RE: REPORT ON PROPOSED BRIDGE LOCATIONS OVER  
THE MISSISSIPPI RIVER AT KEOKUK, IOWA

Dear Mayor Eppers:

We are pleased to submit, herewith, our letter report, along with appendices on the advantages and disadvantages of the Main Street Bridge location vs. the Timea-Bank Streets location, and including an analysis of the maintenance and operation of the existing Keokuk Municipal Bridge, all in accordance with our proposal dated September 3, 1976 and accepted by you on September 14, 1976.

STATEMENT OF PROBLEM

The existing Keokuk Municipal Bridge, although in excellent condition, proves inadequate from a standpoint of traffic operation because of the narrow width of the deck and the necessity for frequent openings and closings due to the passage of river traffic. A number of studies have been made over the past years on possible new bridge locations. The Iowa Department of Transportation is now proposing a new bridge at the Main Street location. Doubts have been expressed, by those concerned, about possible future congestion within the central business district due to a bridge at the Main Street location. Prior studies have considered various locations south of the Main Street location. Among these locations was one in the vicinity of Timea-Bank Streets. The purpose of this report is to compare the advantages and the disadvantages of the Main Street location vs. the Timea-Bank Streets location. The Department of Transportation is proposing that the new bridge be built with toll funding. They also propose that the existing bridge be maintained and operated for railroad traffic only. This report analyzes and estimates the cost of maintenance and operation of the existing bridge as a railroad structure.

**MODJESKI AND MASTERS**

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

-2-

November 12, 1976

PREVIOUS STUDIES AND INVESTIGATIONS

In December, 1967, the Iowa State Highway Commission authorized the preparation of a preliminary feasibility report for a proposed new toll bridge at Keokuk, Iowa. This report, published under date of September, 1968, was a bridge location, revenue, and traffic study report for a number of bridge locations. Two locations, which would connect to Main Street in Keokuk, were studied along with additional alternate location studies for a bridge connecting at Sixth Street, a bridge connecting at Timea Street, and a bridge connecting at U. S. 61. This report was updated in 1974, at which time an additional study, a location connecting to Bank Street, was made in addition to the Main Street crossing site.

In June, 1976, the Iowa Department of Transportation issued a report on estimated revenues, expenses, and proposed funding for the Iowa-Illinois Bridge over the Mississippi River at Keokuk, Iowa. This report recommends a bridge to be constructed at the Main Street location which was the Main Street Alternate A in the 1968 report. The report proposes funding for the new bridge through the collection of tolls by the State of Iowa. The report further recommends that the existing dual usage bridge be discontinued for vehicular traffic, but that it continue to operate as a railroad bridge. Operation under this condition would require the maintenance of the bridge for railroad traffic to be continued through the auspices of the Keokuk Bridge Commission.

INFORMATION AND DATA SOURCES

The City of Keokuk provided Modjeski and Masters with the following reports: Bridge Location, Revenue and Traffic Studies, Keokuk, Iowa dated September, 1968. Supplemental Report for Bridge Location, Revenue and Traffic Studies dated 1974. The Iowa Department of Transportation report on Estimated Revenues, Expenses and Proposed Funding of the Iowa-Illinois Bridge over the Mississippi River at Keokuk, Iowa, dated June, 1976. The Keokuk Origin and Destination Traffic Report of July, 1970. Additional traffic information was provided by the Iowa Department of Transportation and the City of Keokuk in October, 1976. The Keokuk, Iowa Comprehensive Plan dated 1975. Additional data was supplied by the City Engineers' office in the form of City Maps and Plans. Several on-the-spot field reconnaissances were made by members of our staff in company with officials of the City. Data pertaining to the operation and maintenance of the existing bridge was obtained from the Keokuk Bridge Commission.

MODJESKI AND MASTERS

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

November 12, 1976

DESCRIPTIONS OF ALTERNATE LOCATIONS

Main Street Location

This location is shown as Alternate A in the 1968 report. This location begins at a point approximately 2,000 feet from the Illinois bank of the Mississippi River on existing Route 136, and proceeds on alignment approximately 450 feet downstream and parallel to the existing Keokuk Municipal Bridge. The Iowa approach would connect directly to Main Street coming to grade approximately at Second Street. The Illinois approach is through a wooded area and crosses the right-of-way of the Toledo, Peoria and Western Railroad. The Iowa approach would cross a portion of Victory Park, located at the foot of Main Street, and from that point to its terminus in the vicinity of Second Street would occupy the existing right-of-way of Main Street. The toll plaza would be on the Iowa approach in the vicinity of First and Main Streets. Main Street, from Second to Seventh Streets, is concrete pavement in excellent condition, 69 feet wide back-to-back of curbs, with two through lanes in each direction and a provision for parallel parking on both sides of the street. At all street intersections, except for the Seventh Street intersection, the parking lanes are shadowed by the curb returns. All intersections, with the exception of Second Street, are controlled through the use of traffic signalization equipment. The Central Business District is centered on Main Street.

Timea-Bank Streets Location

This location begins at a grade intersection with the Hamilton-Warsaw Road approximately 4,700 feet south of Route 136, in Illinois, and proceeds through agriculture land and wooded areas to the Mississippi River, crossing same almost at right angle, approximately 2,000 feet south of the existing Keokuk Municipal Bridge, thence, proceeding across riverfront property, including a portion of the railroad yard, coming to the bluff midway between Timea and Bank Streets, thence, splitting to make use of existing Timea Street for eastbound traffic and existing Bank Street for westbound traffic. The foregoing streets would be used for traffic to and from a connection with Seventh Street. The toll plaza and facilities would be located in the vicinity of First Street. Both Timea and Bank Streets, at the present time, are in a residential area zoned as medium density residential from Fifth to Seventh Streets and high density residential from First to Fifth Streets according to the City of Keokuk's Comprehensive Plan. On Timea Street, there is an elementary school between Sixth and Seventh Streets. Large shade trees line this street between Fourth and Fifth Streets. A railroad grade crossing exists between Third and Fourth Streets, which is presently in poor condition. Bank Street is tree lined between Second and Third Streets and from Fifth to Seventh Streets. A railroad grade crossing, in poor condition, is located at Fourth and Bank Streets. There is another grade crossing on Bank Street between Third and Fourth Streets;

## MODJESKI AND MASTERS

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

-4-

November 12, 1976

however, this crossing is not in use and could probably be abandoned. In the case of both of these streets, the low point for drainage is at the grade crossings. Both of these streets have rather steep grades between Fifth and Sixth Streets with the Timea Street grade being particularly steep. Timea Street is 35 feet wide with a gravel base course and a seal coat from Second to Fifth Streets and is 37 feet wide back-to-back of curb and is constructed of six inch plain cement concrete pavement between Fifth and Sixth Streets and is 35 feet wide back-to-back of curb with a brick base course and asphalt overlay from Sixth to Seventh Streets. Its condition is generally poor from Second to Fifth Streets. Bank Street construction from Second to Fifth Streets is 35 feet wide of asphalt construction and from Fifth to Seventh Streets is 35 feet wide with a brick base course and an asphalt overlay. Its condition is also poor from Second to Fifth Streets.

### STRUCTURES

#### Main Street Location

The proposed Main Street bridge superstructure, as recommended in the prior reports, consists of ten spans of continuous girders approximately 188 feet each; three spans of continuous girders of 165 feet each; five spans of continuous girders of 100 feet each; a short approach span of about 55 feet; and a 450-foot tied arch span over the navigation channel. The substructure consists of two main piers of 100 feet height and nine river piers ranging from 45 to 80 feet in height, along with eight land piers ranging from 25 to 75 feet high. The overall length of structure at this location is 3,380 feet. The proposed width of bridge is 40 feet curb-to-curb.

#### Timea-Bank Streets Location

The superstructure of the proposed bridge at this location, as proposed in the 1974 report, consists of seven continuous girder spans of about 225 feet each, a three span continuous unit with spans of 225 feet, 250 feet, and 225 feet; and a tied arch span of 750 feet over the navigational channel. The substructure consists of two main piers approximately 100 feet high; six river piers ranging from 50 to 85 feet high; and two land piers ranging from 40 to 60 feet high. The overall length of structure is 3,025 feet. The proposed width of the bridge is 40 feet curb-to-curb.

Alternative types of navigation spans that might be considered are a simple truss or a near record length girder span at the Main Street location. At the Timea-Bank Streets location, a continuous truss or cable stayed girder might also be considered. Although alternative types of navigation channel spans might be under consideration for final design, it is fair to say that the type of structures that are recommended in the previous reports are entirely reasonable.

## MODJESKI AND MASTERS

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

-5-

November 12, 1976

The structures are about equivalent aesthetically. The further questions of structural advantages and disadvantages of these two sites and their proposed bridges seems to rest strictly with the economy of the structures. Here, the Main Street site appears to have the advantage, although its overall length is 355 feet longer than the Timea-Bank Streets structure. This is more than offset by the 300 foot difference in the navigation channel spans. The question evolves around whether the cost of 655 feet of girder span is comparable to the cost of increasing the arch length 300 feet. It is assumed that the economical approach span lengths selected for both structures will result in essentially the same cost per foot of structure for that portion of the bridges. Using broad assumptions and approximate equations, resulting from long years of experience in bridge design, and further assuming continuous girders to be an economical form of construction and tied-arches to be only average, it would appear to result in a 20 percent greater cost for the Timea-Bank Streets site. Furthermore, about a 35 percent reduction in the cost of the navigation channel span would be required to equalize the estimated cost of both sites. This, of course, favors the Main Street location, and indicates that even small savings from slight variations in span length or structure type are not likely to alter these results.

The only significantly different feature between these structures is the relative cost, caused primarily by the difference in the lengths of the navigation channel spans. It appears that the Timea-Bank Streets structure would be in the neighborhood of 5 to 20 percent greater than at the Main Street location. Without making detailed studies and cost estimates, which are beyond the scope of this report, it is more probable that the 20 percent figure is more accurate; however, for cost comparison purposes, we have used 15 percent.

### TRAFFIC

#### Assignment

The available traffic data was examined and a base year (1975) ADT volume assignment prepared for each alternative. The design year (2000) ADT volumes were projected by applying an appropriate growth factor to each base year assignment.

Iowa Department of Transportation reported a 1975 ADT of 6,650 vehicles and has projected an ADT of 13,574 vehicles for the year 2000, on the bridge. This yields an annual growth of 2.9 percent over 25 years for the river crossing. The dispersion of the traffic throughout the design period was assumed to remain in the same proportions as that reported in the 1970 Origin-Destination Traffic Report.

The uniform growth factor method assumes that the land use in each zone will not change over the period, that future trip generation will reflect the past, that sufficient undeveloped area remains to support

MODJESKI AND MASTERS

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

-6-

November 12, 1976

this growth, that all trips in all zones increase at the same rate. It is doubtful that the stated parameters will prevail in the City of Keokuk throughout the design period. However, since no information was readily available concerning future growth for various areas of Keokuk, the uniform growth factor method was deemed best for use in this study. We feel that the method is sufficiently accurate to predict the dispersion of future bridge traffic and may be used to evaluate the relative merits of the alternate bridge locations.

This assignment also assumes that congestion and delays will be so severe on Main Street north of Seventh Street that traffic will divert to the U. S. 136/61 bypass. This probably will not happen until 1990 to 1993, assuming a uniform 2.9 percent annual growth. It is doubtful that the Keokuk area can support such an extreme growth rate or that the traffic will divert to the bypass. It should also be noted that unless traffic engineering steps are taken to prohibit through traffic on Timea-Bank Streets, these streets will carry much of the traffic bound for the northwest areas of Keokuk instead of the U. S. 136/61 bypass.

See Exhibit IV in the Appendix for further details on traffic assignments. The traffic assignments are tabulated in Exhibits Numbered IV-A through IV-F in the Appendix.

Analysis

Main Street Location

Traffic patterns on Main Street from Second Street through Seventh Street were analyzed first with current, (1975) traffic volumes, and then with the design year (2000) traffic volumes under existing geometric conditions. While the quality of traffic service in the Keokuk CBD is currently acceptable, overloading of the Third Street, Fourth Street, Fifth Street and Seventh Street intersections will occur prior to the end of the design period (See Table I). This analysis assumes that the committed project to widen Seventh Street from Main Street to Route 61 is implemented.

TABLE I

<u>Intersection</u>	<u>Year Service Level C is Exceeded</u>	<u>Year Service Level E is Exceeded</u>
Second and Main	2000+	2000+
Third and Main	1986	1993
Fourth and Main	1996	2000+
Fifth and Main	1993	1999
Sixth and Main	2000	2000+
Seventh and Main	1986	1992

MODJESKI AND MASTERS

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

-7-

November 12, 1976

It was determined that Main Street intersections between Second Street and Seventh Street could be feasibily improved to provide an acceptable quality of traffic service in the Keokuk CBD with the river crossing at the Main Street location. Signalization of the Second and Main Streets intersection would be necessary. At the Third and Main Streets intersection, a right turn lane from Main Street into Keosippi Plaza and widening of the Keosippi Plaza entrance to provide three traffic lanes, would be required. Curb side parking would be banned within 150 feet of the intersection on Fourth Street east and on Fifth Street east and west. At the Seventh and Main Streets intersection, extensive widening of both Seventh Street and Main Street would be necessary. Parking would be banned within 250 feet of the intersection on Seventh and Main Streets. The parking loss would be approximately 10 spaces at Third and Main, 6 spaces at Fourth and Main, 12 spaces at Fifth and Main and 25 spaces at Seventh and Main Streets. Channelizing islands on Seventh Street west and on Main Street should be included to provide pedestrian refuge. The reconstruction at Seventh and Main Streets could be accomplished as part of the Iowa Department of Transportation's Seventh Street widening project.

Timea-Bank Streets Location

Timea-Bank Streets would be operated as a one way pair between Second Street and Seventh Street. Both streets would revert to two way operation beyond Seventh Street. Signalization would be required at Fourth and Bank Streets, Fourth and Timea Streets, Seventh and Bank Streets and Seventh and Timea Streets. Both Bank Street and Timea Street would be rebuilt to 40 foot width, providing two traffic lanes with parking on both sides.

With the bridge at the Timea-Bank Streets location, traffic operations on Main Street from Second Street through Seventh Street were analyzed with design year 2000 traffic volumes and existing geometric conditions. Construction of the Timea-Bank Streets alternative would provide acceptable quality of traffic service on Main Street throughout the design period at all locations, except at Seventh Street and Main Street intersections. Quality of service would deteriorate at Seventh and Main Streets by 1987 and overloading would occur by 1993. Extensive reconstruction of Seventh Street at the Seventh Street and Main Street intersections would be required and could be incorporated into the Seventh Street widening project proposed by the Iowa Department of Transportation. A loss of approximately 45 parking spaces (all at the Seventh Street and Main Street intersection area) would occur if this alternative were implemented.

**MODJESKI AND MASTERS**

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

-8-

November 12, 1976

Traffic Analysis Comparison

In terms of traffic operations, the Timea-Bank Streets bridge location has many advantages and few disadvantages when compared to the Main Street bridge location. These advantages/disadvantages are summarized below.

1. The Timea-Bank Streets bridge location will relieve congestion in the Keokuk CBD by removing non-CBD bound traffic (including trucks) from Main Street, while with the Main Street bridge location, the non-CBD traffic will remain on Main Street.
2. Average delay and total delay encountered by a driver on Main Street will be 40-45 percent less with the Timea-Bank Streets bridge.
3. Main Street will operate at a very high level of service (A) with the Timea-Bank Streets bridge location, while the quality of traffic service on Main Street with the Main Street bridge location will be barely acceptable (Service Level D).
4. Both alternatives will cause a loss in curb parking; however, the loss with the Timea-Bank Streets alternate will be approximately 15 percent less and will be concentrated at the Seventh and Main Streets intersection.
5. Both alternatives will require widening of Seventh Street beyond that proposed by the Iowa Department of Transportation. The Main Street bridge location alternate will also require widening of Main Street at Seventh and Main Streets intersection.
6. The chief disadvantage of the Timea-Bank Streets bridge location is that it will change the character of Timea and Bank Streets from residential streets to major routes.

See Exhibit V in the Appendix for a summary of traffic operation. The intersection capacity analyses are shown in Exhibit VI of the Appendix.

ALIGNMENT COMPARISONS

Main Street Location

Geometric Alignment

Advantages of this location are more direct routing, better overall horizontal and vertical alignment, and the absence of any grade crossings in Keokuk. The disadvantages of this location would be a possible grade crossing on the Illinois approach, and a possible introduction of more overall travel time, due to congestion of traffic on Main Street.

MODJESKI AND MASTERS

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

-9-

November 12, 1976

Timea-Bank Streets Location

Advantages of this location, alignmentwise, are possible better travel times at peak hours, and it will serve as a traffic relief measure for congestion on Main Street, while still being located physically close to the Central Business District. Disadvantages are more numerous and include less direct routing, the introduction of the grade intersection and curvature on same at the entrance to the Hamilton-Warsaw Road, a definite vertical grade problem on both Timea and Bank Streets in the vicinity of Fifth and Sixth Streets, grade crossings on both approaches, and the definite possibility of a drainage problem at the grade low points located at the railroad grade crossings on both Timea and Bank Streets.

OTHER LOCATION COMPARISONS

Main Street Location

The following statements are concerned with definite advantages of this location.

1. Less right-of-way and demolition costs.
2. No housing or business displacement.
3. Through traffic will not be routed through zoned residential areas.
4. The Mississippi River navigation channel is crossed at a point where navigation hazards are reduced to a minimum.
5. Less hindrance to river operations.
6. Less interference with existing railroad location and operation.
7. Less overall disruption of the environment.

Decided disadvantages of this location are as follows.

1. Disruption of a public park area.
2. Loss of the use of Main Street, east of Second Street as a local traffic artery.
3. Possible interruption to Main Street traffic during construction.

MODJESKI AND MASTERS

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

-10-

November 12, 1976

4. Disruption to the traffic pattern on the approach to the existing bridge during construction.
5. Possible serious contribution toward traffic congestion in the Central Business District.

Timea-Bank Streets Location

Advantages of this location are as follows.

1. Will provide definite traffic relief for the Central Business District.
2. Less interruption to local traffic during construction.

Disadvantages of this location are as follows.

1. This location will definitely be more expensive.
2. Through traffic is introduced in a residential area.
3. More right-of-way will be required, which will require loss of some residences.
4. Through traffic will be routed past a school, namely, the school on Timea Street between Sixth and Seventh Streets.
5. More tree cover will be removed.
6. May cause disruption to the railroad yard on the west bank of the Mississippi River.
7. Will involve railroad grade crossings on both Timea and Bank Streets.
8. Will involve a greater travel distance to the Central Business District shopping area from Illinois.
9. May introduce navigation hazards in the approach channel to Lock Number 19.
10. More disruptive to environmental conditions.

**MODJESKI AND MASTERS**

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

-11-

November 12, 1976

**COST COMPARISONS**

A cost comparison estimate sheet is included in the appendices. Since a detailed cost comparison estimate was beyond the scope of this study, it was decided to use basic cost estimates from the Iowa Department of Transportation Report, Table B, dated June 10, 1976. However, it was necessary to add costs for reconstruction on Timea and Bank Streets between Second and Seventh Streets, assuming a 40 foot width of street back-to-back of curbs. Costs were also added to the Timea-Bank Streets location for improvement of the Hamilton-Warsaw Road between the bridge approach intersection and its intersection with Route 136. On the basis of the preliminary structure analysis, the Timea-Bank Streets location structure costs were figured at 15 percent increase over the Main Street location.

While estimates are not provided in this report, there will be greater right-of-way and demolition costs on the Timea-Bank Streets location.

For the total of the items shown in the cost comparison estimates, indication is that the Timea-Bank Streets location costs will be approximately 25 percent greater than the Main Street location.

**KEOKUK TRAFFIC ALTERNATE FOR MAIN STREET BRIDGE LOCATION**

From the foregoing, it was determined that the Main Street location, although it has many advantages, has a decided disadvantage in that it will cause traffic congestion within the Central Business District, while the Timea-Bank Streets location will tend to remove that traffic congestion within the Central Business District. However, in order to benefit from all the other decided advantages for the Main Street location, a study was made to use Exchange Street between Second and Seventh Streets as a Central Business District bypass for through traffic. Exchange Street between Second and Fourth Streets has been recently reconstructed to improve alignment and grades and consists of six inch plain cement concrete pavement, 45 feet wide back-to-back of curb. Between Fourth and Seventh Streets, Exchange Street is in good condition with brick base and asphalt surfacing and is 35 feet back-to-back of curb. Except for the intersection with Seventh Street, Exchange Street does not need to be improved at the present time or within the near future in order to handle the expected traffic load for such a bypass. Parking should be banned on one side of Exchange Street between Fourth and Seventh Streets to provide sufficient width to handle the bypass traffic. With the concurrence of the Iowa Department of Transportation, this so-called bypass could be signed as traffic route 136 and 61. Our traffic studies indicate that an acceptable level of traffic service would be provided by this

MODJESKI AND MASTERS

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

-12-

November 12, 1976

bypass. It would be necessary to introduce signalization of the Second and Main Streets intersection and the Seventh and Exchange Streets intersection. Although the bypass is expected to relieve congestion on Main Street, it may still be necessary to introduce some partial parking bans with the inherent loss of parking spaces at the Main Street intersections between Second and Seventh Streets in order to maintain an acceptable level of service on Main Street and assure that the signalization at these intersections works efficiently.

Advantages attributable to use of a CBD bypass are as follows.

1. Traffic bound for the north and west will be diverted from Main Street, thereby providing definite relief on Main Street leading to a higher level of service (C).
2. Average and total delay to vehicles on Main Street will be 30 to 35 percent less with the use of a bypass.
3. The parking loss on Main Street will be approximately 10 percent less.
4. The bypass can be implemented without any intersection widening other than those already programmed as part of the Iowa Department of Transportation's Seventh Street Widening Project. Traffic engineering measures alone will suffice.

The main disadvantage to the use of the proposed CBD bypass is that it does not provide as high a level of relief to the Keokuk Central Business District as does the Timea-Bank Streets location. However, the quality of traffic service that it will provide is acceptable at all locations throughout the projected usage.

EXISTING KEOKUK MUNICIPAL BRIDGE -  
MAINTENANCE AND OPERATION FOR RAILROAD TRAFFIC

Under the current plan of the Iowa Department of Transportation, it is their intention to construct a new bridge crossing the Mississippi River for highway usage. The State of Iowa will retain the highway tolls on this new highway bridge to pay for its construction. The existing bridge must continue to remain in service for rail traffic.

The existing bridge is a low level dual usage bridge with railroad traffic using the lower level and highway traffic the upper level. At the navigation lock on the Iowa shore, there is a swing span to permit the passage of river traffic. The existing bridge has been inspected yearly by Modjeski and Masters for a long period of time and is in excellent condition considering the age of the structure. Since the Bridge

**MODJESKI AND MASTERS**

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

-13-

November 12, 1976

Commission may be required to maintain the bridge in the future for rail operations, it is recommended that the roadway deck and both highway approach trestles be removed to minimize the maintenance expense.

The Toledo, Peoria and Western Railroad operates one freight train to Keokuk daily, with Keokuk the terminus of their operation. The train operates six days per week, arriving at the bridge during the early morning considerably after the schedule of 1:30 A.M., but normally 6:00 A.M. to 8:00 A.M. The return leaves more promptly to its 6:30 P.M. schedule.

The Norfolk and Western Railroad operates across the bridge under service it has requested to be abandoned. Service now operates from Quincy to Keokuk twice a week with 6 to 10 cars per train. The trains normally enter Keokuk during the early afternoon of Monday and Thursday and begin their return at noon Tuesday and Friday.

Since the rail traffic would normally be limited to the above traffic, it is recommended that the swing span of the bridge be in the open position as the normal condition. This will permit the uninterrupted flow of river traffic and reduce the expenses for bridge operators. The U. S. Army Corps of Engineers and the U. S. Coast Guard have offered no objection to this procedure. At the present time, when the swing span is in the open position the bridge is over the lock wall of the Keokuk lock and dam. This lock wall consists of two gravity walls, founded on rock, and filled with compacted material. It is recommended that two rest piers be constructed on this lock wall to secure the bridge when in the open position. The U. S. Army Corps of Engineers was contacted and has offered no objection to the construction of two rest piers on the lock wall.

It is reasonable to consider placing the swing span in the open position to allow unrestricted river navigation until notice of the need for closing, for the crossing of a freight train, necessitates dispatch of an operator to close the swing span.

The Bridge Section of the Second District of the U. S. Coast Guard could anticipate no difficulty with navigational requirements if the span were securely held in the open position, clear of the navigational channel. A railroad bridge at Keithsburg, Illinois, 64 miles upstream, is similarly operated, from the open position, on demand.

The Toledo, Peoria and Western Railroad operating to Keokuk passes a 24-hour operator's station at LaHarp about 30 miles from Keokuk and could provide notice of required crossing at 1-1/2 to 4 hours before the train reached the bridge, with a tolerance of one hour in arrival time. A "beeper" station 9 miles away would give more immediate notice. Departures from Keokuk could provide reliable advance notice. Norfolk and Western Railroad could give notice 30 to 40 minutes in advance of their train approach to the structure when the crew changes at Elvaston, Illinois, 8 miles away, if this service remains in operation.

MODJESKI AND MASTERS

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

-14-

November 12, 1976

It would appear that the Keokuk Department of Public Works could operate the bridge under a method where operators could be dispatched to close the span for train crossings 12 to 16 times per week. They could also inspect and maintain the operating machinery of the swing span along with a cursory inspection of the railroad deck daily.

Financial Considerations and Costs

In addition to the loss of the highway users' tolls to the Bridge Commission, the loss of \$44,000.00 in taxes to the City of Keokuk and \$38,000.00 to Illinois may be expected. Some consideration could be given by the State of Iowa to provide a like amount of funds to the taxing bodies in Iowa and Illinois.

Operation and maintenance of the railroad bridge at minimum cost to the City of Keokuk would be contingent upon the following:

1. Supervision of operation and maintenance by the Department of Public Works of Keokuk.
2. Operation of the swing span from a normal open position on call from the railroad by a single operator out of the Department of Public Works.
3. Removal of the highway portion of the structure to cut maintenance costs.
4. Minimum regular maintenance in the operation and maintenance budget and special maintenance by contract.

The estimated annual cost might be expected as follows:

a.	A swing span operation 2,500 hours per year	\$24,000.00
b.	Maintenance of swing span structure and machinery	12,000.00
c.	Maintenance of railway deck only	6,000.00
d.	Maintenance of piers and superstructure (minimum without repainting or structural repairs)	<u>18,000.00</u>
	TOTAL	\$60,000.00

MODJESKI AND MASTERS

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

-15-

November 12, 1976

The present average annual revenue from railway and permit sources is \$60,000.00. Since the Norfolk and Western Railroad has made application for abandonment of its service, there may be a further reduction of revenue from the railroad sources. Alternative rail service is available in the Keokuk area by use of the Burlington Northern System or the Toledo, Peoria and Western Railroad. Any use of the Burlington Northern would provide no revenues to operate and maintain the bridge. It is estimated that the abandonment of service by the Norfolk and Western Railroad would amount to a reduction in bridge revenues of approximately \$3,000.00 per year.

It is recommended that the capital cost of removing the highway deck and highway approach spans and the construction of the required rest piers on the lock wall, estimated to be \$200,000.00 be included in the cost of the construction of the new highway bridge. Assuming the above can be accomplished, it is still apparent that the City of Keokuk will not realize sufficient revenues from the railroad traffic to maintain the railroad structure. The estimate for operation and maintenance presented above is only for routine maintenance and does not cover repainting or structural repairs. It is recommended that a reserve fund to cover special maintenance be funded at approximately \$25,000.00 per year, plus sufficient funds to cover the deficiency of operating revenues of approximately \$3,000.00 a year.

Consideration should be given by the City of Keokuk of transferring the operation and maintenance responsibilities to the State to avoid the expense continued operation with greatly reduced revenues.

SUMMARY OF FINDINGS

1. The advantages of the Main Street location would appear to greatly outweigh the advantages of the Timea-Bank Streets location with the exception of the item of traffic congestion within the Central Business District.

2. This traffic congestion disadvantage can be partially relieved by use of a bypass using Exchange Street between Second and Seventh Streets.

3. It would appear to be feasible to perform yearly maintenance and operation of the existing Keokuk Municipal Bridge for railroad traffic, through the use of personnel of the Keokuk Department of Public Works.

4. If continued operation and maintenance of the existing bridge is to be a function of the City of Keokuk, it is recommended that funding assistance be supplied through State funds in order to make up the expected deficit.

MODJESKI AND MASTERS

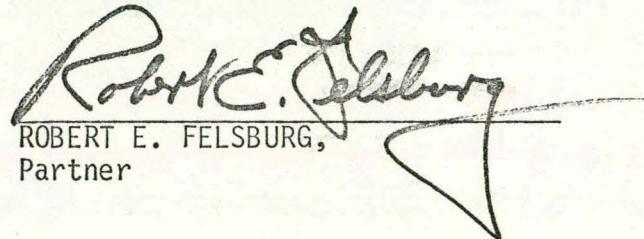

The Honorable Charles F. Eppers, Mayor  
City of Keokuk

-16-

November 12, 1976

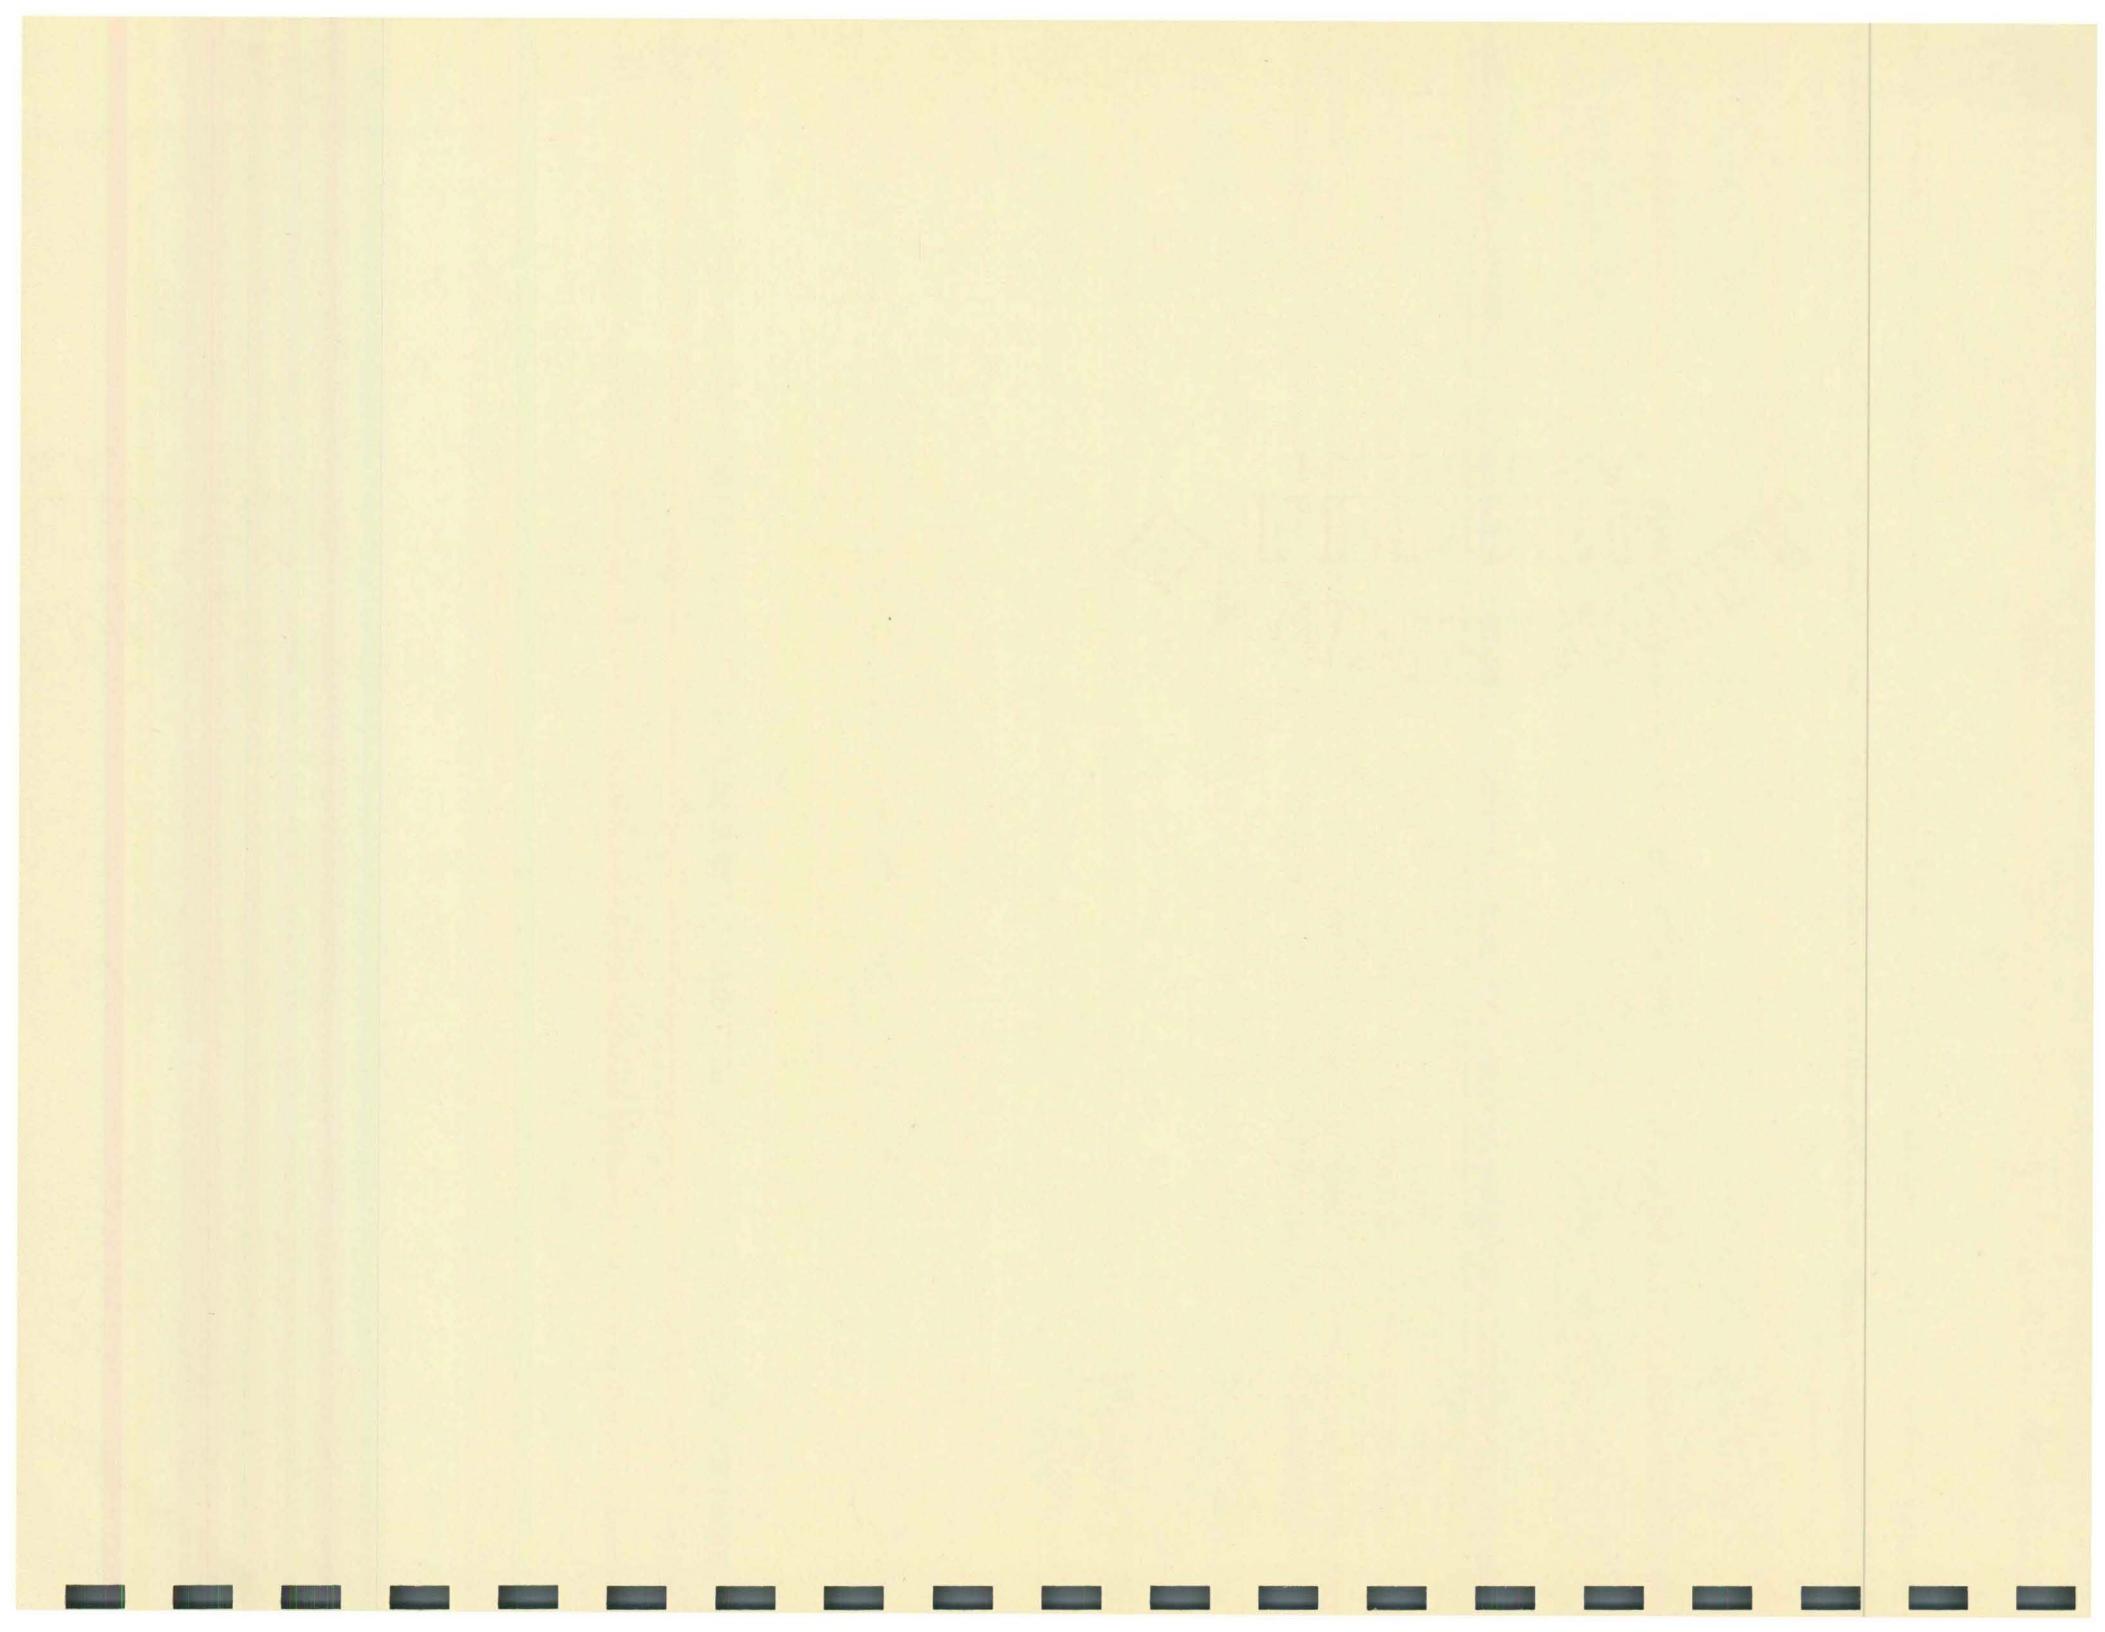

Grateful acknowledgement is extended to you, council members,  
your staff, members of the Bridge Commission, and personnel of the  
Iowa Department of Transportation for the excellent cooperation and  
helpful assistance given us in the development of this report.

Respectfully submitted,

  
ROBERT E. FELSBURG,  
Partner

MODJESKI AND MASTERS

EXHIBIT IV - TRAFFIC PROJECTIONS

Basic information for the traffic assignment was obtained from the following sources:

1. Keokuk, Iowa - Origin and Destination Traffic Report of July, 1970.
2. 1976 Iowa Department of Transportation Bridge Study.
3. 1975 Comprehensive Plan, Keokuk, Iowa.
4. Howard, Needles, Tammenn and Bergendoff Bridge Study, 1968 and 1974.
5. Field Counts from Iowa Department of Transportation, Second and Main Streets and Seventh and Main Streets taken September, 1976.

I. ADT Traffic Assignment

No information was available indicating future growth for any of the origin and destination tracts or stations, except for Station 705, the bridge. Iowa Department of Transportation reported a 1975 ADT of 6,650 vehicles and has projected an ADT of 13,574 vehicles for the year 2000 on the bridge. This yields an annual growth of 2.9 percent over 25 years.

The 1970 ADT trips between stations and tracts of the O-D Study were factored to 1975 ADT volumes by multiplying by 1.07, the ratio of 1975 ADT bridge traffic to 1970 ADT bridge traffic. The 1975 ADT was obtained from the Iowa Department of Transportation 1976 bridge study. The 1970 ADT was given in the Iowa Department of Transportation O-D study. The year 2000 ADT volumes were obtained by applying the 2.9 percent annual growth factor (multiplier 2.045) to the 1975 ADT's uniformly.

The following assumptions were made in determining the traffic assignment for the alternatives evaluated. The tract and station numbers are the same as were used in the 1970 O-D study (See Exhibit II for tract and station numbers).

Alternate No. 1 - Main Street Bridge Location

A. Main Street traffic bound for the Water Street area will be routed via Second Street, Johnson Street, and/or Bank Street with the predominant trip interchange occurring between Main Street and Second Street southwest.

MODJESKI AND MASTERS

Exhibit IV (Continued)

-2-

B. At Seventh and Main Streets, the trip interchange between Bridge Station 705 and the study area tracts and stations, was assigned as follows:

1. Tracts 7, 11, 12, 13, 14 and Stations 701, 702, 706, 707, 708, 709, and 710 to U. S. 136 (Seventh Street eastbound).

2. Tracts 1, 5, 6, 8, 9 and Station 703 to U. S. 218 (Main Street).

3. Tract 4 and Station 704 to Seventh Street eastbound.

C. Dispersion of CBD bound traffic (Tract 2) was based on gross square feet of parking area in the CBD, as shown below:

- 1) Keosippi Plaza - 45 percent.
- 2) Commercial uses west of Main Street between Fourth and Seventh Streets - 20 percent.
- 3) Commercial uses east of Main Street between Fourth and Seventh Streets - 35 percent.

ADT volumes were available from the O-D study for the principal streets in the CBD; however, no volumes were available for Third or Sixth Streets. Third Street traffic was assumed to be greater than Seventh Street but less than Fourth or Fifth Streets, say 1900 ADT. Sixth Street was assumed to carry about 1,000 ADT.

D. Tract 10 traffic was assigned to Second Street westbound.

E. Tract 3 traffic was assigned to Fourth Street eastbound.

F. This assignment assumes that congestion and delays will be so restrictive on Main Street north of Seventh Street that traffic bound for Tracts 7, and 14 and Stations 701 and 702 will divert to U. S. 136/61 route.

Alternate No. 2 - Timea-Bank Streets Bridge Location

A. Timea and Bank Streets would be operated as a one way pair between Second Street and Seventh Street. North of Seventh Street, both streets would revert to two way operation.

B. The trip interchange between Bridge Station 705 and the study area tracts and stations, was assigned as follows:

1. Tracts 7, 11, 12, 13, 701, 702, 706, 707, 708, 709, and 710 to U. S. 136 (Seventh and Bank Streets Intersection or Seventh and Timea Streets Intersection).

MODJESKI AND MASTERS

Exhibit IV (Continued)

-3-

2. Tracts 1, 4, 5, 6 and Stations 703 and 704 to U. S. 136 east via Seventh Street and Main Street.

3. Tracts 8 and 9 to Timea and Bank Streets.

4. CBD bound traffic (Tract 3 and Tract 2) to Fourth Street.

5. Tract 10 to Second Street.

6. At Main and Seventh Streets, traffic bound for Tracts 4 and Station 704 would remain on Seventh Street. Traffic for Tracts 1, 5, 6, and Station 703 would turn left onto Main Street.

C. This assignment assumes that traffic engineering measures will have been instituted to prohibit traffic bound for Tract 7 and Stations 701 and 702 from using Timea and/or Bank Streets north of Seventh Street.

Alternate No. 3 - Main Street Bridge Location with a CBD Bypass

A. The CBD bypass would consist of Second Street between Main and Exchange Streets and Exchange Street from Second Street to Seventh Street with access to the bridge via Second Street.

B. The trip interchange between Bridge Station 705 and the study area tracts and stations was assigned as follows:

1. Tracts 7, 11, 12, 13, 14 and Stations 701, 702, 706, 707, 708, 709, and 710 to U. S. 136 at Seventh and Exchange Streets intersection.

2. Tracts 8 and 9 to remain on Exchange Street.

3. All other trip interchanges would remain as in Alternate 1, Main Street Bridge Location.

C. This assignment assumes that sufficient traffic, control measures will have been employed to discourage traffic bound for Tract 7 and Stations 701 and 702 from using Exchange Street north of Seventh Street.

See Exhibits IV-A, IV-B, and IV-C for the ADT traffic assignments for the alternatives studied.

II. DHV Traffic Assignment

Design hourly volumes (DHV) were calculated using the ADT traffic assignment as a base. KDT factors were obtained from Iowa Department of

**EXHIBIT V - TRAFFIC OPERATION SUMMARY**

A summary of traffic operations on Main Street in the Keokuk CBD was prepared for each of the alternatives evaluated (See Exhibits V-A, V-B, V-C, and V-D). Existing geometric conditions are shown on Exhibit III. This summary refers to conditions that would be encountered during the peak hour in the design year 2000.

Average delay is a measure of the delay an individual driver may encounter during the peak hours. Total delay is the sum of individual delays to all drivers. It serves as a measure of the relative effectiveness of an alternate.

## MODJESKI AND MASTERS

EXHIBIT VI - INTERSECTION CAPACITY ANALYSIS

Intersection capacity analysis was performed for all intersections on Main Street from Second Street through Seventh Street and for those intersections for which signalization would be required prior to the end of the design period. Since short time volume counts were not available to enable calculation of a peak hour factor (PHF), a PHF = 0.85 was selected as typical of a small urban area such as Keokuk. Main Street intersections were analyzed under "CBD" area conditions while all other intersections were assumed to operate under "Fringe" area conditions. Service Level C was chosen as design service level for all intersections.

The results of the intersection capacity analysis for the alternatives studied follow. See Table I below for explanation of the "Chart Code" used for analysis.

TABLE IBASE CONDITION SELECTION CHART

<u>Chart Code</u>	<u>Street Type</u>	<u>Parking</u>	<u>Area</u>
1	Two Way	No	Central Business District
2	"	No	Fringe
3	"	No	Outlying Business District
4	"	No	Residential
5	"	Yes	Central Business District
6	"	Yes	Fringe
7	"	Yes	Outlying Business District
8	"	Yes	Residential
9	One Way	No	Central Business District
10	"	No	Fringe
11	"	No	Outlying Business District
12	"	No	Residential
13	"	One Side	Central Business District
14	"	"	Fringe
15	"	"	Outlying Business District
16	"	"	Residential
17	"	Both Sides	Central Business District
18	"	"	Fringe
19	"	"	Outlying Business District
20	"	"	Fringe
21	Two Way	No	Rural
22	Separate Turning Lanes - No Separate Signal		
23	Separate Turning Lanes - With Separate Signal
