-ray there was angulation of the distal half of the distal sacral segment which was interpreted as either old or recent trauma. No clarification appears in the record.

Claimant again complained of her back in July of 1983. X-rays showed narrowing at L4-5. Subsequent x-rays revealed degenerative arthritis. Dr. Skoglund, who has been claimant's treating physician, confines her impairment to the lower extremities. His letter of September 21, 1983 reports "back pain probably related to her previous surgery by Dr. Milas." He specifically deliniates a separate impairment rating to the back due to the 1979 injury.

Dr. Fischer's evaluation may be somewhat tainted by the accuracy of his history in that he assumed injury to both ankles and to claimant's back. The doctor reviewed x-rays of claimant's lumbar spine and characterized the changes he saw as laminectomy changes.

Dr. Barnett's history also contains some deficits in that he assumed that a bruised tailbone and nerve damage to the right leg which has worsened since surgery presumably to the right. He attributed claimant's muscle spasms to active low back disease, but he also wrote that disc pathology "can be result of aggravation of trauma." Later he stated: "Apparently she had two injuries here, to account one for the back injury and one for the leg injury."

Claimant's burden is preponderance and in light of claimant's preexisting back condition, she must show a causal relationship between her fall in November of 1982 and her current back complaints. She does not preponderate on that point. However, the record clearly establishes impairment to claimant's lower extremities attributed to her injury of November 3, 1982.

The remaining issue is claimant's entitlement to permanent partial disability.

The right of a worker to receive compensation for injuries sustained which arose out of and in the course of employment is statutory. The statute conferring this right can also fix the amount of compensation to be paid for different specific injuries, and the employee is not entitled to compensation except as provided by the statute. Soukup v. Shores Co., 222 Iowa 272 268 N.W. 598 (1936).

That a worker sustaining one of the injuries for which specific compensation is provided under the statute might, because of such injury, be unable to resume employment and because of his lack of education or experience or physical strength or ability, might be unable to obtain other employment, does not entitle him to be classed as totally and permanently disabled. Id. at 278, 268 N.W. 598.

Where the result of an injury causes the loss of a foot, or eye, etc., the loss, together with its ensuing natural results upon the body, is a permanent partial disability and is entitled only to the prescribed compensation. Barton v. Nevada Poultry Co., 253 Iowa 285, 290, 110 N.W.2d 660 (1961). The schedule fixed by the legislature includes compensation for resulting reduced capacity to labor and earning power. Schell v. Central Engineering Co., 232 Iowa 424, 425, 4 N.W.2d 339 (1942). The claimant has the burden of showing that his ailment extends beyond the scheduled loss. Kellogg v. Shute and Lewis Coal Co., 256 Iowa 1257, 130 N.W.2d 667 (1964).

Larson in 2 Workmen's Compensation, §58 at 10-28 (Desk ed. 1976) discusses the nature of scheduled benefits and points out that "payments are not dependent on actual wage loss" and that they are not "an erratic deviation from the underlying principle of compensation law--that benefits relate to loss of earning

capacity and not to physical injury as such." The theory, according to Larson, is unchanged with the only difference being that "the effect on earning capacity is a conclusively presumed one, instead of a specifically proved one based on the individual's actual wage-loss experience."

The Iowa Supreme Court recently has reaffirmed the concept of scheduled member injuries in Graves v. Eagle Iron Works, 331 N.W.2d 116 (Iowa 1983).

Iowa Code section 85.34(2)(s) provides:

> If an employee has suffered a personal injury causing permanent partial disability for which compensation is payable as provided in subsection 2 of this section, the employer shall pay to the employee compensation for a healing period, as provided in section 85.37, beginning on the date of injury, and until the employee has returned to work or it is medically indicated that significant improvement from the injury is not anticipated or until the employee is medicaly capable of returning to employment substantially similar to the employment in which the employee was engaged at the time of injury, whichever occurs first.

Claimant had injury to both lower extremities in a single incident. The Iowa Supreme Court in Simbro v. DeLong's Sportswear, 332 N.W.2d 886 (Iowa 1983) made it very clear that "compensation benefits for permanent partial disability of two members caused by a single accident is a scheduled benefit" meaning that "the degree of impairment must be computed on the basis of a functional, rather than an industrial disability." The court went on to explain at 887 the two methods for evaluating disability--functional and industrial:

> Functional disability is assessed solely by determining the impairment of the body function of the employee; industrial disability is gauged by determing the loss to the employee's earning capacity. Functional disability is limited to the loss of physiological capacity of the body or body part. Industrial disability is not bound to the organ or body incapacity, but measures the extent to which the injury impairs the employee in the ability to earn wages....
>
> ...A specific scheduled disability is evaluated by the functional method; the industrial method is used to evaluate an unscheduled disability.

Dr. Skoglund used the A.M.A. Guides to evaluate claimant's impairment. He measures impairment to each lower extremity and converts each to body as a whole. Applying the combined value results in a seven percent impairment of the whole person. Dr. Fischer claimant's evaluating physician, initially assigned a thirty percent permanent partial impairment to both legs with an additional industrial loss of thirty-five percent to the left foot and seven percent industrial loss to the right foot. Dr. Barnett assesses a "major loss of use of the man as a whole."

The greatest weight in this decision is being given to the evidence presented by the treating physician. Lemon v. Georgia Pacific Corporation, I Iowa Industrial Commissioner Report 204 (Appeal Decision 1981); Clement v. Southland Corporation, I Iowa Industrial Commissioner Report 56 (1981). Dr. Skoglund, in addition to being the treating physician, determines claimant's functional impairment and refrains from assigning industrial disability. Assessment of industrial disability is beyond the scope of expert medical testimony. Wright v. Walter Kidde Co., 33 Biennial Report of the Industrial Commissioner 237 (Appeal Decision 1977). Dr. Fischer, who evaluated claimant, has not provided a pure impairment rating. It is important to note that the impairments referred to by Dr. Skoglund convert to seven percent of the whole person. The whole person impairment is not achieved by combining the three and the four percent. The whole person impairment is multiplied times 500 weeks. Using that calculation, claimant is entitled to thirty-five weeks of permanent partial disability benefits.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant is forty-two (42) years of age.

That claimant was seen for back complaints as early as February of 1979 and for periodic back complaints thereafter.

That prior to her injury of November 1982 claimant had disc surgery and had a weight limitation of thirty-five (35) pounds.

That claimant while working at her employer's premises had an accident resulting in spraining of her right ankle and a trimalleolar dislocation and fracture of the left ankle.

That claimant had surgery on her left foot and casts placed on both legs.

That claimant was returned to work on April 4, 1983 with special provisions made for her disability.

That claimant subsequently missed some work with left knee pain.

That claimant has been working steadily since February 6, 1984.

That claimant is restricted from lifting, pushing or pulling over ten (10) pounds; excessive reaching, twisting or bending and prolonged standing or walking.

That claimant wears special shoes and stockings and takes medication.

That claimant complained of ankle swelling and soreness in 1979.

That claimant complained of her left knee in 1979.

That claimant had two surgeries to her left foot--one in 1981 and one in 1982 due to plantar warts.

That claimant's foot surgeries prior to November 1982 resulted in no restriction.

That claimant has impairment to each lower extremity attributable to her injury of November 3, 1982.

That claimant has degenerative arthritis in her spine.

That claimant does not have increased impairment to her back traceable to her injury of November 3, 1982.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has established by a preponderance of the evidence a causal relationship between her injury of November 3, 1982 and her present disability to her lower extremities.

That claimant has shown entitlement to thirty-five (35) weeks of permanent partial disability benefits attributable to her injury of November 3, 1982.

ORDER

THEREFORE, IT IS ORDERED:

That defendant pay unto claimant thirty-five (35) weeks of permanent partial disability benefits at a rate of two hundred fifty and 62/100 dollars ($250.62).

That defendant pay amounts due and owing in a lump sum.

That defendant pay interest pursuant to Iowa Code section 85.30.

That defendant pay costs pursuant to Industrial Commisioner Rule 500-4.33.

That defendant file a final report in ninety (90) days.

Signed and filed this 13 day of August, 1984.

DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

BLANCHE M. RINEHART,	:	
Claimant,	:	
vs.	:	FILE NO. 601858
THUNDERBIRD RESTAURANT, INC.,	:	A P P E A L
Employer,	:	D E C I S I O N
and	:	FILED
AID INSURANCE SERVICES,	:	AUG 24 1984
Insurance Carrier, Defendants.	:	IOWA INDUSTRIAL COMMISSIONER

By order of the industrial commissioner dated June 18, 1984 the undersigned deputy industrial commissioner has been appointed under the provisions of §86.3, Code of Iowa, to issue the final agency decision on appeal in this matter. Claimant appeals from an adverse review-reopening decision.

The record consists of the transcript; claimant's exhibits 1 through 14, 16 and 17, 19 through 26, and 28 through 46; and defendants' exhibits A through O, inclusive, all of which evidence was considered in reaching this final agency decision.

ISSUES

Claimant states the issues on appeal:

1. Did the Deputy Commissioner error in his Decision finding that the Claimant failed to prove by a preponderance of evidence that the cause of her disability is the injury of June 10, 1979.

2. Did the Deputy Commissioner error in his Decision disallowing medical expenses other than for Drs. Lund and Andre.

EVIDENCE PRESENTED

Claimant argues that her disability is connected to her injury of June 10, 1979. That argument at bottom is based upon the opinion of Larry E. Phipps, D.C., as brought out on direct examination, which is opposed to the opinions of Robert A. Morantz, M.D., and M. W. Andre, M.D. The review-reopening decision found that the opinions of Drs. Morantz and Andre were more reliable for four reasons: (1) They were the treating physicians and both were neurosurgeons; (2) Dr. Phipps was not given a complete history; (3) The motor impairment rating of Dr. Phipps was inaccurate; and (4) Dr. Phipps impairment rating was based on claimant's subjective complaints as opposed to the essentially objective data used by the two neurosurgeons. A review of the entire record discloses that the hearing deputy's conclusion in this respect is proper, and it will be adopted.

Claimant's argument that certain medical expenses should have been awarded fails because claimant did not show that the employer or insurance carrier authorized the care. Under §85.27, The Code, the employer clearly has the choice of treatment, and without authorization by the employer or insurance carrier, no award can be made.

Wherefore, the review-reopening decision filed March 20, 1984 is hereby adopted as the final agency decision.

FINDINGS OF FACT

1. On June 10, 1979 claimant fell at work when she tripped over an electrical cord.

2. As a result of her fall claimant was off work from June 10, 1979 until October 1979.

3. It was medically indicated that claimant could return to work on September 11, 1979.

4. Claimant was authorized to seek treatment from Dr. Lund and Dr. Andre.

5. Defendants paid claimant temporary total disability from June 10, 1979 to September 11, 1979.

6. Claimant did not suffer any permanent disability as a result of her fall.

7. Defendants have paid all authorized medical expenses.

CONCLUSIONS OF LAW

Claimant has failed to prove by a preponderance of the evidence that the cause of her disability is the injury of June 10, 1979.

Claimant has failed to prove by a preponderance of the evidence that she was authorized to receive medical treatment from anyone other than Drs. Lund and Andre.

ORDER

THEREFORE, claimant shall take nothing further from these proceedings.

Pursuant to Industrial Commissioner Rule 500-4.33, defendants are ordered to pay the costs of the attendance of the certified shorthand reporter. Claimant shall pay all remaining costs.

Signed and filed this 24th day of August, 1984.

vs.	:	File No. 601858
THUNDERBIRD RESTAURANT, INC.,	:	R E V I E W -
Employer,	:	R E O P E N I N G
and	:	FILED
AID INSURANCE SERVICES,	:	MAR 20 1984
Insurance Carrier, Defendants.	:	IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in review-reopening brought by Blanche M. Rinehart, claimant, against Thunderbird Restaurant, Inc., employer, and AID Insurance Services, insurance carrier, for the recovery of further benefits as the result of an injury on June 10, 1979. Claimant's rate of compensation as indicated in the memorandum of agreement previously filed in this proceeding is $94.50. A hearing was held before the undersigned on February 29, 1984. The case was considered fully submitted at the conclusion of the hearing.

The record consists of the testimony of claimant, Larry E. Phipps, D.C., Eldon Zinc, Rebecca L. Madison, Bonnie L. Stanley, Roger Romig, Danny R. Abrahams; claimant's exhibits 1 through 14, 16, 17, 19 through 26, 28 through 35, 37 through 43, 45 and 46; and defendants' exhibits A through O.

ISSUES

The issues presented by the parties at the time of the pre-hearing and the hearing are whether there is a causal relationship between the alleged injury and the disability on which she is now basing her claim; the extent of temporary total, healing period and permanent partial disability benefits to which she is entitled and authorization for medical benefits pusuant to §85.27, Code of Iowa.

EVIDENCE PRESENTED

Claimant testified she is 49 years old, married, and a resident of Kansas City, Kansas. She revealed that she is not presently employed and contends she has not been employed for at least two years.

Claimant stated that on June 10, 1979 she was an employee of the Thunderbird Restaurant in Marshalltown, Iowa. She explained that on that day she suffered an injury at the restaurant when she tripped and fell over an electrical cord. She indicated that she fell face forward and extended her arms to break the fall. Claimant added that immediately after the fall she felt stunned, her hands were stinging and there were shooting pains across her shoulder and into her neck and head. She stated that she sat down in a chair for awhile and then went home.

Claimant advised that when she got home that day her hands and arm were in so much pain that her daughter had to open the door for her. She stated that she went inside and laid down on the couch with a heating pad on her neck, but later applied cold packs. She indicated that the pain continued through the night and because of it she was unable to sleep. She further indicated that it was necessary for her daughter to help her move around.

Claimant testified that on the next day she went to see Axel T. Lund, M.D. She recalled that she saw Dr. Lund two or three times after which he felt he could do little to help. Claimant stated that Dr. Lund then referred her to a neurosurgeon, M.W. Andre, M.D.

It was claimant's recollection that she first saw Dr. Andre in June or July 1979. Claimant contended that Dr. Andre did not examine her neck or shoulder blades. She also stated that Dr. Andre did not provide her with any form of treatment. Claimant testified that she continued to see Dr. Andre on several occasions, and in August 1979 he sent her to Iowa Methodist Hospital for a cervical myelogram and an electromyographic examination. She stated that after the examination Dr. Andre came to her hospital room and said there was nothing wrong so she could go home. Claimant revealed that sometime during this period she was receiving physical therapy. She indicated that she continued physical therapy and seeing Dr. Andre until late September 1979.

Claimant alleged that she left Iowa in September 1979 and returned to Kansas City because she was no longer receiving workers' compensation benefits, she was unable to work and thus she could not support herself. She admitted, however, that upon her return to Kansas, she became employed at Nicholl Bros., Inc. Claimant said this employment commenced in October 1979 and continued into May 1980. Claimant testified that she left Kansas in May 1980 and returned to Iowa. She stated that she lived with her sister and brother-in-law in Des Moines. She recalled that she found employment in Des Moines with Victoria Cleaners and this job lasted from August 1, 1980 until the middle of September 1980. She added that she was next employed from the middle of September 1980 until the latter part of October of that year at Charles Todd Uniforms. She said she then left Iowa and returned to her husband in Kansas.

Claimant testified that upon her return to Kansas she obtained employment with Crest Quality Cleaners in Kansas City. She revealed that this employment continued from November 1, 1980 through September 29, 1981. Claimant alleged she has not worked since that time. She further alleged that she left Kansas at that time to hire an attorney for her workers' compensation case. According to claimant she was in Iowa from September 1981 until July 1982 to accomplish the goal of hiring an attorney. It was her testimony that she stayed this length of time because it was convenient and she couldn't afford long distance telephone calls to the lawyer.

Claimant testified that she began to experience trembling in her upper extremities in late 1980 or early 1981. She attributed this trembling to her injury. Claimant revealed, however, that she did not see a doctor concerning her injury until she consulted Robert A. Morantz, M.D., in November 1981. She stated that Dr. Morantz maintains his office in Kansas City. She explained that Dr. Morantz also had a cervical myelogram and electromyographic examination conducted and found no neurological dysfunctions. Claimant indicated that Dr. Morantz referred her to Steven Waldman, M.D., at the Menorah Medical Center in Kansas City, Missouri. She stated that she received several spinal injections at this center. Claimant said she was given medication for pain and trembling.

Claimant testified that she next consulted Donald E. Tyler, M.D., in December 1982. According to claimant, Dr. Tyler did not treat her or prescribe medication.

Claimant testified that she returned to Dr. Andre in the winter of 1982. Claimant stated that Dr. Andre scheduled a CAT scan to be done in Minneapolis, Minnesota. She recalled that this was done in March 1983.

Claimant said that the last doctor she had seen was Larry E. Phipps, D.C., whom she saw in December 1983 for evaluation purposes. Claimant believed that the examination given by Dr. Phipps was more extensive than any previous examinations she received.

Claimant alleged that she has been in continuous, agonizing pain since June 10, 1979. She further alleged that because of this pain it was impossible for her to earn a living to support herself so she has been forced to live off her family in Iowa. Claimant offered little explanation why her husband in Kansas could or would not support her.

On cross-examination, claimant admitted that she suffered a prior work related injury to her right arm in 1974. She related that as a result of the injury she was off work six to eight weeks.

Claimant revealed that some of her trips to Iowa from Kansas City were because of domestic problems with her husband. She recalled that at sometime in 1980 or 1981 she filed for a dissolution of marriage from her husband while she was in Marshalltown. Claimant continued to insist that she was in Iowa from September 1981 to July 1982 for the sole purpose of hiring a lawyer, but admitted that during this time she was driving to Kansas City for medical attention.

Eldon Zinc testified he is a resident of Laurel, Iowa and has known claimant for 32 years. He stated that he had seen her on occasion after June 10, 1979. It was Mr. Zinc's recollection that he first noticed claimant's trembling about six months ago. He remembered that claimant had been in his home about a month before the hearing at which time she appeared to be shakey and in a lot of pain. He revealed, however, that claimant was at his home a year ago and was not trembling and was not complaining of back problems.

Rebecca Madison testified that she is claimant's daughter. She related claimant's condition when claimant came home from the Thunderbird Restaurant on June 10, 1979. It was Mrs. Madison's recollection that claimant began the trembling immediately after the accident. She stated that claimant had lived with her on occasion since 1979 and she observed that claimant always appeared to be suffering severe pain. She added that since the accident she had not seen claimant perform any physical activity other than walking and sitting.

On cross-examination, Mrs. Madison opined that based on her observations of claimant it would not have been possible for claimant to have worked more than one week at a time since June 1979. She did not believe claimant had worked in Kansas City after the accident and could not recall having ever been told by claimant of any such employment. She admitted that she conferred with claimant numerous times by telephone while claimant was in Kansas City.

Bonnie Stanley testified she is claimant's sister. She stated that claimant has lived with her on several occasions since 1979. She stated that it was her observation that claimant always appeared to be in severe pain and was unable to do most of the activities she did before June 1979. Mrs. Stanley adamantly rejected the suggestion that claimant could have worked for as long as six months after the accident in 1979. She asserted that claimant may have worked for a week, but it was not possible for her to have worked for more than a week or so.

Danny Abrahams testified he was claimant's son. He stated that the first time he observed claimant after the accident was in 1982. He recalled that at that time she appeared to be in severe pain. He testified that he drove claimant to Minneapolis, for the CAT scan test and that according to his observations riding in an automobile greatly aggravated her pain.

Roger Romig testified he is claimant's brother-in-law. He recalled that claimant lived with him and his wife from June to October 1980. He thought she worked for a couple of weeks during that time, but stated that he did not believe claimant has worked since then and would be surprised if she had. He further testified that when claimant left for Kansas City in October 1980 she drove herself.

Larry E. Phipps, D.C., testified that he is a practitioner of chiropractic in Marshalltown, Iowa. He stated that he has been engaged in the practice of chiropractic for 20 years. He further stated that he has attended numerous seminars on soft tissue injuries. He also proffered his membership in several professional organizations. Dr. Phipps advised that he has a general chiropractic practice with an emphasis on patients with chronic problems.

Dr. Phipps stated that his initial contact with claimant was on December 19, 1983. He conducted an examination on December 20, 1983. Dr. Phipps explained that the examination consisted of the following: First, a complete history was obtained from claimant. X-rays were taken and then claimant was given an orthopedic and neurological examination. Dr. Phipps outlined the procedure he used for the orthopedic and neurological examination. He stated that he went through a range of motion and strength test with claimant. He revealed that he conducted a pinwheel test; deep tendon reflex; checked the cranial nerves; palpation; vital signs; weight; heart sounds and eye, ear and nose.

According to Dr. Phipps, claimant's range of motion was within the lower range of normal limits. He stated that claimant's range of motion was sufficient to preclude a finding of impairment on that basis.

Dr. Phipps reviewed the x-rays he had taken of claimant's cervical and thoracic spine. Dr. Phipps opined that the x-rays showed some mild degenerative changes at C-4, 5 and 6 where the peripheral nerves come out of the intervertebral foramen. Also, that there was marked scoliotic change in the mid and upper thoracic regions from C-7 to T-3. Finally, Dr. Phipps testified that there was a definite flattening of the normal cervical kyphosis.

Dr. Phipps expressed his opinion that claimant was suffering from chronic post-traumatic bilateral sprain/strain of the upper thoracic and cervical spine. He concluded that this problem was the result of claimant's fall in June 1979.

Dr. Phipps also concluded that claimant was presently suffering from a functional disability equal to 75 percent of her body as a whole. He stated that this rating was arrived at through the application of chapter two of the 1977 copywrite edition of the American Medical Association's Guides to the Evaluation of Permanent Impairments. (Hereinafter referred to as the guide.)

On cross-examination, Dr. Phipps conceded that he inadvertently utilized lower muscle strength grades in calculating the motor impairment than those which he had in fact obtained as a result of his examination. As a consequence, he admitted that the motor impairment rating he had established was higher than it should have been. Dr. Phipps was uncertain how much lower the rating would have been, but pointed out that even if it was completely disregarded the sensory impairment rating of 52 percent was valid. The doctor testified that he arrived at the 52 percent sensory impairment rating by applying chapter two of the guide on the peripheral spinal nerves, though he was aware claimant had no known dysfunction of the peripheral spinal nerves. It was his opinion that chapter two of the guide was appropriate whether or not there was actual dysfunction of the nerves. Dr. Phipps further testified that he based his sensory impairment rating exclusively on the claimant's statements to him concerning the nature and extent of her pain.

Finally, Dr. Phipps testified that he was unaware of claimant's 1974 injury to her right arm. He admitted that the injury was not included in the history given to him by claimant. It was Dr. Phipps' opinion that this injury very likely could have caused nerve damage through scarring and that it would be a factor to consider in evaluating claimant's present disability.

Defendants' exhibit "O" was admitted into evidence which is a copy of chapter two of the guide upon which Dr. Phipps calculated claimant's disability rating. Chapter two states in relevant part:

> This "Guide" provides criteria for evaluating permanent impairment resulting from dysfunction of the various peripheral spinal nerves.
>
> ....
>
> In evaluating pain associated with peripheral spinal nerve disorders the physician should consider: (1) how the pain interferes with the individual's performance of the activities of daily living, eg, annoys but is forgotten during activity, or interferes with activity, or prevents activity, or causes outcries as well as preventing activity; (2) to what extent the pain follows the dermatome distribution (see p. 56); and (3) to what extent the description of the pain indicates that it is caused by the peripheral spinal nerve impairment, ie, the pain should correspond to other aspects of disturbance in the involved nerve or nerve root. Subjective complaints of pain which cannot be substantiated along these lines are not considered within the scope of this guide.

Defendants also submitted several medical reports into evidence. Exhibit C is a copy of a medical report from Robert A. Morantz, M.D. Dr. Morantz's report recites claimant's contention that her problems arose from the work injury. It also says claimant believed she had several tumors of her nerves. X-rays showed a "swan neck," with questionable osteoarthritis. A myelogram was performed which was normal. Several documents were introduced from M. W. Andre, M.D. Neither Dr. Morantz nor Dr. Andre found any permanent neurological damage to claimant. Defendants' exhibit E is a report from Dr. Andre which establishes that claimant was released to return to work on September 11, 1979.

APPLICABLE LAW

The claimant has the burden of proving by a preponderance of the evidence that the injury of June 10, 1979 is causally related to the disability on which she now bases her claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

In regard to medical testimony, the commissioner is required to state the reasons on which testimony is accepted or rejected. Sondag, 220 N.W.2d 903.

Section 85.27, The Code, provides in relevant part:

> For purposes of this section, the employer is obliged to furnish reasonable services and supplies to treat an injured employee, and has the right to choose the care. The treatment must be offered promptly and be reasonably suited to treat the injury without undue inconvenience to the employee. If the employee has reason to be dissatisfied with the care offered, he should communicate the basis of such dissatisfaction to the employer, in writing if requested, following which the employer and the employee may agree to alternate care reasonably suited to treat the injury.

ANALYSIS

The report and findings of Dr. Phipps will be rejected and the findings of Drs. Morantz and Andre are accepted as having greater reliability. The report of Dr. Phipps is rejected for the following reasons. First, he was not the treating physician. Second, he was not given a full and complete history of claimant's prior injuries to her arm. Third, by his own admission his motor impairment rating is not accurate. Fourth, his sensory impairment rating was based entirely on claimant's subjective complaints which chapter two of the AMA Guide is not designed to rate.

The reports of Drs. Morantz and Andre are accepted as having greater reliability because they were treating physicians. Also, each is a neurosurgeon having particular expertise in evaluation of peripheral nerve and spinal injuries. Finally, each of the doctors based their opinions on substantially objective diagnostic tests.

Claimant was watched closely during this proceeding. It was sad to observe her obvious inability to face her family and friends as they testified about her inability to work, in apparent ignorance of the fact that claimant had worked off and on for at least 21 months after her injury.

While it is clear that claimant is suffering from some form of malady it is not clear that this malady was caused by the June 10, 1979 injury.

Finally, claimant did not establish that any of the medical care other than that of Dr. Andre was authorized by defendants. Defendants have continued to pay for the services of Dr. Andre and claimant has offered no justification for incurring the medical expenses she did. Clearly, claimant was not dissatisfied with Dr. Andre since she was engaging his services as late as 1983. In addition, she has failed to establish an emergency situation which would have required immediate attention.

FINDINGS OF FACT AND CONCLUSIONS OF LAW

WHEREFORE, based upon the evidence presented and principles of law above stated the following findings of fact and conclusions of law are made:

FINDINGS OF FACT:

1. On June 10, 1979 claimant fell at work when she tripped over an electrical cord.

2. As a result of her fall claimant was off work from June 10, 1979 until October 1979.

3. It was medically indicated that claimant could return to work on September 11, 1979.

4. Claimant was authorized to seek treatment from Dr. Lund and Dr. Andre.

5. Defendants paid claimant temporary total disability from June 10, 1979 to September 11, 1979.

6. Claimant did not suffer any permanent disability as a result of her fall.

7. Defendants have paid all authorized medical expenses.

CONCLUSIONS OF LAW:

Claimant has failed to prove by a preponderance of the evidence that the cause of her disability is the injury of June 10, 1979.

Claimant has failed to prove by a preponderance of the evidence that she was authorized to receive medical treatment from anyone other than Drs. Lund and Andre.

ORDER

THEREFORE, claimant shall take nothing further from these proceedings.

Pursuant to Industrial Commissioner Rule 500-4.33, defendants are ordered to pay the costs of the attendance of the certified shorthand reporter. Claimant shall pay all remaining costs.

Signed and filed this 20th day of March, 1984.

AUG 15 1984

IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in arbitration brought by Scott R. Ross against Land O'Lakes, Oakland Division, a self-insured employer. Claimant alleges that he sustained an injury arising out of and in the course of his employment on or about March 17, 1983. He alleges that the injury occurred as a result of repetitive use of his right upper extremity.

The hearing commenced June 22, 1984 at the Pottawattamie County Courthouse in Council Bluffs, Iowa. Claimant appeared in person and with his attorney Timothy O'Grady. Defendant appeared through its counsel James Thorn. The case was considered fully submitted upon conclusion of the hearing.

The record in this proceeding consists of the testimonies of claimant, Nancy Finegan and Ray Oslund. Also admitted into evidence were joint exhibits A through Q and claimant's exhibits 1 through 6.

ISSUES

The issues presented by the parties at the time of hearing are whether claimant sustained an injury arising out of and in the course of his employment; whether there is a causal connection between any disability which claimant exhibits and his employment; a determination of the nature and extent of any disability which is causally connected to claimant's employment; and a determination of claimant's entitlement to benefits.

Defendants raised as a defense a lack of notice of injury under the provisions of Code section 85.23.

It was stipulated by the parties that in the event of an award the correct rate of compensation is $235.87 per week. It was also stipulated that the employer has paid all of claimant's medical expenses incurred for treatment of the alleged injury.

REVIEW OF THE EVIDENCE

Scott R. Ross testified that he is 22 years of age, married with one minor child and that he graduated from high school in 1979. He denied any other formal education.

Claimant described his prior medical history as having twice been treated on an outpatient basis for motorcycle accidents which resulted in a broken leg on one occasion and lacerations on another. He described his general health as good and denied any inpatient hospitalization.

Claimant related that he has previously worked as a laborer and forklift operator and a mason's assistant. He denied that any of these activities caused any problem or discomfort in his collarbone area even though such involved lifting weights of as much as 40 pounds on a regular basis and occasionally as much as 75 pounds.

Claimant testified that he commenced work with Land O'Lakes October 7, 1981 trimming meat from between ribs. This work required lifting approximately 10 pounds. After approximately six months he was assigned removing arm bones which required lifting approximately 40 pounds. After approximately eight months at that position he was assigned to removing neck bones from chucks which required lifting in the range of 50 to 100 pounds.

On March 17, 1983 claimant contacted the plant nurse complaining of pain and popping in his right collarbone area. He testified that he had noticed the sensation approximately two weeks earlier and that it had been fairly constant since that time. He denied having that sensation prior to March, 1983. Claimant was seen by Charles L. Pigneri, D.O., and was referred on to Timothy C. Fitzgibbons, M.D.

While treating with Dr. Fitzgibbons claimant was placed on light duty. He continued to work until the plant closed in May, 1984. Claimant has now obtained work as a press operator at the Red Oak Forge where he is required to lift weights of approximately 20 pounds at a rate of approximately 150 times per hour.

Claimant testified that since March, 1983 his collarbone pops out of joint on strenuous activity. He stated that such causes a loss of strength but no loss of control. He described the sensation as catching and painful and stated that it is accompanied by swelling. He stated that it slows him down and caused him difficulty in keeping up with the production line at Land O'Lakes. He related that the collarbone continues to bother him while working at the forge and that it was bothering him at the time of hearing. Claimant testified that, while he was unemployed following the Land O'Lakes plant closing, the condition of his collarbone remained the same.

Claimant testified that he sought other jobs before commencing work at the forge. He has inquired about work in areas other than general labor and has looked into vocational rehabilitation.

Claimant testified that he first consulted an attorney in regard to this matter approximately six months after seeing Dr. Fitzgibbons and stated that he was called upon by an adjuster approximately two months after March 17, 1983.

Nancy Finegan testified that she was formerly employed as a plant nurse by Land O'Lakes. She identified exhibit O as nursing station records maintained by another former employee in the nursing department.

Ray Oslund testified that he was claimant's lead foreman at Land O'Lakes. He testified that at the end of April, 1984, claimant's name was not on the light duty list.

Exhibits A through E are records of claimant's prior medical history centering upon the treatment he received following motorcycle accidents. There is no indication in the records of any injury to his sternoclavicular joints.

When Dr. Fitzgibbons saw claimant on March 18, 1983, it was his impression that claimant had a chronic subluxation of both sternoclavicular joints, more marked on the right, with recent irritation and swelling secondary to his work at Land O'Lakes. (Deposition page 5) He related that claimant could remember no other specific trauma, other than the work he did at Land O'Lakes as the source of the problem. Dr. Fitzgibbons was of the opinion that claimant had a predisposition to sternoclavicular subluxation as a result of a developmental abnormality and that such preexisted claimant's work at Land O'Lakes. (Dep. pp. 22 & 23) He expressed the opinion that claimant would not have developed symptoms of pain, swelling and popping if he had been performing sedentary work and that claimant should not continue to do strenuous upper body labor. (Dep. pp. 13 & 14)

Dr. Fitzgibbons rated claimant as having a permanent impairment of 10 percent of the body as a whole as a result of his condition, with the impairment rating being based on the pain and swelling and limitation of function which claimant exhibited, not directly to the dislocation itself. (Dep. pp. 17, 18, 35 & 36)

At page 15 of his deposition the following discussion occurred:

Q. I believe you testified that you would expect him to continue to have trouble if he continued to do strenuous upper body work.

A. Uh-huh.

Q. Would his condition deteriorate further from what it is if he continued to do strenuous upper body work?

A. I think it would be an excellent chance that that would happen, yes.

Ronald K. Miller, M.D., as shown in exhibit M, found claimant to have an impairment of four percent of the whole body of which approximately 50 percent was based upon claimant's preexisting problems and anatomy and 50 percent upon aggravation caused by his job. He went on to state:

> I think it is interesting that the natural history of these types of problems certainly in conjunction with the occupation would predispose this gentleman to a recurrance of his symptoms if he engages in similar type hard forceful activities. This is simply not a matter of problems relating to Land O Lakes but a matter of defective anatomy.

APPLICABLE LAW AND ANALYSIS

Under the provisions of section 85.23 of the Code of Iowa an employee is required to give an employer notice of the occurrence of a work related injury within 90 days from the date of the occurrence of the injury. This requirement does not apply if the employer, through its representatives, has sufficient knowledge of the injury to cause a reasonably conscientious manager to believe that the potential for a compensation claim exists. Robinson v. Department of Transp., 296 N.W.2d 809, 811 (Iowa 1980). Exhibit O shows that on March 17, 1983 the employer's nurse was aware of claimant's problem and of the referral to Dr. Fitzgibbons. Exhibit F is a report from Dr. Fitzgibbons dated March 30, 1983 which indicates that claimant's condition was related to his employment. The same holds true with exhibit I which is dated May 18, 1983. These reports are certainly sufficient to cause a reasonably conscientious manager to realize that the potential for a compensation claim existed. Defendant's notice defense must fail.

Claimant has the burden of proving by a preponderance of the evidence that he received an injury on March 17, 1983 which arose out of and in the course of his employment. McDowell v. Town of Clarksville, 241 N.W.2d 904 (Iowa 1976); Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

The supreme court of Iowa in Almquist v. Shenandoah Nurseries, 218 Iowa 724, 731-32, 254 N.W. 35, 38 (1934), discussed the definition of personal injury in workers' compensation cases as follows:

> While a personal injury does not include an occupational disease under the Workmen's Compensation Act, yet an injury to the health may be a personal injury. [Citations omitted.] Likewise a personal injury includes a disease resulting from an injury.... The result of changes in the human body incident to the general processes of nature do not amount to a personal injury. This must follow, even though such natural change may come about because the life has been devoted to labor and hard work. Such result of those natural changes does not constitute a personal injury even though the same brings about impairment of health or the total or partial incapacity of the functions of the human body.
>
> ....
>
> A personal injury, contemplated by the Workmen's Compensation Law, obviously means an injury to the body, the impairment of health, or a disease, not excluded by the act, which comes about, not through the natural building up and tearing down of the human body, but because of a traumatic or other hurt or damage to the health or body of an employee. [Citations omitted.] The injury to the human body here contemplated must be something, whether an accident or not, that acts extraneously to the natural processes of nature, and thereby impairs the health, overcomes, injures, interrupts, or destroys some function of the body, or otherwise damages or injures a part or all of the body.

An employer takes an employee subject to any active or dormant health impairments, and a work connected injury which more than slightly aggravates the condition is considered to be a personal injury. Ziegler v. United States Gypsum Co., 252 Iowa 613, 620, 106 N.W.2d 591 (1960), and cases cited.

An employee is not entitled to recover for the results of a preexisting injury or disease but can recover for an aggravation thereof which resulted in the disability found to exist. Olson v. Goodyear Service Stores, 255 Iowa 1112, 125 N.W.2d 251 (1963); Yeager v. Firestone Tire & Rubber, Co., 253 Iowa 369, 112 N.W.2d 299 (1961); Ziegler 252 Iowa 613, 106 N.W.2d 591 (1960). See also Barz v. Oler, 257 Iowa 508, 133 N.W.2d 704 (1965); Almquist, 218 Iowa 724, 254 N.W. 35 (1934).

The claimant has the burden of proving by a preponderance of the evidence that the injury of March 17, 1983 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

Drs. Fitzgibbons and Miller agree that claimant had an anatomical abnormality which preexisted his employment at Land O'Lakes. They also agree that the strenuous labor which claimant performed at Land O'Lakes caused claimant to become symptomatic. They agree that claimant has a permanent impairment arising from his condition. Dr. Miller states that approximately 50 percent of the impairment which he assigned is a result of claimant's strenuous activities at Land O'Lakes. Dr. Fitzgibbons believes that claimant's condition will deteriorate further if he continues to perform strenuous upper body work. Claimant testified that he was asymptomatic prior to his work at Land O'Lakes but that later, during an extended period of inactivity when he was unemployed, his symptoms did not completely subside.

Claimant's developmental abnormality gave him an increased susceptibility to injury. His problem was medically confirmed, and he has been left in a condition which is worse than that from which he started. The change occurred in a relatively short span of time and cannot be said to be merely the natural changes which come about as a result of a life which has been devoted to labor and hard work. It is therefore found and concluded that claimant did sustain an injury arising out of and in the course of his employment with Land O'Lakes on or about March 17, 1983.

Both doctors have found a permanent impairment and claimant's own testimony establishes that he has not returned to his former state of health even though he has changed jobs and experienced a period of inactivity. This supports that he has sustained a permanent impairment and some degree of permanent disability. The opinions concerning the amount of permanent impairment range from four percent to ten percent.

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

Claimant's change of employment cannot be related to the injury. Since the employer's plant closed it became necessary for him to seek other employment, the same as other employees. He was able to work until the plant closed and was able to find employment shortly thereafter. Claimant is young and has a high school education. At hearing he appeared to be of at least average intelligence and did not exhibit any propensities which would render him unemployable. There is no evidence in the record of loss of control or loss of range of motion. There is no indication that the injury which he suffered has resulted in industrial disability which is significantly different from his physical impairment. It is therefore found and concluded that the amount of claimant's disability which is related to the injury, when measured industrially, is 7 1/2 percent.

The evidence in this case does not show whether claimant missed any work as a result of the injury except for those occasions when he received medical care. The record does not reflect whether or not claimant was paid during those absences. There having been no healing period under the provisions of section 85.34(1), it is concluded that compensation for claimant's permanent partial disability should begin effective March 18, 1983.

The allowable costs under Industrial Commissioner Rule 500-4.33 are as follows: Rex M. Blair & Associates $169.00; witness fees for the deposition of Timothy C. Fitzgibbons, M.D., in the amount of $150.00 as limited by Code section 622.72 and $175.00 for the cost of obtaining medical reports from Dr. Fitzgibbons. The balance of the items contained in claimant's exhibits 1 through 6 exceed the scope of the agency rule and cannot be assessed against the defendant.

FINDINGS OF FACT

1. Claimant is a resident of the State of Iowa and his place of employment for defendant was in the State of Iowa.

2. Claimant was injured on March 17, 1983 as a result of repetitious strenuous movement of his right upper extremity. The injury was in the nature of an irritation of tissues arising from a subluxation of claimant's right sternoclavicular joint.

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

vs.	:	
	:	F I L E D
POLK COUNTY, IOWA,	:	R E O P E N I N G
	:	D E C I S I O N
Employer,	:	AUG 14 1984
Self-Insured,	:	
Defendant.	:	IOWA INDUSTRIAL COMMISSIONER

This is a proceeding in review-reopening brought by Donald E. Sandelin, claimant, against Polk County, Iowa, the self-insured employer, to recover benefits under the Iowa Workers' Compensation Act as a result of injuries he sustained on January 1, 1976 and February 28, 1976.

This matter came on for hearing before the undersigned deputy industrial commissioner in Des Moines, Iowa on October 28, 1983 at which time the record was considered fully submitted.

The record in this matter, based upon the undersigned's notes, consists of the oral testimony of the claimant, his spouse, Ronald Woods, Markay Soll, Stephen Foles, Bill Mackin and Ralph Baker, together with claimant's exhibits 1 through 12 and defendant's exhibits A through H.

The issues in this matter are: (a) whether the claimant's injuries of January 1, 1976 and February 28, 1976 arose out of and in the course of his employment with the defendant; (b) the extent of claimant's functional impairment and; (c) the extent of, if any, claimant's resulting industrial disability.

There is sufficient credible evidence in the record to support the following statement of facts:

Claimant, age 50 on the date of his injuries, was an employee of the defendant, Polk County, Iowa. He began his employment with defendant during 1973 at which time he was hired in the capacity of a bailiff in the Polk County Courthouse and was so employed in such capacity at the time of his injuries.

In his first injury, that of January 1, 1976, he slipped on the steps coming from a judge's bench in the Polk County Courthouse. He struck his shoulder and his hip against a cement railing and was hospitalized for a period of time. The second injury of February 28, 1976 occurred while he was escorting an unruly spectator out of a courtroom at which time the spectator struck the claimant across the neck and ribs.

The duties of a bailiff required claimant to assist the court in whatever matters the court deemed fit and appropriate. In the first incident he was required to be in the location he was in for the assistance of a prisoner. In regards to the second injury it was required of him to remove the unruly spectator. These two acts fell within the claimant's duties as bailiff.

A medical report from Robert A. Hayne, M.D., submitted by claimant, indicates that an x-ray examination of the cervical spine by James McMillan and Associates was done on November 15, 1976 which showed an inter-body fusion to have been carried out between the 4th and 5th cervical segments and between the 5th and 6th cervical segments. A final diagnosis of residual effects of a herniated disc between the 4th and 5th segments and between the 5th and 6th cervical segments on the right side treated with surgery was made. Dr. Hayne continued in his report to indicate that claimant's condition in the cervical spine had been aggravated by the trauma which he received on February 28, 1976. A diagnosis of a probable seizure disorder characterized by episodes of loss of consciousness without aura was also made.

Robert C. Jones, M.D., in a medical report, also submitted by claimant, established a physical impairment figure of 15 percent to the body as a whole. Thomas A. Carlstrom, M.D., prepared a report which was submitted by defendant whereby he rated claimant as having a one to two percent impairment to the body as a whole.

The claimant has the burden of proving by a preponderance of the evidence that the injuries of January 1, 1976 and February 28, 1976 are causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

In applying the foregoing legal principles to the case at hand, it is apparent that the claimant has sustained his burden of proof.

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587,

3. At the time of injury claimant was employed by Land O'Lakes working as a neck boner.

4. Claimant lost no time from work as a result of the injury but did require medical care. Following the injury claimant returned to work on March 18, 1983.

5. Claimant presently exhibits permanent functional impairment in the range of from four percent to ten percent of the body as a whole, of which approximately one-half is attributable to the injury and one-half to the preexisting abnormality.

6. Claimant is 22 years of age, married and has one dependent child.

7. Claimant's normal rate of earning with the defendant employer was $376.73 per week resulting in a rate of compensation of $235.87 per week.

8. Claimant received medical care or evaluation from Drs. Pignęri, Fitzgibbons and Miller, the cost of which has been paid by the employer.

9. At the present time claimant experiences a popping and catching sensation accompanied by discomfort when he engages in strenuous activity with his upper right extremity. He is presently employed.

10. Claimant graduated from high school but has no further formal education.

11. Claimant has work experience as a forklift operator and mason's assistant as well as his packinghouse work and work as a press operator in his current position.

12. Claimant appears to have the intelligence and emotional stability to be regularly employed, and he appears well motivated.

13. Following the injury claimant remained at work with the defendant until its plant closed, and he has since found other suitable work although at a lesser wage.

14. The underlying condition of claimant's sternoclavicular joint preexisted his work with Land O'Lakes, but the work caused an irritation of the tissues surrounding that joint whenever subluxation occurred, resulting in permanent impairment and disability.

15. Claimant incurred fees for the attendance of a court reporter and transcription at the deposition of Timothy C. Fitzgibbons, M.D., in the amount of $169.00, witness fees payable to Dr. Fitzgibbons in the amount of $250.00, of which $150.00 may be allowed as a witness fee and fees for medical reports to Dr. Fitzgibbons in the amount of $175.00.

CONCLUSIONS OF LAW

This agency has jurisdiction of the subject matter of this proceeding and of its parties.

The irritation of claimant's sternoclavicular joint resulting from the repetitious strenuous activity he engaged in with his employment with Land O'Lakes constitutes a personal injury.

As a result of the injury claimant sustained on or about March 17, 1983, he has sustained a permanent partial disability of 7 1/2 percent when the same is measured industrially.

Claimant is entitled to recover costs in the total amount of $494.00 under the provisions of Industrial Commissioner Rule 500-4.33.

ORDER

IT IS THEREFORE ORDERED that defendant pay claimant thirty-seven and one-half (37 1/2) weeks of compensation for permanent partial disability at the rate of two hundred thirty-five and 87/100 dollars ($235.87) per week commencing March 18, 1983. Said entire amount is now past due and owing and defendant shall pay the same in a lump sum together with interest pursuant to section 85.30 of the Code of Iowa.

IT IS FURTHER ORDERED that defendant pay the costs of this action in the amount of four hundred ninety-four and no/100 dollars ($494.00) pursuant to Industrial Commissioner Rule 500-4.33.

IT IS FURTHER ORDERED that defendant file a final report within twenty (20) days from the date of this decision.

Signed and filed this 15th day of August, 1984.

MICHAEL G. TRIER
DEPUTY INDUSTRIAL COMMISSIONER

593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

In applying the foregoing to the case under review, it is concluded that this 50 year old former bailiff has sustained an industrial disability of 30 percent of the body as a whole. Claimant is of an age and background that does realistically operate against a new vocational area in light of his existing functional impairment.

Dr. Jones, in his report, states:

> The problem in this man is that I am afraid to let him go back to his original job because of his slight build and the question of a man with such a build and in such a job as a baliff [sic] trying to fend off the slings of the fortunes that may befall him in such a job following his experience since my operation in September. It would be far better if he could be adapted to a different kind of work, such work to entail less possibility of fisticuffs with the public. I think that his actions as stated were obviously work-related.

It is further clear that based upon the opinion of Dr. Jones, claimant's current medical difficulties are casually connected to his February 28, 1976 injury.

WHEREFORE, after having heard and seen the witnesses in open hearing and after taking all the credible evidence into account, the following findings of fact are made:

1. That this agency has jurisdiction of the persons and the subject matter.

2. That the claimant sustained two admitted industrial injuries on January 1, 1976 and February 28, 1976, respectively.

3. That the claimant was paid a healing period from March 3, 1976 until July 2, 1978 for a period of 12 5/7 weeks.

4. That the claimant has found employment as a mobile home park manager and that his healing period has been fully paid by the defendant employer.

5. That the claimant cannot return to his former occupation of court bailiff.

6. That the claimant has sustained an industrial disability of 30 percent of the body as a whole due to his cervical instability.

THEREFORE, IT IS ORDERED that defendant pay claimant a period of permanent partial disability of a one hundred fifty (150) week duration at the agreed rate of one hundred two and 99/100 dollars ($102.99) per week in a lump sum together with legal interest beginning on July 3, 1978.

Costs are charged to the defendant who is further directed to file a final report within twenty (20) days from the date that this decision becomes final.

Signed and filed this 14 day of August, 1984.

HELMUT MUELLER
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

DONALD A. SCHAER, Claimant, vs. CITY OF MASON CITY, Employer, and UNITED STATES FIDELITY & GUARANTY COMPANY, Insurance Carrier, Defendants.	File No. 629318 R E V I E W - R E O P E N I N G D E C I S I O N

FILED
JUL 24 1984
IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in review-reopening brought by Donald A. Schaer, claimant, against City of Mason City, employer, and United States Fidelity & Guaranty Company, insurance carrier, defendants, to recover additional benefits under the Iowa Workers' Compensation Act for an injury arising out of and in the course of his employment on January 22, 1980. It came on for hearing on January 4, 1984 at the Cerro Gordo County Courthouse in Mason City, Iowa. It was considered fully submitted at that time.

The industrial commissioner's file shows a first report of injury received March 4, 1980. A memorandum of agreement was filed on the same date. A final report shows the payment of ten weeks and five days of healing period benefits and four percent of the right lower extremity as well as medical benefits.

At the time of hearing the parties stipulated to a rate in the event of an award of $168.10.

The record in this matter consists of the testimony of claimant, Sharon Schaer, Charles B. Hammen, Eugene Kleinow and Myron Langhoff; claimant's exhibit 1, a letter from Robert E. McCoy, M.D., dated January 24, 1980; claimant's exhibit 2, a letter dated April 18, 1980 from Dr. McCoy with accompanying notes; claimant's exhibit 3, notes from Dr. McCoy; claimant's exhibit 4, notes from Dr. McCoy; claimant's exhibit 5, a letter from Dr. McCoy dated October 20, 1981; claimant's exhibit 6, a letter from Dr. McCoy dated November 30, 1981; claimant's exhibit 7, a letter dated June 17, 1983 from Dr. McCoy; claimant's exhibit 8, a letter from Dr. McCoy dated July 8, 1983; claimant's exhibit 9, records from North Central Correctional Facility; claimant's exhibit 10, records from Anamosa; claimant's exhibit 11, a letter from Dr. McCoy dated August 3, 1983; claimant's exhibit 12, unpaid medical expenses; claimant's exhibit 13, report expenses; claimant's exhibit 14, mileage expenses; claimant's exhibit 15, a statement to Job Service; defendant USF&G's exhibit A, an employee attendance record; and defendant USF&G's exhibit B, an attendance record. The record in the prior hearing of January 9, 1980 was reviewed in its entirety although it is not set out in detail herein.

ISSUES

The issues in this matter are whether or not there is a causal relationship between claimant's injury and his disability; and whether or not claimant is entitled to further permanent partial disability relating to his injury of January 22, 1980.

STATEMENT OF THE CASE

Forty-four year old married claimant recalled having a hearing on January 8, 1980. Claimant said that his first back injury was in January of 1969 while he was working for the sanitation department. He denied any injuries prior to that time. He fell flat on his back. He had surgery and returned to work. A claim for compensation was resolved with a special case settlement. It was his understanding he was paid disability for the injury. In 1976 he had another injury while working for the water department. He and another employee were carrying a water tapping tool. He had a pop in his back. He was not hospitalized, but he was treated with bed rest and medication. By the time of a 1978 injury to his left knee he was back at the sanitation department. He was classified as a driver, but he still picked up garbage In May of 1979 he had back pain and went off work. A short time after his January 8, 1980 hearing he had an additional injury.

He remembered: He was working in sanitation picking up garbage. It was "real icy." He went down on his right kneecap. He called Dr. McCoy who drained blood from his knee and then did surgery. He was placed in a full leg cast. He was off work and received temporary total disability payments from January 22, 1980 to April 6, 1980.

At the time of his return to work he was placed in a garage on light duty. He went back on the garbage truck when he was given clearance by the doctor. Claimant reported that he got along well except for some problems with his back which he

relieved by having his helper drive and he picked up the garbage.

He denied any injury during the time from April 7, 1980 to August 4, 1980. Rather he said that his back had started hurting "out of the clear blue sky." He had a burning sensation in his back. He was off work from August 4, 1980 to October 9, 1980 because of his back. He took sick leave and vacation to keep defendant employer from learning of his trouble.

In October claimant went back to driving a garbage truck and loading and unloading. He worked until he had left knee surgery in March of 1981. Surgery which had been scheduled for later was moved up when his knee locked as he was working. Claimant received weekly benefits from March 16, 1981 to August 9, 1981. He was in a full leg cast. Claimant acknowledged removing his cast on three separate occasions, but he did not feel his actions extended his healing time.

When he was released to return to work he was under no specific restrictions by Dr. McCoy. He anticipated returning to the garbage truck. He took some vacation time. On his resumption of work, he was sent to be a parking lot attendant. He had some forewarning of this in that he got a letter from defendant employer while he was on vacation. He asserted that he did not consent to the change and that he wished to be a garbage driver. As a parking lot attendant he sat for most of the time. The sitting bothered his back and he got up and walked and stood. If the machine was not working, he noted times. He collected money. The parking lot job paid $3.35 per hour. He lost benefits because although he worked forty hours he was considered part-time help. As a garbage worker he did not need to be on the job for forty hours. Work as a garbage driver gave him $7.28 per hour, a day and one-half sick leave each month, a paid vacation and paid life and health and accident insurance.

When a heavy equipment job opened he applied. The union tried to help him. Dr. McCoy was sent a description of the job, but claimant was not hired. A water meter job also became available. Again, the union helped and a letter was sent to Dr. McCoy who decided claimant could lift a 200 pound meter with help.

Claimant grew disgusted with defendant employer and filed a civil rights complaint which was later administratively closed.

Claimant worked the parking lot job until December 1, 1981 at which time he was suspended until he went to trial on criminal charges. As a result of that trial he was found guilty and served a year before being paroled.

Claimant claimed no new injuries from the time he went to work as a parking lot attendant or while he was incarcerated. He indicated that while he was in jail his back bothered him from time to time and he took Anacin. In April of 1983 his back tied up and he had trouble getting out of bed. He was given Motrin to take as he needed it.

In May of 1983 he came home to his family and began looking for employment. He testified that he has put down his injuries and his criminal charges on his applications. He had some part-time work until October. Beginning in late October he started part-time work as a cutting torch operator. His work provides him with no benefits and an hourly rate of $5.00. He averages close to thirty hours. The job necessitates standing and bending. The iron which he cuts is picked up by a machine. He takes pills for his pain and tries to keep it out of his mind.

As to his present condition with his back, claimant complained of pain from the beltline down into the buttocks on the right and sometimes on the left which bothers him at night. He has some cramping. Any activity can bring on pain. On comparing his difficulties he has now with those experienced before January of 1980, he said that his pain is more frequent and requires use of two Motrin tablets whereas before one would suffice, or he would walk off the problem, or it would be relieved by Anacin. His pain does not go into his lower leg.

Claimant also compared his left leg condition as it is at present and as it was presurgery in March of 1981. Popping in his left knee is about the same or perhaps more. He considered the surgery unsuccessful in that his knee is worse now than before. Moving too fast will cause the knee to buckle.

The right knee is less trouble. It still pops, but it does not catch as catching was helped by the surgery. Overall, his right knee remained close to the same.

Claimant said that he has not been paid mileage since January of 1980.

Claimant admitted having a part-time salvage business in which he went around and picked up junk and old cars. While he agreed that lifting was necessary, he said that he had special methods for doing it and that things were not as heavy because they were cut into pieces. After his release from prison he worked at this for a while, but since he got the job in October he has not had the time. He recalled that his earnings from this before his prior hearing in January of 1980 averaged $100 weekly. His children now help with pickup.

Claimant recalled that he worked on stock cars until September of 1981. By using special equipment he is able to work on his own vehicles.

Claimant denied that either work on stock cars or in his salvage business aggravated his condition.

Claimant insisted he could labor as a garbage worker by living with his back or as a meter repairperson if he had extra help with lifting meters.

Claimant asserted the city was responsible for his criminal acts. Claimant acknowledged a prior incident with another child for which he sought help. He had a discussion about moving to the water meter repairperson's job on okay from his doctor. The doctor said the work would be all right, but claimant did not know that the city agreed to this change until after his suspension. Dr. McCoy approved on November 30, 1981. Claimant was incarcerated on December 1, 1981. Claimant recalled having been told by his union representative that he would not be given the water meter job. He commenced drinking at 10:00 a.m. and later assaulted his daughter. He denied being told by the city after his arrest that should he be found not guilty he could have the water meter job. Instead, he said he was told by Kleinow that he would not work for the city again.

Claimant testified that he has not contacted any of his former supervisors since his release from prison as he did not think it would do any good.

Claimant alleged his entitlement to compensation from August 8, 1980 to October 9, 1980 as he was off for back pain. Claimant denied his being off was related to any incident while working on his personal car or a stock car. During this period he took some vacation in August. He said that he stayed home except for a few days in Missouri.

Claimant completed ninth grade. His work experience prior to beginning work for defendant had been loading bread and fertilizer, doing various jobs for a cement company with one job as a monitor, operating a forklift, and laboring and driving a truck for a construction company.

A review of records seems to show claimant was off work from August 1 until August 15, 1980. Beginning on August 18, 1980 claimant took vacation through September 5, 1980. He took sick leave the week of September 8 and then went on light duty on September 14.

In 1981 claimant took vacation the week of March 9. He seemingly drew compensation from March 17, 1981 until August 9, 1981. It appears he may have worked in garbage for about eight days. He took vacation from August 24 until September 15, 1981 wnen he was moved to parking lot attendant.

Sharon Schaer, claimant's spouse, a nurse's aide, who was separated from him from December 1, 1981 until he got out of prison, testified that although claimant has not called the doctor and has not complained, she is aware of his having frequent back problems by the way he walks and bends. She massages his back and gives him medication. It was her opinion that he has had a gradual worsening of his condition since his hearing in 1980. She reported claimant's spending time in bed when he is off work.

Schaer was unaware of any nonwork injury.

Regarding claimant's knees, she claimed that the popping sound which was present before is now louder. Claimant's feet are cold.

The witness recalled that when claimant was changed from garbage work to the parking lot he was angry and became withdrawn. He also commenced drinking heavily. She asserted that this was new for him as he had been only a social drinker. Drinking was not involved in the first assault with one of their children.

Charles Hammen, who has been employed with the city for thirteen and one-half years, testified to the circumstances surrounding claimant's attempt to move to the water department: The water department had a job available on October 6, 1981. Normal procedure was to post the job. Thereafter, employees wishing to make application could apply. After a two week posting period, the job would be offered to the senior employee or the person with the most time working for the city.

Claimant filed an application on October 7. An investigation was made of claimant's physical capabilities to perform the work. Dr. McCoy was contacted.

Claimant was not terminated until May 4, 1982 after his sentencing. The water department vacancy was filled on May 10, 1982. If claimant had been acquitted, he would have gotten the job as the senior applicant. The union was relied upon to make claimant aware that the water meter job was being kept open.

Myron Langhoff, sanitation foreman for the city of Mason City since 1967, testified to being responsible for claimant's attendance records. According to those records claimant returned to light duty on Septmeber 14, 1980 in the street department where he was paid at the same rate. He explained that if claimant kept his compensation check the city made up the difference between sick leave and vacation pay. Employees are permitted to build up to 120 days of sick leave. There is no reimbursement for the accrued sick leave. In August of 1980 claimant took sick pay and vaction and then sick pay again. He said that claimant took compensation in August and September of 1980.

Langhoff recalled having been told by claimant he had an operation coming up in March of 1981. The witness did not know whether it would be covered by workers' compensation.

Eugene Kleinow, currently police chief for Mason City, testified to being an administrative captain in September of 1981 and to being supervisor of the parking lot attendants. He acknowledged knowing both that claimant had been arrested and had been temporarily suspended. He denied telling claimant that he would not work for the city again and said that he would not have had the authority to do so. He stated that he had nothing to do with the award of the water meter job.

Robert E. McCoy, M.D., performed an arthroscopy on both of claimant's knees on January 16, 1980 and found evidence of degenerative arthritis of the medial compartment on the left and to a somewhat lesser degree on the right. There was no evidence of a meniscal tear. In a letter dated January 24, 1980 Dr. McCoy proposed that claimant undergo a high tibial osteotomy on the left "to transfer the center of maximum weight bearing from the medial side of the knee, where his severe degenerative arthritis is, to the lateral compartment of the knee joint which has been relatively spared from the severe degenerative arthritis." He anticipated that degenerative arthritis on the right would progress at a slower rate, but that eventually he would need the high tibial osteotomy on the right as well. The doctor wrote: "In retrospect it would seem that the episodes of increasingly frequent injury to his knees with symptoms of popping and giving way of the knees have been associated with and probably caused by his gradually increasing degenerative arthritis of both knees."

Dr. McCoy recorded an injury to the right knee on January 22, 1980 when claimant slipped on ice while he was on his garbage route. As a result of the slip he sustained a fracture of the lateral portion of the patella. After an arthroscopy a fragment of the patella was removed. The doctor stated that this injury was "completely unrelated to his [claimant's] previous knee difficulties."

Claimant was released for work on April 7, 1980. He worked for two days and then commenced having pain in the right lower lumbar area. Discomfort decreased during the day. Medication was prescribed. Dr. McCoy related claimant's symptoms at that time to his back and not his knee.

On August 8, 1980 claimant visited the doctor using one crutch and complaining of severe back pain in the lower midline. More specifically, the pain was in the lumbosacral joint area and the sacral area in the midline. There was no radiation, but motion was painful. The right ankle jerk was absent. Straight leg raising on the right at 20° caused pain which increased on sciatic stretch. Straight leg raising to 35° on the left caused pain without positive sciatic stretch. Dr. McCoy thought claimant had nerve root irritation based on mild disc protrusion and consented to claimant's having complete bed rest at home.

When claimant came back the next week, he spoke of trying to find lighter work with the city in the water or street departments. Claimant was found to be improved with negative straight leg raising. He was moved to increasing ambulation and partial bed rest with no bending or lifting.

The doctor was visited by two persons from the city--Myron Langhoff and Robert Sceffler. According to the doctor's notes, the two expressed concern regarding claimant's ability to tolerate work as a garbage man. Dr. McCoy agreed that claimant would be better off doing lighter work.

On August 26, 1980 the physician wrote of recommending claimant being given lighter work, but he noted that as of yet there was no lighter work available through the city.

When claimant was seen on October 7, 1980, he reported working at the city garage doing maintenance work on a temporary basis. Claimant thought he was able to return to garbage collecting. An inch of atrophy was found in claimant's right thigh. Emphasis was placed on claimant's doing his leg exercises to overcome the atrophy.

In early 1981 claimant's main complaint was of low back pain with episodes of subjective numbness in his posterior right thigh. X-rays of the knee compared to those taken in 1979 before his injury showed no progression of degenerative arthritis. Permanent partial impairment of the function of claimant's right lower extremity was rated at four percent.

In March of 1981 claimant underwent a valgus type high tibial osteotomy on the left. There was some problem with keeping claimant in his cast, but claimant gradually progressed to weight bearing. He was to return to work on August 6, 1981.

When claimant was seen on October 3, 1981 he told the doctor of his transfer to parking lot attendant. Claimant returned on October 20, 1981 with a job description for the water meter repairperson. After reviewing the description which apparently included the ability to lift 200 pounds with the assistance of tools and another worker, Dr. McCoy concluded claimant's condition would be compatible with performing the work if it was done infrequently. A letter was written on October 20, 1981 which so indicated. The doctor anticipated claimant would be able to tolerate squatting and kneeling to install meters and to do intermittent lifting of meters weighing sixty to sixty-five pounds. It seems that a description of the job of heavy equipment operator also was reviewed and that position was found less appropriate.

Medical information from the men's reformatory indicates that when claimant was evaluated in September of 1982 he was given a bedboard. He took no medication and apparently told his evaluator he had learned to live with his discomfort. In December claimant was given Tylenol for back and knee pain.

Early in 1983 claimant was given a knee wrap. In April claimant had an episode of low back pain. Motrin was given. Claimant was subsequently allowed to use his back brace.

A status report from May 1983 notes that claimant was working with no restrictions before April 14, 1983 when he had an episode of back pain. He made no knee complaints to that date.

Claimant was reevaluated by Dr. McCoy on June 17, 1983. Claimant's complaints were of low back aches across the lower lumbar spine for which he took Motrin, wore a lumbosacral belt and walked; snapping, popping and tenderness in the right knee with the primary problem in the lateral parapatellar area; and occasional popping in the left knee.

On examination claimant had a slight list to the left. He bent forward to within eight inches of touching the floor with pain in the lumbosacral joint area. The right ankle jerk which had been absent since the 1969 surgery was absent. Combined straight leg raising to 85° caused a feeling of pulling in the low back. There was a varus deformity of 60° on the right knee and a valgus of 10° on the left. Varus on the right was viewed as abnormal. Tenderness to palpation was present over the lateral facet of the right patella. X-rays of the lumbar spine showed no further narrowing at L5-S1 in comparison with the films taken in May of 1980. There was slight Schmorl's Node formation at D12-L1 and at D11-D12. There was no progression of narrowing in the medial joint line in the right knee when it was viewed with films taken in January of 1981. X-rays of the left knee taken in May of 1983 evidenced narrowing of the medial joint space.

In a letter dated July 8, 1983 Dr. McCoy reviewed his prior ratings of claimant's impairments noting that on February 21, 1980 he gave a fifteen percent impairment to the left lower extremity and eight percent to the right lower extremity with the latter attributable to degenerative arthritis; an additional four percent to the right lower extremity resulting from the patellar fracture of January 22, 1980; five percent of the whole man related to a 1969 disc problem; and five percent of the whole man because of the 1976 injury. His present impairment ratings are set out thusly:

> I would estimate his permanent partial impairment of function of the whole man from his back at 15% of which I would estimate 3% to be related to further work injury. I think his permanent partial impairment of function of the left lower extremity was diminished by his high tibial osteotomy to about 12%, which has remained the same to the present time. I think that the permanent partial impairment of function of the right lower extremity has increased from the 12% rating I previously gave to 15% at the present time.

The doctor explained his increase in the permanent partial impairment rating as follows:

> In April of 1980 he was seen for low back pain apparently aggravated by work and in August of 1980 he was having fairly severe pain again which made it necessary for him to be off work from August until October of 1980. As a result of that episode of low back pain, I recommended to his employer that he be given lighter work. It was because with the episode of August 1980, his condition changed to the extent that I felt permanent arrangements should be made for lighter work. That I felt his permanent partial impairment of function rating as a result of work related back problems should be increased by 3% over the previous rating as it had not been felt prior to that that any long term modification of his work activities should be made. I feel that since his status at that time required a change in his recommended work designation further impairment of function had been incurred as a result of back aggravation at work.

APPLICABLE LAW AND ANALYSIS

The claimant has the burden of proving by a preponderance of the evidence that the injury of January 22, 1980 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

The right of a worker to receive compensation for injuries sustained which arose out of and in the course of employment is statutory. The statute conferring this right can also fix the amount of compensation to be paid for different specific injuries,

and the employee is not entitled to compensation except as provided by the statute. Soukup v. Shores Co., 222 Iowa 272, 268 N.W. 598 (1936).

That a worker sustaining one of the injuries for which specific compensation is provided under the statute might, because of such injury, be unable to resume employment and because of his lack of education or experience or physical strength or ability, might be unable to obtain other employment, does not entitle him to be classed as totally and permanently disabled. Id. at 278, 268 N.W. 598.

Where the result of an injury causes the loss of a foot, or eye, etc., the loss, together with its ensuing natural results upon the body, is a permanent partial disability and is entitled only to the prescribed compensation. Barton v. Nevada Poultry Co., 253 Iowa 285, 290, 110 N.W.2d 660 (1961). The schedule fixed by the legislature includes compensation for resulting reduced capacity to labor and earning power. Schell v. Central Engineering Co., 232 Iowa 424, 425, 4 N.W.2d 339 (1942). The claimant has the burden of showing that his ailment extends beyond the scheduled loss. Kellogg v. Shute and Lewis Coal Co., 256 Iowa 1257, 130 N.W.2d 667 (1964).

Larson in 2 Workmen's Compensation, §58 at 10-28 (Desk ed. 1976) discusses the nature of scheduled benefits and points out that "payments are not dependent on actual wage loss" and that they are not "an erratic deviation from the underlying principle of compensation law--that benefits relate to loss of earning capacity and not to physical injury as such." The theory, according to Larson, is unchanged with the only difference being that "the effect on earning capacity is a conclusively presumed one, instead of a specifically proved one based on the individual's actual wage-loss experience."

The Iowa Supreme Court recently has reaffirmed the concept of scheduled member injuries in Graves v. Eagle Iron Works, 331 N.W.2d 116 (Iowa 1983).

Claimant testified that his right knee has remained much the same since his surgery.

When claimant was seen on October 7, 1980 he had no pain in his knee, but occasional crepitus. He did have some atrophy on the left. The doctor suggested he do exercises. In January of 1981 claimant's impairment was rated at four percent of the right lower extremity.

Dr. McCoy saw claimant in June of 1983 to reevaluate the right knee. Claimant complained of snapping and popping and of tenderness in the patella area which prevented his kneeling. X-rays taken at that time showed irregularity of the patella laterally from the previous patella fracture. Dr. McCoy increased his rating of the right lower extremity by three percent.

Iowa Code section 85.34(2)(o) provides:

> The loss of two-thirds of that part of a leg between the hip joint and the knee joint shall equal the loss of a leg, and the compensation therefor shall be weekly compensation during two hundred twenty weeks.

Claimant will be awarded an additional 6.6 weeks permanent partial disability to his right lower extremity.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant injured his right knee in January of 1980.

That claimant's knee injury was treated with surgery.

That claimant had a four percent (4%) permanent impairment to his right lower extremity in January of 1981 which was attributable to his January 1980 injury.

That claimant had degenerative arthritis in his knee prior to the injury.

That claimant has been paid for four percent (4%) of a right lower extremity.

That based on x-ray findings, Dr. McCoy has increased his rating to the right lower extremity by three percent (3%).

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has established by a preponderance of the evidence a causal relationship between his injury of January 22, 1980 and his present disability to his right lower extremity.

That claimant has established entitlement to an additional six and six tenths (6.6) weeks of permanent partial disability to his right lower extremity.

ORDER

THEREFORE, IT IS ORDERED:

That defendants pay unto claimant six and six-tenths weeks of permanent partial disability benefits at a rate of one hundred sixty-eight and 10/100 dollars ($168.10).

That defendants pay interest pursuant to Iowa Code section 85.30.

That defendants pay Dr. McCoy fourteen dollars ($14.00)

That defendants pay North Iowa Medical Center fifty-nine and 50/100 dollars ($59.50).

That defendants pay drug charges with Medical Arts Pharmacy of twelve and 50/100 dollars ($12.50).

That defendants pay the following milage expenses:

3 trips to Dr. McCoy totaling 30 miles at $.18 per mile.
1 1/2 trips to Dr. McCoy totaling 15 miles at $.20 per mile
1/2 trip to Dr. McCoy totaling 5 miles at $.24 per mile.

That defendants pay one-fourth (1/4) of the costs of the proceedings on January 4, 1983 pursuant to Industrial Commissioner Rule 500-4.33 including twenty-seven and 50/100 dollars ($27.50) for report expenses from Dr. McCoy.

That defendants file a final report in sixty (60) days.

Signed and filed this 24 day of July, 1984.

Judith Ann Higgs
JUDITH ANN HIGGS
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

DONALD A. SCHAER, Claimant, vs. CITY OF MASON CITY, Employer, and UNITED STATES FIDELITY & GUARANTY COMPANY, Insurance Carrier, Defendants.	:	File No. 753618 R E V I E W - R E O P E N I N G D E C I S I O N FILED JUL 24 1984 IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in review-reopening brought by Donald A. Schaer, claimant, against the city of Mason City, employer, and United States Fidelity & Guaranty Company, insurance carrier, defendants, to recover additional benefits under the Iowa Workers' Compensation Act for an injury arising out of and in the course of his employment on May 18, 1979. It came on for hearing on January 4, 1984 at the Cerro Gordo County Courthouse in Mason City, Iowa. It was considered fully submitted at that time.

The industrial commissioner's file shows a first report of injury received April 17, 1980. A final report shows the payment of nine weeks and five days of temporary total disability as well as medical expenses.

At the time of hearing the parties stipulated that the rate was fixed by the prior decision at $156.47.

The record in this matter consists of the testimony of claimant, Sharon Schaer, Charles B. Hammen, Eugene Kleinow and Myron Langhoff; claimant's exhibit 1, a letter from Robert E. McCoy, M.D., dated January 24, 1980; claimant's exhibit 2, a letter dated April 18, 1980 from Dr. McCoy with accompanying notes; claimant's exhibit 3, notes from Dr. McCoy; claimant's exhibit 4, notes from Dr. McCoy; claimant's exhibit 5, a letter from Dr. McCoy dated October 20, 1981; claimant's exhibit 6, a

letter from Dr. McCoy dated November 30, 1981; claimant's exhibit 7, a letter dated June 17, 1983 from Dr. McCoy; claimant's exhibit 8, a letter from Dr. McCoy dated July 8, 1983; claimant's exhibit 9, records from North Central Correctional Facility; claimant's exhibit 10, records from Anamosa; claimant's exhibit 11, a letter from Dr. McCoy dated August 3, 1983; claimant's exhibit 12, unpaid medical expenses; claimant's exhibit 13, report expenses; claimant's exhibit 14, mileage expenses; claimant's exhibit 15, a statement to Job Service; defendant USF&G's exhibit A, an employee attendance record; and defendant USF&G's exhibit B, an attendance record. The record in the prior hearing of January 9, 1980 was reviewed in its entirety although it is not set out in any detail herein.

ISSUES

The issues in this matter are whether or not there is a causal relationship between claimant's injury and his disability; and whether or not claimant is entitled to permanent partial disability relating to his injury of May 18, 1979.

STATEMENT OF THE CASE

Forty-four year old married claimant recalled having a hearing on January 8, 1980. Claimant said that his first back injury was in January of 1969 while he was working for the sanitation department. He denied any injuries prior to that time. He fell flat on his back. He had surgery and returned to work. A claim for compensation was resolved with a special case settlement. It was his understanding he was paid disability for the injury. In 1976 he had another injury while working for the water department. He and another employee were carrying a water tapping tool. He had a pop in his back. He was not hospitalized, but he was treated with bed rest and medication. By the time of a 1978 injury to his left knee he was back at the sanitation department. He was classified as a driver, but he still picked up garbage. In May of 1979 he had back pain and went off work. A short time after his January 8, 1980 hearing he had an additional injury.

He remembered: He was working in sanitation picking up garbage. It was "real icy." He went down on his right kneecap. He called Dr. McCoy who drained blood from his knee and then did surgery. He was placed in a full leg cast. He was off work and received temporary total disability payments from January 22, 1980 to April 6, 1980.

At the time of his return to work he was placed in a garage on light duty. He went back on the garbage truck when he was given clearance by the doctor. Claimant reported that he got along well except for some problems with his back which he relieved by having his helper drive and he picked up the garbage.

He denied any injury during the time from April 7, 1980 to August 4, 1980. Rather he said that his back had started hurting "out of the clear blue sky." He had a burning sensation in his back. He was off work from August 4, 1980 to October 9, 1980 because of his back. He took sick leave and vacation to keep defendant employer from learning of his trouble.

In October claimant went back to driving a garbage truck and loading and unloading. He worked until he had left knee surgery in March of 1981. Surgery which had been scheduled for later was moved up when his knee locked as he was working. Claimant received weekly benefits from March 16, 1981 to August 9, 1981. He was in a full leg cast. Claimant acknowledged removing his cast on three separate occasions, but he did not feel his actions extended his healing time.

When he was released to return to work he was under no specific restrictions by Dr. McCoy. He anticipated returning to the garbage truck. He took some vacation time. On his resumption of work, he was sent to be a parking lot attendant. He had some forewarning of this in that he got a letter from defendant employer while he was on vacation. He asserted that he did not consent to the change and that he wished to be a garbage driver. As a parking lot attendant he sat for most of the time. The sitting bothered his back and he got up and walked and stood. If the machine was not working, he noted times. He collected money. The parking lot job paid $3.35 per hour. He lost benefits because although he worked forty hours he was considered part-time help. As a garbage worker he did not need to be on the job for forty hours. Work as a garbage driver gave him $7.28 per hour, a day and one-half sick leave each month, a paid vacation and paid life and health and accident insurance.

When a heavy equipment job opened he applied. The union tried to help him. Dr. McCoy was sent a description of the job, but claimant was not hired. A water meter job also became available. Again, the union helped and a letter was sent to Dr. McCoy who decided claimant could lift a 200 pound meter with help.

Claimant grew disgusted with defendant employer and filed a civil rights complaint which was later administratively closed.

Claimant worked the parking lot job until December 1, 1981 at which time he was suspended until he went to trial on criminal charges. As a result of that trial he was found guilty and served a year before being paroled.

Claimant claimed no new injuries from the time he went to work as a parking lot attendant or while he was incarcerated. He indicated that while he was in jail his back bothered him from time to time and he took Anacin. In April of 1983 his back tied up and he had trouble getting out of bed. He was given Motrin to take as he needed it.

In May of 1983 he came home to his family and began looking for employment. He testified that he has put down his injuries and his criminal charges on his applications. He had some part-time work until October. Beginning in late October he started part-time work as a cutting torch operator. His work provides him with no benefits and an hourly rate of $5.00. He averages close to thirty hours. The job necessitates standing and bending. The iron which he cuts is picked up by a machine. He takes pills for his pain and tries to keep it out of his mind.

As to his present condition with his back, claimant complained of pain from the beltline down into the buttocks on the right and sometimes on the left which bothers him at night. He has some cramping. Any activity can bring on pain. On comparing his difficulties he has now with those experienced before January of 1980, he said that his pain is more frequent and requires use of two Motrin tablets whereas before one would suffice, or he would walk off the problem, or it would be relieved by Anacin. His pain does not go into his lower leg.

Claimant also compared his left leg condition as it is at present and as it was presurgery in March of 1981. Popping in his left knee is about the same or perhaps more. He considered the surgery unsuccessful in that his knee is worse now than before. Moving too fast will cause the knee to buckle.

The right knee is less trouble. It still pops, but it does not catch as catching was helped by the surgery. Overall, his right knee remained close to the same.

Claimant said that he has not been paid mileage since January of 1980.

Claimant admitted having a part-time salvage business in which he went around and picked up junk and old cars. While he agreed that lifting was necessary, he said that he had special methods for doing it and that things were not as heavy because they were cut into pieces. After his release from prison he worked at this for a while, but since he got the job in October he has not had the time. He recalled that his earnings from this before his prior hearing in January of 1980 averaged $100 weekly. His children now help with pickup.

Claimant recalled that he worked on stock cars until September of 1981. By using special equipment he is able to work on his own vehicles.

Claimant denied that either work on stock cars or in his salvage business aggravated his condition.

Claimant insisted he could labor as a garbage worker by living with his back or as a meter repairperson if he had extra help with lifting meters.

Claimant asserted the city was responsible for his criminal acts. Claimant acknowledged a prior incident with another child for which he sought help. He had a discussion about moving to the water meter repairperson's job on okay from his doctor. The doctor said the work would be all right, but claimant did not know that the city agreed to this change until after his suspension. Dr. McCoy approved on November 30, 1981. Claimant was incarcerated on December 1, 1981. Claimant recalled having been told by his union representative that he would not be given the water meter job. He commenced drinking at 10:00 a.m. and later assaulted his daughter. He denied being told by the city after his arrest that should he be found not guilty he could have the water meter job. Instead, he said he was told by Kleinow that he would not work for the city again.

Claimant testified that he has not contacted any of his former supervisors since his release from prison as he did not think it would do any good.

Claimant alleged his entitlement to compensation from August 8, 1980 to October 9, 1980 as he was off for back pain. Claimant denied his being off was related to any incident while working on his personal car or a stock car. During this period he took some vacation in August. He said that he stayed home except for a few days in Missouri.

Claimant has completed ninth grade. His work experience prior to beginning work for defendant had been loading bread and fertilizer, doing various jobs for a cement company with one job as a monitor, operating a forklift, and laboring and driving a truck for a construction company.

A review of records seems to show claimant was off work from August 1 until August 15, 1980. Beginning on August 18, 1980 claimant took vacation through September 5, 1980. He took sick leave the week of September 8 and then went on light duty on September 14.

In 1981 claimant took vacation the week of March 9. He seemingly drew compensation from March 17, 1981 until August 9, 1981. It appears he may have worked in garbage for about eight days. He took vacation from August 24 until September 15, 1981 when he was moved to parking lot attendant.

Sharon Schaer, claimant's spouse, a nurse's aide, who was separated from him from December 1, 1981 until he got out of prison, testified that although claimant has not called the doctor and has not complained, she is aware of his having

frequent back problems by the way he walks and bends. She massages his back and gives him medication. It was her opinion that he has had a gradual worsening of his condition since his hearing in 1980. She reported claimant's spending time in bed when he is off work.

Schaer was unaware of any nonwork injury.

Regarding claimant's knees, she claimed that the popping sound which was present before is now louder. Claimant's feet are cold.

The witness recalled that when claimant was changed from garbage work to the parking lot he was angry and became withdrawn. He also commenced drinking heavily. She asserted that this was new for him as he had been only a social drinker. Drinking was not involved in the first assault with one of their children.

Charles Hammen, who has been employed with the city for thirteen and one-half years, testified to the circumstances surrounding claimant's attempt to move to the the water department: The water department had a job available on October 6, 1981. Normal procedure was to post the job. Thereafter, employees wishing to make application could apply. After a two week posting period, the job would be offered to the senior employee or the person with the most time working for the city.

Claimant filed an application on October 7. An investigation was made of claimant's physical capabilities to perform the work. Dr. McCoy was contacted.

Claimant was not terminated until May 4, 1982 after his sentencing. The water department vacancy was filled on May 10, 1982. If claimant had been acquitted, he would have gotten the job as the senior applicant. The union was relied upon to make claimant aware that the water meter job was being kept open.

Myron Langhoff, sanitation foreman for the city of Mason City since 1967, testified to being responsible for claimant's attendance records. According to those records claimant returned to light duty on Septmeber 14, 1980 in the street department where he was paid at the same rate. He explained that if claimant kept his compensation check the city made up the difference between sick leave and vacation pay. Employees are permitted to build up to 120 days of sick leave. There is no reimbursement for the accrued sick leave. In August of 1980 claimant took sick pay and vaction and then sick pay again. He said that claimant took compensation in August and September of 1980.

Langhoff recalled having been told by claimant he had an operation coming up in March of 1981. The witness did not know whether it would be covered by workers' compensation.

Eugene Kleinow, currently police chief for Mason City, testified to being an administrative captain in September of 1981 and to being supervisor of the parking lot attendants. He acknowledged knowing both that claimant had been arrested and had been temporarily suspended. He denied telling claimant that he would not work for the city again and said that he would not have had the authority to do so. He stated that he had nothing to do with the award of the water meter job.

Robert E. McCoy, M.D., performed an arthroscopy on both of claimant's knees on January 16, 1980 and found evidence of degenerative arthritis of the medial compartment on the left and to a somewhat lesser degree on the right. There was no evidence of a meniscal tear. In a letter dated January 24, 1980 Dr. McCoy proposed that claimant undergo a high tibial osteotomy on the left "to transfer the center of maximum weight bearing from the medial side of the knee, where his severe degenerative arthritis is, to the lateral compartment of the knee joint which has been relatively spared from the severe degenerative arthritis." He anticipated that degenerative arthritis on the right would progress at a slower rate, but that eventually he would need the high tibial osteotomy on the right as well. The doctor wrote: "In retrospect it would seem that the episodes of increasingly frequent injury to his knees with symptoms of popping and giving way of the knees have been associated with and probably caused by his gradually increasing degenerative arthritis of both knees."

Dr. McCoy recorded an injury to the right knee on January 22, 1980 when claimant slipped on ice while he was on his garbage route. As a result of the slip he sustained a fracture of the lateral portion of the patella. After an arthroscopy a fragment of the patella was removed. The doctor stated that this injury was "completely unrelated to his [claimant's] previous knee difficulties."

Claimant was released for work on April 7, 1980. He worked for two days and then commenced having pain in the right lower lumbar area. Discomfort decreased during the day. Medication was prescribed. Dr. McCoy related claimant's symptoms at that time to his back and not his knee.

On August 8, 1980 claimant visited the doctor using one crutch and complaining of severe back pain in the lower midline. More specifically, the pain was in the lumbosacral joint area and the sacral area in the midline. There was no radiation, but motion was painful. The right ankle jerk was absent. Straight leg raising on the right at 20° caused pain which increased on sciatic stretch. Straight leg raising to 35° on the left caused pain without positive sciatic stretch. Dr. McCoy thought claimant had nerve root irritation based on mild disc protrusion and consented to claimant's having complete bed rest at home.

When claimant came back the next week, he spoke of trying to find lighter work with the city in the water or street departments. Claimant was found to be improved with negative straight leg raising. He was moved to increasing ambulation and partial bed rest with no bending or lifting.

The doctor was visited by two persons from the city--Myron Langhoff and Robert Sceffler. According to the doctor's notes, the two expressed concern regarding claimant's ability to tolerate work as a garbage man. Dr. McCoy agreed that claimant would be better off doing lighter work.

On August 26, 1980 the physician wrote of recommending claimant being given lighter work, but he noted that as of yet there was no lighter work available through the city.

When claimant was seen on October 7, 1980, he reported working at the city garage doing maintenance work on a temporary basis. Claimant thought he was able to return to garbage collecting. An inch of atrophy was found in claimant's right thigh. Emphasis was placed on claimant's doing his leg exercises to overcome the atrophy.

In early 1981 claimant's main complaint was of low back pain with episodes of subjective numbness in his posterior right thigh. X-rays of the knee compared to those taken in 1979 before his injury showed no progression of degenerative arthritis. Permanent partial impairment of the function of claimant's right lower extremity was rated at four percent.

In March of 1981 claimant underwent a valgus type high tibial osteotomy on the left. There was some problem with keeping claimant in his cast, but claimant gradually progressed to weight bearing. He was to return to work on August 6, 1981.

When claimant was seen on October 3, 1981 he told the doctor of his transfer to parking lot attendant. Claimant returned on October 20, 1981 with a job description for the water meter repairperson. After reviewing the description which apparently included the ability to lift 200 pounds with the assistance of tools and another worker, Dr. McCoy concluded claimant's condition would be compatible with performing the work if it was done infrequently. A letter was written on October 20, 1981 which so indicated. The doctor anticipated claimant would be able to tolerate squatting and kneeling to install meters and to do intermittent lifting of meters weighing sixty to sixty-five pounds. It seems that a description of the job of heavy equipment operator also was reviewed and that position was found less appropriate.

Medical information from the men's reformatory indicates that when claimant was evaluated in September of 1982 he was given a bedboard. He took no medication and apparently told his evaluator he had learned to live with his discomfort. In December claimant was given Tylenol for back and knee pain.

Early in 1983 claimant was given a knee wrap. In April claimant had an episode of low back pain. Motrin was given. Claimant was subsequently allowed to use his back brace.

A status report from May 1983 notes that claimant was working with no restrictions before April 14, 1983 when he had an episode of back pain. He made no knee complaints to that date.

Claimant was reevaluated by Dr. McCoy on June 17, 1983. Claimant's complaints were of low back aches across the lower lumbar spine for which he took Motrin, wore a lumbosacral belt and walked; snapping, popping and tenderness in the right knee with the primary problem in the lateral parapatellar area; and occasional popping in the left knee.

On examination claimant had a slight list to the left. He bent forward to within eight inches of touching the floor with pain in the lumbosacral joint area. The right ankle jerk which had been absent since the 1969 surgery was absent. Combined straight leg raising to 85° caused a feeling of pulling in the low back. There was a varus deformity of 60° on the right knee and a valgus of 10° on the left. Varus on the right was viewed as abnormal. Tenderness to palpation was present over the lateral facet of the right patella. X-rays of the lumbar spine showed no further narrowing at L5-S1 in comparison with the films taken in May of 1980. There was slight Schmorl's Node formation at D12-L1 and at D11-D12. There was no progression of narrowing in the medial joint line in the right knee when it was viewed with films taken in January of 1981. X-rays of the left knee taken in May of 1983 evidenced narrowing of the medial joint space.

In a letter dated July 8, 1983 Dr. McCoy reviewed his prior ratings of claimant's impairments noting that on February 21, 1980 he gave a fifteen percent impairment to the left lower extremity and eight percent to the right lower extremity with the latter attributable to degenerative arthritis; an additional four percent to the right lower extremity resulting from the patellar fracture of January 22, 1980; five percent of the whole man related to a 1969 disc problem; and five percent of the whole man because of the 1976 injury. His present impairment ratings are set out thusly:

> I would estimate his permanent partial impairment of function of the whole man from his back at 15%

of which I would estimate 3% to be related to further work injury. I think his permanent partial impairment of function of the left lower extremity was diminished by his high tibial osteotomy to about 12%, which has remained the same to the present time. I think that the permanent partial impairment of function of the right lower extremity has increased from the 12% rating I previously gave to 15% at the present time.

The doctor explained his increase in the permanent partial impairment rating as follows:

In April of 1980 he was seen for low back pain apparently aggravated by work and in August of 1980 he was having fairly severe pain again which made it necessary for him to be off work from August until October of 1980. As a result of that episode of low back pain, I recommended to his employer that he be given lighter work. It was because with the episode of August 1980, his condition changed to the extent that I felt permanent arrangements should be made for lighter work. That I felt his permanent partial impairment of function rating as a result of work related back problems should be increased by 3% over the previous rating as it had not been felt prior to that that any long term modification of his work activities should be made. I feel that since his status at that time required a change in his recommended work designation further impairment of function had been incurred as a result of back aggravation at work.

APPLICABLE LAW AND ANALYSIS

The claimant has the burden of proving by a preponderance of the evidence that the injury of May 18, 1979 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

The appeal decision filed December 30, 1980 contains these findings:

That claimant sustained an injury which arose out of and in the course of his employment on May 18, 1979 which resulted in claimant's entitlement to temporary total disability compensation and that claimant did not sustain permanent partial disability as a result of the May 18, 1979 injury.

That as a result of the injury of May 18, 1979 claimant is entitled to three and three-sevenths (3 3/7) weeks temporary total disability at the rate of one hundred sixty-five and 47/100 dollars ($165.47) per week (May 22, 1979 through June 10, 1979).

The undersigned does not find that claimant has established entitlement to any permanent partial disability relating to the May 18, 1979 incident in this matter. Dr. McCoy's letter of July 8, 1983 contains this reference: "On May 18, 1979, he re-injured his back. He made a phone call to Dr. Hoover on May 29, 1979, but was not seen by anyone in our office at that time and we have no record of that episode, though I understand he was off work for 3 weeks and 3 days at that time." No other evidence is contained in the record to causally relate any disability claimant now has with the incident of May 18, 1979.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant had an injury to his back in 1969 which resulted in surgery.

That claimant had an injury to his back in June of 1976 which was treated conservatively.

That claimant had an episode of back pain in May of 1979 which resulted in his being off work.

That claimant had a prior hearing in this matter which resulted in his being paid three and three-sevenths (3 3/7) weeks of temporary total disability relating to the May 1979 injury.

That claimant experienced some back pain which he was able to work out but no new injury between April of 1980 and August of 1980.

That claimant attempted to keep defendant employer from learning he was having back trouble.

That following a knee surgery in the spring of 1981 claimant was made a parking lot attendant in September of 1981.

That sitting as a parking lot attendant bothered claimant's back.

That claimant continues to take medication for back pain.

That claimant continues to have back pain and cramping which can be brought on by any activity.

That claimant's back pain has increased since January of 1980.

That claimant was placed on complete bedrest because of back complaints in August of 1980.

That claimant's employment was terminated by defendant employer when he was sent to prison.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has failed to prove by a preponderance of the evidence a causal relationship between his injury of May 18, 1979 and any disability he now may suffer.

ORDER

THEREFORE, IT IS ORDERED:

That defendants pay Dr. McCoy fourteen dollars ($14.00) and North Central Medical Center forty-one and 05/100 dollars ($41.05).

That defendants pay charges for one-half (1/2) trip to Dr. McCoy's office of five (5) miles at twenty-four cents ($.24) per mile.

That defendants pay one-fourth (1/4) of the costs of the proceedings on January 4, 1984 pursuant to Industrial Commissioner 500-4.33 including report expenses of twenty-seven and 50/100 dollars ($27.50).

Signed and filed this 24 day of July, 1984.

and	:	DECISION
IOWA KEMPER INSURANCE COMPANY,	:	FILED
Insurance Carrier, Defendants.	:	JUL 24 1984
		IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in review-reopening brought by Donald A. Schaer, claimant, against the city of Mason City, employer, and Iowa Kemper Insurance Company, insurance carrier, defendants, to recover additional benefits under the Iowa Workmen's Compensation Act for an injury arising out of and in the course of his employment on June 4, 1976. It came on for hearing on January 4, 1984 at the Cerro Gordo County Courthouse in Mason City, Iowa. It was considered fully submitted at that time.

The industrial commissioner's file shows a first report of injury received July 2, 1976. A memorandum of agreement was received at the the same time. Prior litigation in this matter was resolved with an agreement for settlement under which claimant was paid twenty percent permanent partial disability, eleven and three-sevenths weeks of healing period benefits and medical expenses.

At the time of hearing the parties agreed that the rate was fixed by the prior decision in this matter at $126.90 per week.

The record in this matter consists of the testimony of claimant, Sharon Schaer, Charles B. Hammen, Eugene Kleinow and Myron Langhoff; claimant's exhibit 1, a letter from Robert E. McCoy, M.D., dated January 24, 1980; claimant's exhibit 2, a letter dated April 18, 1980 from Dr. McCoy with accompanying notes; claimant's exhibit 3, notes from Dr. McCoy; claimant's exhibit

4, notes from Dr. McCoy; claimant's exhibit 5, a letter from Dr. McCoy dated October 20, 1981; claimant's exhibit 6, a letter from Dr. McCoy dated November 30, 1981; claimant's exhibit 7, a letter dated June 17, 1983 from Dr. McCoy; claimant's exhibit 8, a letter from Dr. McCoy dated July 8, 1983; claimant's exhibit 9, records from North Central Correctional Facility; claimant's exhibit 10, records from Anamosa; claimant's exhibit 11, a letter from Dr. McCoy dated August 3, 1983; claimant's exhibit 12, unpaid medical expenses; claimant's exhibit 13, report expenses; claimant's exhibit 14, mileage expenses; claimant's exhibit 15, a statement to Job Service; defendant USF&G's exhibit A, an employee attendance record; and defendant USF&G's exhibit B, an attendance record. The record in the prior hearing of January 9, 1980 was reviewed in its entirety.

ISSUES

The issues in this matter are whether or not there is a causal relationship between claimant's injury of June 4, 1976 and his disability; and whether or not claimant is entitled to further permanent partial disability relating to that injury.

STATEMENT OF THE CASE

Forty-four year old married claimant recalled having a hearing on January 8, 1980. Claimant said that his first back injury was in January of 1969 while he was working for the sanitation department. He denied any injuries prior to that time. He fell flat on his back. He had surgery and returned to work. A claim for compensation was resolved with a special case settlement. It was his understanding he was paid disability for the injury. In 1976 he had another injury while working for the water department. He and another employee were carrying a water tapping tool. He had a pop in his back. He was not hospitalized, but he was treated with bed rest and medication. By the time of a 1978 injury to his left knee he was back at the sanitation department. He was classified as a driver, but he still picked up garbage. In May of 1979 he had back pain and went off work. A short time after his January 8, 1980 hearing he had an additional injury.

He remembered: He was working in sanitation picking up garbage. It was "real icy." He went down on his right kneecap. He called Dr. McCoy who drained blood from his knee and then did surgery. He was placed in a full leg cast. He was off work and received temporary total disability payments from January 22, 1980 to April 6, 1980.

At the time of his return to work he was placed in a garage on light duty. He went back on the garbage truck when he was given clearance by the doctor. Claimant reported that he got along well except for some problems with his back which he relieved by having his helper drive and he picked up the garbage.

He denied any injury during the time from April 7, 1980 to August 4, 1980. Rather he said that his back had started hurting "out of the clear blue sky." He had a burning sensation in his back. He was off work from August 4, 1980 to October 9, 1980 because of his back. He took sick leave and vacation to keep defendant employer from learning of his trouble.

In October claimant went back to driving a garbage truck and loading and unloading. He worked until he had left knee surgery in March of 1981. Surgery which had been scheduled for later was moved up when his knee locked as he was working. Claimant received weekly benefits from March 16, 1981 to August 9, 1981. He was in a full leg cast. Claimant acknowledged removing his cast on three separate occasions, but he did not feel his actions extended his healing time.

When he was released to return to work he was under no specific restrictions by Dr. McCoy. He anticipated returning to the garbage truck. He took some vacation time. On his resumption of work, he was sent to be a parking lot attendant. He had some forewarning of this in that he got a letter from defendant employer while he was on vacation. He asserted that he did not consent to the change and that he wished to be a garbage driver. As a parking lot attendant he sat for most of the time. The sitting bothered his back and he got up and walked and stood. If the machine was not working, he noted times. He collected money. The parking lot job paid $3.35 per hour. He lost benefits because although he worked forty hours he was considered part-time help. As a garbage worker he did not need to be on the job for forty hours. Work as a garbage driver gave him $7.28 per hour, a day and one-half sick leave each month, a paid vacation and paid life and health and accident insurance.

When a heavy equipment job opened he applied. The union tried to help him. Dr. McCoy was sent a description of the job, but claimant was not hired. A water meter job also became available. Again, the union helped and a letter was sent to Dr. McCoy who decided claimant could lift a 200 pound meter with help.

Claimant grew disgusted with defendant employer and filed a civil rights complaint which was later administratively closed.

Claimant worked the parking lot job until December 1, 1981 at which time he was suspended until he went to trial on criminal charges. As a result of that trial he was found guilty and served a year before being paroled.

Claimant claimed no new injuries from the time he went to work as a parking lot attendant or while he was incarcerated. He indicated that while he was in jail his back bothered him from time to time and he took Anacin. In April of 1983 his back tied up and he had trouble getting out of bed. He was given Motrin to take as he needed it.

In May of 1983 he came home to his family and began looking for employment. He testified that he has put down his injuries and his criminal charges on his applications. He had some part-time work until October. Beginning in late October he started part-time work as a cutting torch operator. His work provides him with no benefits and an hourly rate of $5.00. He averages close to thirty hours. The job necessitates standing and bending. The iron which he cuts is picked up by a machine. He takes pills for his pain and tries to keep it out of his mind.

As to his present condition with his back, claimant complained of pain from the beltline down into the buttocks on the right and sometimes on the left which bothers him at night. He has some cramping. Any activity can bring on pain. On comparing his difficulties he has now with those experienced before January of 1980, he said that his pain is more frequent and requires use of two Motrin tablets whereas before one would suffice, or he would walk off the problem, or it would be relieved by Anacin. His pain does not go into his lower leg.

Claimant also compared his left leg condition as it is at present and as it was presurgery in March of 1981. Popping in his left knee is about the same or perhaps more. He considered the surgery unsuccessful in that his knee is worse now than before. Moving too fast will cause the knee to buckle.

The right knee is less trouble. It still pops, but it does not catch as catching was helped by the surgery. Overall, his right knee remained close to the same.

Claimant said that he has not been paid mileage since January of 1980.

Claimant admitted having a part-time salvage business in which he went around and picked up junk and old cars. While he agreed that lifting was necessary, he said that he had special methods for doing it and that things were not as heavy because they were cut into pieces. After his release from prison he worked at this for a while, but since he got the job in October he has not had the time. He recalled that his earnings from this before his prior hearing in January of 1980 averaged $100 weekly. His children now help with pickup.

Claimant recalled that he worked on stock cars until September of 1981. By using special equipment he is able to work on his own vehicles.

Claimant denied that either work on stock cars or in his salvage business aggravated his condition.

Claimant insisted he could labor as a garbage worker by living with his back or as a meter repairperson if he had extra help with lifting meters.

Claimant asserted the city was responsible for his criminal acts. Claimant acknowledged a prior incident with another child for which he sought help. He had a discussion about moving to the water meter repairperson's job on okay from his doctor. The doctor said the work would be all right, but claimant did not know that the city agreed to this change until after his suspension. Dr. McCoy approved on November 30, 1981. Claimant was incarcerated on December 1, 1981. Claimant recalled having been told by his union representative that he would not be given the water meter job. He commenced drinking at 10:00 a.m. and later assaulted his daughter. He denied being told by the city after his arrest that should he be found not guilty he could have the water meter job. Instead, he said he was told by Kleinow that he would not work for the city again.

Claimant testified that he has not contacted any of his former supervisors since his release from prison as he did not think it would do any good.

Claimant alleged his entitlement to compensation from August 8, 1980 to October 9, 1980 as he was off for back pain. Claimant denied his being off was related to any incident while working on his personal car or a stock car. During this period he took some vacation in August. He said that he stayed home except for a few days in Missouri.

Claimant has completed ninth grade. His work experience prior to beginning work for defendant had been loading bread and fertilizer, doing various jobs for a cement company with one job as a monitor, operating a forklift, and laboring and driving a truck for a construction company.

A review of records seems to show claimant was off work from August 1 until August 15, 1980. Beginning on August 18, 1980 claimant took vacation through September 5, 1980. He took sick leave the week of September 8 and then went on light duty on September 14.

In 1981 claimant took vacation the week of March 9. He seemingly drew compensation from March 17, 1981 until August 9, 1981. It appears he may have worked in garbage for about eight days. He took vacation from August 24 until September 15, 1981 when he was moved to parking lot attendant.

Sharon Schaer, claimant's spouse, a nurse's aide, who was

separated from him from December 1, 1981 until he got out of prison, testified that although claimant has not called the doctor and has not complained, she is aware of his having frequent back problems by the way he walks and bends. She massages his back and gives him medication. It was her opinion that he has had a gradual worsening of his condition since his hearing in 1980. She reported claimant's spending time in bed when he is off work.

Schaer was unaware of any nonwork injury.

Regarding claimant's knees, she claimed that the popping sound which was present before is now louder. Claimant's feet are cold.

The witness recalled that when claimant was changed from garbage work to the parking lot he was angry and became withdrawn. He also commenced drinking heavily. She asserted that this was new for him as he had been only a social drinker. Drinking was not involved in the first assault with one of their children.

Charles Hammen, who has been employed with the city for thirteen and one-half years, testified to the circumstances surrounding claimant's transfer to the water department: The water department had a job available on October 6, 1981. Normal procedure was to post the job. Thereafter, employees wishing to make application could apply. After a two week posting period, the job would be offered to the senior employee or the person with the most time working for the city.

Claimant filed an application on October 7. An investigation was made of claimant's physical capabilities to perform the work. Dr. McCoy was contacted.

Claimant was not terminated until May 4, 1982 after his sentencing. The water department vacancy was filled on May 10, 1982. If claimant had been acquitted, he would have gotten the job as the senior applicant. The union was relied upon to make claimant aware that the water meter job was being kept open.

Myron Langhoff, sanitation foreman for the city of Mason City since 1967, testified to being responsible for claimant's attendance records. According to those records claimant returned to light duty on Septmeber 14, 1980 in the street department where he was paid at the same rate. He explained that if claimant kept his compensation check the city made up the difference between sick leave and vacation pay. Employees are permitted to build up to 120 days of sick leave. There is no reimbursement for the accrued sick leave. In August of 1980 claimant took sick pay and vaction and then sick pay again. He said that claimant took compensation in August and September of 1980.

Langhoff recalled having been told by claimant he had an operation coming up in March of 1981. The witness did not know whether it would be covered by workers' compensation.

Eugene Kleinow, currently police chief for Mason City, testified to being an administrative captain in September of 1981 and to being supervisor of the parking lot attendants. He acknowledged knowing both that claimant had been arrested and had been temporarily suspended. He denied telling claimant that he would not work for the city again and said that he would not have had the authority to do so. He stated that he had nothing to do with the award of the water meter job.

Robert E. McCoy, M.D., performed an arthroscopy on both of claimant's knees on January 16, 1980 and found evidence of degenerative arthritis of the medial compartment on the left and to a somewhat lesser degree on the right. There was no evidence of a meniscal tear. In a letter dated January 24, 1980 Dr. McCoy proposed that claimant undergo a high tibial osteotomy on the left "to transfer the center of maximum weight bearing from the medial side of the knee, where his severe degenerative arthritis is, to the lateral compartment of the knee joint which has been relatively spared from the severe degenerative arthritis." He anticipated that degenerative arthritis on the right would progress at a slower rate, but that eventually he would need the high tibial osteotomy on the right as well. The doctor wrote: "In retrospect it would seem that the episodes of increasingly frequent injury to his knees with symptoms of popping and giving way of the knees have been associated with and probably caused by his gradually increasing degenerative arthritis of both knees."

Dr. McCoy recorded an injury to the right knee on January 22, 1980 when claimant slipped on ice while he was on his garbage route. As a result of the slip he sustained a fracture of the lateral portion of the patella. After an arthroscopy a fragment of the patella was removed. The doctor stated that this injury was "completely unrelated to his [claimant's] previous knee difficulties."

Claimant was released for work on April 7, 1980. He worked for two days and then commenced having pain in the right lower lumbar area. Discomfort decreased during the day. Medication was prescribed. Dr. McCoy related claimant's symptoms at that time to his back and not his knee.

On August 8, 1980 claimant visited the doctor using one crutch and complaining of severe back pain in the lower midline. More specifically, the pain was in the lumbosacral joint area and the sacral area in the midline. There was no radiation, but motion was painful. The right ankle jerk was absent. Straight leg raising on the right at 20° caused pain which increased on sciatic stretch. Straight leg raising to 35° on the left caused pain without positive sciatic stretch. Dr. McCoy thought claimant had nerve root irritation based on mild disc protrusion and consented to claimant's having complete bed rest at home.

When claimant came back the next week, he spoke of trying to find lighter work with the city in the water or street departments. Claimant was found to be improved with negative straight leg raising. He was moved to increasing ambulation and partial bed rest with no bending or lifting.

The doctor was visited by two persons from the city--Myron Langhoff and Robert Sceffler. According to the doctor's notes, the two expressed concern regarding claimant's ability to tolerate work as a garbage man. Dr. McCoy agreed that claimant would be better off doing lighter work.

On August 26, 1980 the physician wrote of recommending claimant being given lighter work, but he noted that as of yet there was no lighter work available through the city.

When claimant was seen on October 7, 1980, he reported working at the city garage doing maintenance work on a temporary basis. Claimant thought he was able to return to garbage collecting. An inch of atrophy was found in claimant's right thigh. Emphasis was placed on claimant's doing his leg exercises to overcome the atrophy.

In early 1981 claimant's main complaint was of low back pain with episodes of subjective numbness in his posterior right thigh. X-rays of the knee compared to those taken in 1979 before his injury showed no progression of degenerative arthritis. Permanent partial impairment of the function of claimant's right lower extremity was rated at four percent.

In March of 1981 claimant underwent a valgus type high tibial osteotomy on the left. There was some problem with keeping claimant in his cast, but claimant gradually progressed to weight bearing. He was to return to work on August 6, 1981.

When claimant was seen on October 3, 1981 he told the doctor of his transfer to parking lot attendant. Claimant returned on October 20, 1981 with a job description for the water meter repairperson. After reviewing the description which apparently included the ability to lift 200 pounds with the assistance of tools and another worker, Dr. McCoy concluded claimant's condition would be compatible with performing the work if it was done infrequently. A letter was written on October 20, 1981 which so indicated. The doctor anticipated claimant would be able to tolerate squatting and kneeling to install meters and to do intermittent lifting of meters weighing sixty to sixty-five pounds. It seems that a description of the job of heavy equipment operator also was reviewed and that position was found less appropriate.

Medical information from the men's reformatory indicates that when claimant was evaluated in September of 1982 he was given a bedboard. He took no medication and apparently told his evaluator he had learned to live with his discomfort. In December claimant was given Tylenol for back and knee pain.

Early in 1983 claimant was given a knee wrap. In April claimant had an episode of low back pain. Motrin was given. Claimant was subsequently allowed to use his back brace.

A status report from May 1983 notes that claimant was working with no restrictions before April 14, 1983 when he had an episode of back pain. He made no knee complaints to that date.

Claimant was reevaluated by Dr. McCoy on June 17, 1983. Claimant's complaints were of low back aches across the lower lumbar spine for which he took Motrin, wore a lumbosacral belt and walked; snapping, popping and tenderness in the right knee with the primary problem in the lateral parapatellar area; and occasional popping in the left knee.

On examination claimant had a slight list to the left. He bent forward to within eight inches of touching the floor with pain in the lumbosacral joint area. The right ankle jerk which had been absent since the 1969 surgery was absent. Combined straight leg raising to 85° caused a feeling of pulling in the low back. There was a varus deformity of 60° on the right knee and a valgus of 10° on the left. Varus on the right was viewed as abnormal. Tenderness to palpation was present over the lateral facet of the right patella. X-rays of the lumbar spine showed no further narrowing at L5-S1 in comparison with the films taken in May of 1980. There was slight Schmorl's Node formation at D12-L1 and at D11-D12. There was no progression of narrowing in the medial joint line in the right knee when it was viewed with films taken in January of 1981. X-rays of the left knee taken in May of 1983 evidenced narrowing of the medial joint space.

In a letter dated July 8, 1983 Dr. McCoy reviewed his prior ratings of claimant's impairments noting that on February 21, 1980 he gave a fifteen percent impairment to the left lower extremity and eight percent to the right lower extremity with the latter attributable to degenerative arthritis; an additional four percent to the right lower extremity resulting from the patellar fracture of January 22, 1980; five percent of the whole man related to a 1969 disc problem; and five percent of the whole man because of the 1976 injury. His present impairment ratings are set out thusly:

I would estimate his permanent partial impairment of function of the whole man from his back at 15% of which I would estimate 3% to be related to further work injury. I think his permanent partial impairment of function of the left lower extremity was diminished by his high tibial osteotomy to about 12%, which has remained the same to the present time. I think that the permanent partial impairment of function of the right lower extremity has increased from the 12% rating I previously gave to 15% at the present time.

The doctor explained his increase in the permanent partial impairment rating as follows:

In April of 1980 he was seen for low back pain apparently aggravated by work and in August of 1980 he was having fairly severe pain again which made it necessary for him to be off work from August until October of 1980. As a result of that episode of low back pain, I recommended to his employer that he be given lighter work. It was because with the episode of August 1980, his condition changed to the extent that I felt permanent arrangements should be made for lighter work. That I felt his permanent partial impairment of function rating as a result of work related back problems should be increased by 3% over the previous rating as it had not been felt prior to that that any long term modification of his work activities should be made. I feel that since his status at that time required a change in his recommended work designation further impairment of function had been incurred as a result of back aggravation at work.

APPLICABLE LAW AND ANALYSIS

Previous litigation in this matter was settled with an agreement for settlement which allowed claimant, among other things, twenty percent permanent partial industrial disability.

The claimant has the burden of proving by a preponderance of the evidence that the injury of June 4, 1976 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

Claimant's testimony in the first hearing was that following the 1976 injury he had pain into his right leg which was worse than what he experienced in 1979. At the time of that 1980 hearing he was experiencing pain down his right leg from time to time.

Reports from Dr. Masters offered in the first proceeding traced claimant's difficulties from the 1976 injury through his surgery. Dr. Masters described claimant's injury in 1976 as "acute aggravation of a chronic lumbar subluxation complex with related etiology of surgical intervention."

Dr. Walker examined claimant in February of 1979 and expressed the opinion:

We are dealing with an entirely different situation here than what he had originally. He has not hurt the lumbar spine or the discs in any way but what he has is a chronic, moderately severe sprain of the right sacroiliac joint. He has point tenderness here and the sciatic nerve stretching tests are all negative but the pelvic torsion tests reproduce the pain in the right sacroiliac joint.

Dr. Adams' letter of November 29, 1979 offered in the first proceeding states:

I feel that the back condition that he had with an injury in 1969 that resulted in surgery turned out all right and that he did get a good result. He did return to his regular work, and he has been compensated for any residual disability that he has as a result of that injury. I feel that any back sprains and back trouble that he has had since that time are a natural course of the problem that he's had, particularly in view of the kind of work that he is doing. I do not feel that any increase in disability in his back has occurred since 1969 as a result of any injures that he has had. I think that he will continue to occasionally have some minor trouble with his back if he continues to do heavy work, in all kinds of weather, and may have to occasionally wear his belt.

In a letter dated September 5, 1978 Dr. McCoy recounted his treatment of claimant:

On April 16, 1969, Mr. Schaer underwent removal of a herniated intervertebral disc at L5-S1 on the right. This was as a result of a work injury which occurred in his work as a garbage man. Apparently he was not covered by Iowa Kemper at that time. He did well after that surgery and returned to work in July of 1969. He returned to work in May of that year and did well until June of 1976 which was the next time I saw him for his back. He did well, that is, until he felt something pop in his low back while lifting on the job on 6/4/76. He returned to work for the Street Department, I believe, on about 8/23/76 and subsequently did well and did not have a lot of trouble until September 1978. He began going to a chiropractor one to two times a month in about September of 1977. Though I feel he would have been entitled to a permanent partial impairment rating after his initial episode of trouble in 1969, I think that he did well until 1976 and that that injury should therefore be considered as the cause of his exacerbation at that time even though it is recognized that a disc space never returns to normal after the disc has been removed or after there has been an extrusion of a disc fragment.

A prior letter offered additional explanation:

I think that his problem is with pain originating at the level of his previous disc herniation where the shock-absorbing function of the disc which herniated is not normal. He irritates himself in this area fairly easily. Twisting and prolonged sitting seem to be particularly aggravating to him. However, he seems to be getting by at work in spite of his symptoms. I think that he should avoid bending and particularly lifting when bending as much as possible though in his occupation this is not particularly avoidable.

Dr. McCoy's notes in April of 1980 refer to "discomfort in the right lumbar area without particular radiation." Again in August the pain was a few inches to the right of the mid-line with no "particular radiation into his lower extremities." The doctor thought claimant had "nerve root irritation on the basis of mild disc protrusion."

Evidence offered in the present case includes a letter from Dr. McCoy of June 17, 1983 which refers only to the injury of 1969:

Mr. Schaer has three basic problems. One is low back pain, which is the residual of difficulty which arose from an injury while at work as a garbage man on January 20, 1969, and which eventuated in his requiring a right partial hemilaminectomy at L5-S1 on the right with removal of a protruding disc fragment at L5-S1 on the right on April 16, 1969. The sort of back symptoms that he is having at the present time are with low backache intermittently felt across his lower lumbar spine area for which he wears a lumbosacral belt and walks as an exercise. These modalities usually bring about improvement, but this is not always the case.

A letter from Dr. McCoy of July 8, 1983 refers to incidents in 1969, 1976 and 1979:

Mr. Schaer has been followed in this office since January of 1962 and had no history of back trouble until his injury of January of 1969 when he slipped on the ice while at work and had difficulty which eventually led to his undergoing right partial hemilaminectomy at L5-S1 on the right on April 16, 1969. On June 4, 1976, he injured his back while at work when he had back pain while lifting. He was off work until August 3, 1976, at that time. On May 18, 1979, he re-injured his back. He made a phone call to Dr. Hoover on May 29, 1979, but was not seen by anyone in our office at that time and we have no record of that episode, though I understand he was off work for 3 weeks and 3 days at that time.

That same letter makes reference to pain in April and August of 1980 but does not relate that pain to the 1969, 1976 or 1979 incidents:

In April of 1980 he was seen for low back pain apparently aggravated by work. In August of 1980 he was having fairly severe pain again and it was necessary for him to be off work again until October of 1980.

Dr. McCoy seemingly views the pain in April as an aggravation brought on by work.

Dr. McCoy's most recent letter states:

In April of 1980 he was seen for low back pain apparently aggravated by work and in August of 1980 he was having fairly severe pain again which made it necessary for him to be off work from August until October of 1980. As a result of that episode of low back pain, I recommended to his employer that he be given lighter work. It was because with the episode of August 1980, his condition changed to the extent that I felt permanent arrangements should be made for lighter work. That I felt his permanent partial impairment of function rating as

a result of work related back problems should be increased by 3% over the previous rating as it had not been felt prior to that that any long term modification of his work activities should be made. I feel that since his status at that time required a change in his recommended work designation further impairment of function had been incurred as a result of back aggravation at work.

The causation issue in this case is complicated by the fact of a remote surgery in 1969, an incident in 1976 to which claimant wishes to relate his present disability and a temporary aggravation in 1979.

In 1936 the Iowa Supreme Court attempted to supply some guidance for sorting through this type of case in Oldham v. Scofield & Welch, 222 Iowa 764, 767, 266 N.W. 480, 481 (1936):

> The question of whether the disability sustained by the employee shall be attributed to the first accident or to the later accidents depends on whether or not the disability sustained was caused by a change in the original condition, or by a recurrence of the original injury, or by an independent and subsequent cause. If the employee suffers a compensable injury and thereafter suffers further disability which is the proximate result of the original injury, such further disability is compensable. Where an employee suffers a compensable injury and thereafter returns to work and, as a result thereof, his first injury is aggravated and accelerated so that he is greater disabled than before, the entire disability may be compensated for.

More recently the court in DeShaw v. Energy Manufacturing Co., 192 N.W.2d 777, 780 (Iowa 1971) established this rule:

> When a workman sustains an injury, later sustains another injury, and subsequently seeks to reopen an award predicated on the first injury, he must prove one or two things: (a) that the disability for which he seeks additional compensation was proximately caused by the first injury, or (b) that the second injury (and ensuing disability) was proximately caused by the first injury.

Clearly and unquestionably the claimant had back problems in April and August of 1980. Clearly and unquestionably his back trouble in August led to concern by claimant, his doctor and his employer. That concern prompted adjustments in claimant's work. Where those adjustments in claimant's work fit into the total picture in this case is just not clear. Claimant's symptomatology in 1976 included radiating pain. That is not a current symptom. Dr. McCoy's recent report of June refers only to the 1969, his July letter in a nebulous way to 1969, 1976 and 1979, and his August letter only to the April and August 1980 incidents.

The undersigned is unable to attach claimant's present disability to his 1976 injury. Viewing the record as a whole does not allow claimant to preponderate. There are too many incidents and there is too little specificity in the medical evidence.

As claimant has failed to preponderate on the causation issue, discussion of an increase in the industrial disability is unnecessary.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant had a prior hearing in this matter.

That claimant's prior litigation resulted in an agreement for settlement fixing his industrial disability at twenty percent (20%).

That claimant had an injury to his back in 1969 which resulted in surgery.

That claimant's injury in June of 1976 was also to his back and was treated conservatively.

That claimant had a subsequent injury to his left knee on March 17, 1978 which resulted in permanent impairment in his left lower extremity.

That claimant had a subsequent episode of back pain in May of 1979 which resulted in his being off work slightly less than a month.

That claimant had a subsequent injury to his right knee in January of 1980 which was surgically treated and which resulted in a permanent impairment in his right lower extremity.

That claimant was able to return to his garbage truck after his injury to his right knee.

That claimant was off work from August 4, 1980 to October 9, 1980.

That claimant attempted to keep defendant employer from learning that he was having back trouble.

That claimant was off work for knee surgery from March to August of 1981.

That claimant was released to return to work without restrictions.

That claimant was made a parking lot attendant in September of 1981.

That sitting as a parking lot attendant bothered claimant's back.

That work as a parking lot attendant paid three and 35/100 dollars ($3.35) per hour with no benefits.

That claimant's work as a garbage driver paid seven and 28/100 dollars ($7.28) per hour and provided him with additional benefits as well.

That claimant applied for a job as heavy equipment operator which he did not get.

That claimant also applied for a job as a water meter repairperson.

That Dr. McCoy believed that claimant could do the water meter repairperson's job.

That claimant worked as a parking lot attendant until December 1, 1981 at which time he was suspended.

That claimant was terminated by the city after he was sentenced to prison.

That claimant was incarcerated until May of 1983.

That at the time of the present hearing claimant was working as a cutting torch operator with an hourly rate of five dollars ($5.00) and no benefits.

That claimant continues to take medication for the back pain.

That claimant continues to have back pain and cramping which can be brought on by any acitivity.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant has failed to establish a causal relationship between his present disability and his injury of June 4, 1976.

the evidence his entitlement to any further permanent partial disability or any further healing period attributable to his injury of June 4, 1976.

ORDER

THEREFORE, IT IS ORDERED:

That defendants pay the following expenses:

Dr. McCoy	$14.00
North Iowa Medical Center	41.05

That defendants pay onto claimant mileage for one-half (1/2) visit to Dr. McCoy's office totaling five (5) miles at a rate of twenty-four cents ($.24) per mile.

That defendants pay one-quarter (1/4) of the costs of the proceedings on January 4, 1984 pursuant to Industrial Commissioner Rule 500-4.33 to include the cost of report expenses totaling twenty-seven and 50/100 dollars ($27.50).

Signed and filed this 24 day of July, 1984.

JUDITH ANN HIGGS
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

DONALD A. SCHAER,

Claimant,

vs.

CITY OF MASON CITY,
Employer,
and
UNITED STATES FIDELITY & GUARANTY COMPANY,

Insurance Carrier,
Defendants.

File No. 753619

R E O P E N I N G

D E C I S I O N

FILED
JUL 24 1984
IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in review-reopening brought by Donald A. Schaer, claimant, against City of Mason City, employer, and United States Fidelity & Guaranty Company, insurance carrier, defendants, to recover additional benefits under the Iowa Workers' Compensation Act for an injury arising out of and in the course of his employment on March 17, 1978. It came on for hearing on January 4, 1984 at the Cerro Gordo County Courthouse in Mason City, Iowa. It was considered fully submitted at that time.

The industrial commissioner's file shows a first report of injury received April 17, 1980. In an appeal decision filed December 30, 1980 defendants were ordered to pay 26.4 weeks of permanent partial disability. A final report shows payment of 21 weeks of healing period benefits and 26.4 weeks of permanent partial disability for twelve percent of the left lower extremity.

The rate as fixed by the decision on appeal is $152.77.

The record in this matter consists of the testimony of claimant, Sharon Schaer, Charles B. Hammen, Eugene Kleinow and Myron Langhoff; claimant's exhibit 1, a letter from Robert E. McCov, M.D., dated January 24, 1980; claimant's exhibit 2, a letter dated April 18, 1980 from Dr. McCoy with accompanying notes; claimant's exhibit 3, notes from Dr. McCoy; claimant's exhibit 4, notes from Dr. McCoy; claimant's exhibit 5, a letter from Dr. McCoy dated October 20, 1981; claimant's exhibit 6, a letter from Dr. McCoy dated November 30, 1981; claimant's exhibit 7, a letter dated June 17, 1983 from Dr. McCoy; claimant's exhibit 8, a letter from Dr. McCoy dated July 8, 1983; claimant's exhibit 9, records from North Central Correctional Facility; claimant's exhibit 10, records from Anamosa; claimant's exhibit 11, a letter from Dr. McCoy dated August 3, 1983; claimant's exhibit 12, unpaid medical expenses; claimant's exhibit 13, report expenses; claimant's exhibit 14, mileage expenses; claimant's exhibit 15, a statement to Job Service; defendant USF&G's exhibit A, an employee attendance record; and defendant USF&G's exhibit B, an attendance record. The record in the prior hearing of January 9, 1980 was reviewed in its entirety although it is not set out in any detail herein.

ISSUES

The issues in this matter are whether or not there is a causal relationship between claimant's injury and his disability; and whether or not claimant is entitled to further permanent partial disability relating to his injury of March 17, 1978.

STATEMENT OF THE CASE

Forty-four year old married claimant recalled having a hearing on January 8, 1980. Claimant said that his first back injury was in January of 1969 while he was working for the sanitation department. He denied any injuries prior to that time. He fell flat on his back. He had surgery and returned to work. A claim for compensation was resolved with a special case settlement. It was his understanding he was paid disability for the injury. In 1976 he had another injury while working for the water department. He and another employee were carrying a water tapping tool. He had a pop in his back. He was not hospitalized, but he was treated with bed rest and medication. By the time of a 1978 injury to his left knee he was back at the sanitation department. He was classified as a driver, but he still picked up garbage. In May of 1979 he had back pain and went off work. A short time after his January 8, 1980 hearing he had an additional injury.

He remembered: He was working in sanitation picking up garbage. It was "real icy." He went down on his right kneecap. He called Dr. McCoy who drained blood from his knee and then did surgery. He was placed in a full leg cast. He was off work and received temporary total disability payments from January 22, 1980 to April 6, 1980.

At the time of his return to work he was placed in a garage on light duty. He went back on the garbage truck when he was given clearance by the doctor. Claimant reported that he got along well except for some problems with his back which he relieved by having his helper drive and he picked up the garbage.

He denied any injury during the time from April 7, 1980 to August 4, 1980. Rather he said that his back had started hurting "out of the clear blue sky." He had a burning sensation in his back. He was off work from August 4, 1980 to October 9, 1980 because of his back. He took sick leave and vacation to keep defendant employer from learning of his trouble.

In October claimant went back to driving a garbage truck and loading and unloading. He worked until he had left knee surgery in March of 1981. Surgery which had been scheduled for later was moved up when his knee locked as he was working. Claimant received weekly disability benefits from March 16, 1981 to August 9, 1981. He was in a full leg cast. Claimant acknowledged removing his cast on three separate occasions, but he did not feel his actions extended his healing time.

When he was released to return to work he was under no specific restrictions by Dr. McCoy. He anticipated returning to the garbage truck. He took some vacation time. On his resumption of work, he was sent to be a parking lot attendant. He had some forewarning of this in that he got a letter from defendant employer while he was on vacation. He asserted that he did not consent to the change and that he wished to be a garbage driver. As a parking lot attendant he sat for most of the time. The sitting bothered his back and he got up and walked and stood. If the machine was not working, he noted times. He collected money. The parking lot job paid $3.35 per hour. He lost benefits because although he worked forty hours he was considered part-time help. As a garbage worker he did not need to be on the job for forty hours. Work as a garbage driver gave him $7.28 per hour, a day and one-half sick leave each month, a paid vacation and paid life and health and accident insurance.

When a heavy equipment job opened he applied. The union tried to help him. Dr. McCoy was sent a description of the job, but claimant was not hired. A water meter job also became available. Again, the union helped and a letter was sent to Dr. McCoy who decided claimant could lift a 200 pound meter with help.

Claimant grew disgusted with defendant employer and filed a civil rights complaint which was later administratively closed.

Claimant worked the parking lot job until December 1, 1981 at which time he was suspended until he went to trial on criminal charges. As a result of that trial he was found guilty and served a year before being paroled.

Claimant claimed no new injuries from the time he went to work as a parking lot attendant or while he was incarcerated. He indicated that while he was in jail his back bothered him from time to time and he took Anacin. In April of 1983 his back tied up and he had trouble getting out of bed. He was given Motrin to take as he needed it.

In May of 1983 he came home to his family and began looking for employment. He testified that he has put down his injuries and his criminal charges on his applications. He had some part-time work until October. Beginning in late October he started part-time work as a cutting torch operator. His work provides him with no benefits and an hourly rate of $5.00. He averages close to thirty hours. The job necessitates standing and bending. The iron which he cuts is picked up by a machine. He takes pills for his pain and tries to keep it out of his mind.

As to his present condition with his back, claimant complained of pain from the beltline down into the buttocks on the right and sometimes on the left which bothers him at night. He has some cramping. Any activity can bring on pain. On comparing his difficulties he has now with those experienced before January of 1980, he said that his pain is more frequent and requires use of two Motrin tablets whereas before one would suffice, or he would walk off the problem, or it would be relieved by Anacin. His pain does not go into his lower leg.

Claimant also compared his left leg condition as it is at present and as it was presurgery in March of 1981. Popping in his left knee is about the same or perhaps more. He considered the surgery unsuccessful in that his knee is worse now than before. Moving too fast will cause the knee to buckle.

The right knee is less trouble. It still pops, but it does not catch as catching was helped by the surgery. Overall, his right knee remained close to the same.

Claimant said that he has not been paid mileage since January of 1980.

Claimant admitted having a part-time salvage business in which he went around and picked up junk and old cars. While he agreed that lifting was necessary, he said that he had special methods for doing it and that things were not as heavy because they were cut into pieces. After his release from prison he worked at this for a while, but since he got the job in October he has not had the time. He recalled that his earnings from this before his prior hearing in January of 1980 averaged $100 weekly. His children now help with pickup.

Claimant recalled that he worked on stock cars until September of 1981. By using special equipment he is able to work on his own vehicles.

Claimant denied that either work on stock cars or in his salvage business aggravated his condition.

Claimant insisted he could labor as a garbage worker by living with his back or as a meter repairperson if he had extra help with lifting meters.

Claimant asserted the city was responsible for his criminal acts. Claimant acknowledged a prior incident with another child for which he sought help. He had a discussion about moving to the water meter repairperson's job on okay from his doctor. The doctor said the work would be all right, but claimant did not know that the city agreed to this change until after his suspension. Dr. McCoy approved on November 30, 1981. Claimant was incarcerated on December 1, 1981. Claimant recalled having been told by his union representative that he would not be given the water meter job. He commenced drinking at 10:00 a.m. and later assaulted his daughter. He denied being told by the city after his arrest that should he be found not guilty he could have the water meter job. Instead, he said he was told by Kleinow that he would not work for the city again.

Claimant testified that he has not contacted any of his former supervisors since his release from prison as he did not think it would do any good.

Claimant alleged his entitlement to compensation from August 8, 1980 to October 9, 1980 as he was off for back pain. Claimant denied his being off was related to any incident while working on his personal car or a stock car. During this period he took some vacation in August. He said that he stayed home except for a few days in Missouri.

Claimant has completed ninth grade. His work experience prior to beginning work for defendant had been loading bread and fertilizer, doing various jobs for a cement company with one job as a monitor, operating a forklift, and laboring and driving a truck for a construction company.

A review of records seems to show claimant was off work from August 1 until August 15, 1980. Beginning on August 18, 1980 claimant took vacation through September 5, 1980. He took sick leave the week of September 8 and then went on light duty on September 14.

In 1981 claimant took vacation the week of March 9. He seemingly drew compensation from March 17, 1981 until August 9, 1981. It appears he may have worked in garbage for about eight days. He took vacation from August 24 until September 15, 1981 when he was moved to parking lot attendant.

Sharon Schaer, claimant's spouse, a nurse's aide, who was separated from him from December 1, 1981 until he got out of prison, testified that although claimant has not called the doctor and has not complained, she is aware of his having frequent back problems by the way he walks and bends. She massages his back and gives him medication. It was her opinion that he has had a gradual worsening of his condition since his hearing in 1980. She reported claimant's spending time in bed when he is off work.

Schaer was unaware of any nonwork injury.

Regarding claimant's knees, she claimed that the popping sound which was present before is now louder. Claimant's feet are cold.

The witness recalled that when claimant was changed from garbage work to the parking lot he was angry and became withdrawn. He also commenced drinking heavily. She asserted that this was new for him as he had been only a social drinker. Drinking was not involved in the first assault with one of their children.

Charles Hammen, who has been employed with the city for thirteen and one-half years, testified to the circumstances surrounding claimant's transfer to a parking lot attendant: The water department had a job available on October 6, 1981. Normal procedure was to post the job. Thereafter, employees wishing to make application could apply. After a two week posting period, the job would be offered to the senior employee or the person with the most time working for the city.

Claimant filed an application on October 7. An investigation was made of claimant's physical capabilities to perform the work. Dr. McCoy was contacted.

Claimant was not terminated until May 4, 1982 after his sentencing. The water department vacancy was filled on May 10, 1982. If claimant had been acquitted, he would have gotten the job as the senior applicant. The union was relied upon to make claimant aware that the water meter job was being kept open.

Myron Langhoff, sanitation foreman for the city of Mason City since 1967, testified to being responsible for claimant's attendance records. According to those records claimant returned to light duty on Septmeber 14, 1980 in the street department where he was paid at the same rate. He explained that if claimant kept his compensation check the city made up the difference between sick leave and vacation pay. Employees are permitted to build up to 120 days of sick leave. There is no reimbursement for the accrued sick leave. In August of 1980 claimant took sick pay and vaction and then sick pay again. He said that claimant took compensation in August and September of 1980.

Langhoff recalled having been told by claimant he had an operation coming up in March of 1981. The witness did not know whether it would be covered by workers' compensation.

Eugene Kleinow, currently police chief for Mason City, testified to being an administrative captain in September of 1981 and to being supervisor of the parking lot attendants. He acknowledged knowing both that claimant had been arrested and had been temporarily suspended. He denied telling claimant that he would not work for the city again and said that he would not have had the authority to do so. He stated that he had nothing to do with the award of the water meter job.

Robert E. McCoy, M.D., performed an arthroscopy on both of claimant's knees on January 16, 1980 and found evidence of degenerative arthritis of the medial compartment on the left and to a somewhat lesser degree on the right. There was no evidence of a meniscal tear. In a letter dated January 24, 1980 Dr. McCoy proposed that claimant undergo a high tibial osteotomy on the left "to transfer the center of maximum weight bearing from the medial side of the knee, where his severe degenerative arthritis is, to the lateral compartment of the knee joint which has been relatively spared from the severe degenerative arthritis." He anticipated that degenerative arthritis on the right would progress at a slower rate, but that eventually he would need the high tibial osteotomy on the right as well. The doctor wrote: "In retrospect it would seem that the episodes of increasingly frequent injury to his knees with symptoms of popping and giving way of the knees have been associated with and probably caused by his gradually increasing degenerative arthritis of both knees."

Dr. McCoy recorded an injury to the right knee on January 22, 1980 when claimant slipped on ice while he was on his garbage route. As a result of the slip he sustained a fracture of the lateral portion of the patella. After an arthroscopy a fragment of the patella was removed. The doctor stated that this injury was "completely unrelated to his [claimant's] previous knee difficulties."

Claimant was released for work on April 7, 1980. He worked for two days and then commenced having pain in the right lower lumbar area. Discomfort decreased during the day. Medication was prescribed. Dr. McCoy related claimant's symptoms at that time to his back and not his knee.

On August 8, 1980 claimant visited the doctor using one crutch and complaining of severe back pain in the lower midline. More specifically, the pain was in the lumbosacral joint area and the sacral area in the midline. There was no radiation, but motion was painful. The right ankle jerk was absent. Straight leg raising on the right at 20° caused pain which increased on sciatic stretch. Straight leg raising to 35° on the left caused pain without positive sciatic stretch. Dr. McCoy thought claimant had nerve root irritation based on mild disc protrusion and consented to claimant's having complete bed rest at home.

When claimant came back the next week, he spoke of trying to find lighter work with the city in the water or street departments. Claimant was found to be improved with negative straight leg raising. He was moved to increasing ambulation and partial bed rest with no bending or lifting.

The doctor was visited by two persons from the city--Myron Langhoff and Robert Sceffler. Acording to the doctor's notes, the two expressed concern regarding claimant's ability to tolerate work as a garbage man. Dr. McCoy agreed that claimant would be better off doing lighter work.

On August 26, 1980 the physician wrote of recommending claimant being given lighter work, but he noted that as of yet there was no lighter work available through the city.

When claimant was seen on October 7, 1980, he reported working at the city garage doing maintenance work on a temporary basis. Claimant thought he was able to return to garbage collecting. An inch of atrophy was found in claimant's right thigh. Emphasis was placed on claimant's doing his leg exercises to overcome the atrophy.

In early 1981 claimant's main complaint was of low back pain with episodes of subjective numbness in his posterior right thigh. X-rays of the knee compared to those taken in 1979 before his injury showed no progression of degenerative arthritis. Permanent partial impairment of the function of claimant's right lower extremity was rated at four percent.

In March of 1981 claimant underwent a valgus type high tibial osteotomy on the left. There was some problem with keeping claimant in his cast, but claimant gradually progressed to weight bearing. He was to return to work on August 6, 1981.

When claimant was seen on October 3, 1981 he told the doctor of his transfer to parking lot attendant. Claimant returned on October 20, 1981 with a job description for the water meter repairperson. After reviewing the description which apparently included the ability to lift 200 pounds with the assistance of tools and another worker, Dr. McCoy concluded claimant's condition would be compatible with performing the work if it was done infrequently. A letter was written on October 20, 1981 which so indicated. The doctor anticipated claimant would be able to tolerate squatting and kneeling to install meters and to do intermittent lifting of meters weighing sixty to sixty-five pounds. It seems that a description of the job of heavy equipment operator also was reviewed and that position was found less appropriate.

Medical information from the men's reformatory indicates that when claimant was evaluated in September of 1982 he was given a bedboard. He took no medication and apparently told his evaluator he had learned to live with his discomfort. In December claimant was given Tylenol for back and knee pain.

Early in 1983 claimant was given a knee wrap. In April claimant had an episode of low back pain. Motrin was given. Claimant was subsequently allowed to use his back brace.

A status report from May 1983 notes that claimant was working with no restrictions before April 14, 1983 when he had an episode of back pain. He made no knee complaints to that date.

Claimant was reevaluated by Dr. McCoy on June 17, 1983. Claimant's complaints were of low back aches across the lower lumbar spine for which he took Motrin, wore a lumbosacral belt and walked; snapping, popping and tenderness in the right knee with the primary problem in the lateral parapatellar area; and occasional popping in the left knee.

On examination claimant had a slight list to the left. He bent forward to within eight inches of touching the floor with pain in the lumbosacral joint area. The right ankle jerk which had been absent since the 1969 surgery was absent. Combined straight leg raising to 85° caused a feeling of pulling in the low back. There was a varus deformity of 60° on the right knee and a valgus of 10° on the left. Varus on the right was viewed as abnormal. Tenderness to palpation was present over the lateral facet of the right patella. X-rays of the lumbar spine showed no further narrowing at L5-S1 in comparison with the films taken in May of 1980. There was slight Schmorl's Node formation at D12-L1 and at D11-D12. There was no progression of narrowing in the medial joint line in the right knee when it was viewed with films taken in January of 1981. X-rays of the left knee taken in May of 1983 evidenced narrowing of the medial joint space.

In a letter dated July 8, 1983 Dr. McCoy reviewed his prior ratings of claimant's impairments noting that on February 21, 1980 he gave a fifteen percent impairment to the left lower extremity and eight percent to the right lower extremity with the latter attributable to degenerative arthritis; an additional four percent to the right lower extremity resulting from the patellar fracture of January 22, 1980; five percent of the whole man related to a 1969 disc problem; and five percent of the whole man because of the 1976 injury. His present impairment ratings are set out thusly:

> I would estimate his permanent partial impairment of function of the whole man from his back at 15% of which I would estimate 3% to be related to further work injury. I think his permanent partial impairment of function of the left lower extremity was diminished by his high tibial osteotomy to about 12%, which has remained the same to the present time. I think that the permanent partial impairment of function of the right lower extremity has increased from the 12% rating I previously gave to 15% at the present time.

The doctor explained his increase in the permanent partial impairment rating as follows:

> In April of 1980 he was seen for low back pain apparently aggravated by work and in August of 1980 he was having fairly severe pain again which made it necessary for him to be off work from August until October of 1980. As a result of that episode of low back pain, I recommended to his employer that he be given lighter work. It was because with the episode of August 1980, his condition changed to the extent that I felt permanent arrangements should be made for lighter work. That I felt his permanent partial impairment of function rating as a result of work related back problems should be increased by 3% over the previous rating as it had not been felt prior to that that any long term modification of his work activities should be made. I feel that since his status at that time required a change in his recommended work designation further impairment of function had been incurred as a result of back aggravation at work.

APPLICABLE LAW AND ANALYSIS

The claimant has the burden of proving by a preponderance of the evidence that the injury of March 17, 1978 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

The right of a worker to receive compensation for injuries sustained which arose out of and in the course of employment is statutory. The statute conferring this right can also fix the amount of compensation to be paid for different specific injuries, and the employee is not entitled to compensation except as provided by the statute. Soukup v. Shores Co., 222 Iowa 272, 268 N.W. 598 (1936).

That a worker sustaining one of the injuries for which specific compensation is provided under the statute might, because of such injury, be unable to resume employment and because of his lack of education or experience or physical strength or ability, might be unable to obtain other employment, does not entitle him to be classed as totally and permanently disabled. Id. at 278, 268 N.W. 598.

Where the result of an injury causes the loss of a foot, or eye, etc., the loss, together with its ensuing natural results upon the body, is a permanent partial disability and is entitled only to the prescribed compensation. Barton v. Nevada Poultry Co., 253 Iowa 285, 290, 110 N.W.2d 660 (1961). The schedule fixed by the legislature includes compensation for resulting reduced capacity to labor and earning power. Schell v. Central Engineering Co., 232 Iowa 424, 425, 4 N.W.2d 339 (1942). The claimant has the burden of showing that his ailment extends beyond the scheduled loss. Kellogg v. Shute and Lewis Coal Co., 256 Iowa 1257, 130 N.W.2d 667 (1964).

Larson in 2 Workmen's Compensation, §58 at 10-28 (Desk ed. 1976) discusses the nature of scheduled benefits and points out that "payments are not dependent on actual wage loss" and that they are not "an erratic deviation from the underlying principle of compensation law--that benefits relate to loss of earning capacity and not to physical injury as such." The theory, according to Larson, is unchanged with the only difference being that "the effect on earning capacity is a conclusively presumed one, instead of a specifically proved one based on the individual's actual wage-loss experience."

The Iowa Supreme Court recently has reaffirmed the concept of scheduled member injuries in Graves v. Eagle Iron Works, 331 N.W.2d 116 (Iowa 1983).

Claimant at the time of hearing considered a surgery in March of 1981 as unsuccessful and expressed the opinion that his knee is worse now than before. He claimed that moving too fast will cause his knee to buckle. At the time of hearing claimant made little complaint regarding his right knee.

Dr. McCoy made findings which were just opposite. When he reevaluated claimant's knee in June of 1983 he reported that although claimant had occasional popping in his left knee he was "not particularly troubled by it." Dr. McCoy did a tibial osteotomy on the left. Claimant took off his cast a few days after surgery. X-rays at that time showed his staples to be secure. X-rays revealed maintenance of position the next time claimant removed his cast. After his third removal he still had good position. Dr. McCoy has not changed his impairment rating to the left lower extremity. In a letter dated July 8, 1983 he wrote: "As you know, in a deposition on February 21, 1980, I stated that I felt he had 15% permanent partial impairment of the left lower extremity from his knee and 8% permanent partial impairment of the right lower extremity from the degenerative arthritis of his right knee....I think his permanent partial impairment of function of the left lower extremity was diminished by his high tibial osteotomy to about 12%, which has remained the same to the present time."

No additional award of benefits can be made to claimant regarding injury to his left lower extremity as medical evidence from Dr. McCoy fails to show any increase in impairment.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

That claimant injured his left knee in March of 1978.

That claimant had a prior hearing in this matter.

That claimant's prior litigation resulted in his being awarded benefits for twelve percent (12%) of his left lower extremity.

That claimant had surgery to his left knee in March of 1981.

That claimant received healing period payments from March 16, 1981 to August 9, 1981.

That claimant was released to return to work on August 6, 1981 without restrictions.

That claimant has difficulty with his knees buckling.

That arthroscopy showed degenerative arthritis in the medial compartment of claimant's left knee in January of 1980.

That in February of 1980 claimant was given an impairment rating of fifteen percent (15%).

That after the surgery in 1981 claimant's impairment was lowered to twelve percent (12%).

That claimant's impairment to his left lower extremity was unchanged at the time of Dr. McCoy's evaluation in June of 1983.

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

That claimant is not entitled to additional permanent partial disability as a result of his injury of March 17, 1978.

ORDER

THEREFORE, IT IS ORDERED:

That defendants pay one-quarter (1/4) of the charge for office visits to Dr. McCoy in May and June of 1983, or fourteen dollars ($14.00).

That defendants pay North Iowa Medical Center forty-two and 50/100 dollars ($42.50) for x-ray charges.

That defendants pay the following mileage expenses for visits to Dr. McCoy: 1 trip of 10 miles at $.18 cents per mile; 9 trips at $.20 per mile; 2 trips at $.22 per mile; and 5 miles at $.24 per mile.

That defendants pay one-quarter (1/4) of the expenses in this matter pursuant to Industrial Commissioner Rule 500-4.33 including twenty-seven and 50/100 dollars ($27.50) reported expenses with Dr. McCoy.

Signed and filed this 24 day of July, 1984.

JUDITH ANN HIGGS
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

EDWIN SCHARF,
Claimant,
vs.
CITY OF FORT DODGE,
Employer,
and
ROYAL INSURANCE COMPANY,
Insurance Carrier,
Defendants.

File No. 729303
APPEAL
DECISION

FILED
JUL 23 1984
IOWA INDUSTRIAL COMMISSIONER

By order of the industrial commissioner filed April 20, 1984 the undersigned deputy industrial commissioner has been appointed under the provisions of §86.3, Code of Iowa, to issue the final agency decision on appeal in this matter. Defendants appeal from an adverse review-reopening decision.

The record on appeal consists of the transcript; claimant's exhibits 1 through 5, and defendants' exhibits A and B, all of which evidence was considered in reaching this final agency decision.

Neither side filed briefs.

The result of this final agency decision will modify the review-reopening decision.

The record shows that claimant hurt his hand in the injury under consideration here, that of April 1, 1980. The review-reopening decision shows that the hearing deputy took the opinions of John D. Birkett, M.D., and Samir R. Wahby, a qualified orthopedic surgeon, both treating physicians, over that of William R. Boulden, a qualified orthopedic surgeon, an examining physician. It would seem that the opinions of the treating physicians would in this case be more valuable than that of an examining physician and therefore there is no compelling reason to change the award.

The order in the review-reopening decision appointed Samir Wahby, M.D., as claimant's physician; however, §85.27, The Code, provides that the employer has the choice of doctor. Since claimant has presented no issue of choice of doctor, no order will be made.

The findings of fact, conclusion of law and order are those of the undersigned.

FINDINGS OF FACT

1. That the claimant, Edwin Scharf, was employed by the City of Fort Dodge, Iowa, as a custodian on April 1, 1980.

2. That on that date claimant hurt himself at work when he fell backwards into a window well.

3. That as a result of said work injury, claimant sustained a permanent partial impairment to his right arm of 50 percent.

4. That the claimant sustained six weeks of healing period for which he has been paid weekly compensation at the rate of $107.70 per week, which weekly rate has been stipulated.

5. That the claimant is in need of future medical care.

CONCLUSION OF LAW

That claimant sustained an injury which arose out of and in the course of his employment which resulted in permanent partial disability to the right arm of fifty (50) percent, entitling him to benefits for ninety-five (95) weeks at the rate of one hundred seven and 70/100 dollars ($107.70).

ORDER

IT IS THEREFORE ORDERED that the defendants pay unto the claimant ninety-five (95) weeks of permanent partial disability at the rate of one hundred seven and 70/100 dollars ($107.70) per week beginning on July 28, 1983 being the date that Dr. Boulden concluded that claimant had a functional impairment of the right hand.

Legal interest is to accrue on this award from July 28, 1983.

Defendants are further ordered to pay all the unpaid medical expenses incurred by the claimant as necessary to treat the injury under review.

Costs are taxed against defendants.

Defendants shall file a activity report upon payment of this award.

Signed and filed this 23rd day of July, 1984.

JUL 26 1984
IOWA INDUSTRIAL COMMISSIONER

On July 23, 1984 the undersigned deputy industrial commissioner reached a final agency decision in the above captioned case. An error was made in No. 3 of the Findings of Fact and in the Conclusion of Law.

WHEREFORE, Finding of Fact No. 3 and Conclusion of Law should read as follows:

3. That as a result of said work injury, claimant sustained a permanent partial impairment to his right hand of 50 percent.

That claimant sustained an injury which arose out of and in the course of his employment which resulted in permanent partial disability to the right hand of fifty (50) percent, entitling him to benefits for ninety-five (95) weeks at the rate of one hundred seven and 70/100 dollars ($107.70).

AUG 8 1984

IOWA INDUSTRIAL COMMISSIONER

STATEMENT OF THE CASE

Claimant appeals from a proposed decision in review-reopening wherein claimant was awarded temporary total and permanent partial disability benefits based upon a work-related injury. Certain medical expenses were also awarded claimant.

The record on appeal consists of the transcript of the review-reopening proceeding; claimant's exhibits 1 through 8; defendants' exhibit 1; the deposition testimony of Sinesio Misol, M.D.; and the briefs and filings of all parties on appeal.

ISSUES

Claimant states the issues as:

> The deputy industrial commissioner in his decision failed to rule upon claimant's issue at hearing regarding whether or not the claimant was entitled to additional benefits in 1980 when his workers' compensation benefits were terminated on January 17, 1980 without prior written notice or knowledge.
>
> Claimant has sustained a high degree of industrial disability as a result of the injuries arising out of and in the course of his employment on October 20, 1979 and the deputy erred in finding that there was no permanent-partial disability to the claimant as regards his back injuries.

REVIEW OF THE EVIDENCE

Claimant was unmarried and 31 years old at the time of the hearing. He has 11 1/2 years of formal schooling and a G.E.D. (Transcript, page 8) He spent six months in the Marine Corp and completed a course in gas station mechanics. He worked in dry ice delivery until 1972 and then went to truck driving school for his Iowa road license. (Tr., pp. 9-13) For the next few years claimant drove 18-wheeler trucks for various employers. His duties included loading, unloading and hauling to the East Coast. (Tr., pp. 13-19) He earned approximately $200 a week at a rate of 9-10 cents a mile. (Tr., pp. 16-17) Claimant began working for defendant employer in August of 1979. He hauled perishables to the East Coast and did loading and unloading. Claimant stated he was paid on a percentage basis and earned approximately $400 a week. (Tr., p. 19) On October 20, 1979 claimant was injured while attempting to turn a crank for a dolly on a semitrailer. Claimant drove his load to Des Moines and went to the hospital to be x-rayed. (Tr., pp. 20-22) Claimant testified he had no fractures and was referred to his family doctor. He consulted P. E. Coggeshell, D.C., and was treated with manipulation, heat and ultrasound on his neck and back. (Tr., p. 22, Claimant's Exhibit 3) Claimant returned to driving for a short period and again saw Dr. Coggeshell for pain in his chest, arm and shoulder. He was referred by defendant employer to William Reinwasser, D.O., who noted the impression of "substantial functional overlay" in claimant's complaints. (Tr., pp. 23-25; Defendants' Ex. 1) Claimant was then referred by Dr. Reinwasser to Sinesio Misol, M.D., an orthopedic specialist, on November 30, 1979. (Tr., p. 25, Cl. Ex. 4) He was treated on a complaint of upper back pain and was released to work on January 17, 1980. (Cl. Ex. 4) Dr. Misol testified he believed that claimant had improved sufficiently to return to driving a truck. (Misol Deposition, p. 11) Claimant testified he was still in pain and did not return to work. He was told by defendant employer he no longer had a job. His benefits were terminated in January and claimant stated he called Mrs. Nehring at the insurance company to find out why. He was told his payments had been cut off. Claimant then returned to the care of Dr. Coggeshell. (Tr., pp. 27-28) On March 24, 1980 claimant filed an original notice and petition with the industrial commissioner indicating benefits had been cut off and claimant was unable to work.

Claimant continued to receive chiropractic treatment and in June of 1980 consulted Stuart Winston, M.D., a neurosurgeon. (Tr., p. 32; Def. Ex. 1) Dr. Winston found no neurological signs and indicated a diagnosis of cervical myofascial strain. Dr. Winston indicated claimant's prognosis for his back complaint was excellent and no permanent disability was anticipated. (Def. Ex. 1) Dr. Winston's report indicates that claimant felt he was ready to return to work. (Def. Ex. 1) Claimant had physical therapy during the summer and was improved by July 23, 1980. (Def. Ex. 1) Claimant babysat for his sister and did not look for other work until the summer or fall of 1981. (Tr., pp. 33-34) He had a job driving without loading or unloading duties for approximately three months and then saw Dr. Misol in October 1981 with a complaint of pain in the right shoulder, arm and between the shoulder blades. (Tr., pp. 35, 59; Misol Deposition, p. 13) Dr. Misol testified claimant then had an impairment of ten percent of the shoulder. (Misol Dep., p. 21) Surgery to explore the joint was scheduled for December 1981. (Misol Dep., p. 17) When claimant failed to keep the appointment, Dr. Misol cancelled the surgery and referred claimant to Jerome G. Bashara, M.D., an orthopaedic surgeon. (Tr., p. 36; Cl. Ex. 5) On December 21, 1981 Dr. Bashara performed a resection arthroplasty of the right shoulder AC joint. On January 4, 1982 Dr. Bashara determined a five percent permanent partial physical impairment of the body as a whole as a result of the work injury. (Cl. Ex. 5) Claimant testified that following the surgery his shoulder was better, but he continued to suffer pain in his chest, rib and shoulder blades. (Tr., p. 38) He was referred by Dr. Bashara for evaluation at the University of Iowa surgical department. The results of the examination were normal except that claimant had "discomfort to great resistance to abduction of the shoulder on the right." (Def. Ex. 1) It was indicated that claimant could return to truck driving with lifting restrictions of 25-50 pounds with no bending, stooping or twisting. (Def. Ex. 1) Claimant testified he still has muscle spasms between his shoulder and pain in the rib area. (Tr., pp. 38-39) He has applied at Vocational Rehabilitation and a few trucking companies but has not found work. (Tr., p. 39) Claimant testified he uses a Taylor back brace and a TENS unit which were prescribed by the Iowa City clinic. (Tr., p. 39)

Donald Shoeman, retired general manager of defendant employer, testified that claimant was told to see the company doctor when claimant first reported his injury. (Tr., pp. 67-69) Mr. Shoeman testified claimant brought in a release to work on November 1 and immediately took a round-trip load. On the second load, claimant took the advance payment but didn't drive the load. Mr. Shoeman did not see claimant until the following December. He testified claimant, at that time, wanted to settle the $150 he owed but said nothing about a physical problem. (Tr., pp. 69-71) Mr. Shoeman stated that drivers receive extra pay if they do their own loading or unloading and that most drivers don't do their own loading duties. (Tr., pp. 72-73) Mr. Shoeman believed he would want to get a doctor's opinion before hiring a driver who had the physical restrictions that claimant has. (Tr., p. 79)

The claim activity form filed February 13, 1982 indicates claimant's rate of compensation is $216.34 per week.

APPLICABLE LAW

In Auxier v. Woodard State Hosp.-Sch., 266 N.W.2d 139, 142-143 (Iowa 1978), the court stated:

> We hold, on the basis of fundamental fairness, due process demands that, prior to termination of workers [sic] compensation benefits, except where the claimant has demonstrated recovery by returning to work, he or she is entitled to a notice which, as a minimum, requires the following:
>
> [1] the contemplated termination,
>
> [2] that the termination of benefits was to occur at a specified time not less than 30 days after notice,
>
> [3] the reason or reasons for the termination,
>
> [4] that the recipient had the opportunity to submit any evidence or documents disputing or contradicting the reasons given for termination, and, if such evidence or documents are submitted, to be advised whether termination is still contemplated,
>
> [5] that the recipient had the right to petition for review-reopening under §86.34.

The claimant has the burden of proving by a preponderance of the evidence that the injury of October 20, 1989 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman v. Central Telephone Co., 261 Iowa 352,

154 N.W.2d 128 (1967).

If claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

ANALYSIS

Claimant was receiving compensation benefits in January of 1980 when he was seen by Dr. Misol in followup. Dr. Misol has testified he believed claimant could return to his driving duties and released him to work effective January 17, 1980. Evidentially, defendant insurer terminated the compensation payments in accordance with the date of the work release, and claimant had to call the insurance company's office to find out what had happened to his benefit payments.

The Auxier ruling equates compensation benefits to a property right which may not be taken away without due process of law. Due process requires a procedure of notification, and the Auxier decision makes mandatory a minimal 30 day notice of payment termination unless the recipient has returned to work. The evidence supports a finding that claimant did not receive the required notice by defendant insurer and had not returned to work. Therefore, additional benefits are due claimant. With regard to the duration of benefit period, the purpose of the Auxier notice provision is to warn the recipient so that he may initiate action if he disputes the termination reasons. Claimant's petition filed March 24, 1980 evinces that he was aware of his rights and exercised those rights by initiating an action. Claimant is entitled to an additional benefit period from January 17, 1980 to March 24, 1980.

Claimant's second issue on appeal argues for a finding of industrial disability in excess of 15 percent. Since his injury, claimant has returned to truck driving on at least two occasions. While he has some restrictions which would limit him from loading and unloading, he has been able in the past to secure driving work which did not entail these duties, and Mr. Shoeman has indicated that such loading activities are a source of extra income to drivers rather than a requirement of the job. Dr. Winston did not anticipate that claimant's back complaint would result in a permanent condition. Dr. Bashara, who performed the shoulder surgery, has determined a physical impairment of five percent of the body as a whole, which represents a relatively small amount of functional limitation. At least three of claimant's doctors have discharged him to return to work, and none have reported that he is unable to resume driving duties. Even though claimant was not employed at the time of the hearing, there is no evidence that his earning potential as an experienced driver has been significantly diminished as a result of his disability. For these reasons, the deputy's finding of 15 percent industrial disability is accepted as correct.

FINDINGS OF FACT

1. Claimant is 31 years old and has a G.E.D.

2. Claimant's work experience has been primarily in driving 18-wheeler trucks.

3. Claimant's disability benefits were terminated on January 16, 1980 without notice.

4. Claimant was not working at that time.

5. Claimant filed an original notice and petition of his claim for additional benefits on March 24, 1980.

6. Claimant has a permanent impairment of five percent of the body as a whole as a result of the October 20, 1979 work-related injury.

7. There was no medical finding of permanency with regard to claimant's back.

8. Claimant has lifting, bending and twisting restrictions.

9. Claimant has previously worked as a driver without performing loading and unloading duties.

10. Claimant has been released to return to truck driving.

11. Claimant has an industrial disability of 15 percent as a result of his work-related injury.

12. The applicable rate of compensation is $216.34 per week.

13. Previous findings of the deputy with regard to temporary total and permanent partial disability benefits, as well as medical costs payable by defendants, which were not at issue on appeal, are incorporated in this decision.

CONCLUSIONS OF LAW

WHEREFORE, it is found:

Claimant is entitled to additional benefits as a result of defendants' failure to timely notify him of the termination of benefits. The benefit period extends from the date of termination of compensation payments, January 16, 1980 to the date claimant's petition was filed with this office on March 24, 1980, a period of nine and three-sevenths (9 3/7) weeks.

Claimant is entitled to permanent partial disability benefits based upon a finding of 15 percent industrial disability.

THEREFORE, the decision of the deputy is affirmed in part and modified in part.

ORDER

THEREFORE, it is ordered:

Defendants are to pay unto claimant an additional nine and three-sevenths (9 3/7) weeks of disability benefits at a rate of two hundred sixteen and 34/100 dollars ($216.34) per week as a result of the termination without notice of compensation payments.

As found in the proposed decision, defendants are to pay unto claimant twenty-five and six-sevenths (25 6/7) weeks of temporary total disability benefits at a rate of two hundred sixteen and 34/100 dollars ($216.34) per week. Defendants are also ordered to pay unto claimant seventy-five (75) weeks of permanent partial disability benefits at a rate of two hundred sixteen and 34/100 dollars ($216.34) per week.

Defendants are to reimburse claimant for the following medical expenses:

Mercy Hospital	$ 828.00
Iowa Sickroom Supply Co., Inc.	477.36
Iowa Methodist Medical Center	190.00
Neuro-Associates, P.C.	140.00
Radiology & Nuclear Medicine, P.C.	125.00
Iowa Lutheran Hospital	92.95
University Hospitals	115.00
Northwest Community Hospital	2,756.00
Dr. Bashara	925.00
Drug Town	64.42
Franklin Drug	10.25
City Drug	24.95
Drug Mart	10.23
Dahl's Pharmacy	12.85
Whitaker Pharmacy Co.	4.80

Defendants are to be given credit on these amounts if previously paid.

Accrued benefits are to be made in a lump sum together with statutory interest at the rate of ten percent (10%) per year pursuant to section 85.30, Code of Iowa, as amended.

Costs are taxed to defendants pursuant to Industrial Commissioner Rule 500-4.33.

Defendants shall file a final report upon payment of this award.

Signed and filed this 8 day of August, 1984.

IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in arbitration brought by Norman L. Shaffer, claimant, against Robert G. Talbot Co., Inc., employer, and Mission Insurance Company, insurance carrier.

Claimant alleges that he sustained a compensable injury to his back on November 5, 1981 and seeks compensation for permanent disability, healing period and medical benefits under section 85.27 of the Code of Iowa.

The hearing commenced on June 18, 1984 at the Pottawattamie County Courthouse in Council Bluffs, Iowa with Michael G. Trier, Deputy Industrial Commissioner presiding. Claimant appeared in person with his attorney Robert Kohorst and defendants appeared through their attorney Scott H. Peters. The case was considered fully submitted upon conclusion of the hearing.

The record in this proceeding consists of the testimony of Norman L. Shaffer; claimant's exhibits 1, 2, 4, 5, 6, 7 and 9; and defendants' exhibits A and B.

ISSUES

The issues presented by the parties at the time of hearing are whether a causal connection exists between the injury claimant sustained on November 5, 1981 and any disability with which he may presently be afflicted. There is also an issue concerning the determination of claimant's entitlement to benefits for temporary total disability, healing period and/or permanent disability. The parties also identified claimant's entitlement to benefits under the provisions of section 85.27 of the Code of Iowa as an additional issue in the case. It was stipulated that claimant's rate of compensation is $221.77 per week in the event of an award. The defendants admitted that claimant was injured on the job on November 5, 1981. Claimant's exhibits 3 and 8 were not received into evidence when they were offered. There is no showing in the file or otherwise that either of those exhibits was ever delivered to defendants in any fashion. Even though a copy of exhibit 3 appears in the agency file of this matter, there is no indication that it was ever delivered to either of the defendants.

REVIEW OF THE EVIDENCE

Claimant testified that he is 52 years of age and was born November 3, 1931. He stated that he presently resides at Irwin, Iowa and that on November 5, 1981 he resided at Route 1, Hancock, Iowa.

Commencing at page 5 of claimant's deposition he related that he quit school in the tenth grade, worked on a farm until age 17, worked as a coal miner for approximately a month and then learned how to drive a truck. He stated that he entered the army where he served for more than 13 years during which time he was a drill instructor and a mechanic. Upon leaving the army in 1964, he became a truck driver and stated that such was the main type of work he had done since, except for some on-the-job training as a dispatcher and for one occasion when he managed a bar and motel in New York State for approximately eight months.

Claimant described his medical history as generally uneventful except for a low back injury incurred in a truck wreck in 1953 while he was in the army as related commencing at page 48 of his deposition. He also described an accident in 1973 which occurred in a similar fashion to the accident which is the subject matter of this case and produced similar symptoms. He reported that he underwent surgery and was off work approximately eight months. At page 16 of his deposition the following conversation occurred:

A. They operated on me. They took out--cut out something, L5 or L4.

Q. Could it possibly have been part of the disc material at L4, L5?

A. Yes, sir.

Claimant went on to state that he was paid workers' compensation through the State of North Carolina for his healing period of approximately eight months. He related that he was rated as having a 20 percent disability for which he was paid additional compensation. (Exhibit A, pages 16 and 17)

Claimant stated that after he had healed from the 1973, injury he returned to work and was virtually asymptomatic until the injury of November 5, 1981.

Claimant testified that he began working for the defendant employer approximately 10 months prior to the date of injury. He stated that his job was to drive a truck delivering produce from California primarily to Iowa and Minnesota and then, on the return trip, to deliver meat from Iowa back to California.

Claimant stated that on November 5, 1981 he had gone to the John Morrell plant in Sioux City, Iowa to have meat loaded onto the trailer. He stated that while alighting from the tractor he had mud on his feet and slipped. He stated that his left hand was on the handrail of the tractor and, that when his foot slipped off the first step, he slapped his body against the truck. Claimant stated that he felt immediate pain in his left leg and that he reported it to his employer shortly thereafter. He reported taking some aspirin. He stated that he finished loading the truck and went to a motel in Sioux City, Iowa where he was met by another driver sent by the employer. Claimant stated that he quit as he refused to drive with another driver, particularly since the employer had recently terminated the services of his spouse who had been his co-driver. He turned the truck over to the other driver.

Claimant testified that the pain in his left hip got worse over the night and that on the next day he sought treatment from Charles L. Pigneri, D.O. He stated that after a series of treatments his condition had not significantly improved and that he was referred to Maurice P. Margules, M.D. Claimant described his symptoms at that time as very bad pain in the left hip which ran down to the foot. He stated that part of his foot was numb. Claimant testified that Dr. Margules recommended surgery but that defendant insurance carrier denied liability and that he, claimant, could not pay for the recommended surgery.

Claimant testified that he applied for social security disability in 1982 and was awarded the same in December, 1982 as shown by exhibit 4. Claimant stated that he has not worked since November 5, 1981 and that the social security benefits have been his only source of income.

Claimant testified that he has been evaluated by Dr. Ayres in Atlantic, Iowa, Michael Egger, M.D., in Council Bluffs, Iowa, E. B. Weis, Jr., M.D., in Omaha, Nebraska, Dr. Myer at Manning, Iowa, and David B. McClain, D.O., in Des Moines, Iowa.

Claimant testified that during 1982 the bottom of his foot felt numb and his leg grew smaller. He stated that his condition was unchanged during 1983 and that now, in 1984, he is learning to live with it. He stated that he experiences a pulling sensation and pain in the calf of his left leg running from the heel up past the hip to an area on the left side of his lower back slightly below the belt line. He stated that he had no prescription medication on a regular basis prior to the injury, but that he has been on codeine since 1981 following the injury and still sees Dr. Myer. He stated that he has incurred ulcers during the last two years. He confirmed that Dr. Margules recommended surgery but that Drs. Myer and McClain advised against surgery and that none is presently scheduled. He stated that he has no more evaluations scheduled for his social security disability benefits and that no proceedings which could result in their termination are presently pending.

Claimant stated that he does not feel he could work in his present condition. He stated that he could not lift and cannot sit or stand for any substantial length of time. He stated that around his home he does the dishes and that he formerly did vacuuming, but discontinued such upon the advice of his doctors. He stated that this matter has caused a lot of mental problems for him and that he now has problems with his nerves and fights with his wife more frequently. He also related that he takes Triavil and Tagamet on a daily basis.

Claimant denied hearing any doctors speak to him about degenerative joint disease.

Claimant's exhibit 1 indicates that he was examined on July 25, 1980 by Ronald I. Peterson, M.D., who found him qualified to work as a truck driver at that time.

Claimant's exhibit 2, a report from Jennie Edmundson Memorial Hospital and Dr. Margules, the first page of the exhibit is a discharge summary for a period of hospitalization from January 23 until Janury 28, 1982. The neurological evaluation performed by Dr. Margules found weakness of plantar flexion of the left foot, decreased sensitivity to pain in the lateral aspect of the left foot within the cutaneous distribution of the S1 nerve root and marked spasm of the paravertebral lumbar musculature. The impression at the conclusion of the neurological evaluation stated:

> ...The patient's history and findings are those of an acute radicular compression of the S1 root on the LEFT, most likely due to an acute disc herniation at the L5-S1 interspace due to trauma sustained in an accidental fall from a truck on the 5 of November, 1981 in Sioux City, Iowa.

The discharge summary stated:

X-ray studies of the lumbar spine were obtained and were found to be normal except for narrowing of the L5,S1 interspace compatible with the previous surgery at this level. Electromyographic studies were performed showing evidence of a normal study. Metrizamide lumbodorsal myeloradiculography on 1/26/82 revealed evidence of a defect at the L4,L5 interspace indicating the presence of a disc herniation at this level on the LEFT....

...

FINAL DIAGNOSIS: Herniated lumbar disc, acute, due to trauma, L4,L5 interspace, LEFT, sustained in an accidental fall in Sioux City, Iowa on November 5, 1981.

Claimant's exhibit 6 constitutes charges from Manning General Hospital for physical therapy in the total amount of $113.40. Exhibit 7 is a bill from Dr. McClain in the amount of $140.00 for an evaluation and x-rays.

Exhibit 9 is the deposition of Robert G. Talbot wherein he acknowledges that claimant reported the injury to him on November 5, 1981. Defendants' exhibit B is the deposition of E. B. Weis, Jr., M.D., including deposition exhibits 1, 2 and 3. They related that claimant was examined by Dr. Weis on October 5, 1983. As shown in deposition exhibit 3 the examination revealed:

...With the patient dressed in a hospital gown, he is noted to have a normal station and gait while walking across the examining room floor. He does seem to have some difficulty with his left ankle, but he is able to walk on his heels and toes without difficulty and inverts and everts his feet while standing showing good muscle strength about the feet and ankles. He is able to bend forward with difficulty until his fingertips are about 4 inches from the floor. He is able to bend backwards until his spine makes an angle of 40 degrees with the vertical. He is able to bend to the right and to the left until his spine makes an angle of 40 degrees with the vertical. With the patient supine on the table, he has negative straight leg raising signs on both sides. With the patient prone on the table, there are normal ankle reflexes and no tenderness to palpation in the posterior calf, thigh, popliteal area, trochanteric area, buttock, iliolumbar, or paraspinal region on either side. There is a well healed scar of surgery in the midline low back.

Review of the x-rays of the lumbosacral spine shows the degenerative joint disease at L-5, S-1 with narrowing and a vacuum sign. There is additional evidence of degenerative joint disease on the lateral views of the spine at L-4-5 level.

I have reviewed the records by Dr. Margules when he had a myelogram in January of 1982 and note Dr. Margules' diagnosis of herniated disc at L-4-5 and at L-5, S-1. Dr. Margules apparently relies on the finding of sensory abnormality in the distribution of the left S-1 nerve root as a major part of his diagnosis. Dr. Margules states a decreased ankle jerk on the left of 1+ compared to 3+ on the other side and that is certainly not my finding at the present time.

Dr. Weis went on to state that in his opinion claimant's problem was degenerative joint disease and that surgery was not indicated.

The operative report from the myelogram conducted during claimant's January, 1982 hospitalization states: "Evidence of a defect noted at the L5-S1 interspace on the LEFT, and also evidence of a midline disc herniation noted at the L4-L5 interspace."

At page 14 of exhibit B, Dr. Weis opined that claimant's degenerative joint disc disease had been in existence for five to ten years. He went on to state:

A. Degenerative joint disease is an organic disease. It's not caused by a specific event of trauma. It may result as secondary to trauma. In this particular case there was no evidence of any trauma.

Q. You found no evidence that the disease was related to a fall in '81, for example?

A. Nothing explicit.
(Ex. A, p. 14)

With regard to his diagnosis the following conversation occurred:

Q. Did you find any evidence whatsoever of injury or illness that might have been attributed to the fall he described in 1981?

A. Nothing explicit.

Q. Doctor, do I understand correctly that it is possible that a fall such as Mr. Shaffer described to you may cause a lighting up of a degenerative joint disease?

A. Well, certainly you see a lot of people with degenerative joint disease who have car crashes or falls, or different kinds of traumatic events who have a lot of complaints of discomfort secondary to that. That's true. It's a condition that is subject to a lot of inflammatory changes when excited by excess physical activity such as might be associated with some traumatic event.

Q. How long in your experience do those inflammatory changes normally last?

A. Well, most back pain problems secondary to basically arthritis are, you know, 95 per cent of them are over in three months, certainly four months. I would expect him to be as recovered as he would ever be in three months.

Q. Do you have an opinion, then, Doctor, based on a reasonable degree of medical certainty as to whether Mr. Shaffer had an existing degenerative joint disease in November of 1981?

A. That would be two years before I saw him. Yes, I have an opinion.

Q. What is your opinion?

A. He certainly had an existing degenerative joint disease at that time.

Q. And do you have an opinion based on a reasonable degree of medical certainty as to whether assuming he did have a fall of some sort as he described to you in '81, as to whether he may have had some inflammatory symptoms resulting from that fall?

A. The question again--he had--I would expect him to have. He had the degenerative joint disease at that time and any significant fall would probably make it worse, yes.

Q. And what is your opinion as to how long those symptoms would be normally expected to last?

A. As I said before, in 95 per cent of the cases, they would be over in three months.

Q. Do you have an opinion at this time, Doctor, based on a reasonable degree of medical certainty as to whether Mr. Shaffer at this time has any injury or illness which would be attributable solely to the fall of 1981?

A. I have an opinion.

Q. What's your opinion?

A. That is nothing that's going on at the present time that's not related primarily to his degenerative joint disease.

Q. And the way I phrased the question was solely. If you take the same question and I say that is in any way attributable to the fall of 1981, what would your opinion be?

A. I can't rule out the possibility that the fall made the arthritis a little bit worse, but nothing other than that. I see no explicit changes such as fractures, or dislocations, or any of the normal traumatic changes that would indicate any direct injury at that time.

Q. Do you have an opinion, Doctor, based on a reasonable degree of medical certainty as to whether Mr. Shaffer has suffered any permanent injury as a result of the fall in 1981?

A. I have an opinion.

Q. What is that?

A. I don't think there is anything that's going on with that man that is related to his injury in '81.
(Ex. B, pp. 15-17)

Concerning the possibility of a herniated lumbar disc, the following conversation occurred:

Q. Based on your consideration of Dr. Margules' EMG finding, based on your physical examination, your x-rays and your testing, did you find any evidence whatsoever to support a conclusion of traumatically related herniated lumbar disc?

A. I did not.
(Ex. B, p. 53)

ANALYSIS AND APPLICABLE LAW

The claimant has the burden of proving by a preponderance of the evidence that the injury of November 5, 1981 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

While a claimant is not entitled to compensation for the results of a preexisting injury or disease, the mere existence at the time of a subsequent injury is not a defense. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756, 760-761 (1956). If the claimant had a preexisting condition or disability that is aggravated, accelerated, worsened or lighted up so that it results in disability, claimant is entitled to recover. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812, 815 (1962).

When an aggravation occurs in the performance of an employer's work and a causal connection is established, claimant may recover to the extent of the impairment. Ziegler v. United States Gypsum Co., 252 Iowa 613, 620, 106 N.W.2d 591, 595 (1960).

Dr. Margules indicates that claimant suffered a herniated disc as a result of the injury. Dr. Weis disagrees and is of the opinion that the injury caused only a temporary aggravation of a preexisting degenerative disc disease with no permanent impairment resulting from the injury. Dr. Margules recommends surgical intervention. Dr. Weis does not due to his impression that the problem is degenerative disc disease and not a herniated lumbar disc. Claimant was apparently evaluated by Dr. McClain in August, 1983. According to claimant's testimony Dr. McClain did not recommend surgical treatment. Dr. Myer, with whom claimant is still treating, does not recommend a surgical remedy. The reasons why Drs. McClain and Myer do not recommend surgery are not a part of the record in this case. Surgery is a frequently used procedure for treatment of a herniated disc. It is generally not used, however, for treatment of degenerative arthritis. Claimant had also testified that he did not undergo surgery because of a lack of ability to pay its cost. He also testified that he is now eligible for medicare, but that surgery is not presently scheduled.

It appears likely that claimant has suffered from degenerative arthritis for several years as indicated by Dr. Weis. It also appears that he does exhibit indications of disc herniation. Disc protrusion from degenerative arthritis is not entirely dissimilar from disc herniation. There is no indication that claimant has seen Dr. Margules since January, 1982. It also appears likely that claimant may have disc protrusion at the L4-L5 level as indicated by the myelogram. It is therefore found and concluded that claimant did not suffer disc herniation at the L4-L5 level as a result of the November 5, 1981 injury. The opinion of Dr. Margules is rejected in favor of that of Dr. Weis as being more consistent with the apparent recommendation of Drs. McClain and Myer.

There is no direct medical evidence in the record which indicates that point at which further significant improvement from the injury was not anticipated. Claimant's testimony indicates that he has been essentially stable since shortly after the injury. Dr. Weis indicated that an aggravation of degenerative arthritis generally resolves in three or four months. Where no improvement is anticipated, no healing period benefits are payable. Armstrong Tire & Rubber Co. v. Kubli, Iowa App., 312 N.W.2d 60 (1981). Claimant's medical care has been in the nature of maintenance and little in the record beyond the testimony of Dr. Weis indicates that any improvement of claimant's condition has ever occurred. It is therefore found and concluded that claimant's recovery ended February 5, 1982, a period of approximately 90 days following the date of the injury as indicated by Dr. Weis.

If claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

Dr. Weis found no permanent impairment arising from the injury. No other expression of expert medical opinion with regard to the amount of impairment resulting from the injury is in the record of this case. It seems reasonable to conclude that claimant's condition is that of degenerative arthritis as aggravated by the accident of November 5, 1981.

According to claimant's testimony he was asymptomatic prior to the injury but, immediately after it occurred, be began experiencing severe pain which has continued until the time of hearing. From the record it appears that claimant was, in fact, steadily employed as an over-the-road truck driver prior to November 5, 1981. He has not been so employed since. The x-rays clearly show an abnormality which could be the source of a significant degree of discomfort. The amount of pain which a person endures is not readily measured or evaluated. There are indications in this case that claimant may have ulterior motives and that his condition is not as bad as he purports it to be.

The fact remains that claimant was sufficiently asymptomatic prior to the date of injury to be steadily employed, but that he has since undergone significant financial hardship without returning to regular employment. Dr. Weis could not rule out the possibility that the injury made the arthritis worse.

It is found and concluded that the injury changed the course of claimant's underlying degenerative arthritis resulting in continuing pain which has reduced or impaired claimant's ability to be gainfully employed. Claimant's injury was to the body as a whole and has suffered a permanent reduction in his earning capacity and actual earnings. He has sustained an industrial disability under the rule of McSpadden v. Big Ben Coal Co., 288 N.W.2d 181 (Iowa 1980).

Claimant's military background indicates a considerable degree of supervisory experience. He has a considerable amount of experience in the trucking industry and an introduction to work as a dispatcher. Claimant's formal education is limited and he is now 52 years of age. Claimant's medically demonstrated physical condition is not such as would normally be expected to remove a person from all forms of gainful employment. Claimant appeared at hearing and appeared capable of engaging in sedentary activity. Nevertheless, his overall disability, when measured in industrial terms, is moderately high. A large portion of that disability is attributable to the 1973 injury which occurred in North Carolina. A portion is also attributable to his underlying degenerative disc disease. It is found and concluded that claimant sustained an industrial disability as a result of the November 5, 1981 injury which is 10 percent of total disability.

Defendants contend that the expenses incurred with Manning General Hospital and Dr. McClain were unauthorized. If the employer denies the compensability of an injury it cannot guide the medical treatment. Barnhart v. M.A.Q., Inc., 1 Iowa Industrial Commissioner Report 16 (App. Decision 1981). The defense on that ground must, accordingly, fail as it was not until time of hearing that defendants indicated a change from the position taken in their answer, namely that liability was denied. It appears, however, that Dr. McClain provided no treatment, only evaluation, and as such, his charges are not the responsibility of the employer. There is nothing in the record which relates the charges from Manning General Hospital to the injury other than claimant's statement that such was indicated by Dr. Myer. An employer is responsible only for medical care that is reasonably necessary for treatment of the injury. Such is a matter of expert medical testimony which was not introduced in this case. Accordingly, defendants will not be ordered to pay the charges from Manning General Hospital shown on claimant's exhibit 6.

FINDINGS OF FACT

1. Claimant is a resident of the State of Iowa and was injured on November 5, 1981 at Sioux City, Iowa when he slipped while getting out of a truck.

2. At the time of injury claimant was employed by Robert G. Talbot Company, Inc., as a truck driver.

3. Following the injury claimant was medically incapable of performing work in employment substantially similar to that he performed at the time of the injury from November 5, 1981 until February 5, 1982 when claimant reached the point that it was medically indicated that further significant improvement from the injury was not anticipated.

4. The injury claimant sustained did not result in permanent impairment from an orthopedic standpoint, but did result in indefinitely continuing pain which reduces claimant's employ-ability, earnings and earning capacity.

5. Claimant is 52 years of age, married and has one dependent child.

6. In accordance with the stipulation of the parties, claimant's rate of compensation is $221.77 per week.

7. Claimant incurred medical expenses with Dr. McClain in the amount of $140.00 and with Manning General Hospital in the amount of $113.40, but such were not shown to be for treatment of the injury claimant sustained on November 5, 1981.

8. Claimant presently experiences pain commencing slightly below the belt line on the left side of his back and extending into his foot. He is restricted in his ability to bend, lift and move.

9. Claimant dropped out of school during the tenth grade and has no further formal education except for that provided while in the army.

10. Claimant's work experience includes truck driving, motel and bar management, dispatching, general farm laborer and supervisory experience through his position as a sergeant in the army.

11. Claimant does not appear highly motivated to return to work and has not sought vocational rehabilitation or employment on a meaningful basis.

12. Claimant suffers from degenerative disc disease but the injury of November 5, 1981 caused a worsening of the disease which has not completely subsided. He has not returned to his pre-injury condition.

CONCLUSIONS OF LAW

This agency has jurisdiction of the subject matter of this proceeding and of its parties.

The injury claimant sustained to his back on November 5, 1981 arose out of and in the course of his employment with Robert G. Talbot Company, Inc.

The injury claimant sustained on November 5, 1981 resulted in industrial disability which is 10 percent of total disability.

Claimant's healing period began November 6, 1981 and ended February 5, 1982, both dates inclusive.

Defendants are not responsible for the bills claimant incurred with Dr. David B. McClain in the amount of $140.00 or with Manning General Hospital in the amount of $113.40 as the same are not shown to have been incurred for treatment of the injury claimant sustained.

ORDER

IT IS THEREFORE ORDERED that defendants pay claimant thirteen and one-seventh (13 1/7) weeks of compensation for healing period at the rate of two hundred twenty-one and 77/100 dollars ($221.77) per week commencing November 5, 1981.

IT IS FURTHER ORDERED that defendants pay claimant fifty (50) weeks of compensation for permanent partial disability at the rate of two hundred twenty-one and 77/100 dollars ($221.77) per week commencing February 6, 1982. The entire amount is now past due and owing and defendants shall pay the same in a lump sum. Defendants shall receive credit against the award of permanent partial disability made herein by the amount of overpayment of healing period benefits.

IT IS FURTHER ORDERED that defendants pay interest pursuant to Iowa Code section 85.30.

IT IS FURTHER ORDERED that defendants pay the costs of this action pursuant to Industrial Commissioner Rule 500-4.33.

IT IS FURTHER ORDERED that defendants file a final report within twenty (20) days from the date of this decision.

Signed and filed this 24th day of August, 1984.

INTRODUCTION

JUL 24 1984

This matter came on for hearing at the Juvenile Court facility for Linn County at Cedar Rapids, Iowa on November 16, 1983. The case was fully submitted at that time.

This case involves two separate actions:

1. File No. 686045 is an action in review-reopening. A review of the commissioner's file reveals that an employers first report of injury was filed on November 3, 1981. A notice of voluntary payment was filed on December 9, 1981. A memorandum of agreement was filed on December 21, 1981 calling for the payment of $232.82 in weekly compensation. A final report was filed at that time indicating that claimant had been paid five weeks of temporary total disability.

2. File No. 719905 is an action in arbitration. A review of the commissioner's file reveals that an employers first report of injury was filed on November 30, 1982. The claim was subsequently denied.

The record consists of the testimony of the claimant, Marylou Pierce, Warren Feerer, David Norton and Richard Callis; claimant's exhibits 1 through 12; defendants' exhibits A through K; and defendants' answers to claimant's interrogatories 2, 6 and 10.

ISSUES

The issues for resolution are:

1) Whether claimant sustained an injury arising out of and in the course of employment on November 17, 1982;

2) Whether there is a causal connection between the injuries and the condition;

3) The nature and extent of disability for both injuries;

4) The rate of compensation for the alleged injury of November 17, 1982;

5) Whether medical care was authorized for the November 17, 1982 injury;

6) Whether defendants should receive credit pursuant to section 85.38, Code of Iowa; and

7) Whether claimant is entitled to additional compensation pursuant to section 86.13, Code of Iowa;

STATEMENT OF THE EVIDENCE

Claimant, presently age 42, was employed by Quaker Oats in 1961. Claimant was given a company physical on hire. He first was employed in the package department where his duties included cleanup and packing dog food products. He ran the machine which wraps the familiar Quaker Oats cereal for a period of two or three years. He then became a package maker tender and had to supply containers to others. He next was a round operator and was responsible for two or three lines. He worked on a couple of other jobs before becoming a syrup line operator. A conveyor would bring empty syrup bottles to the claimant and he would dump these on a conveyor. The bottles cleaned, filled, capped, labeled and packed. Seven people in all worked on the line.

Claimant testified that he was working the day shift on November 17, 1982. Claimant testified that he ordinarily worked from 7:00 a.m. to 3:00 p.m. Monday through Friday. Additionally, claimant testified that he was required to report in at 4:00 a.m. each Monday. Claimant testified that he slipped on the floor on November 17. He did not fall completely and caught himself before falling. Claimant testified that he exclaimed at the time that he hoped he had not hurt his back again. He continued to work and finished the shift. Claimant testified that after work he felt a dull ache in his back. Claimant testified that at the time he thought the injury was severe, and later thought the severity of pain would decrease. He finished the week.

On Saturday night, claimant testified that he experienced severe back pain when he woke up to relieve himself in the middle of the night. Claimant had trouble sleeping the rest of the night. Claimant applied heat and slept on the floor. He did not sleep well Saturday or Sunday. Claimant testified that he called into work between 3:00 and 4:00 a.m. (he was due in at 4:00 a.m.). Claimant testified that he spoke with a woman in the office. He never heard from Mr. Sutphen even though he left the message for Mr. Sutphen to call. Claimant testified that he called the general foreman later in the day. Claimant indicated that he told the foreman that he would see the company doctor if he was able to get in his car to drive to see the company doctor. Claimant testified that he called the company nurse and was told to come in on Wednesday. Claimant was unable to travel on Tuesday. The records of the employer indicate that on November 23, 1982 claiamant presented himself to the defendants for examination. Claimant was placed on the nonoccupational benefits plan. The form indicates that claimant slipped at work. Claimant testified that he saw Dr. Basler, the company physician. Dr. Basler gave muscle relaxants to the claimant. Follow-up examination indicated that claimant was not progressing satisfactorily so claimant was referred to Leland G. Hawkins, M.D., an orthopedic surgeon. X-rays showed no evidence of fracture, but showed thinning of the disc space between L2-3. Examination revealed restriction of motion in the lumbar spine. He had positive straight leg raising at about thirty degrees on he right side and a weak knee reflex on the right side. Dr. Hawkins diagnosed claimant as having lumbar nerve root irritation. Dr. Hawkins recommended a week's rest.

On January 3, 1983 claimant returned to Dr. Hawkins and showed tenderness when walking. Knee reflexes were symmetrical. Straight leg raising was positive at about sixty degrees. Dr. Hawkins recommended a CT scan.

Claimant obtained the CT scan, and it showed no abnormality from L3 to the S1 level. There was no evidence of disc protrusion. He diagnosed claimant as having severe degenerative disc disease at the L2-3 level. Claimant remained off work until February 1983. The record indicates that he missed work then from February 24, 1983 through April 3, 1983. Claimant was then off a handful of days through the date of the hearing.

Claimant testified that he is still in constant pain. He can perform no quick movements. Claimant also testified that he used to play softball and golf, but now can only participate sparingly in these activities, if at all. Claimant testified that he had many prior back injuries which are clearly evident from reading the medical evidence submitted. Claimant had had injuries both at home and at work.

Claimant testified that he hurt his back in October 1981 when he slipped at work. Claimant was admitted to the hospital and was hospitalized for about five days. Claimant was com-

plaining of low back pain. X-rays taken prior to the hospitalization were normal. The hospitalization proceeded with physical therapy. The diagnosis was lumbar sprain.

On cross-examination, claimant indicated that he had had back problems for some time. He testified that he had his first back injury in 1968. Claimant indicated that he is doing his job to the satisfaction of his superiors. Claimant indicatd that his position is important in the running of the line. He inferred that substandard performance would be noticed. Claimant testified that his job now is easier than before because new machinery has been installed. Claimant testified that at the time of the hearing he has been able to work. Claimant testified that he didn't report the injury because he did not think the injury was serious when it occurred.

Marylou Pierce has been employed by Quaker Oats for 29 years. She is a coemployee and worked in the same area as the claimant on November 17, 1982. She testified that she saw claimant slip and catch himself on that date.

On cross-examination, the witness testified that she is a friend of claimant, but has no contact with claimant other than at the work site.

On redirect examination, she indicated that the insurance company never contacted her to obtain a statement.

Richard M. Callis testified that he was employed by Quaker Oats for seventeen years. He was there on November 17, 1982 when claimant slipped. He stated claimant did not fall and heard claimant exclaim that he hurt his back. The witness testified on cross-examination that he was contacted by supervisory personnel sometime after the incident. He described the events, but did not repeat the utterance made by the claimant.

Warren Feerer is the packing department manager at Quaker Oats and as such is claimant's supervisor. The witness testified that he first became aware of claimant's injury on November 23, 1982. He stated that Mr. Callis' version of what was said in the interview was changed. Mr. Ferrer testified that claimant was nearby at the time the conversation between Callis and Feerer occurred. The witness testified that several unanswered calls were made to the claimant on Novemer 22 and 23, 1982 and that the phone was not answered.

On cross-examination, the witness testified that he was aware of the long history of back problems experienced by the claimant. He testified that he made no writing concerning his conversation with Callis and testified from memory. He did not talk to Marylou Pierce until after the claimant had returned to work.

David Norton was in possession of a number of documents which were received into evidence. He recalled the answers to interrogatories which he answered. He did not place Marylou Pierce's name in the answer to the question regarding the identity of persons having knowledge of the circumstances. The witness testified that Crawford and Company made the ultimate decisions is this case, although the witness offered his opinion if it were asked.

Dr. Hawkins testified by way of deposition in this case. He, of course, treated claimant for the 1981 injury. He testified that a further injury occurred in 1982. He noted that the L2-3 disc space had not been narrowed on the 1981 x-rays, but had been narrowed on the 1982 x-rays. Dr. Hawkins indicated that the change had been going on, but he could not relate this to the November 17, 1982 injury. (Hawkins dep. p. 15) He noted also that these changes were not consistent with any of the many prior injuries. (Hawkins dep. p. 16)

> Q. Okay. Then excluding what we might learn from further films indicating the present status of the L2-3 level, in your opinion does he carry presently any permanent impairment of function?
>
> A. He does because of the narrowing that he has that we can visualize on his X ray. He has a permanent impairment in his back due to degenerative disk disease, which has been aggravated by an incident that we originally talked about on somewhere around October of 1981. It would seem to me that the natural timing of that would be that the -- something happened to him during that period of time that changed from the time that I originally saw him until the time that I saw him a year later. So I relate it to that particular period of time.
>
> Q. But you likewise allow that what you see is consistent with the traumatic event, the fall in 1981?
>
> A. Yes.

Dr. Hawkins wrote a letter to claimant's counsel on November 14, 1983:

> As you recall, following our deposition we were going to see Mr. Shields, and we saw him on July 18, 1983. You have copies of those notes. It is my feeling because of the presence of degenerative disc disease that is present in this man and his presence of continued symptoms, that the patient has a 3 percent permanent disability rating related to the lumbar spine.

APPLICABLE LAW

1. Sections 85.3 and 85.20, Code of Iowa, confer jurisdiction on this agency in workers' compensation matters.

2. Claimant has the burden of proving by a preponderance of the evidence that he received injuries on October 22, 1981 and November 17, 1982 which arose out of and in the course of his employment. McDowell v. Town of Clarksville, 241 N.W.2d 904 (Iowa 1976); Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

3. By filing a memorandum of agreement it is established that an employer-employee relationship existed and that claimant sustained an injury arising out of and in the course of employment. Freeman v. Luppes Transport Co., 227 N.W.2d 143 (Iowa 1975). This agency cannot set this memorandum of agreement aside. Whitters & Sons, Inc. v. Karr, 180 N.W.2d 444 (Iowa 1970).

4. The claimant has the burden of proving by a preponderance of the evidence that the injuries of October 22, 1981 and November 17, 1982 are causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d 732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

5. Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

6. Section 85.27, Code of Iowa, provides that the employer provide medical care to injured employees. The employer has the right to choose the care.

7. Section 85.36, Code of Iowa, provides the method of gross weekly wage. The rate of compensation is ascertained from the gross weekly wage.

8. The last unnumbered paragraph of section 86.13, Code of Iowa, provides that if a delay in commencement or termination of benefits occurs without reasonable or probable cause or excuse, the industrial commissioner shall award additional benefits up to fifty percent of the amount of benefits that were unreasonably delayed or denied.

ANALYSIS

Based on the foregoing principles, it is found that claimant sustained an injury on October 22, 1981 as evidenced by the filing of the memorandum of agreement. Further, it is found that claimant sustained a separate injury at work on November 17, 1982.

The lay evidence, specifically that of the two lay witnesses, was particularly convincing in bolstering claimant's version of the events in November 1982. It is concluded that claimant sustained an injury arising out of and in the course of employment on November 17, 1982. The quoted portion of Dr. Hawkins' deposition indicates that claimant has degenerative disc disease, which was aggravated by the 1981 injury. The finding by Dr. Hawkins is specifically adopted in this.

Although the medical record with regard to the effect of the 1982 injury is unclear, the finding is hereby made that the injury was temporary in nature. Dr. Hawkins put all permanency on the 1981 injury. By process of exclusion and with the knowledge that Dr. Hawkins was the treating physician for both injuries, it is concluded that the Novemer 1982 injury caused no permanent partial disability. It is concluded, however, that claimant is entitled to temporary total disability compensation for this injury. However, the setting of permanent partial disability compensation for the first injury is necessary. Claimant is presently age 42 years of age and has a high school education. He has been employed at Quaker Oats for virtually all of his working life. He complains of pain and has been given a diagnosis of disc disease which is verified by x-rays. Considering the fact that claimant has returned to work, the claimant will be awarded permanent partial disability in the amount of five percent of the body as a whole.

The next item that must be resolved is the temporary total disability compensation to be awarded for the November 17, 1982 injury. Claimant seeks to be compensated from November 22, 1982 through February 6, 1983; February 12, 14, 24 and 25, 1983; and February 28, 1983 through April 1, 1983. These periods total 16 2/7 weeks.

The record (defendants' exhibit D) indicate that claimant's gross wages for the thirteen weeks prior to injury was $4,903.11. The average gross weekly wage for claimant is $377.00. The documentary evidence given by defendants is given greater weight than the testimonial evidence of claimant. Claimant is single and entitled to three income deductions. The rate should be $227.67.

Defendants indicate that any care offered for the November 17, 1982 injury is unauthroized. The right of choice of medical care has a concomitant duty of payment for the care. In order to avail oneself of the unauthorized medical allegation one must offer medical care which is designed to treat the injury. The medical bills will be paid as submitted by claimant.

Defendants have paid certain weekly indemnity pursuant to an accident and health plan. Defendants will be given credit pursuant to section 85.38, Code of Iowa.

Claimant has also sought additional compensation for the alleged unreasonableness of defendants in denying the compensability of the November 17, 1982 injury. Claimant has a point. Claimant's witnesses may have had some insignificant variance in details as to the amount of flexion of the slip, but all evidence adduced indicated that the claimant did slip. This, in itself, makes the denial unreasonable because no other contrary evidence was shown. The unreasonableness was not severe, and was not of such patent quality to warrant any award of more than the ten percent hereby awarded. This additional ten percent will attach to the temporary total disability awarded.

FINDINGS OF FACT

1. Claimant was employed by Quaker Oats on October 22, 1981.

2. Claimant hurt his back while working on October 22, 1981.

3. Defendants filed a memorandum of agreement concerning an October 22, 1981 injury.

4. Claimant sustained a permanent partial disability of five percent (5%) of the body as a whole as a result of the October 21, 1981 injury.

5. Claimant was employed by Quaker Oats on November 17, 1982.

6. Claimant slipped while walking at work on November 17, 1982.

7. Claimant did not sustain permanent disability because of the injury of November 17, 1982.

8. Claimant was disabled from acts of gainful employment on November 22, 1982 through February 6, 1983; February 12, 14, 24 and 25, 1983; and February 28, 1983 through April 1, 1983. The disablement was caused by the injury of November 17, 1982.

9. Claimant incurred certain reasonable medical expenses which were caused by the injury of November 17, 1982.

10. The stipulated rate of compensation for the October 1981 inury is two hundred thirty-two and 82/100 dollars ($232.82).

11. The gross weekly wage for the November 1982 injury is three hundred seventy-seven dollars ($377.00).

12. Defendants paid group plan payments to claimant following the November 17, 1982 injury.

13. Defendants' denial of benefits for the November 17, 1982 injury was unreasonable. The extent of the unreasonableness was not severe and held to the extent of ten percent (10%) within the meaning of section 86.13, Code of Iowa.

CONCLUSIONS OF LAW

1. This agency has jurisdiction of the parties and the subject matter.

2. Claimant was employed by Quaker Oats on October 22, 1981 and November 17, 1982.

3. Claimant sustained an injury arising out of and in the course of employment on October 22, 1981.

4. Defendants will be ordered to pay unto claimant twenty-five (25) weeks of permanent partial disability compensation at the rate of two hundred thirty-two and 82/100 dollars ($232.82) per week.

5. Claimant sustained an injury arising out of and in the course of employment on November 17, 1982.

6. Defendants will be ordered to pay unto claimant sixteen and two-sevenths (16 2/7) weeks of temporary total compensation at the rate of two hundred twenty-seven and 67/100 dollars ($227.67) per week.

7. An additional ten percent (10%) of the healing period compensation due will be awarded to the claimant pursuant to section 85.13, Code of Iowa.

8. Defendants will be ordered to pay the following medical and allied expenses:

Fifth Avenue Surgical	$ 70.00
Linn County Orthopedist	378.00
Mercy Hospital	330.00
Cedar Rapids Radiologists	40.00
Dr. Johnson	30.00
Mileage	25.92

9. Defendants will receive credit for amounts paid pursuant to section 85.38, Code of Iowa.

ORDER

IT IS THEREFORE ORDERED that defendants pay unto claimant twenty-five (25) weeks of permanent partial disability compensation at the rate of two hundred thirty-two and 82/100 dollars ($232.82) per week.

IT IS FURTHER ORDERED that defendants pay unto claimant sixteen and two-sevenths (16 2/7) weeks of temporary total disability compensation in this case at the rate of two hundred twenty-seven and 67/100 dollars ($227.67) per week.

IT IS FURTHER ORDERED that defendants pay an additional ten percent (10%) of the amount awarded in temporary total disability compensation pursuant to section 86.13, Code of Iowa.

IT IS FURTHER ORDERED that defendants pay unto claimant the following medical expenses:

Fifth Avenue Surgical	$ 70.00
Linn County Orthopedists	378.00
Mercy Hospital	330.00
Cedar Rapids Radiologists	40.00
Dr. Johnson	30.00
Mileage	25.92

Defendants will receive credit for amounts paid as contemplated by section 85.38, Code of Iowa.

Interest on the permanent partial disability hereby awarded will accrue from the date of this decision.

Interest on all other amounts awarded will accrue from the date the payments become due.

Costs of this proceeding are taxed against defendants pursuant to Industrial Commissioner Rule 500-4.33.

Defendants shall file a final report upon payment of this award.

Signed and filed this 24th day of July, 1984.

FILED

AUG 20 1984

IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in arbitration brought by Loren T. Simpson, claimant, against Clinton Corn Processing Company, employer, and Commercial Union Insurance Companies, insurance carrier, for benefits as a result of an injury on April 9, 1981. On April 13, 1983 this case was heard by the undersigned.

The record consists of the testimony of claimant, Ema Simpson; claimant's exhibits 1 through 13; and defendants' exhibits A through C. The parties stipulated that claimant's rate is $247.80 per week.

ISSUES

The issues presented by the parties at the time of the pre-hearing and the hearing are whether claimant received an injury arising out of and in the course of his employment; whether there is a causal relationship between the alleged injury and the disability on which he is now basing his claim; the extent of temporary total, healing period and permanent partial disability benefits he is entitled to; whether the action is one under chapter 85 or chapter 85A, of the Code; whether claimant sustained an injury arising out of and in the course of his employment within the meaning of section 85A.8, of the Code; whether claimant sustained any injurious exposure occasioned by the nature of his employment within the meaning of section 85A.8; whether claimant's alleged disease is incidental to the employer's business; whether claimant is disabled within

the meaning of section 85A.4 and section 85A.5, of the Code; whether claimant has sustained any aggravation of a preexisting disease or infirmity within the meaning of section 85A.7(4); whether claimant's disease is due to a hazard of the employment which is characteristic thereof and peculiar to the employment within the meaning of section 85A.12, of the Code; whether claimant provided proper notice within the meaning of section 85A.18, of the Code.

FACTS PRESENTED

Claimant testified regarding being sprayed by oil at work and smelling fumes all the time in a room of 120 degrees but continuing to work. Claimant stated he had no problems with asthma prior to working in this room. Claimant testified that on Easter Sunday of 1981, while at home, he experienced his first problem with shortness of breath. Claimant stated he talked to fellow employees about the fumes. Claimant revealed that on January 12, 1983 he had surgery on a lung.

Ema Simpson, claimant's wife, testified that claimant had a hearing problem since childhood; attended the school for the deaf; and signs with his hands. Mrs. Simpson stated that her husband worked for defendant employer for over 30 years. Mrs. Simpson disclosed that in 1969 claimant was hospitalized for a heart condition and gave up his under-a-pack-a-day smoking habit. She stated that claimant also did part-time farm work and worked as a janitor for the Clinton School System for a period of seven years.

Mrs. Simpson testified that on April 19, 1981, which was Easter Sunday, they were having a big dinner at their home when claimant became pale and started having problems with breathing and talking. Mrs. Simpson stated that claimant was hospitalized on three different occasions and did not improve. She indicated that in the summer of 1981 claimant returned to work and did janitorial type work. Mrs. Simpson testified that they went on a vacation and upon returning, was told that claimant could not return to work. While on vacation, claimant's condition had become worse while attending a fair. Mrs. Simpson stated that claimant hasn't returned to work for anyone in any manner.

Mrs. Simpson disclosed that both medical bills and disability benefits were paid by defendants and that they didn't talk about workers' compensation. She testified that they first became aware of a possible workers' compensation claim after talking to their tax attorney in January of 1982.

On cross-examination Mrs. Simpson stated that claimant told his physician about an incident at work involving being sprayed by insulating oil. Mrs. Simpson testified that claimant would just be covered with oil after working in the area. Later in her testimony Mrs. Simpson stated that in July of 1981 claimant indicated he knew fumes and dust at work caused him problems.

Dale Glen Wulf, M.D., who testified by way of deposition, indicated he is a family practitioner and that in April of 1981 he saw claimant in an emergency room. Claimant was experiencing shortness of breath, dyspnea, cough and wheezing. Dr. Wulf disclosed that the history given by claimant indicated he had problems with shortness of breath which developed initially at work. Dr. Wulf revealed that he knew of no prior problems that claimant may have had with breathing. Dr. Wulf testified that on May 4, 1981 claimant gave a history of being exposed to oils and fumes at work. Claimant was again seen on May 16, 1981 and was instructed to take medication and rest at home. Claimant continued to be seen by doctors. Dr. Wulf opined that claimant's condition is permanent in nature. Dr. Wulf stated:

> Q. Can you give us an opinion as to the degree of functional impairment he has as related to the body as a whole?
>
> A. Well, I wouldn't give a specific percentage. In talking informally with this gentleman and his wife, he has good days and bad days. On a good day he can do considerably more than on a bad day. Unfortunately, when a person is applying for employment, they expect you to have a good day five days a week from Monday through Friday. So this impairs him tremendously in looking for employment. And he has found that exposure to dust; to the grasses outside, such as in his garden; and other contaminants within the area do increase his shortness of breath, things that apparently did not happen to him years ago when he worked on a farm and things of that nature.
>
> Q. As far as shortness of breath is concerned, other than just the gasping and the wheezing how else does this affect Mr. Simpson in doing physical tasks?
>
> A. Well, certainly the shortness of breath and discomfort associated with it is like running the four-minute mile and not being able to rest afterwards.
>
> Q. Does it actually prevent him from being able to perform some physical tasks?
>
> A. I think that any type of heavy labor, that he would not be able to do. Light work that he could do at his own pace on days that he is feeling good, yes. He is not totally disabled from everything.
>
> Q. What, in your opinion, doctor, is the probable cause of this shortness of breath; this asthmatic condition?
>
> A. Well, from prior history and from what limited exposure I've had with the gentleman prior to April of '81, his respiratory problem apparently does not exist prior to that time. There was history of exposure to fumes, et cetera, at work for the several weeks prior to his hospitalization. Cause and effect relationships certainly may exist in that respect. He has been out of that environment since that time. He is still having problems of one -- of a similar nature with exposure to other types of irritants. I think it's logical to assume that the initial insult of injury, the precipitating event, has caused him to have a reaction to more general respiratory irritants than just what he was exposed to, apparently, at work.

Dr. Wulf opined that in December of 1981 or January of 1982 claimant reached maximum recovery.

Steven Wanzek, M.D., who testified by way of deposition, indicated that he saw claimant on September 10, 1981 while he was a fellow associate in the area of pulmonary medicine at the University of Iowa Hospitals. Dr. Wanzek took a history from claimant and examined him. Claimant's examination was essentially normal except for a noted irregular rhythm of his heart. Dr. Wanzek indicated that claimant was not having problems at that time. Dr. Wanzek disclosed that he was unable to test substances at defendant employer's plant to see if they triggered or caused claimant's asthma. Tests on claimant did show that claimant has asthma. Dr. Wanzek opined that by history the substances at work triggered claimant's asthma. Dr. Wanzek stated:

> Q. Doctor, is Mr. Simpson's reversible airways disease or his asthma, is that a permanent condition?
>
> A. I would say that he has a permanent susceptibility to bronchial hyperreactivity which is a form of asthma, yes.
>
> Q. And having that condition, how does it limit Mr. Simpson if at all?
>
> A. By his history it limited him substantially in that he became significantly more short of breath after being at the work place. And if that history is borne out, that would represent a significant limitation secondary to the asthma.
>
> Q. For the record, would you tell us in what regards a person such as Mr. Simpson having an asthmatic attack is limited? What can't he do or how does this affect him?
>
> A. It depends somewhat on the severity, but with the severity he described to me he would be unable, I would think, to perform the usual sorts of activities required of a laborer.
>
> Certainly by history he was limited even in the ability to being able to get his breath at rest which would make it impossible for him to do, I would say, any heavy work certainly or any other activity.

Dr. Wanzek disclosed that they recommended claimant avoid what would appear to be the precipitants of his asthma.

On cross-examination Dr. Wanzek stated:

> Q. When we talk about precipitating asthma in the sense that you just used that term, would the exposure to oil cause the asthmatic reaction?
>
> A. It would lead to exacerbation of an underlying predisposition. The other thing it can be is in a select population lead to so-called small airways dysfunction. I think for our purposes that's something different that doesn't apply here.

APPLICABLE LAW

An employee is entitled to compensation for any and all personal injuries which arise out of and in the course of the employment. Section 85.3(1).

Claimant has the burden of proving by a preponderance of the evidence that he received an injury on April 9, 1981 which arose out of and in the course of his employment. McDowell v. Town of Clarksville, 241 N.W.2d 904 (Iowa 1976); Musselman v. Central Telephone Co., 261 Iowa 352, 154 N.W.2d 128 (1967).

The claimant also has the burden of proving by a preponderance of the evidence that the injury of April 9, 1981 is causally related to the disability on which he now bases his claim. Bodish v. Fischer, Inc., 257 Iowa 516, 133 N.W.2d 867 (1965). Lindahl v. L. O. Boggs, 236 Iowa 296, 18 N.W.2d 607 (1945). A possibility is insufficient; a probability is necessary. Burt v. John Deere Waterloo Tractor Works, 247 Iowa 691, 73 N.W.2d

732 (1955). The question of causal connection is essentially within the domain of expert testimony. Bradshaw v. Iowa Methodist Hospital, 251 Iowa 375, 101 N.W.2d 167 (1960).

However, expert medical evidence must be considered with all other evidence introduced bearing on the causal connection. Burt, 247 Iowa 691, 73 N.W.2d 732. The opinion of experts need not be couched in definite, positive or unequivocal language. Sondag v. Ferris Hardware, 220 N.W.2d 903 (Iowa 1974). However, the expert opinion may be accepted or rejected, in whole or in part, by the trier of fact. Id. at 907. Further, the weight to be given to such an opinion is for the finder of fact, and that may be affected by the completeness of the premise given the expert and other surrounding circumstances. Bodish, 257 Iowa 516, 133 N.W.2d 867. See also Musselman, 261 Iowa 352, 154 N.W.2d 128.

While a claimant is not entitled to compensation for the results of a preexisting injury or disease, the mere existence at the time of a subsequent injury is not a defense. Rose v. John Deere Ottumwa Works, 247 Iowa 900, 908, 76 N.W.2d 756, 760-761 (1956). If the claimant had a preexisting condition or disability that is aggravated, accelerated, worsened or lighted up so that it results in disability, claimant is entitled to recover. Nicks v. Davenport Produce Co., 254 Iowa 130, 115 N.W.2d 812, 815 (1962).

As claimant has an impairment to the body as a whole, an industrial disability has been sustained. Industrial disability was defined in Diederich v. Tri-City Railway Co., 219 Iowa 587, 593, 258 N.W. 899, 902 (1935) as follows: "It is therefore plain that the legislature intended the term 'disability' to mean 'industrial disability' or loss of earning capacity and not a mere 'functional disability' to be computed in the terms of percentages of the total physical and mental ability of a normal man."

Functional disability is an element to be considered in determining industrial disability which is the reduction of earning capacity, but consideration must also be given to the injured employee's age, education, qualifications, experience and inability to engage in employment for which he is fitted. Olson v. Goodyear Service Stores, 255 Iowa 1112, 1121, 125 N.W.2d 251, 257 (1963).

A finding of impairment to the body as a whole found by a medical evaluator does not equate to industrial disability. This is so as impairment and disability are not identical terms. Degree of industrial disability can in fact be much different than the degree of impairment because in the first instance reference is to loss of earning capacity and in the later to anatomical or functional abnormality or loss. Although loss of function is to be considered and disability can rarely be found without it, it is not so that an industrial disability is proportionally related to a degree of impairment of bodily function.

Factors considered in determining industrial disability include the employee's medical condition prior to the injury, after the injury, and present condition; the situs of the injury, its severity and the length of healing period; the work experience of the employee prior to the injury, after the injury and potential for rehabilitation; the employee's qualifications intellectually, emotionally and physically; earnings prior and subsequent to the injury; and age, education, motivation, and functional impairment as a result of the injury and inability because of the injury to engage in employment for which the employee is fitted. Loss of earnings caused by a job transfer for reasons related to the injury is also relevant. These are matters which the finder of fact considers collectively in arriving at the determination of the degree of industrial disability.

There are no weighting guidelines that are indicated for each of the factors to be considered. There are no guidelines which give, for example, age a weighted value of ten percent of total, education a value of fifteen percent of total, motivation - five percent; work experience - thirty percent, etc. Neither is a rating of functional impairment entitled to whatever the degree of impairment that is found to be conclusive that it directly correlates to that degree of industrial disability to the body as a whole. In other words, there are no formulae which can be applied and then added up to determine the degree of industrial disability. It therefore becomes necessary for the deputy or commissioner to draw upon prior experience, general and specialized knowledge to make the finding with regard to degree of industrial disability. See Birmingham v. Firestone Tire & Rubber Company, II Iowa Industrial Commissioner Report 39 (1981); Enstrom v. Iowa Public Services Company, II Iowa Industrial Commissioner Report 142 (1981); Webb v. Lovejoy Construction Co., II Iowa Industrial Commissioner Report 430 (1981).

ANALYSIS

Claimant has met his burden in proving he received an injury arising out of and in the course of his employment with defendant employer on April 9, 1981. It is apparent from the testimony of Dr. Wanzek and Dr. Wulf that claimant has an asthmatic condition which was triggered by the fumes and conditions at claimant's employment. That does not mean that the materials at work caused the asthma but claimant's work aggravated his prior condition. This is supported by the history given by claimant and his wife. It is apparent that there is some small discrepancies in the testimony of claimant and his wife but the undersigned finds both claimant and his wife credible.

The greater weight of evidence supports a finding that claimant's condition was the result of a traumatic incident or incidents over a couple of days and is not an occupational disease under chapter 85A of the Code. Again it should be indicated that claimant's asthma was not caused by his work but aggravated by it.

Defendants argue that they did not receive proper notice of the injury which claimant now complains. The testimony of claimant stands uncontradicted. Claimant stated he talked to the foreman about the problems. From the evidence presented it is determined that defendants had actual knowledge of claimant's injury.

Claimant has met his burden in proving he has permanent impairment as a result of his injury on April 9, 1981. Although no percentage of functional impairment was given, it is clear that claimant's injury increased his propensity towards having asthmatic attacks. Although no rating of impairment was given, one must remember that functional impairment is only one of the factors in determining a person's industrial disability.

Claimant is 58 years old and has an eighth grade education. Claimant has had a hearing problem since childhood and signs with his hands. Claimant also has a preexisting heart condition. Claimant worked for defendant employer for 32 years and at the time of his injury was working insulating pipes. Claimant also has experience farming and in the area of janitorial work. The physicians have indicated that claimant should not return to work which requires heavy lifting or work around fumes or dust. Claimant's ability to find new work is affected by his hearing problem and his eighth grade education. At the same time it does not appear that claimant has a great amount of motivation to attempt to find further employment. Based on all the evidence presented it is determined that claimant has an industrial disability of 70 percent as a result of his injury of April 9, 1981.

In his deposition Dr. Wulf opined that claimant reached maximum recovery in December of 1981 or January of 1982. It is determined that claimant reached maximum recuperation on December 31, 1981.

FINDINGS OF FACT AND CONCLUSIONS OF LAW

WHEREFORE, based on the evidence presented and the principles of law previously stated, the following findings of fact and conclusions of law are made:

FINDING 1. On or about April 9, 1981 claimant worked in a room which contained oil fumes.

FINDING 2. The oil fumes triggered an asthma attack.

FINDING 3. Claimant had no previous asthma attacks.

FINDING 4. Claimant has since had other asthmatic attacks even when not working.

FINDING 5. Claimant's work did not cause claimant's asthma.

CONCLUSION A. The oil fumes that claimant was exposed to aggravated an underlying predisposition that claimant had for asthma.

FINDING 6. Claimant's foreman was aware of the conditions claimant was working under as well as claimant's breathing problems.

FINDING 7. Claimant told his foreman about the oil fumes.

CONCLUSION B. Defendants had actual knowledge of claimant's injury.

FINDING 8. As a result of the aggravation to his condition claimant has permanent impairment.

FINDING 9. No percentage of impairment has been given.

FINDING 10. Claimant is fifty-eight (58) years old and has an eighth grade education.

FINDING 11. Claimant is hearing impaired.

FINDING 12. Claimant has a prior heart condition.

FINDING 13. Claimant worked for defendant employer for thirty-two (32) years and has experience farming and doing janitorial work.

FINDING 14. At the time of his injury claimant was insulating pipes.

FINDING 15. As a result of the aggravation claimant should avoid heavy lifting and working around fumes or dust.

FINDING 16. Claimant is not presently well motivated to return to work.

CONCLUSION C. As a result of his injury, claimant has an industrial disability of seventy percent (70%).

FINDING 17. Claimant reached maximum improvement on December 31, 1981.

FINDING 18. Claimant has not returned to work.

CONCLUSION D. Claimant is entitled to healing period benefits until December 30, 1981.

THEREFORE, defendants are to pay unto claimant twenty-seven and three-sevenths (27 3/7) weeks of healing period benefits at a rate of two hundred forty-seven and 80/100 dollars ($247.80) per week and three hundred fifty (350) weeks of permanent partial disability benefits at a rate of two hundred forty-seven and 80/100 dollars ($247.80) per week.

Defendants are to reimburse claimant for the following medical expenses.

Medical Associates	$ 1,591.00
University of Iowa Hospitals	516.50
St. Joseph Mercy Hospital	10,100.40

Defendants are to be given credit for benefits previously paid.

Accrued benefits are to be made in a lump sum together with statutory interest at the rate of ten percent (10%) per year pursuant to section 85.30, Code of Iowa, as amended.

Costs are taxed to defendants pursuant to Industrial Commissioner Rule 500-4.33.

Defendants shall file a final report upon payment of this award.

Signed and filed this 20th day of August, 1984.

DAVID E. LINQUIST
DEPUTY INDUSTRIAL COMMISSIONER

BEFORE THE IOWA INDUSTRIAL COMMISSIONER

JIMMY J. SMITH, Claimant, vs. WAYNE COUNTY, Employer, and FARMERS ALLIANCE MUTUAL INSURANCE COMPANY, Insurance Carrier, Defendants.	File No. 620570 A P P E A L D E C I S I O N

FILED
AUG 27 1984
IOWA INDUSTRIAL COMMISSIONER

By order of the industrial commissioner filed June 27, 1984 the undersigned deputy industrial commissioner has been appointed under the provisions of §86.3, Code of Iowa, to issue the final agency decision on appeal in this matter. Claimant appeals from an adverse decision.

The record consists of the transcript; claimant's exhibits 1 through 6; and defendants' exhibits A through K, all of which evidence was considered in reaching this final agency decision.

The outcome of this final agency decision will be the same as that reached by the hearing deputy.

The hearing deputy awarded payment of 125 weeks at the rate of $158.74 per week for permanent partial disability plus healing period. The award was in "arbitration" but should have been styled in review-reopening. Claimant appealed and later made a motion for enlargement of time in which to file his brief, but that motion was denied because it was received after the brief was due.

Although no briefs have been filed, this decision is de novo and the entire record has been examined. A review of the record shows the findings of fact and conclusions of law of the hearing deputy are correct, and they are adopted, as is the order. Because this final agency decision adopts the proposed agency decision, there is no need to rule on defendants' motion filed August 1, 1984.

FINDINGS OF FACT

WHEREFORE, IT IS FOUND:

Claimant injured his back in the course of his employment on December 4, 1979.

Claimant is forty-two (42) years old.

Claimant has completed the seventh grade.

Claimant has had in the field training and is certified as a dragline operator.

Claimant has worked as a manual laborer, a saw miller, an auto mechanic, a bulk truck driver, a bulldozer operator, and welder as well as a dragline operator.

Claimant has had difficulty sitting, standing, walking and lifting since his injury.

Claimant's healing period runs from his injury date to October 20, 1982.

Claimant has refused recommended surgery to correct a suspected herniated disc.

Claimant has not returned to work since his injury.

Claimant was terminated by his employer January 10, 1981.

Claimant has not returned to any gainful employment since his injury.

Claimant earned five and 48/100 dollars ($5.48) per hour and worked a forty-five (45) hour week when injured.

Claimant's earning capcity has been reduced by between nine percent (9%) and thirty-one percent (31%) as a result of his injury.

Claimant has a functional impairment of fifteen percent (15%) of the body as a whole as a result of his injury.

Claimant's weekly compensation rate is one hundred fifty-eight and 74/100 dollars ($158.74).

CONCLUSIONS OF LAW

THEREFORE, IT IS CONCLUDED:

Claimant has established that his injury of December 4, 1979 is the cause of the disability on which he now bases his claim.

Claimant is entitled to permanent partial disability resulting from his injury of twenty-five percent (25%) of the body as a whole.

ORDER

THEREFORE, IT IS ORDERED:

Defendants pay claimant permanent partial disability benefits for one hundred twenty-five (125) weeks at the rate of one hundred fifty-eight and 74/100 dollars ($158.74).

Defendants pay claimant healing period benefits from his injury date to October 20, 1982 at the rate of one hundred fifty-eight and 74/100 dollars ($158.74).

Defendants pay accrued amounts in a lump sum.

Defendants pay interest pursuant to section 85.30 as amended from March 30, 1984.

Defendants pay costs pursuant to Industrial Commissioner Rule 500-4.33.

Defendants file a final report when this award is paid.

Signed and filed this 27th day of August, 1984.

IOWA INDUSTRIAL COMMISSIONER

INTRODUCTION

This is a proceeding in arbitration brought by the claimant, Jimmy J. Smith, against his employer, Wayne County, and its insurance carrier, Farmers Alliance Mutual Insurance Company, to recover benefits under the Iowa Workers' Compensation Act as a result of an injury claimant sustained December 4, 1979.

This matter came on for hearing before the undersigned deputy industrial commissioner at the Iowa Industrial Commissioner's Office in Des Moines, Iowa on November 28, 1983. The record was considered fully submitted on that date.

An examination of the industrial commissioner's file indicates that a first report of injury was filed December 19, 1979.

The record in this case consists of the testimony of the claimant, Jimmy J. Smith, of claimant's wife, Barbara Ann Smith; of Todd F. Hines Ph.D; of Marian S. Jacobs; of claimant's exhibits 1 through 5; and of defendants' exhibits A through K. Rulings reserved on specific exhibits and other evidence are made in the review of the evidence. It is noted that neither party filed a witness list before hearing.

At the time of hearing, the parties stipulated that, in the event permanent partial disability benefits are awarded, claimant's healing period should end October 20, 1982, and that claimant's medical expenses are fair and reasonable.

ISSUES

The issues to be resolved are:

1. The nature and extent of claimant's injury.

2. Whether there is a causal relationship between the alleged injury and the disability.

3. Whether claimant is entitled to benefits and the nature and extent of these.

4. The rate of weekly compensation if an award is made.

REVIEW OF THE EVIDENCE

Claimant testified in his own behalf. Claimant is 42 years old, married and has two children with his present wife. He has three children of a previous marriage to whom he has a court-ordered child support obligation of forty dollars per month. Two of these children are under age 18. Claimant completed seventh grade and has not received a GED. His only other training is as a dragline operator. Claimant is a certified dragline operator. To obtain his certification, claimant underwent two years of infield training (1000 hours).

Claimant first testified concerning his work experience and his beliefs as to his current limitations. Claimant's work experience includes working in the foundry at Maytag, working as a saw miller, working as an auto mechanic, driving a bulk gas truck, and operating a bulldozer.

Claimant stated he had worked as a dragline operator for Central Paving for five years before beginning his employment with Wayne County. He drove dragline and fixed truck tires when paving was impossible. He also shoveled rock and put in new cable. To install the cable, claimant had to climb 10 or 15 feet and pull the cable through the machine. The cable is approximately 130 to 150 feet long and weighs 100 pounds. Truck tires were changed by breaking the sides down. Claimant reported doing that requires considerable strength.

Claimant stated it was sometimes necessary to work three or four hours without a break while running the dragline. This involves sitting in the machine while using the legs and back in drag operation. Claimant stated he cannot sit longer than 15 minutes without pain.

Claimant reported that his work as an auto mechanic also required physical strength and the ability to crawl and lie under the vehicle. Claimant stated he cannot lie on his back for more than 20 minutes without pain.

Claimant reported he cannot sleep or lie prone unless he puts a pillow on his chest. If he does so, he can lie prone for 30 to 40 minutes.

Claimant recited that work as an auto mechanic often requires carrying, lifting, or pulling of fifty or more pounds. He stated at times he has difficulty carrying a gallon of milk. Claimant also had accompanied his former employer on auto buying trips to Chicago. He now reports difficulty in riding more than 10 miles. Claimant can drive a car provided he uses the arm rest for support and provided he stops every 40 to 50 miles.

Claimant believes he could neither function as a mechanic nor as a truck driver with his current limitations. Claimant recited that his foundry job had required that he stand and walk throughout an eight hour work day. He now has difficulty walking for one-half hour.

Claimant recited he was hired by Wayne County in September 1978 as a dragline operator. He also built bridges, welded, ran a jackhammer, loaded tubing, and ran the air tamper. Claimant believes he could run an air tamper today. He reported he cannot weld since he cannot handle the heavy objects involved and cannot sit long enough to make a steady bead. Claimant recited the Wayne County dragline is difficult to operate since it is non-hydraulic and, therefore, requires foot operation of the pedals. Claimant believes he could neither operate the dragline nor repair cable with his present problems.

Claimant stated he told Todd F. Hines, Ph.D., that he could work as a small engines or gun repairer. Claimant explained that he has always had an interest in guns and consequently this was the only employment idea he could come up with. Claimant has not looked into gunsmithing but to discuss it with a gunsmith in Centerville. The gunsmith told claimant he would need a federal license in order to work as a smith. Consequently, claimant did two gun repairs and stopped. He has a gun repair license application but has not applied for the license. Claimant has attempted to sell his personal firearms through newspaper ads, but has not been able to do so.

Claimant uses a cane. Claimant has lost 10 pounds since his injury.

Claimant reported he "kept time" when his foreman was on vacation but otherwise has done no book work. Claimant is unaware of any way he could make a living working at home. He is uncertain he could earn enough repairing guns to make it worth his while.

Claimant next testified concerning his injury. Claimant stated that on the injury date he was cutting steel beams to the right length of a bridge with a torch. He ran out of gas and went to refill at the truck. While climbing off the truck, he caught his overshoe on an object and fell onto his feet. Claimant recites "he hung onto the beams" for the rest of the day but did not directly seek medical attention because there had been "so much hollering" about co-workers getting injured. He called Keith A. Garber, M.D., the following day. The doctor recommended hospitalization. Claimant stayed home and rested in bed, however. The following morning he entered the hospital.

Claimant has been treated with Serax and Percodan. His dosage at the time of the hearing was approximately equal to his dosage on initial injury. Dr. Garber has remained claimant's treating physician though claimant has seen other physicians at defendants' direction. Claimant refused defendants' request he travel to Minnesota for treatment. Claimant opined Minnesota was "a long ways and they do the same procedure in Des Moines." Claimant refused defendants' request he see a vocational rehabilitation specialist in 1983. Claimant explained he had already seen two rehabilitation counselors and did not feel that seeing a third would do any good.

On cross-examination claimant reported Dr. Garber referred him to John H. Kelley, M.D., in Des Moines when claimant showed no improvement. Claimant first saw Dr. Kelley on February 11, 1980. Dr. Kelley advised claimant he could return to work by late March 1980. Claimant reports he tried to pull weeds at home and had severe pain and, therefore, did not attempt a work return. In May 1980, Dr. Kelley ordered a myelogram and subsequently advised claimant to undergo a laminectomy. Claimant sought a second opinion from Richard A. Brand, M.D., in Iowa City. Claimant then was referred to William R. Boulden, M.D., and Thomas Bowers, L.P.T., by the insurer. Dr. Boulden apparently advised claimant by letter (Defendants' exhibit C) that surgery would relieve his back pain and would give him a 90 percent chance to return to normal functioning. Claimant stated the doctor characterized the surgery as exploratory. Claimant explained he would rather live with his pain than have surgery "come out the way they have indicated it might come out."

Claimant states he has not been able to return to work since his December 4, 1979 injury. He remained on the employer's payroll with full benefits through January 10, 1981, however. His benefits expired January 30, 1981.

Claimant has applied for disability benefits; he has consulted with state vocational rehabilitation; he has not consulted with Job Service or otherwise sought employment since his injury. Claimant underwent evaluation at the Des Moines Mercy Evaluation Center. He consulted with vocational rehabilitation specialists at that time but refused defendants' request of a private consultation. Claimant has sought no schooling in the past year.

He stated he considered registering for a four hour per week gunsmithing school but did not do so since the school began the evening of the day of the hearing.

On redirect examination, claimant stated he feared surgery "would not come out." Defendants' objection to claimant's report of remarks made by his Iowa City doctors as hearsay and his motion to strike that answer is sustained.

Defendants' objection to claimant's query as to whether any examining physicians were opposed to surgery on the grounds that the best evidence regarding the medical facts is the medical records, is sustained.

Claimant recited only Dr. Kelley has released him to return to work. Claimant's hourly rate of compensation was $5.48 per hour. He worked a 45 hour week with 40 hours regular time and five hours overtime.

On recross-examination, it was established that claimant's exhibit 4, claimant's pay vouchers, do not reflect the number of hours claimant worked or the hourly wage paid claimant during each pay period.

Barbara Ann Smith testified in her husband's behalf. She substantiated claimant's injury of December 4, 1979, and that he has had pain since that time. She stated that before his injury date claimant did not indicate back pain.

Todd P. Hines, Ph.D., was the first witness called by the defendants. Dr. Hines is a clinical psychologist whose work emphasis is in industrial labor accidents. He works in consultation with physicians and with the Mercy Vocational Rehabilitation Center and the Mercy Pain Center. Claimant's objection to Dr. Hines' oral testimony on the grounds it was an attempt to change the evidence contained in Dr. Hines' written report, is overruled. Claimant's objection to the doctor's testimony on the grounds claimant was unaware the doctor would be a witness is also overruled. The record reveals claimant originally intended to call the doctor as a witness.
