JANUARY, 1903. No. 1.

CONTENTS.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECAST OFFICIAL,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

DES MOINES:
BERNARD MURPHY, STATE PRINTER
1903.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Meteorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve
Algona	C. D. Pettibone
Allerton	Ed. T Burns
Alta	D. E. Hadden
Alta (near)	W. J. Minard
Amana	Conrad Schadt
Ames	Exp. Station
Atlantic	J. W. Love
Audubon	Frank Mott
Baxter	W. T. Thorp
Bedford	E. E. Healy
Belknap	A. W. Rankin
Belle Plaine	S. P. Vandike
Bonaparte	Hon. B. R. Vale
Britt	G. P. Hardwick
Buckingham (Traer P. O.)	Dr. W. A. Daniel
Burlington	I. S. Shontz
Carroll	Moses Simon
Carson	Agent C. B. & Q. Ry
Cedar Rapids	Electric Light & Power Co
Centerville	C J Brower
Chariton	Hon. S. H. Mallory
Charles City	C. H. Priebe
Chester	C. H. Meredith
Clarinda	A. S. Van Sandt
Clear Lake	John Cobb
Clinton	Luke Roberts
College Springs	A. M. Finley
Columbus Junction	Prof. H. E. Simpson
Corning	Jerome Smith
Council Bluffs	Agent C. R. I. & P. Ry
Cresco	J. P. Howe
Cumberland	Agent C. B. & Q. Ry
Danville	Agent C. B. & Q. Ry
Davenport	*J. M. Sherier
Delaware	Wm. Ball
Decorah	F. H. Baker
Denison	Prof. W. C. Van Ness
Des Moines	*Geo. M. Chappel
De Soto	R. D. Minard
Dows	A. C. Fuller
Dubuque	Orin Parker
Earlham, R. F. D	Geo. Phillips
Eldon	T. Madden
Elkader	Chas. Reinecke
Estherville	Alvero O Salisbury
Fairfield	Prof. W. W. Mendenhall
Fayette	R. Z. Latimer
Fort Dodge	C. R. I. & P. Agent
Ft. Madison	Miss L. A. McCready
Fonda	H. P. Barron
Forest City	J. A. Peters
Galva	D. W. Farnsworth
Gilman	Jas. L. Wylie
Gladbrook	Agent C. G. W. Ry
Grand Meadow (Postville P. O.)	F. L. Williams
Greene	J. L. Cole
Greenfield	J. G. Culver
Grinnell	Prof. S. J. Buck
Grinnell (near)	A. O. Price
Grundy Center	Ed King
Guthrie Center	W. F. Braun

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. JANUARY, 1903. No. 1.

EDITORIAL NOTES.

Marconi has expressed the opinion that wireless messages sent across the Atlantic will cost ten cents per word at the outset, and will eventually be transmitted at a one cent rate.

* * *

The Rockford *Register* says: "Iowa furnishes more winter tourists for California than any other state. They go from this state because they are able to go, and they are able to go because they live in this state."

* * *

Marconi took advantage of a recent storm to test the effects of adverse weather conditions on his wireless telegraph system, and the messages were successfully transmitted while storms were raging at both ends of the line.

* * *

An inventive genius mounted two windmills on a wagon, the wind serving as power to haul the wagon to any place desired. A pulley on a shaft driven by the windmills can be belted and used for driving various kinds of farm machinery. Thus saith a newspaper item.

* * *

The meteorological station at Mason City has been re-established, with Mr. J. S. Mills serving as voluntary observer. Mr. Mills is highly recommended and takes a deep interest in the service. It is desirable that a permanent station shall be maintained at that important commercial center.

* * *

We have received a valuable table showing the monthly and annual rainfall at Clermont, Fayette county, Iowa, for the years 1877 to 1902, inclusive, the data being the records of observations by Augusta Larrabee and William Larrabee, Jr. The table will be published in the annual report for 1902.

* * *

It is not often that famine visits a country as a result of excessive rainfall, the periodical famines of central Russia and India being invariably caused by drought, but in the northern districts of Sweden and in Finland a famine involving the lives of over 100,000 people exists to-day as a result of the excessive rainfall of the year 1902.—*J. S. Trigg, in Rockford Register.*

* * *

We hear reports now and then of discoveries of oil in Iowa. Well, there's plenty of oil in the soil of this state—oil in paying quantities. But the best of it is not to be found in gushers, or by boring. It's the oil of corn, and it can be produced in great abundance by planting, cultivating and harvesting that great staple product. There may be traces of oleaginous matter in the lower rocks, but there is some uncertainty about striking paying quantities of patroleum in this section. As to corn-oil, however, there's no doubt whatever, and it's good for millions of revenue.

* * *

At the recent annual congress of the Swiss Society of Natural Science, held at Berne, a new and interesting theory as to the origin of the appearance of the higher atmosphere, which is popularly styled as the "blue sky," was advanced by M. Spring, a well known scientist of Liege. Hitherto the azure tint has been supposed to be due to the refraction of light upon minute corpuscles disseminated in the air M Spring, however, has conceived a new explanation of the phenomenon. He has carried on a number of experiments with luminous rays under almost all conceivable conditions, injecting them into agitated solutions, and into a glass tube containing pseudo solutions, such as chlorides of aluminum, of absolute limpidity; but although he could obtain red, yellow, violet, etc, under no circumstances could he obtain blue, until by the use of electricity he secured a perfectly pure atmosphere in which blue was clearly discernible. M. Spring therefore concludes that the blue of the sky is purely electrical in origin, and is an essential quality of the air.—*Scientific American.*

AUSTRALIAN DROUGHTS AND THE MOON.

Mr. H. C. Russell, Director of the Observatory at Sydney, New South Wales, has published in the Journal and Proceedings of the Royal Society of New South Wales, for the year 1901, a memoir on the relation of the moon's motion in declination and the quantity of rain in that colony, in which the author concludes "that rain is clearly shown to come in abundance when the moon is in certain degrees of her motion south; but when the moon begins to go north then droughty conditions prevail for seven or even eight years. This phenomenon repeated for three periods of nineteen years each constitutes a marvellous coincidence, such that there must be a law connecting the two phenomena."

The influence of the moon on the weather is a matter that will not be downed by the exercise of any amount of common sense. According to the most ancient notions, the moon ought to have and must have a controlling influence in excess of the sun's, and every one who seeks to demonstrate its power is liable to become infatuated with the study. The moon has so many variations north and south of the equator, north and south of the ecliptic, to and from the earth, from new moon to full moon, conspiring with the sun and opposing the sun, that it does seem as though one ought to be able to make its periodical oscillations agree with some of the many variations in the aspect of the weather. However, we know of but one relation between the moon and the earth's atmosphere that can be said to have been settled upon a rational basis, and that is the matter of atmospheric tides. Laplace stated that the semi-

diurnal lunar tide in the atmosphere ought to amount to about 0.003 inches of barometric pressure for equatorial stations, and this agrees with the results of observations carried on at Batavia, Java. His formu'æ also showed, although we believe he did not state the fact, that as the moon moves north and south of the equator monthly, there ought to be a fortnightly tide, or a general pull of the atmosphere southward for two weeks and northward for two weeks. This, we believe, was first demonstrated as an observable quantity by A.Poincare, a civil engineer of Paris, and a member of the Meteorological Society of France. From his articles published by that society in 1885–1888, we learn that the average barometric pressure on parallels of latitude around the whole globe, as measured on the International Maps published by the United States Weather Bureau, give the following results: The pressure on latitude 40° minus that on latitude 10° is plus 1 88 millimeters when the moon is in the extreme south and plus 4.82 millimeters when the moon is in the extreme north. The normal difference is plus 3.35. This indicates that when the moon is furthest north there is a slight accumulation of atmosphere in the Northern Hemisphere, amounting to an increase of 1.47 millimeter, or 0.06 inch of pressure on the parallel of 40°.

Now, all lunar phenomena go through rather rapid periodic changes. What happens in one part of a lunar month is offset by an opposite effect in the other half of that month, or what happens at the time when the sun and moon conspire is offset by an opposite effect a few months or years later when the sun and moon oppose each other. When the moon is far south and begins to go north, according to Mr. Russell, droughty conditions prevail and continue for seven or eight years. But the strange part is that the moon begins to go north from her extreme southern position every month without exception, not only just before the seven or eight year drought, but during the whole of that long period, and continues to do so during the whole of the succeeding rainy period. How can her beginning to go north be rationally supposed to be a basis for predicting droughts in one case and rains in another?

But if we lay aside all these vagaries about the moon, and recognize Mr. Russell's meteorological induction that droughty conditions do prevail for seven or eight years in Australia, followed by years of rain, and that this cycle of droughts and rains has been repeated about three times since 1840, then, we have a fair observational basis upon which to build a rational explanation. Now, this periodicity, or rather the irregular succession of good seasons and bad seasons is a fact recognized in every portion of the world We have also enough data to show that in most cases a drought in one portion of the globe is accompanied by rains in other portions, and that the regions of excess and deficiency of rain move over the surface of the globe month by month and year by year. They do not move in courses so nearly parallel as to justify long range predictions any more than do our storm centers, but the movements are certainly governed by laws, and we can begin to generalize as a first step in the process from induction to deduction. For instance floods in the upper Nile, due to rains in the highlands of central Africa, mean that an unusual proportion of moisture has been taken from the southeast trade wind current, and that, therefore, when that has turned northeastward over the Indian Ocean, and has become the southwest monsoon of India, it will bring droughts over the western portion of that country. A drought in New South Wales, or on the southeast side of Australia, means a deficiency in the easterly winds blowing on that coast, and especially so in the rainy season, or December, January, February and March. But this means that the great area of high pressure over the Indian Ocean at the latitude 30° south has been pushed farther west than usual, or in other words that the general circulation of the atmosphere in that region has been disturbed. Now, such a disturbance, continued over several months or even years, can hardly be produced by the rapidly changing moon; it might be due to secular changes in the quantity and quality of the solar heat, but is most of all likely to be simply the result of accumulations of pressure, temperature and moisture in various portions of the earth's atmosphere. Australia has about the same area as the United States, but lies on the average about 15° nearer the equator. This latter feature gives it soil temperatures and monsoon influences similiar to those that prevail in northern Africa, so that it may itself produce an appreciable disturbance of the general circulation in the southern half of our atmosphere. But the principal cause of the droughts in Australia and India is undoubtedly to be found in the changes going on periodically in the relation between the general atmospheric pressure and resultant circulation in the south and in the north, or between Cape Colony and Australia, China and eastern Siberia. In this large portion of the globe a system of circulation prevails that is affected but comparatively little by what goes on to the west of it and north of it. A large quantity of air enters into this region from the Anarctic Ocean and passes out of it as the southwest monsoon of southern Asia to eventually become the westerly winds of the North Pacific. We may, therefore, look for some connection by this roundabout way between the droughts and rains of Australia, or southeastern Asia, and those of northwestern America.—*Prof. Cleveland Abbe in U. S. Weather Review, Nov. 1902.*

WEATHERING ROCKS.

Rain, assisted by the dissolved gases and surrounding air, acts chemically on rock surfaces, producing changes known as weathering. Next to beds of rock-salt and gypsum (calcium sulphate) limestone is the rock which is dissolved most readily. The waste of the hard and massive surface is often shown only by the way in which it becomes studded with less soluble nodules or fossils originally hidden in its substance. Sir Archibald Geikie has calculated that by the acid-laden rain of towns one-third of an inch is removed from the surface of marble monuments in a century. Insoluble sulphides, such as that of iron, are rapidly oxidized by air in the presence of moisture to form soluble sulphates, and when this process goes on in the pores of a rock the expansion of the chrystalized salts splits the block into thin layers. This action is the basis of the common way of making alum. In the case of granite and most other rocks the process of weathering is more complicated. Some of the minerals are decomposed. In felspar, for instance, the silicates of potash, soda, and lime are changed to corbonates which are washed away, while the silica and the more resisting silicate of alumina remain as a soft crust of kaolin or china clay, valuable for making porcelain. Granite has been found weathered in this way in South America to the depth of 600 feet. Rocks containing iron usually become brown or reddish in color, although the freshly broken rock may be white or gray. The lines of stratification and joints of rocks are sometimes etched out by weathering, so that the face of the cliff assumes the appearance of a gigantic wall of masonry. The crumbling of rocks in rainy regions is assisted by the action of the sun in drying and warming the surface, which may then be splintered into flakes by a shower of cold rain. Rain soaking by capillary attraction through the weathered crust and into the pores of the solid rock is frozen in cold weather, and the ice, expanding as it forms, acts like a multitude of minute wedges driven simultaneously in all directions. When the thaw comes, the bases of the cliffs and banks are strewn with weather crusts and stones, often of a great size, broken off in this way.—*Mill, in "Realm of Nature."*

PRECIPITATION AT WATERLOO, IOWA.

December	1.94	1.16	1.94	1902
Total	49.76	37.29		

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 30.02 inches; highest observed, 30.44 inches, at Dubuque, on the 8th; lowest observed, 29.29 inches, at Dubuque, on the 6th; range for state, 1 15 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 105 stations, 23.0 degrees, which is 3.5 above normal. By sections the mean temperatures were as follows: Northern section, 19.8 degrees; central section, 23 8 degrees; southern section, 25.8 degrees. The highest monthly mean was 27.8, at Red Oak; lowest monthly mean, 17 5, at New Hampton. The highest temperature reported was 60°, at Belknap, on the 1st; lowest temperature reported, -12°, at Clear Lake, on the 11th. The average monthly maximum was 46 7; average monthly minimum, -6.2. Greatest daily range, 45°, at Carroll; average of greatest daily ranges, 32.1.

PRECIPITATION.—Average precipitation for the state, as shown by records of 120 stations, was 0.28 inch, which is .74 of an inch below normal. The averages by sections were as follows: Northern section, .21; central section, .29; southern section, .28. The largest amount reported was 1 46 inches, at Fort Madison; least amount reported, a trace, at Charles City, Carroll, Cumberland, Afton, Atlantic, Thurman and Winterset. The greatest daily rainfall reported was .70 inches at Danville on the 2nd. Average number of days on which .01 of an inch or more was reported, 4.

WIND AND WEATHER.—Prevailing direction of wind, northwest; highest velocity reported, 72 miles per hour, from the northwest, at Sioux City, on the 6th. Average number of clear days, 13; partly cloudy, 7; cloudy, 11.

The month was unusually favorable for feeding stock, and or gathering the unharvested portion of the corn crop. Fall wheat and rye, of which a small acreage was sown, were not materially injured by freezing weather.

OBSERVERS' NOTES.

AFTON—*N. W. Rowell.* On the 7th the wind was 40 to 50 miles an hour, the high wind prevailing 24 hours

ALTA—*David E Hadden.* Gale with blinding snowstorm raged from 8 P. M of the 6th to sunset on the 7th; some slight damage done Last week of the month was warm, and December's legacy of snow was nearly all gone.

AMANA—*C. Schadt.* Excepting a few days January was mild; cattle still finding green grass in protected places.

ATLANTIC—*J. W. Love.* The mildest January in 12 years. No rain, and only a trace of snow three times; zero temperature only on two days.

BONAPARTE—*B. R Vale* A mild month, too soft at times; stock did well on blue grass meadows and pastures all the month.

BRITT—*Geo P. Hardwick.* Mild weather excepting severe wind on 7th and 8th; ground nearly bare at close of month; stock healthy; some corn yet in fields; hay scarce.

CLINTON—*Dr. Luke Roberts.* Cloudiness 59 per cent. or 8 per cent above normal. Precipitation 1.03 less than normal; country roads better than usual; two weeks of sleighing; ice crop excellent and abundance secured Mean temperature for January 22.7° being 4.1° above normal. Maximum velocity of wind twenty-seven miles an hour on the 7th, and again on 29th; total wind movement for the month 4000 miles,—nearly 1000 miles less than normal.

DENISON—*W. C Van Ness.* A very mild and pleasant January, easy on stock and feed.

EARLHAM—*Geo. Phillips.* A fine January; farmers finished picking corn; some young cattle dying.

GRAND MEADOW—*F L. Williams.* On the 6th the mercury in barometer was down to 27 80 inches; month as a whole a pleasant one; stock wintering well.

GRINNELL—*A. O. Price.* Little snow and generally fair weather; fine for stock.

GRUNDY CENTER—*E. S King.* A good month for gathering corn, but not all picked yet.

OLIN—*Nathan Potter.* A pleasant winter month, with no extremes; much corn gathered; stock in fine condition

RIDGEWAY—*Arthur Betts.* Mild January; no excessive cold; distant lightning after sunset on 6 h and 26th; 142 hours of sunshine; forest ground has remained unfrozen; farmers grubbing every day; crows and other birds numerous.

ERRATA IN DECEMBER REVIEW.

CHESTER.—Total precipitation recorded, 3.35 inches, on page 7, should have been 4 37 inches. Total snowfall, recorded 6.2 inches, on page 7, should have been 10.3 inches.

DE SOTO.—Mean temperature, recorded 23 2 degrees, on page 7, should have been 22.5 degrees. Mean maximum temperature, recorded 29.4 degrees, on page 9 should have been 29.7 degrees. Mean minimum temperature, recorded 15.1 degrees, on page 9, should have been 15.3 degrees.

HAMPTON.—Total snowfall, recorded 15.4 inches, on page 7, should have been 16 4 inches

LACONA.—Total precipitation, recorded 3.80, on pages 8 and 11, should have been 3.60 inches.

OVID.—Maximum temperature, recorded 41 degrees, on page 8, should have been 47.

1903.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. McDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Meteorological data are received by the Iowa Weather and Crop Service.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. FEBRUARY, 1903. No. 2.

EDITORIAL NOTES.

Snowfall in the Texas "Panhandle" of sufficient depth to stop railway traffic was a recent novelty, breaking the weather records in that region for the past twenty years.

* * *

On the average the winter has been fairly mild and favorable for this latitude. December was a little colder than usual, but January was warmer than the average, and February brought no very severe storms. The forecast made by some weatherwise people, that the winter's snowfall would be correspondingly heavy as the summer's rainfall, came far short of verification.

* * *

A farmers' mutual insurance company of a county in a western state paid $2,375 on thirty-nine losses during the year. Of this amount $2,284.84 was for losses caused by lightning, stock killed, while only $129 75 was paid out for fire losses. This goes to show that lightning in these days of barbed wire fences is a very destructive agent —*J. S. Trigg.*

* * *

The bureau of forestry will this year begin experimenting among the sand hills of northwestern Nebraska, to see if they may be made to grow valuable timber. A nursery has been established at Halsey, Nebraska, and seed of yellow pine, jack pine, and red cedar will be planted this spring. About 100 acres will be uses for experimental work this year, and it is expected in time to extend the forest over a large part of the Nebraska reserves. The experts believe the experiment will be successful.

* * *

Mr. C. W. Hawley of Fort Dodge, contributes an interesting description and a graphic representation of parhelia observed by himself and others about 11 a m. on February 7th. There were three brilliant "mock suns" within a bright aureole encircling the zenith and in contact with the sun at the south. The phenomenon continued about half an hour The sky was blue, with a light haze, following snowfall of about six inches earlier in the day It was a rare but not an unprecedented sight under certain peculiar atmospheric conditions Observer L. E. Burdick at Storm Lake observed the phenomenon, and made a pencil sketch of the rings and luminous spots.

* * *

In a signed letter addressed to the editor of the Cincinnati *Price Current*, Prof. Willis L. Moore, chief of the weather bureau, says: "No reputable scientist will today essay to make long-range predictions. With our present knowledge of meteorological science such forecasts cannot be made with any marked degree of accuracy. Of course, anyone, with a proper consideration of the weather that usually occurs in a season,may make long range predictions and have some of them verified, but such work is worse than useless. If it were possible to make reliable long-range forecasts the weather bureau, with its corps of trained scientists, would surely do such work for the people, as no one can overestimate the immense benefit that agricultural and commmercial interests would reap from a knowledge of what the weather would be during an advancing crop season."

THE DISTRIBUTION OF RAINFALL.

(*A. S. Henderson Ph. D., in November, 1902, Harpers.*)

Rainfall, an agency at first sight so humble, is, through the ultimate dependence of all life upon vegetation, an essential link in the chain which connects the lowest and the highest forms of life. The difference in the vegetative covering in low lands is due not so much to variation in sunshine or temperature as to the differences in the distribution of the third factor —moisture.

The moisture of the atmosphere has not until recently been so thoroughly studied as temperature or pressure and winds. Yet it plays an all important part in the world's economy. Water is the life blood of the organic world, penetrating to all parts of it, purifying the air and fertilizing the land. As cloud it screens the earth' surface from the scorching sun's rays and protects it from excessve radiation. When it is deficient, extremes of temperature are great and vegetation is scanty; when it is abundant, climate is relatively equable and vegetation is prolific. The distribution of water available for plant growth is therefore a question of supreme practical importance.

The measurement of rainfall is very simple when proper precautions are taken. The amount precipitated is usually expressed in terms of the depth to which it would cover the land were none to sink into the ground and none to be evaporated. Millions of observations have been made on rainfall. The map of the rainfall of the world is based on returns from nearly 9,000 stations, and if we consider fifteen years as the average period of observation at each station, which is considerably under the mark, it represents 50,000,000 observations taken in different parts of the world.

The scientific study of rainfall distribution has been mainly the work of the last quarter of a century. The first temperature map of the world was made by the great Humboldt in 1817; that of pressure by Dr. Buchan of Edinburg in 1869; while the first quantatitive map of rainfall was made just twenty years ago by Prof Loomis of Yale. Since that time Dr. Supan of Gotha and the present writer have independently made public maps, embodying more recent results, in 1898.

By examining a map of the rainfall of the world, we notice at once that rain is very unevenly distributed. In many intertropical lands over eighty inches falls every year, while arctic circles are correspondingly dry. Arctic aridity and equatorial rains are partly expressions of the temperature differences. The warmer air holds more water in a state of vapor than the colder air, and the same degree of cooling brings about a much greater precipitation in the hotter regions. A cubic foot of air over the Caribbean Sea at 80° F. can hold 10.95 grains of water in the state of vapor, whereas at Boston at 50° F. it can hold 4 09 grains, and over Hudson Bay at 20° F. only 1.30 grains. Supposing the cubic foot of air at these places was suddenly cooled by 10° F. which is roughly what would happen were it rapidly elevated to 3,000 feet above the sea, then it could contain only 7.99 grains of water vapor at the Caribbean Sea, 2.86 grains over Boston, and 0.84 grains over Hudson Bay, forcing 2 96 grains to be precipitated in the first case, 1.23 grains in the second case, but only 0.46 grains in the third. Without going into further details, it is obvious from this that the possibilities

of heavy precipitation due to cooling diminish from the thermal equator to the thermal poles.

The divisions of the world by rainfall are of the greatest practical consequence. Each has its characteristic vegetation, and, speaking generally, the economic products of one region of each group can be grown in any corresponding region as far as climate is concerned. An instance in point is the similar distribution of Mediterranean climates and Mediterranean fruits.

Many economic problems in which rainfall is a factor present themselves for consideration, of which one or two may be mentioned as typical. There is an inferior and a superior limit of rainfall for each crop. Very little wheat is grown in the United States to the drier western side of the line where the mean annual precipitation is twenty inches. In England wheat growing is concentrated in the eastern counties, where the rainfall is less than thirty inches per annum, and in Scotland it is cultivated in similarly dry areas. In South Australia special attention has been paid by Sir Charles Todd to the relationship between the yield of the wheat crop and rainfall. The figures of average rainfall and average yield for the agricultural lands of south Australia show how very close is the connection between them.

Natural grass and fodder plants flourish best where the rainfall is uniformly distributed, and their economic value, as measured by the number of animals they can support, steadily increases with rainfall Mr. J. T. Wills shows that in Australia land receiving less than ten inches of rainfall per annum is worth next to nothing unless it can be irrigated; with ten inches of rain eight or nine sheep can be kept per square mile; with about twenty inches of rain, 640 sheep per square mile, eighty times as many; and with thirty-four inches of rain in Buenos Ayres, a square mile will support the enormous number of 2560.

The day of the medicine man with his rain-making charms is past. The future belongs not to the magician who attempts to interfere with the laws of nature, but to the man of science who can state with something approaching to certainty how they will operate under given conditions. Of all those who contribute to the cause of human progress, and the transferrence of human activites from the sphere of the accidental to the sphere of the causal, none perhaps are concerned with weightier issues than the men who patiently and persistently, day by day and season by season, measure and compare, compare and measure, the rainfall of their little districts. We may forgive the meteorologist his uninteresting statistics when we reflect that in their trustworthiness and in their right interpretation may lie the future of an abundant food supply and even of industries yet undeveloped.

PRACTICAL VALUE OF THE WEATHER SERVICE.

(From J. S. Trigg's Farm Notes.)

It costs this country $1,250,000 annually to maintain the weather signal service, and a friend writes us asking what it amounts to and what goood it does. Where a man's view is contracted so that he can only take in his immediate local conditions it is not strange that such a question should be asked. This service from a small beginning has been gradually extended so as to cover nearly the whole country. It furnishes the only reliable data as to rainfall, force of winds, varying temperature and barometrical readings. The reports from its agents are tabulated in each state, and very accurate forecasts can thus be made of coming marked changes in the weather. The value of these reports as applied to the coast and lake shipping interests is almost inestimable, while for the agricultural and horticultural interests of the country immense good results. A warning recently given out by the weather bureau saved the people of Florida millions of dollars, and a late notice given of a coming cold wave prevented shippers of perishable products from losing an enormous sum of money. The records thus made of the rainfall in any locality constitute the most reliable information to be obtained as to whether such locality is fit for settlement and cultivation or not. Perhaps if the weather service assumed to be wise enough to forecast the weather a year ahead, as do some so called weather prophets, those who doubt its value might have more faith in it. It is one of the best organized and most useful departments maintained by the general government.

IOWA FARM PRODUCTS.

Concerning some of the major and minor products of Iowa, William E Curtis of the *Chicago Record-Herald*, writes as follows:

George Fayette Thompson of the bureau of animal industry of the Agricultural Department has been making a very interesting comparison between Iowa and other of the great agricultural states in this respect, and secretary Wilson approves the totals. In 1900 the number of poultry in Iowa over three months old was 20,043 343, and they were worth $6,535,464 A comparison of values with previous census years cannot be made, as the census of 1890 only gave values. The value of poultry products for one year, when compared with that of poultry for one year is sufficient to cause astonishment For instance, the value of poultry on the farms of Iowa, as has been stated, was $6,535,464 while the poultry and eggs sold off the farm amounted to $19,508,526. Of the latter sum $10,016,707 was for eggs and $9,491,819 was for poultry. The number of dozens of eggs laid in Iowa in 1899 was 99,621,920, which was an increase of about 20,000,000 dozen over 1889. The average price per dozen of the eggs was 10 cents. The value of all animal products on the Iowa farms was $169,858,981, poultry products forming 11 5 per cent of the whole. The animals sold; with a value of $113,078,523, and the dairy products, with a value of $27,516,870, were the only two products worth more than poultry and eggs. The statement below shows the relative position of poultry in the farm economy of Iowa:

Animals sold	$113,078,523
Corn	97,297,707
Oats	33,254,987
Hay and forage	30,042,246
Dairy products (milk, butter and cheese)	27,516,870
Poultry and eggs	19,016,707
Wheat	11,457,808

LET IN THE SUNSHINE.

Spring is coming and with it sunshine and greater warmth. Do not shut out the sunshine. It is Nature's great healer and preventive of sickness. In the Mammoth Cave of Kentucky, there is a wonderful uniformity of temperature and because of this there was a belief that consumptives might be benefited by a residence there. So huts were built and the experiment tried. It was not a success There was quiet there; there were no adverse winds, but there was darkness, impenetrable darkness, where artificial light was not used. There was no sunshine, and its absence counteracted all the benefits derived from pure air, uniformity of temperature and quiet.

Invite the sunshine into your home, Don't allow the house to be so shaded by trees that it will be darkened or dampened thereby. Especially let the sunshine into the sick room. The patient needs its health-giving as well as cheering rays. The sunlight will not only warm, but purify the air and destroy

disease germs. As vegetation sickens, dies or has an unhealthy growth in the shade; so animal life loses its vitality, droops and dies without the invigorating influence of sunshine. Don't shut out the sunshine!—*Iowa Health Bulletin*.

CLIMATOLOGY OF THE MONTH.

BAROMETER—Mean pressure, 30.16 inches; highest observed, 30 68 inches, at Des Moines, on the 18th; lowest observed, 29.37 inches, at Davenport, on the 3d; range for state, 1.31 inches.

TEMPERATURE—The monthly mean temperature for the state, as shown by the records of 108 stations, was 19.8 degrees, which is 0.2 degree below normal. By sections the mean temperatures were as follows: Northern section, 17 2 degrees; central section, 20 2 degrees; southern section, 22.1 degrees. The highest monthly mean was 26 4 degrees at Keokuk; lowest monthly mean, 14 2 degrees, at Estherville. The highest temperature reported was 56 degrees, at Eldon on the 2nd; lowest temperature reported, -21 degrees, at Clear Lake, Estherville and Sioux Center, on the 16th, 17th and 18th. The average monthly maximum was 45 7 degrees; aveage monthly minimum, -16.4 degrees. Greatest daily range, 44 at Villisca; average of greatest daily ranges, 35.8.

PRECIPITATION—Average precipitation for the state, as shown by records of 120 stations, was 1.18 inches, which is 09 of an inch above normal. The averages by sections were as follows: Northern section, 1.02 inches; central section, 1 13 inches; southern section, 1 38 inches. The largest amount reported was 3.25 inches at Danville; least amount reported, .30 of an inch, at Galva. The greatest daily rainfall reported was 1 50 inches at Indianola, on the 4th. Average number of days on which .01 of an inch or more was reported, 4.

WIND AND WEATHER—Prevailing direction of the wind, northwest; highest velocity reported, 52 miles per hour, from the northwest, at Sioux City, on the 28th. Average number of clear days, 13; partly cloudy, 7; cloudy, 8

OBSERVERS' NOTES.

ALTA—*David E. Hadden.* Blizzard nearly all day the 3d. Second decade very cold; warm and thawing latter part of month.

ATLANTIC—*J. W. Love.* February was a pleasant month. Quite an electrical display in southeast on night of 2d.

BONAPARTE—*B. R. Vale.* A pleasant month; coldest of the season 16th to 20th; roads very muddy at close of the month.

BRITT—*Geo. P. Hardwick.* Excepting from 15th to 20th the month was comparatively mild, with light snowfall, allowing stock feeding in stalk fields.

CLEAR LAKE—*John Cobb.* No bad storms; ideal weather most of the month.

CLINTON—*Dr. Luke Roberts.* February, 1903, was a disappointment to many weather prophets who had avertised an extra cold month as well as a very stormy one. While there was one excessively severe and widespread storm period about the middle of the month, its behavior during other portions entitles it to be entered in the column of mild Februaries.

The month came in cloudy and sustained that record to the number of three cloudy days above normal and three per cent of cloudiness above normal, while the clear days were one less than normal. The storm days were 8 in number, each giving light precipitation, so that the total rainfall was only 1 29 inches, being 67 hundreths of an inch below normal. This was principally in the form of snow which, in depth, measured 9½ inches. There were three days, the 16th, 17th and 18th, which gave a mean temperature below zero of 1.5 degrees, 1.7 degrees and 1 degree respectively. The mean temperature for the month was 23 9 degrees, or 2 6 degrees above normal. The maximum temperature was 52 degrees, occurring on the 27th, being 1.3 degrees above normal.

Following is given some season comparisons of the last 25 winters, that is the time embraced in the three months commencing on the first of December. There is found great variation both in rainfall and temperature, especially in the latter. The mean daily temperature for this period was 21 4 degrees. For the winter just closed the mean temperature was 23 degrees or 1.6 degrees above the 25 year average, which is a small variation from normal, but enough to entitle it to a place among the warmer winters.

The highest average winter temperature for the 25 years, was 31 degrees, credited to the winter of 1899–00. The lowest average was 14 degrees, occuring in the winter of 1892–93, making a range of 17 degrees, which aggregated by its multiplication with the number of days in a winter, which is 90, would give to the latter winter 1,260 degrees of heat less than is embraced in the former.

The maximum temperature for the 25 winters was 67 degrees credited to February, 1891. The minimum temperature was 36 degrees below zero, credited to January, 1884. Approximating this terrible cold period may be mentioned a record of 33 degrees below zero in February, 1885, and one of 30 degrees below zero in December, 1886. It will be noticed that these three low records occured in three continuouos winters. Those winters can never be lost to the memory of those who experienced the inflexibility of the extreme and prolonged cold, when the minimum temperature would range from 4 to 36 degrees below zero for 16 consecutive days, and the earth frozen six feet down.

The total precipitation for the 25 winters was 11.75 feet. About one-half of that amount came in the form of snow, equaling fifty feet in depth, or an average of two feet per winter. The winter of 1884–85 furnished four feet of snow.

EARLHAM—*Geo. Phillips.* Cool and cloudy; ground bare at close of month; first flight of wild ducks on 27th.

ELKADER—*Chas. Reinecke.* Ice went out of Turkey river on 27th.

GRAND MEADOW—*F. L. Williams.* Month generally pleasant; no bad storms.

RIDGEWAY—*Arthur Betts.* Month mild; 3° above normal; 220 hours of sunshine; coldest weather of the winter 15th to 21st, with a mean of 5 degrees; about one-tenth of the corn remains to be husked.

BELATED REPORTS.

FAYETTE—January. Mean temperature, 19.3°; highest, 43° on the 29th and 31st; lowest, -9 on the 12th; greatest daily range, 33; total precipitation, 04 inch; greatest 'in 24 hours .04 inch; total snowfall 0.5 inch; prevailing direction, northwest Number of clear days 12, partly cloudy 8, cloudy 11, rainy 1.

MT. PLEASANT—January Mean temperature; 24.2°; highest, 52° on the 16th; lowest, -5° on the 12th, greatest daily range 34; total precipitation .15 inch; greatest in 24 hours, .10 on the 4th; prevailing direction, northwest; total snowfall, 1.0 inch. Number of clear days 12, partly cloudy 9, cloudy 10, rainy 2.

PELLA—January. Mean temperature, 24.4°; highest, 49° on the 31st; lowest, -5 on the 12th; greatest daily range 34; prevailing direction, northwest. Number of clear days 13, partly cloudy 0, cloudy 18.

VILLISCA—January. Mean temperature 26.4°; highest 50° on the 15th and 16th; lowest, -5° on the 12th; greatest daily range, 36; total precipitation .05 inch; greatest in 24 hours; .05 inch; total snowfall, 0.5 inch; prevailing direction, northwest. Number of clear days 12, partly cloudy 13, cloudy 6, rainy 1.

STOCKPORT—January. Total precipitation .39 inch; greatest in 24 hours .10 inch on the second; total snowfall 3.8 inches; prevailing direction, northwest. Number of clear days 14, partly cloudy 3, cloudy 14, rainy 8.

ERRATA IN JANUARY REIVEW.

ALTA—Mean temperature recorded 23.6° on page 6, should have been 21.6°. Mean minimum temperature recrded 15.5° on page 8, should have been 11.5°.

COLLEGE SPRINGS—Mean temperature recorded 27.4° on page 7, should have been 27 2°. Mean minimum temperature recorded 18 7° on page 8, should have been 18.4°.

COLUMBUS JUNCTION—Mean temperature recorded 24 4° on page 7, should have been 24 5°. Mean maximum temperature recorded 32 3° on page 8 should have been 32.6°.

BURLINGTON—Maximum temperature recorded 53° on the 1st, should have been 66° on the 28th on page 7.

GRINNELL—Total snowfall recorded 3 8 inches on page 6, should have been 2 8 inches.

OGDEN—Mean temperature recorded 23.0° on page 6, should have been 23.7°. Total precipitation recorded .16 inch on pages 6 and 10, should have been .18 inch.

OTTUMWA—Total snowfall recorded 3.8 inches on page 7, should have been 4.8 inches.

1903.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. McDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Meteorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve
Algona	C. D. Pettibone

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. MARCH, 1903. No. 3.

EDITORIAL NOTES.

The up-to-date Iowa Idea is to plant and harvest in 1903 the biggest and soundest crop of corn ever grown in this state. We need it in our business.

* * *

Within the past month we have received the sad news of the passing away of two of the most faithful co-workers in this service, Hon. S. H. Mallory, of Chariton, and Mr. H. C. Miller, of Ovid. The communities in which they lived, and the people of the state at large, have suffered a serious loss by the death of these public spirited and intelligent citizens.

* * *

The department of geology and mining engineering of the Iowa State College has been engaged in the study of Iowa clays during the past three years and finds that everyone of the ninety-nine counties in the state contains clay suitable for the manufacture of clay products. In 1901 the state ranked eighth in total clay production. Ninety-three counties marketed clay wares valued at $2,737,825, consisting chiefly of common building brick and drain tile, constituting 2.48 per cent of the production of the entire country, which amounted to $110, 211,587, In the cheaper clay wares, building brick, drain tile, hollow block and burnt clay ballast, she produced 4.45 per cent of a production of about $51,000,000 in those lines.

* * *

Science is touching agriculture and horticulture in many ways in plant breeding, cross fertilization, in the spraying and limitation of insect pests, in analyses of all foodstuffs as animal rations, in soil physics whereby the soil is fitted for its work, in animal husbandry, the feeding and breeding of all domestic animals—in fact, there is no other business in which man is engaged where science touches him more helpfully or with which it works more harmoniously.—*J. S. Trigg.*

THE UNITED STATES AS A STORM CENTER.

There are several reasons for believing that this continent is the peculiar theater for the interchange between the heat and the cold of the Northern Hemisphere, and that the Euro-Asian Continent plays a very different role in the meteorological economy of this hemisphere. For it is well known (1) that while the American Continent is the place for the profuse generation of cyclones, Europe is the region for their dissipation, and in Asia very few cyclones occur except along the ocean borders; (2) that the velocity of motion of the atmosphere generally is about twice as great over North America as over Europe. This points to a profound difference between the actions of the atmosphere in these two regions, but one cause of it at least is easily perceived. It has been shown that the currents which are especially concerned in forming cyclones are contained for the most part within two or three miles of the ground, though their accompanying effects may extend much higher. Hence, any barriers of elevated ground, as mountain ranges, which tend to deflect the flow of the lower strata, must strongly influence the formation of the cyclones themselves, if they are to be referred to the counter flow of long horizontal currents of different temperature rather than to local vertical convective currents.

The great range of the Himalaya Mountains stretching east and west is such a barrier to the flow of the tropical and polar currents in that region, and the result is that true cyclonic movements are almost excluded from the interior of Asia. On the other hand the Rocky Mountain range, stretching north and south along the western districts of North America, favors the counter flow from the tropics and the polar regions by deflecting the westward current of the tropics toward the north, and the eastward drift of the higher latitudes toward the south. The same tendency is favored by the location of the high pressure belt in the latitude of 35°, which causes a high pressure area to form over the middle Atlantic Ocean, while the Rocky Mountain range breaks through the midst of it The result is to produce a powerful anti-cyclonic center of action over the Atlantic Ocean, which maintains a strong northward component from the West Indies toward the interior of the continent. At the same time the American Continent causes the isobars and isotherms to loop southward, and thus in consequence to draw the Siberian atmosphere in a direction nearly parallel to the Rocky Mountain range. These physical conditions are a constant incentive to the formation of countercurrents which meet on the Canadian and United States territory, with the result that 75 per cent or 80 per cent of the storms of the Northern Hemisphere are generated in these districts.—*Relation between the general circulation and the cyclones and anti-cyclones, by Prof. Frank H. Bigelow, in the Monthly Weather Review for May, 1902.*

HOW THE AIR IS WARMED.

BY PROF. G. D. SWEEZY, LINCOLN, NEB.

The great furnace from which we get most of our heat is the sun. It sends to us little waves of heat—many thousands of these tiny waves every second; but they pass so easily and quickly through the air that they have little effect upon it on their way down; but they do warm the ground upon which they fall. for they cannot get through that so easily, and when the ground gets warm it soon warms up the air which lies upon it. This it does in two ways. In the first place, the bottom of the atmosphere actually touches the ground and rests upon it and is warmed by it just as a flat-iron is warmed when it is set on the stove; the heat creeps slowly up from the hot griddle of the

stove into the bottom of the flat-iron, or from the warm earth into the lower air. This process is called conduction. Then again, the earth warms the air in another way. If you hold your hand near the ground when it has been well heated in the sunshine, you will feel the warmth coming to your hand from the ground even if you do not touch it. This is called radiation; that is, the heat is radiated from the earth in little waves much like those which come down from the sun; but there is this difference—the heat waves radiated from the warm soil do not vibrate as rapidly as those which come from the sun, and for this reason they cannot pass through the air so easily. They are mostly stopped before they get very high up into the air, and so the air is warmed by them. That is why it is cold high up in a balloon; the sun is shining there just as much as it is at the surface of the earth, but its rapid waves pass by on their way down and do not warm the air much, and the slower waves coming back from the warmed earth do not get up so high, but mainly warm the lower air, in which the plants and trees live and grow. And so the earth's atmosphere acts as a blanket to keep the earth warm by letting in the heat waves from the sun more readily than it lets out the slower heat waves coming back from the warmed earth. The glass which is put over a hotbed acts in just the same way; it lets the sun's heat come in but will not let the heat arising from the ground get out, and so the plants are kept warm.

For fifteen years past the temperature of the soil has been measured daily at the state farm at seven different depths, ranging from one inch to three feet, and a study of the results recently has brought out many interesting conclusions.

For example, it appears that in every month of the year the surface of the ground averages warmer than the air; this shows that it is the ground which first feels the effect of the solar heat and is warmed by it and then it imparts its heat to the air, rather than the air warming the soil. The warmed surface layers also impart their heat to the deeper soil, but more slowly, so that at a depth of three feet the highest and lowest temperatures of the year are not reached till about a month later than they occur at the surface. At a depth of three feet the range between summer and winter is only thirty-four degrees, instead of a hundred and more, as it is in the air at the surface. The greatest depth to which the ground freezes in the winter is most commonly eighteen or twenty inches; twice since 1890 it has frozen to a depth of more than three feet, viz., in 1895 and in 1899.

PROGRESS AND OPPORTUNITY.

Pittsburg Gazette.

"Do you ever stop to consider young man," said the old stager, "how much you depend upon applied electricity? There goes the telephone bell now. A newspaper office without a system of telephones would be on a par of a 'home without a mother,' or nearly so. Click, click, I hear the telegraph instruments working there in the other room. That's right, my boy, push the button and let us have light. You see electricity comes at every turn. Light and the news—that's light, too—come with the electric touch, I came up an electrically operated elevator just now, and the other day when I was looking over the plant, I noted that your presses on the ground floor and your Mergenthaler machines on the top floor were all run by electricity. Wonderful machines, rapid, efficient, accurate, splendid; wonderful energy that makes them go.

"Young man, these things have all been developed, except the telegragh, within the span of your life. Most of them within the last two decades, yet there are foolish young fellows who con the names of the great and wealthy and lament that the door of opportunity is not as wide open as when those men made their start in life. Nonsense. The door of opportunity was never as wide open as now. Fame and wealth were never as ready to be embraced by ambition and brains as at this moment. Never.

"The inventions that have been made will be surpassed by those yet to come. We have but begun to realize the differentations of voltage, potentials and electro-motive force. The door of opportunity stands wide for the man whose think-tank runs at the touch of the electric facet.

"Not only in the electrical field is there opportunity. In chemistry, in engineering, in geology, in biology there are as good opportunities as were ever improved by Berthelot, Bequerel, Roebling, Lyell or Darwin. In plain business there are rich fields as rich as any worked by Rockefeller or Morgan. In industry Carnegie and Havemeyer have not exhausted the possibilities. In exploration the whole world has not been covered by Humboldt and Captain Cook. There is always opportunity, but the man who grasps it must have force and persistence, energy and brains. That's all. It's a great world, or queer world, a funny world—yes, it is a real good world to live in and be active."

WHAT "CATCHING COLD" MEANS.

The old-fashioned cold has been ousted to some extent from its former position in domestic medicine by the more modern influenza. An attack of influenza is a much better excuse for non-attendance at the office or shop than a cold, the latter being commonly regarded as an accommodation bill drawn by laziness on idleness. There is unquestionably such a thing as a cold—that is to say, a deviation from health obviously consequent upon and due to exposure to cold and damp. The initial sensation of cold is followed by more or less pronounced physical discomfort, possibly by more definite signs and symptoms of bronchitis or other disease a frigore. With that predilection for for inexorable logic which characterizes the undiscerning, the average citizen regards every illness commencing with a chill as a cold, losing sight of the fact that there are chills—i. e.: sensations of cold—which are in no wise due to the action of low temperatures. This vulgar error has been productive of serious consequences in mo e than one direction. Nowadays, and rightly, we are all for fresh air. We fear no foe save the ubiquitous microbe, and we fight him with fire and poison, with results that amply suffice to justify this war. It may, on the other hand, be a person with a weak chest who experiences a "chill," and, as it is theoretically impossible ever to exclude the influence of cold, he or she attributes the symptoms which follow—the cough, the sweating, the exporation, etc.—to incautious exposure, whereas this chill merely heralded a rise of temperature incidental to an outburst of tuberculous disease. It would suprise many intelligent people to be told that a chill is a sign that there is fever, and that sweating is usually a sign that the fever is abating. Yet such is the unvarnished fact, and it would be well for it to be generally known. Cold is merely a debilitating agent, the effects whereof will vary according to the individual. It throws a strain on the organic machinery and the weakest part gives. If the machine as a whole is in good trim, nothing happens beyond a little temporary discomfort. In a rheumatic person it may determine pains in the joints; in another, bronchitis; in a third, kidney trouble, and so on—in short, it picks out the weak spots and converts weakness into disease. Colds are notoriously infectious, and the places where colds are most frequently caught are places where ventilation is defective and where microbes abound, as in certain theaters, churches, railway carriages, and the like, so that even the symptoms of the old fashioned cold are, for the most part, the result of microbial infection and not of exposure.—*London Medical Press.*

SOME OLD-TIME DROUGHTS.

The following interesting statement of dry seasons extenting back to days of the Pilgrim Fathers, has been compiled and is worth preserving.

In the summer of 1621, twenty-four days in succession without rain.

In 1530, forty-one days without rain.
In 1657, seventy-five days without rain.
In 1674, forty-five days in succession without rain.
In 1688, eighty-one days in succession without rain.
In 1694, sixty-two days wi hout rain.
In 1705, forty days in succession without rain.
In 1715, forty-six days in succession without rain.
In 1728, sixty-one days in succession without rain.
In 1730, ninety-two days in succession without rain.
In 1741, seventy two days in succession without rain.
In 1749, one hundred and eight days in succession without rain.
In 1755, forty-two days without rain.
In 1762, one hundred and twenty-three days without rain.
In 1773, eighty days in succession without rain.
In 1791, eighty-two days in succession without rain.
In 1802, twenty-three days in succession without rain.
In 1812, twenty-eight days without rain.
In 1856, twenty-four days without rain.
In 1871, forty-two days without rain.
In 1875, twenty-six days without rain.
In 1876, twenty-six days without rain.

It will be seen that the longest drought that ever occured in America was in the summer of 1762. No rain fell from the 1st of May to the 1st of September, making 123 days without rain. Many of the inhabitants sent to England for hay and grain.—*Ex.*

WEATHER AND CROPS.

The month was warmer than usual, with less than the normal amount of precipitation. But the excessive cloudiness and lack of drying winds and sunshine retarded farm work except in dry sandy soil. The fields were excessively wet, and the roads well nigh impassable the larger part of the month. While the spring opened earlier than usual, the condition of the soil made a late start in spring work. Grass and fall grain wintered well.

CLIMATOLOGY OF MARCH 1903.

BAROMETER.—Mean pressure, 30.13 inches; highest observed, 30.50 inches, at Des Moines, on the 11th; lowest observed, 29.75 inches, at Davenport on the 23d, range for state, 0.75 inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 114 stations, was 38.8 degrees, which is 6.6 above normal. By sections the mean temperature were as follows: Northern section, 36.1 degrees; Central section, 39.4 degrees; Southern section, 41.1 degrees. The highest monthly mean was 45 0 degrees at Eldon; lowest monthly mean, 30.8 at Sibley. The highest temperature reported was 82 degrees, at Mt. Pleasant on the 14th; lowest temperature reported, 6 degree at Baxter and Clear Lake on the 1st. The average monthly maximum was 72.1 degrees; average monthly minimum, 11.2 degrees. Greatest daily range, 48 at Monticello; average of greatest daily ranges, 35.3 degrees.

PRECIPITATION.—Average percipitation for the state, as shown by records of 126 stations, was 1.38 inches, which is 0.53 of an inch below normal. The averages by sections were as follows: Northern section, 1.40 inches; Central section, 1.34 inches; Southern section, 1.39 inches. The largest amount reported was 3.90 inches at Le Mars; least amount reported, .15 of an inch at Denison and Ruthven. The greatest daily rainfall reported was 1.80 inches at Keokuk on the 7th. Average number of days on which .01 of an inch or more was reported, 7.

WIND AND WEATHER.—Prevailing direction of the wind, southwest; highest velocity reported, 41 miles per hours, from the northwest, at Sioux City, on the 23d. Average number of clear days, 11; partly cloudy, 7; cloudy, 13.

OBSERVERS' NOTES.

ALGONA—*C. D. Pettibone.* On 17th first robin appeared, wild geese observed flying northward.

ALTA—*David E. Hadden.* Month warm, dry and generally cloudy; mean temperature 7° above, and precipitation 1.09 inches below average of preceding thirteen years.

AMANA—*Conrad Schadt.* Spring opened early, yet no field work could be done till about the close of the month, as the ground was too wet, on account of lack of sunshine and drying winds. Roads have not been in worse condition for many years. Some wheat and oats sown.

ATLANTIC—*J. W. Love.* Wild geese observed on 6th, robbins on 7th, and bluebirds on 8th. Month unusually mild.

BONAPARTE—*B. R. Vale.* Severe electrical storms on 7th, 17th and 18th, the last doing much damage to barns and stock; ground very wet and no farming practicable.

BRITT—*Geo. P. Hardwick.* Month comparatively mild, with little snow or wind; fruit buds forward.

CLINTON—*Dr. Luke Roberts.* March, 1903, gave us her coldest day on the 1st, having been preceded by a windy day with March characteristics, but those conditions had spent their forces at the crossing of the line, and no more "March winds" prevailed until the 23d and 24th, when an average speed of seventeen miles prevailed for thirty hours, commencing at noon of the 23d. The maximum movement of twenty miles an hour occurring during the central portion of the 24th. Snow, by spells, accompanied the wind. Not over two inches of snow fell altogether. This comprised all the snow of the month. Total

precipitation for the month was 2.36 inches, being eighteen hundredths below normal. The greatest precipitation during any twenty-four consecutive hours was 1.10 inches, occurring on the 7th. The maximum temperature was 78°, occurring on the 18th, and was 12° above normal. The minimum temperature was 14° , occurring on the 1st, and was 12.6° above normal.

The warmest day was the 18th, giving a mean of 65.2°, or 13.9° above normal. The coldest day was the 1st, giving a mean of 27°, or 15° above normal.

The total movement of the wind was 3,040, or 2,750 miles below normal, being the smallest run of wind for any March during the last twenty-two years.

It will be observed the departures from normal are greatly in excess, causing a record breaker. On some kinds of trees the buds were putting out at the close of the month.

COLUMBUS JUNCTION—*Prof. H. E. Simpson.* Ice went out of the Iowa and Cedar rivers early on morning of the 7th, followed by a very rapid rise of water on 8th, rising within three feet of high water mark of last August.

FOREST CITY—*J. A. Peters.* Robins came on 11th. No seeding done, frost out of ground.

GRAND MEADOW—*F. L. Williams.* Bluebirds on the 12th, and robins on 17th. All frost out by the 20th; grass well started by end of month; roads very bad.

GRUNDY CENTER—*E. S. King.* Some sod plowing done; clover mostly killed; heaviest snowstorm of season on 23d.

HANLONTOWN—*Miss G. M. Paschen.* First flock of geese observed on 8th; ducks on 18th; robins on 17th. Pussy willows in bud the 13th.

HUMBOLDT—*H. S. Wells.* First robin observed on 17th; fine weather at close of month.

IDA GROVE—*Theo. A. Collett.* On 12th robins appeared; on 14th plowing sod begun; on 17th lawns looked green.

LEON—*M. F. Stookey.* Two inches of snow on morning of 22nd; all off by night; four inches on morning of 23; disappeared by night.

MASON CITY—*J. S. Mills.* Robins and wild ducks on 7th; bluebirds and wild geese on 17th.

OLIN—*Nathan Potter.* Grass three weeks ahead of last year; meadows and ryefields in best of condition; some gardens made.

RIDGEWAY—*Arthur Betts.* Month unseasonably warm, same as in 1902; much thunder; 185 hours of sunshine; much hazy weather and fog; road almost impassable; at end of month soft maples, willows and hazel blossomed out.

WAUKEE—*E. J. Leonard.* First part of month gave promise of an early spring; unusually heavy snowstorms 22d and 23d postponed work in the fields till about 30th.

WAVERLY—*H. S. Hoover.* First wild geese flew north on 5th. Ice went out river on 8th; on 21st planted lettuce, radishes etc.

WEST BEND—*Ph. Dorweiler.* Month warmer than usual; ground too wet to work: roads very bad.

BELATED REPORTS FOR FEBURARY.

FAYETTE.—Mean temperature 18.1 degrees; highest 47 degrees on the 26th; lowest 17 on the 18th; greatest daily range 43 degrees; total precipitation 1.22 inches; greatest in twenty-four hours .70 inches on the 4th; total snowfall 8.7 inches; prevailing direction, northwest. Number of clear days 14, partly cloudy 8, cloudy 6, rainy 4.

WAPELLO.—Mean temperature 23.6 degrees; highest 47 degrees on the 27th; lowest 11 degrees on the 17th; greatest daily range 28 degrees; total precipitation 1.56 inches; greatest in twenty-four hours .90 inches on the 3d; total snowfall 11.5 inches; prevailing direction, northwest; number of rainy days 4.

ERRATA IN FEBRUARY REVIEW.

GRAND MEADOW.—Mean temperature recorded 17 0 degrees on page 7, should have been 18.8 degrees. Mean maximum temperature recorded 24.8 degrees on page 9, should have been 28.4 degrees.

HAMPTON.—Mean temperature recorded 18 6 degrees on page 7, should have been 19.0 degrees. Mean maximum temperature recorded 27.7 degrees on page 9, should have been 28.4 degrees.

BAXTER.—Total precipitation recorded 1.15 inches on pages 7 and 11, should have been 1.05 inches.

BUCKINGHAM.—Total snowfall recorded 5.2 inches on page 7, should have been 4.2 inches.

COLLEGE SPRINGS.—Total precipitation recorded .92 inches on pages 8 and 11, should have been .96 inches.

GUTHRIE CENTER.—Total precipitation recorded .49 inch on page 7, should have been 1.19 inches.

IOWA FALLS.—Mean temperature recorded 16.8 degrees on page 7, should have been 17.0 degrees.

PELLA.—Mean temperature recorded 22 8 degrees should have been 21.8 degrees.

LE MARS.—Maximum temperature recorded 43 degrees on the 22d, on page 7, should have been 44 degrees on the 27th.

MARSHALLTOWN.—Maximum temperature recorded 47 degrees on the 22d, on page 7, should have been 49 degrees on the 10th.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. APRIL, 1903. No. 4.

EDITORIAL NOTES.

The exportation of American agricultural products in March amounted to $81,000,000, an increase of $21,000,000 as compared with March, 1902.

* * *

On the night of April 28th lightning struck a new church at Dedham, Carroll county, damaging the structure to the amount of about $2,000. It was set on fire, but the flames were soon extinguished. Churches should be protected by rods, as they are exposed more than ordinary buildings.

* * *

A correspondent writing under date April 28th, says: "The ground is so saturated from last year's rains that I fear there will be much land hereabout that will not be planted this season, unless it turns off dry very soon." This describes the situation in large areas of the central counties.

* * *

On Sunday, April 19th, large portions of central Europe were swept by a hurricane, accompanied by a heavy fall of snow, which caused a large amount of damage to chimneys, trees, parks and telegraph wires. The brunt of the storm was suffered in Germany, Austria-Hungary and the Polish plains.

* * *

The Turkish government has removed the ban on American pork, which hereafter will be admitted to the empire after the customary inspection.

* * *

The general prospects of winter wheat are exceptionally promising, according to the *Modern Miller*.

* * *

A report of the bureau of statistics of the Treasury Department says: "To sum up in a single sentence comparison of production with exportation, in America, in agricultural and manufactured products respectively, it may be said that, comparing conditions in 1900 with those of 1870, agricultural production has increased 92 per cent, agricultural exportation 132 per cent, production of manufactures 209 per cent and exportation of manufactures 538 per cent."

THE NATIONAL WEATHER REVIEW.

The Monthly Weather Review, published by the weather bureau in the Department of Agriculture, challenges admiration for its high character. It is a work at once scientific and practical, besides furnishing much that is theoretical, suggestive and interesting. Its accumulation of facts and the records thereof must constitute a record of data which may hereafter prove valuable in meteorological science. Many trained and amateur observers are working in its behalf. With headquarters at Washington, D. C., the bureau has a wide area of useful activity. Particularly are the forecasts valuable, beneficial and appreciated. Science associated with the political movements of the day is surely a gratifying index of the advancing civilization of the age.

The issue of January, 1903, besides much varied matter, has an article by Prof. Edwin G. Dexter of the University of Illinois, entitled "Inductive Studies in Weather Influence." Almost every one can appreciate such a topic, for who has not heard of "blue Monday," or felt the "blues" in gloomy weather. The professor traces the influences of the weather as modified by temperature, pressure, precipitation, humidity and cloudiness on the mind and body of man through twelve respects. So much for the effects on man of meteorology, though few think of it in this aspect.

The previous issue is mainly filled with the normal summary of 1902. Other contents furnish an elaborate discussion of cannonading the clouds against hail storms, resulting in its more than probable futility. Also the studies on the snow crystals as they occurred during the winter of 1901-2. Twenty-four and one-fourth full pages of twelve cuts each are given, showing ninety-nine various types.—*Dubuque Trade Journal.*

NITROGEN FOR FERTILIZING.

The principal sources of nitrogen for fertilizers are nitrate of soda and slaughter-house products, of which latter dried blood is the most important. Slaughter-house products are called "organic" fertilizers because produced from the "organs" of animals. The nitrate of soda is obtained from mineral deposits mainly on the west coast of South America. The known deposits are by no means inexhaustible, and unless other beds are found the world a generation or two hence may have serious trouble to secure nitrogenous manures. By that time, however, it is hoped that we shall have learned how to obtain nitrogen from the air on a commercial scale, and at a cost which the industry can bear. Many scientific men are at work on the problem. Prof. A. J. Cook makes the following comparison between nitrate of soda and dried blood:

Nitrate of soda being a soluble salt in a condition for ready absorption by plants ranks first as an available source of nitrogen. It is the cheapest and most direct form of nitrogen for plant feeding. Dried blood as a source of organic nitrogen easily convertible to nitrates in the soil is a first-class product. It is a humus producer more enduring than nitrate and can be used in larger quantity without danger of loss by drainage, but its benefits are more protracted, and it must be expected to act on the crop as quickly, because it must first be nitrified in the soil

by the organisms of nitrification there. It takes a high temperature in the soil for these bacteria to do effective work, so when blood is applied in cold weather it is well to remember it only becomes available as the warmth of spring and summer proceeds.—*San Francisco Chronicle.*

COURSES OF INSTRUCTION.

Among the recent courses of instruction in meteorology and climatology we notice those offered by Dr. J. Paul Goode, Ph. D., instructor in geography in the Wharton School of Economics, in the University of Pennsylvania. There is a short course of four hours a week during the first term of the year entitled 'Climatology and Applications in Economic Geography." It covers the following subjects:

Principles of meteorology; general atmospheric circulation; laws of storms with special attention to the cyclonic storm; charting of weather elements. Application of principles of meteorology to the interpretation of regional climates. Climate as a factor in economic and social development.

There is also in the course for teachers a series of lectures, occupying one hour, given each Saturday throughout the college year, about forty in all, entitled "The Atmosphere and the Ocean."

Part 1. Meteorology; the general atmospheric circulation, the laws of storms, the charting of weather elements, and the interpretation of weather maps. Scientific weather forecasting.

Part 2. Oceanography; the principles of oceanic circulation, action of waves and tides, harbors, sailing routes.

Part 3. Climatology; the regional application of the principles of climate to the world at large.

Dr Goode has recently accepted a position in the department of geology of the University of Chicago, and will probably give these same courses at that place next year. It is most important that all teachers should profit by such lectures so that the general public may be educated up to a better appreciation of the difference between the daily weather map with the forecasts of the weather bureau and the farmers' almanacs with the forecasts of these astrological editors.—*Monthly Weather Review for February, 1903.*

OUR NATIONAL DOMAIN.

At the annual meeting of the National Geographic Society, February 10, 1903, Mr. Cyrus C. Adams delivered an address on "The United States—Land and Waters," from which the following extract is made:

"Many foreigners who cross our country are impressed by two facts: Its vast extent and its very apparent sparsity of population away from a few great centers. We are among the most populous nations in the world, but our domain south of Canada is so great that with all our 77,000,000 people we have an average density of population of only about twenty-eight to the square mile, in which respect we are comparable with Norway, one of the most thinly peopled countries of Europe. The part of Great Britain occupied by England is one of the most densely peopled regions in the world; but if England had only our density of population its inhabitants would number less than one-fourth the number in Greater London.

"We have really no conception derived from our experience at home of what great density of population means. Perhaps the following facts may give a vivid idea of it. If we were to crowd our 77,000,000 people into Texas and add to them 40,000,000 more, we should have a density of population in that state comparable with that of the lower Yangste valley and the great eastern plain of China between the Yangste and the Hoang rivers. But human experience has recently recorded a still greater density of population than this, and the following is deduced from the census taken last year by the Chinese government and already accepted by statisticians as a fair approximation of the number of persons in China. If we were to place in Texas double the population of the United States or, say, 150,000,000 persons, we should have in that state approximately the density of population that is to be found in the Shantung province. Our nation may never be called upon to confront the problems growing out of such a prodigious congestion of humanity as this; and these illustrations of great density of population are given here only to show one aspect of our enormous territory. China is not half so large as our country, and its natural resources, area for area, are no greater than our own; so the 408,000,000 souls in China, proper, at least give emphasis to the thought that we have as yet scarcely began to scratch the surface of the capacity of this country to support many times its number of inhabitants.

"Another influence of our vast area is permanent, far reaching and most significant. The United States, extending from ocean to ocean, reaching far into the north and far into the south, with vast areas only 1,000 feet or less above the sea, and others of high altitude, has great variety of climatic conditions and therefore great diversity of products; so that we grow nearly all the commodities of the temperate and sub-tropical zones, and not a few products of the tropical zones. We raise the citrus fruits of the Mediterranean, the figs of Smyrna and the dates of the Persian gulf. We find that we can grow the famous Sumatra tobacco which we still import to the amount of millions of dollars every year; that we can produce Egyptian cotton, and Egypt does not raise all that the world would like to consume of that unique and superior fiber. This diversity of products, and our large mineral resources, make the country practically self-sufficient. No nation can become self-sufficient unless it reaches across a continent and embraces a wide latitude like the Russian Empire, Australia and the United States. We really need to import very little except certain raw materials from the tropics which our own colonial possessions may some day supply."

WEATHER AND CROP CONDITIONS.

In respect to temperature and precipitation the month of April was about normal. The soil and subsoil, however, were abnormally moist at the outset, except in fields naturally well drained or thoroughly tiled. The prevalence during the larger part of April of cloudy, misty and humid weather, retarded the necessary drying of the surface, and hindered seeding and plowing operations on a very considerable area of land intended for grain seeding or corn planting. Fair progress was made in seeding and plowing, under somewhat adverse conditions, but the acreage of oats, barley and wheat was somewhat reduced on account of the excessive moisture in some portions of the land intended for these crops. Pastures and meadows made an early start, and cattle were turned on grass somewhat earlier than usual. The cereal crops germinated readily, and made a fairly good stand. The snow storm and freezing temperature at close of the month checked growth, but did not injure field crops. Apples were but slightly injured in the larger part of the state. Cherries and plums suffered the greatest amount of damage.

TORNADO IN CALHOUN COUNTY.

Late in the afternoon of Saturday, April 11th, a small but vigorous tornado was observed about four miles northeast of Rockwell City, Calhoun county. It struck the farm of C. H. Clark, occupied by P. G. Armour, on the west bank of South

Twin Lake, destroying the house and barn and much personal property, and then swept across the lake, raising a column of water in its passage and spending its force within a short distance on the east side. The Armour family found refuge in a cave and escaped personal injury, but their losses were considerable. Mr. H. C. Maulsby, who was driving homeward from the town of Jolly, was caught very near the center of the whirling shaft, and had a rough experience, but was not injured seriously. He wrote a graphic account of his observations and experiences, which appeared in the *Rockwell Advocate*. The air was dense and hot, and conditions were favorable for the development of a tornado. A cloud was noticed in the southwest, moving eastward, which shortly assumed the funnel shape and soon thereafter the lower appendage reached the earth, raising a column of dust and loose articles in its pathway. Driving rapidly southward Mr. Maulsby reached the west bank of the lake, near the Armour residence, a little ahead of the funnel, and drove his team into the grove and awaited the onset of the storm. The roar sounded like a buzzing cylinder, and struck the buildings and grove with an awful crash. Mr. Maulsby affirms that he was caught up in the air, where he was whirled around and around, with everything dark, coming in contact with flying debris of every description, and finally was let down to earth without any sudden jar or serious hurt. His team was badly injured, and a valuable mare that was tied to the hind end of the wagon was lifted bodily and carried into the lake and killed. At this point the tornado was about twenty yards wide, and the debris covered a space two to three hundred yards wide. The length of its track was less than two miles.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.91 inches; highest observed, 30.38 inches at Sioux City, on the 25th and 30th; lowest observed, 29.30 inches at Davenport, on the 2d; range for state, 1.08 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 107 stations, was 49.8 degrees, which is 0.3° above normal. By sections the mean temperatures were as follows: Northern section, 47.6°; Central section, 50.0°; Southern section, 51.8°. The highest monthly mean was 53.8°, at Burlington; lowest monthly mean 44.9°, at Forest City. The highest temperature reported was 86°, at Mt. Vernon on the 11th; lowest temperature reported, 17° at Larchwood on the 30th. The average monthly maximum was 77.4°; average monthly minimum, 25.0°. Greatest daily range, 52°, at Stuart; average of greatest daily ranges, 39.7°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 120 stations, was 2.98 inches, which is 0.03 of an inch below normal. The averages by sections were as follows: Northern section, 3.38 inches; Central section, 2.89 inches; Southern section, 2.67 inches. The largest amount reported was 6.00 inches, at Grand Meadow; least amount reported, 0.74 of an inch, at Logan. The greatest daily rainfall reported was 3.16 inches, at Columbus Junction, on the 10th and 11th. Average number of days on which .01 of an inch or more was reported, 9.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 45 miles per hour, from the south, at Sioux City, on the 27th. Average number of clear days, 11; partly cloudy, 9; cloudy, 10.

OBSERVERS' NOTES.

ALLERTON—*Rex Shriver*. Oats sowing began on 1st. Plums and cherries in bloom on 20th; peaches blooming the 26th.

ALTA—*David E. Hadden*. Compared with the preceding thirteen years April, 1903, was about normal in temperature, and the precipitation was about one half inch below the average.

AMANA—*Conrad Schadt*. Snow, ice and frost on morning of 30th; fruit damaged.

ATLANTIC—*J. W. Love*. Ice formed five nights during April; snow fell on evening of 29th and morning of 30th.

BONAPARTE—*B. R. Vale*. A cold, wet month; not over half the acreage of oats sown; sub-soil, full of water and 4.15 inches of rain fell this month.

BRITT—*Geo. P. Hardwick*. Frosts on two-thirds of the mornings; farm operations backward.

CLARINDA—*A. S. Vansandt*. Hailstones on 11th were very large; one measured 6 inches the larger circumference and 5 inches the shorter.

CLINTON—*Dr. Luke Roberts*. Rainfall 4.93 inches, 2.04 above normal; plenty of moisture and coolness; spring opened early enough, but lack of warmth retarded vegetable growth.

COLUMBUS JUNCTION—*H. E. Simpson*. The spring which opened so early has been set back; fruit seems badly damaged.

ESTHERVILLE—*Earle W. Peterson*. It is a peculiar fact that the first day of the month was the warmest, and the last day the coldest.

FOREST CITY—*J. A. Peters*. Seeding began about 5th; ground very wet; considerable plowing done for corn at close of the month.

GRAND MEADOW—*F. L. Williams*. Month very wet and work backward; grass in pastures good.

RIDGEWAY—*Arthur Betts*. Wettest April on record at this station; a degree warmer than 1902; ground thoroughly soaked; 202 hours of sunshine and seven days without a sun. Large hailstones fell on the 1st and 12th.

WAUKEE—*E. J. Leonard*. Last half of month unseasonably cold; closed with a severe snow storm and freeze for a climax.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. MAY, 1903. No. 5.

IOWA CROPS JUNE 1, 1903.

Reports of the regular crop correspondents of the Iowa Weather and Crop Service, made June 1st, have been received and tabulated for the state at large. The showing as to the acreage, as compared with last year is somewhat better than we had reason to expect in view of the adverse weather conditions and saturated state of the soil in the seeding and planting season. The county reports were generally mailed about the 27th to 30th of June, when the conditions were at their worst for the formation of a fair estimate as to the status of the crops.

The figures as to the acreage of corn, as compared with last year, must needs be revised, and will be included in the report for July 1st. It was impossible to make, during the last week in May, even an approximate estimate of the acreage that will be finally included in the corn harvest of this year. So the figures as to the corn acreage will be omitted from this report. The per centages of the acreage of the other staples are as follows, the figure 100 representing the area of last year:

Winter wheat, 83 per cent; spring wheat, 85; oats, 92; barley, 90; rye, 88; meadows, 101; potatoes, 94; flax, 87.

CONDITION OF CROPS AND FRUIT.—Winter wheat, 96; spring wheat, 93; corn already planted, 75; oats, 93; barley, 96; rye, 94; meadows, 109; pastures, 107; flax, 84; potatoes, 91; apples, 70; plums, 35; peaches, 40; cherries, 35; grapes, 70; strawberries, 90; blackberries, 92; raspberries, 85.

LIVE STOCK.—Cattle, 99; sheep, 99; hogs, 98; spring pigs, 89; horses, 96; foals, 95.

Last year at corresponding date conditions were rated as follows: Corn, 97 per cent; wheat, 99; oats, 98; barley, 100; rye, 99; flax, 98; potatoes, 103; meadows, 96; apples, 70; plums, 72; cherries, 70; grapes, 72; strawberries, 80; raspberries, 71; blackberries, 67.

CONDITION OF FRUIT JUNE 1.

Secretary Green, of the Agricultural Society, has issued the following report:

A summary of the reports for June shows a decline of 10 to 30 per cent in some varieties of fruit since the last report. The lowest percentage is in the Des Moines valley, the next lowest is in the Nishnabotna. The counties east of the Iowa river show the highest percentages in plums, cherries, currants and gooseberries; these fruits, if properly distributed, should bring a good price, as not more than one-fourth the usual crop will be harvested. Apples will be about half a crop in the southwest, from present indications, and three-quarters in the north and east. Strawberries, raspberries and blackberries are well distributed over the state, and will be a good crop unless injured by unfavorable weather conditions later in the season.

A summary for June is as follows: Apples, 68 per cent; pears, 22; plums, 27; cherries, 26; peaches, 30; grapes, 64; currants, 36; gooseberries, 34; red raspberries, 76; black raspberries, 72; blackberries, 90; strawberries, 86 per cent of a full crop.

WEATHER AND CROP CONDITIONS, MAY, 1903.

The month of May, 1903, scored a meterological record fairly comparable with that of May, 1892, which was characterized as the most unfavorable May for farming operations known in Iowa for a quarter of a century. The mean temperature for May, 1892, for the state, was 54°, or 5.7° below normal, and the average rainfall was 8.77 inches, or more than double the normal. In May, 1903, the temperature was 61.6°, which is slightly above normal, and the average rainfall for the state was 8.55 inches, or 4 52 inches above normal, and .22 of an inch below the total for May, 1892. The general weather conditions for the month this year were exceedingly unfavorable, but were notably better than the records show to have been prevalent eleven years ago. The temperature was seasonable except for very short periods at the first of the month and during the heavy storms the last week. The distribution of the rainfall was somewhat variable, ranging in amounts at local stations from 2.88 to 15.45 inches; but the average of each section was above 8 inches. The best conditions as to dryness of soil prevailed in the Mississippi river counties. The great interior basins of the Des Moines, Iowa and Cedar rivers were subjected to very heavy floods about the close of the month, causing much delay in farming operations and damage to all crops. From about the 3d to the 18th conditions were at their best, and during that half of the month the plowing, planting and other farm operations were in progress on the drier lands, with only occasional interruption by showers. Most of the corn that was planted was put in during that period. The protracted and very heavy storms during the last decade rendered field work impracticable in more than four-fifths of the state. At the close of the month not over two-thirds of the usual corn area had been planted. The germination was generally quick and satisfactory in the stand, but the fields soon became very foul from lack of cultivation, and much more than the usual amount of replanting was necessitated as a result of washing and flooding the fields. The general condition of wheat, oats, rye, barley and meadows was better than seemed to be possible during prevalence of the storms. The fruit crop suffered some damage by the frost and freezing temperature the first of the month, but the general condition of apples; berries and grapes is fairly good.

MAY RAINFALL IN IOWA, 1890–1903.

The following table gives the average rainfall for the state, in the month of May, for the period of fourteen years:

Year.	*Inches.*	*Year.*	*Inches.*
1890	3.56	1898	4.67
1891	3.18	1899	6.23
1892	8.77	1900	3.31
1893	3.45	1901	2.35
1894	1.87	1902	5.39
1895	3.19	1903	8.57
1896	6.69		
1897	1.92	Average	4.50

SEASONABLE NOTES.

Within the past seven years many articles have been published under the caption "Lessons of the Drought." A new leaf has been turned, and we are called upon to study object lessons set in another chapter of human experience. Sodden fields, impassable roads, flooded bottoms, eroded hillsides, washed out and drowned out crops, furnish timely topics of interest to students of nature, tillers of the soil and business men of the country.

The people of New England, New York, Canada, and other portions of the east, have been stricken by the drought, while our fields were drenched and our people have been contending with the floods. We might swap literature with them just now, giving them the benefits to be derived from all the writings of all the people of this region who have essayed to tell all about the cause of droughts and how to cure them. We may safely loan them all of that sort of dissertations that have been filed away in libraries and lumber rooms, and if they should forget to return the articles we will not be much the poorer. When the metorological pendulum again swings toward the droughty side in this region, as it surely will in due time, we can then depend upon getting at short notice revised and enlarged editions of the essays that tell specifically how the people have been ruining their climate by draining their farms and cutting off trees somewhere or other.

About fifteen years ago, after the west had suffered some damage from drenching rains and floods, a gentleman of note as an author, wrote an elaborate article wherein he attempted to prove by facts and deductions that the heavy downpours of that period were due in considerable part to human agency. His theory was that the increasing use of steam power in this country, in form of stationary engines, locomotives, and steam heat in buildings, had largely added to the humidity of the air arising from solar evaporation, resulting in a vast increase in the total amount of precipitation. His very ingenious and seemingly plausible article was widely disseminated and elicited much favorable comment; but it was not sufficiently vigorous and well rooted to withstand the very severe drought that came with blistering effect within the next year or two. That theory had in reality more scientific backing than the correlated hypothesis that was broached a little later to account for the drought, viz: that it was the result of man's agency in the drainage and cultivation of western lands. The truth is, as we must allow, man is a puny creature when his strength is pitted against the mighty powers that cause the winds, rains and floods.

The world over the people have persistently trenched upon the rivers, floodlands, and shores of lakes and oceans. As a result of their folly thousands upon thousands have been overwhelmed by floods and tidal waves, and the burden of support of the survivors in times of calamity falls upon those who are wise enough to build their homes upon the uplands. The world is big enough and broad enough, and there is room for all its inhabitants upon the slopes and ridges, far above all high water marks. The bottoms that are subject to periodic overflow may be profitably used for pastures, meadows, truck gardens and cornfields in ordinary seasons. The occasional loss of crops would be trifling in comparison with the damage and risk of life resulting from flooding the homes of the poor, who have been induced to locate on cheap bottom lands. For sanitary reasons, as well as immunity from floods, human habitations should not be permitted in flood districts.

See Matt. 7:25. Anent the foolish man "which built his house upon the sand; and the rain descended, and the floods came, and the winds blew, and beat upon that house and it fell: and great was the fall of it." So the same sort of folly was committed in the olden time.

The Iowa lakes are now at the highest stage they have reached in eleven years. Spirit Lake is reported to have risen twenty-two inches, and many of the docks are under water. Those who a couple of years ago predicted the early drying up of those noted summer resort lakes are not saying anything about it just now.

A news special from Ottawa, Canada, dated May 30th, said no rain had fallen there for several weeks, and for the purpose of breaking the drought and preventing the outbreak of destructive fires the mayor requested the minister of militia to bring out his battery of big guns and bombard the heavens to jar down the moisture from the air. The rains will undoubtedly be copious hereafter—this season or some other year.

Observer Arthur Betts, from Ridgeway, Winneshiek county, reports a distinct shock of earthquake at 2:10 A. M. on the 21st of April. It was a low rumbling that shook the house, jarred windows, for space of about ten seconds, the apparent direction of the wave being from S. E. to N. W.

A dispatch from Utica, New York, dated June 10th, says that Prof. Carl Meyers, the rainmaker, accompanied by experts in the use of oxygen and hydrogen, has gone into the Adirondack forest preserves to conduct experiments in rainmaking by use of powerful explosives. Prof. Meyers' apparatus includes balloon bombs eight, ten and twelve feet in diameter, and he is quoted as saying that the local weather conditions would determine the time and method of exploding them. That is a wise thing to do in making such experiments. The barometer, wind direction and humidity should be carefully noted; then when things are just right you may begin firing, as Dewey said to Captain Gridley at Manila Bay. But how strange it seems to be trying to make rain fall in a great forest preserve! Possibly, however, the trees need to be awakened and set to work at their legitimate business as rainmakers. Those bombs will jar 'em.

FLOODS, DROUGHTS AND DISMAL PROPHECIES.

"Is America's Ruin Threatened by an Era of Floods?" Under this alarming headline the Chicago *Inter-Ocean*, of June 7th, published a half-page article written by John P. Brown, secretary of the International Society of Arboriculture, in which was uttered this solemn warning: "Within twenty-five years these great inundations, which have been steadily increasing in number and violence for sixty years, will be general through-

out the continent, and no section will be secure from periodical deluges; and within half a century the great agricultural regions of the continent will be sterile as the deserts of Arizona, or the plains of China." This most deplorable condition, Mr. Brown affirms, we are bringing upon ourselves by the rapid denudation of forest areas, stripping state after state of the fertilizing timber which for ages has chained the soil to the fields, fed the rivers with a steady flow and regulated the water supply.

This solemn warning is evidently uttered to promote the most excellent cause of arboriculture, by scaring people into good works in the line of tree planting. But the end to be attained, though good in itself, does not justify the questionable means employed in its promotion, such as dire prophecies of evil and irrational arguments or assumptions. There are some most convincing reasons that may be urged in favor of conservation of our remaining forest areas, and in behalf of tree planting on some of the slopes, ridges and practically useless lands in these prairie states, but in this work the appeal must be made to intelligent people, who may not be moved by specious arguments and warnings of awful calamities to come. This pessimistic prophecy uttered by Mr. Brown appears very like the familiar scare-crow that was made to do duty in the same good cause during our recent antedeluvian (before the flood) period of severe drought, the only difference observable being that the frightful figure is now togged out in a rubber suit to withstand the latter day wet weather!

When the excessively wet period began, about a year ago, we found a measure of comfort amid our watery woes in the thought that we had secured a short season of rest from being worried by good people who persisted in warning us that the climate of this section is being ruined by drainage of wet lands and cutting timber, and that this region will become sterile from droughts of greater frequency and severity in future years; that we can only be saved from utter desiccation by planting trees and taking up our tile drains. But now comes Prophet Brown, with a new chapter of lamentations, and a fresh batch of predictions of woes to come in the form of floods only a little less in amount than the Noachian deluge.

There is a confusion of tongues among these two classes of prophets, but they all agree that there is no way of escape from the predicted disasters except to take to the woods. Plant trees to save from droughts and make increased rainfall; and to prevent damaging floods, plant more trees. The trees make more rain, and then perform a beneficent office, we are told, by preventing floods by holding back a big portion of the surplus waters. Mr. Brown says the forests regulate the water supply and feed the rivers with a steady flow.

Seriously now, while it is true that in time of excessive rainfall the forests help to retard the outflow of a portion of the surplus waters, yet this is only a half-truth that has been made to give currency to unsound theories. In matter of fact, the capacity of a forest bed to serve as a reservoir of surplus waters depends upon its character as to density, the kind of trees, and the location, whether on rocky hillsides and mountains or level lands in the valleys. Millions of acres of forests on the rocky hillsides possess no appreciable capacity to retain moisture beyond the actual necessity of the trees, and they only serve a mechanical purpose in preventing erosion of the slopes. There are millions of acres of slopes now subjected to erosion that ought to be protected by trees, but that is far from allowing that such slopes would thereby prevent torrential rains or keep water from running down hill. The dense forests on level lands in the valleys do serve a beneficent end in retaining a portion of the surplus water, and in using a goodly portion of it in the growth of timber. In that respect there is but little to choose between a bottom land forest and a well drained and deeply tilled corn field on the same kind of soil, and the difference, if any, is on the side of the latter. That is to say, our best bottom land corn fields soak up and hold back from the streams more water than the average forest beds.

The floods and droughts of this abnormal season appear to have been sadly misplaced to serve as object lessons in support of Mr. Brown's theories and predictions. The early and later rains of nearly the whole continent were poured out upon the well-nigh treeless plains and valleys of the central west, producing disastrous floods, very nearly as heavy as those which visited this region fifty and sixty years ago. At the east from Ohio to Jersey and Maine, a very damaging drought held sway over a region including the Allegheny and Catskill mountains, the great Adirondack forest preserves, the Green and White mountains, and all the most heavily timbered regions of Maine, Ontario and New Brunswick. In large portions of the forests great destruction was caused by fires, and reports stated that even in some of the most dense forests the fires burned beneath the moss down to the roots of the greenest trees. In that time of greatest need the forests of that region did not "feed the rivers and regulate the water supply," nor did they have capacity to retain enough moisture to save the heaviest timber from destructive flames. In times of severe drought the trees consume for their own support the storage of moisture, and then the litter of the forest becomes dry as tinder, constituting an element of destruction instead of a source of water supply for streams.

So it appears that Mr. Brown's theory will scarcely hold water. He affirmed that great inundations have been steadily increasing in frequency and volume for the past sixty years, but refrained from offering evidence to sustain the statement. As a matter of fact, the flood of 1844 at St. Louis scored high water records that have not been reached since that time. In the Des Moines valley the volume of the flood in 1851 was the greatest ever known. And in that early period the cutting of the forests at the head waters of the Mississippi had not progressed very far. It would be an easier task to prove the reverse of Mr. Brown's assertion. Not only in the treeless central valleys, but also in the most heavily timbered regions of the south and east, the student may notice the erosive effects of great floods, which came at frequent intervals in the centuries before the axe of a civilized man had cut a tree to build a cabin. There have been floods and floods all along down the ages of human history, and in the most distant ages the vast forests of all the continents did not avail much in averting great disasters by floods. Note the formation of the vast delta at the mouth of the Mississippi as proving the occurrence of great inundations for unknown centuries.

While giving due credit to forests for their beneficent effects in the retention of a portion of excessive rainfall, we must also recognize the fact that the deeply tilled soils and subsoils of these western prairies perform the same good office in a larger measure, because they possess greater storage capacity than the average forest areas. In this section the floods have never invaded the valleys to any considerable extent until the deep soil, subsoil and drift deposits had been filled down to the impervious bed rock. So it may be proven quite readily that the mulched and moss-carpeted forests of the rocky hillsides, mountains and valleys of the east do not possess nearly as much storage capacity for moisture as an equal area of well cultivated tile-drained farming lands in Iowa.

It is a subject of general remark by people from abroad, as well as residents of this section, that these well-tilled fields possess a marvelous quality for withstanding both droughts and floods, and the reason is obvious. The storage capacity of the soil and the immense deposits of humus afford a large measure of immunity from ill effects of droughts which would ruin the crops on the lighter soils of the east. With a fair supply of moisture at the outset of the season, it has been found possible in this state to grow and ripen a good crop of corn with less than one-third of our normal rainfall for the crop season.

Prophet Brown, in attempting to sustain his prediction of disastrous floods that will ruin this treeless valley, says the excessive rainstorms that visit this section are caused by electrical disturbances, which are due to the absence of trees. Of this he says there is no doubt, and then hedges by saying: "To what extent this is true is not known." Exactly so; and because it is not known it is best not to indulge in dogmatic statements. We have been led to believe that the electrical disturbance in a storm is a result of rapid condensation of vapor and not the cause thereof; and that condensation of vapor into rain is due to dynamic cooling of the humid air. Mr. Br. wn's mistake is in confounding causes and effects, like the man who expressed wonder that electricity possesses the power to make the dynamos revolve so rapidly in the power plants at Niagara Falls.

Our prophet who warns us that this valley will soon be washed into sterility in consequence of its treeless condition, does not stop to consider the fact that this region has been treeless very many centuries, and that during this period the rich humus of the soil has been stored up for the support of millions. The process of growth and decay, with alternations of wet and dry seasons, has been in operation for centuries, resulting in making a marvelously fertile plain, far away from the "fertilizing timber." And the fact that it was made rich under the same climatic and treeless conditions, gives us strong faith that it will retain its position as the granary of America for centuries to come.

Our faith in the substantial permanence of general climatic conditions in this valley is so strong that we unhesitatingly advise the farmers of Iowa to hold their farms as the richest legacies they can leave to their posterity for scores of generations. But if we gave credence to much of the talk of our over-zealous arboriculturists, we should exhort friends to get out and take to the woods, or climb a tree.

At the east the drought problem has been the foremost topic, while our people have been worried over the floods. And professional rainmakers exploited their theories while the drought was at its worst. The complex weather problems have been discussed at considerable length in the papers, but the sanest and most well considered article appeared in the editorial columns of the New York *Tribune*. Referring to proposed experiments in rainmaking the *Tribune* said:

"It is not at all strange that people whose interests are affected by the present drought in Canada, New England and the Middle Atlantic states should jump at any chance to secure relief. Some of their projects are, however, unpromising. Scientific men long ago became convinced that the occasional association between bombardment and rain after a heavy battle was purely accidental. They think that the precipitation would have come anyhow, owing to other causes, and point to the fact that many engagements in which artillery was employed were not attended with the same consequences. After testing the theories of General Dyrenforth ten years ago, the United States weather bureau reached the conclusion that explosions in the upper air had no effect whatever. Overlooking those experiments and conclusions, perhaps, one of the *Tribune's* contemporaries in this city promoted a similar venture in 1900, but with absolutely no success. A lot of vine growers in southern Europe are resorting to practically the same means to break up hailstorms. Possibly they, too, will in time conclude that their procedure is foolish. At any rate, it is hardly logical to resort to bombardment both to induce and to stave off precipitation.

"A partial but convincing explanation of the present drought is furnished by the daily weather maps. Any one who possesses the most elementary knowledge of meteorology is aware that rain and snow occur in this country only in connection with the great barometric depressions, which move in a generally eastward direction across the continent. The area in which most precipitation is observed is not at the center, but in advance of it, say from two hundred to five hundred miles. The great majority of these depressions, when they come as far east as the Mississippi valley, follow the great lakes and St. Lawrence valley to the Atlantic. Since the middle of April, however, all storms which have entered the country have departed from that rule. Either they would move out to the southward—perhaps entering the Gulf of Mexico—or they would die out. In the latter case precipitation would cease with the rising of the barometer at the center of the 'low.' To all appearances this abnormal behavior was due to the singular obstinacy of areas of high barometer which lingered over the lakes and blocked the path of the storms.

"Now, eccentricities of that sort are compensated by eccentricities of another kind in another part of the country or the hemisphere. While their cause is not fully understood, most meteorologists worthy of the name believe that both 'highs' and 'lows' are a product of the great currents which flow between equatorial and polar regions, and hence the general circulation of the atmosphere. Sooner or later nature herself, in some mysterious way, effects a readjustment in the distribution of pressure, as it appears on the weather maps. It may be asserted with perfect confidence, therefore, that such a change will occur in the route of rainstorms between the Mississippi and the Atlantic, though one cannot predict the exact time. Anybody can see, however, that the forces involved operate on a colossal scale. Possibly half of the globe will be affected in one way or another when a new chapter of meteorological history opens. To hope to hasten that transition by any means within the power of man, is the height of folly. One might with equal sanity expect to bale out the ocean with a thimble, or obliterate Pike's Peak with a firecracker!"

FORESTS AND FLOODS.

As this is a timely topic in this season of extremes, the following clipping, from the *Evening Wisconsin*, will be of interest:

"Henry Gannett, in the *Bulletin* of the American Geographical Society, attacks the theory set forth in many works on forestry, that the presence or absence of forests exerts an influence on the rainfall; and the *Monthly Weather Review*, edited by Prof. Cleveland Abbe, endorses his opinion. He also denies that floods in American rivers are more frequent than formerly, as a consequence of the removal of forests from their drainage areas. This relieves the lumbermen of Wisconsin from the imputation of homicide, for if the old and exploded notion were correct, the men who chop down trees in Wisconsin might be held morally responsible for the drowning of people in Louisiana caused by high water in the Mississippi

"'The situation which exists in the arid regions of the earth, Mr. Gannett says is due to their physiography. The forms of their mountains, cliffs and canons are not such as are found in moist climates and attest that the regions in which they exist have been arid 'for thousands if not millions of years' Popular theory regarding them has put the cart before the horse. 'Want of rain prevents the growth of trees; want of trees does not prevent rain.'

"So much as to the arid regions As to the floods, Mr. Gannett observes that 'where forests are cut away, land is seldom left bare; it is cultivated or covered with bushes which hold the water quite as effectively as forests' Records covering a long series of years show that floods in American rivers are not greater now than they were in the past. 'The Ohio river,' he remarks, 'has been gauged continuously for many years, and these gauges show no appreciable change in regimen, whatever changes may have been made in the forest cover of its basin' He might with equal truth have made the same statement concerning the Mississippi. At the beginning of the nineteenth century, when Wisconsin and Minnesota were given over to solitude and Indians, there were floods in Louisiana as forminable as any of the worst that occurred toward the century's close, when the forests over the large areas had been felled and the spaces that they once occupied had been utilized for farming. A field of corn or wheat will hold the water as effectively as a grove of trees.

"It is pleasant to note these conclusions of science. It would be sad to be forced to believe that a man could not procure the material for constructing a house in territory near the head of a watershed without endangering the habitation and jeopardizing the lives of people down the stream."

HEAVY WIND STORMS.

On the evening of Tuesday, May 26th, a very severe wind, storm swept over a considerable portion of the western and central districts. The storm was wide spread, covering an area of more than one third of the state, and at many places the velocity of the wind was not very far short of a tropical hurricane. Reports from all points as to the characteristics of the storm clearly prove that it was a wind squall, or straight blow of unusual force and destructiveness, and not of the nature of a tornado, or "cyclone," as was set forth in the sensational headlines of the newspapers, and the associated press dispatches. From the tenor of these dispatches the people abroad must have received the impression that a whole brood of tornadoes had been incubated and let loose to devastate some of the fairest cities and towns in the doomed state of Iowa. If all the places visited by the storm of the 26th had been struck by veritable tornadoes the list of fatalities would have been in the thousands, and the loss of property would have amounted to millions. Happily for the people the elements are more merciful than the exaggerated reports make it appear.

The city of Des Moines received the onset of the storm at about 6 P. M. Every part of the city felt the shock and suffered some measure of damage, but the greatest destruction was wrought along the 'Coon river bottoms, where the bluffs at the south deflected and intensified the force of the northwest wind. A number of weak buildings were wrecked at that point, though the aggregate of loss was very small in comparison with the reports that were published. The worst effect of the storm was the death of a man and child, by the wrecking of a frail and very unsafe building in which they lived.

The city of Creston was struck at about 5:15 P. M. The reports of damage, as given in detail in the Creston papers, show that the storm swept over the entire city, and continued to blow for the period of twenty minutes. If it had been a tornado, the pathway of the funnel would not have been more than a block or two in width, and the force would have been expended in less than two minutes; but the loss of life and property within that narrow path would have been very great, and sufficient to justify the most stunning headlines in the reports

The same storm visited Corning, Brooks, and numerous places in the southwest and south central counties, causing a good deal of damage at all points.

On the evening of Monday, May 25th, the state institution for the feeble minded, at Glenwood, was struck by a wind storm similar in character and force to the one above described. It was a straight blow from the north, leaving no indications of the effects of a tornado. The force of the wind was sufficient to unroof and materially damage portions of the structures, and two of the inmates of one of the dormitories were killed. Numerous local squalls were noted in various parts of the state the same evening. The last decade in May was a period of unusual meteorological disturbances, winds, downpours and floods, but happily we have no evidence as yet that any part of the state was visited by a tornado. A number of lives were lost, however, by wind storms of sufficient force to wreck the weaker class of buildings. In the observers' notes severe storms are noted on other dates than the ones referred to above.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.95 inches; highest observed, 30.39 inches, at Davenport, Dubuque and Keokuk, on the 1st; lowest observed, 29.55 inches, at Dubuque, on the 27th; range for state, 0 84 inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 117 stations, was 61.6 degrees, which is 1.4° above normal. By sections the mean temperatures were as follows: Northern section, 60.4°; Central section, 61.9°; Southern section, 62.6°. The highest monthly mean was 65.2°, at Burlington; lowest monthly mean, 55.2°, at Estherville. The highest temperature reported was 91°, at Clinton, on the 20th; lowest temperature reported, 24°, at Bedford and Earlham, on the 1st and 3d. The average monthly maximum was 83.3°; average monthly minimum, 29.6°. Greatest daily range, 49°, at Larchwood; average of greatest daily ranges, 33.8°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 129 stations, was 8.55 inches, which is 4.52 cinhes above normal. The averages by sections were as follows: Northern section, 8.11 inches; Central section, 8.73 inches; Southern section, 8.80 inches. The largest amount reported was 15.45 inches, at Thurman; least amount reported, 2.88 inches, at Fort Madison. The greatest daily rainfall reported was 4.80 inches, at Thurman, on the 22d. Average number of days on which .01 of an inch or more was reported, 16.

WIND AND WEATHER.—Prevailing direction of the wind, southeast; highest velocity reported, 72 miles per hour, from the southeast, at Sioux City, on the 21st. Average number of clear days, 9; partly cloudy, 12; cloudy, 10.

OBSERVERS' NOTES.

AFTON.—*N. W. Rowell.* Greater rainfall in May, 1903, than in any one month in eight years past; 11.90 inches. Frost and ice on 1st and 3d.

ALLERTON.—*Rex Shriver.* Rain has fallen 21 days in May; very little over half of corn crop planted at close of month; meadows and pastures good.

ALTA.—*David E. Hadden.* Severe wind squall about 8 P. M. on 22d, damaged some buildings, windmills and trees, southwest and west of town. Mean temperature of the month one degree above the normal of the preceding thirteen years. The precipitation (6.96 inches), is 2.82 inches in excess of the average during the same period. Thunderstorms occurred on thirteen days; maximum temperature, 79°, is the lowest recorded in thirteen years, except in May, 1892, when it only reached

74°. Last frost on May 3d, which is from two to three weeks earlier than usual.

AMANA.—*Conrad Schadt.* The river was 6 to 8 inches higher than last year. The last decade of May was very wet and little farm work could be done.

ATLANTIC.—*J. W. Love.* Heaviest rainfall (12.37 inches), of any month on record here. Soil very wet and much land under water; rain fell on 20 days.

AUDUBON.—*Frank Mott.* More than twice as much rain in this month as in May, 1902.

BONAPARTE.—*B. R. Vale.* Rainfall 4.30 inches; first half of month seasonable; last half constant rainfall and cold; little farm work possible during last eleven days.

BRITT.—*Geo. P. Hardwick.* Rainfall 6.89 inches; excessively cloudy—not one clear day; field work retarded; but half of corn planted at end of month; severe wind and lightning on 23d, damaging windmills and buildings.

CLINTON.—*Dr. Luke Roberts.* Rain 5.45, or .15 of an inch above normal. During first and second decades rain was needed to germinate seeds and for plant growth; after that rain was plentiful and storms retarded work in fields.

COLUMBUS JUNCTION.—*H. E. Simpson.* Clear, dry weather forepart of month, followed by excessively wet and cold weather.

CORNING.—*Jerome Smith.* A violent wind storm on 26th, at 5:15 P. M., changing from southwest to northwest, caused considerable damage to trees and windmills.

DECORAH.—*F. H. Baker.* On 26th a hard wind blew down barns, windmills and a great many trees.

EARLHAM.—*Geo. Phillips.* May was abnormally wet, with 11.60 inches of rain, on ground already saturated; 7.46 inches fell in the last week.

ESTHERVILLE.—*Earle W. Peterson.* On night of 22d a very hard wind swept the country south of this place, destroying some buildings and much property. Heavy rain of the 25th flooded the Des Moines river.

FOREST CITY.—*J. A. Peters.* Greatest rainfall during the month (10.17 inches) ever recorded here for May within ten years; 20 per cent of corn ground will not be plowed.

GRAND MEADOW.—*F. L. Williams.* Rainfall 8.33 inches. On 26th a fall of 3.16 inches raised all streams, washed cornfields and damaged railroads; farm work backward; hay crop good.

GREENFIELD.—*J G. Culver.* Rainfall 13.50 inches. It was less than normal up to 17th, and since that date it was excessive, with unusual number of thunderstorms, many of them severe. On night of 26th 1.64 inches fell in 46 minutes, and a total of 3.82 for the whole day; corn badly washed out.

GRUNDY CENTER.—*E. S. King.* A very wet month; 11.04 inches of rain; small grain, pastures and meadows very heavy growth.

GUTHRIE CENTER.—*W. F. Brann.* On the 26th a heavy thunderstorm and high wind, caused damage by lightning and wind.

HANLONTOWN.—*Miss G. M. Paschen.* Corn planting begun the 8th; hard windstorm on evening of the 22d; potatoes and peas in blossom May 26th.

HUMBOLDT.—*H. S. Wells.* Rain, 7.50. For the past five months the rainfall was 12 34 inches; for same period last year it was 7.69. Much corn not planted on June 1st.

LANSING.—*J. Ackerman.* The rain on 27th caused heavy floods in this section, doing thousands of dollars' worth of damage; small rivers out of banks, and it will be impossible to plant some of the richest lands.

LARRABEE.—*H. B. Strever.* Rain for month, 10.52 inches. Heavy hailstorm about 1 P. M. on 24th; poultry, pigs and young lambs were killed, and much damage to crops and trees. At this place hail lay on the ground four inches deep. Bottom lands were flooded, and some cattle were washed away and drowned.

MARSHALLTOWN.—*B. S. Jones.* Rain, 8.46 inches. On May 31st the Iowa river reached a point higher than last year's high water mark; it is believed to be the highest since 1881.

MONTICELLO.—*C. E. Heisey.* Corn planting much belated by wet weather. On the 25th lightning struck in three places, damaging three houses and burning one large barn.

MT. VERNON.—*Rev. J. W Hubbard.* Not the amount, but the persistency of the rain told; there being fourteen consecutive days of rainfall; prevailing winds easterly.

NEW HAMPTON.—*R. H. Gurley.* Heavy hailstorm on afternoon of 12th; violent windstorm on night of 22d caused damage to barns and windmills.

OLIN.—*Nathan Potter.* The month was favorable for farm work up to 25th, after which date all field work was suspended because of rains and floods.

OSKALOOSA.—*Joseph Boyd.* On night of 26th a heavy thunder and hailstorm passed over, the hailstones being as large as hickorynuts.

OTTUMWA.—*Dr. W. B. LaForce.* The Des Moines river was 22 feet above low water mark on May 31st and June 1st, breaking all records.

PERRY.—*J. A. Harvey.* A terrible windstorm evening of 22d; rainfall this month, 11.41 inches.

RIDGEWAY.—*Arthur Betts.* This May was 2° above normal. Rainfall, 8.70 inches, or 0.89 of an inch less than the amount in May, 1902; many severe thunderstorms; 262 hours of sunshine; gale on 22d was the worst that ever visited this section, destructive to trees, windmills and buildings.

SPIRIT LAKE.—*W. C. Drummond.* Rainfall, 13.03 inches; last ten days of month brought 7.18 inches, causing the worst washout of bridges known in years.

STORM LAKE.—*L. C. Burdick.* Damaging hail and snowstorm about twenty miles north and west on 24th; small grain doing well.

TOLEDO.—*H. P. Giger.* Severe windstorm on 26th.

VILLISCA.—*C. E. Matteson.* Hail on 20th destroyed crops in a radius of three miles. Rainfall for the year to date, 19.33 inches, of which 13.66 fell in May.

WAUKEE.—*E. J. Leonard.* Rainfall for the month, 10.78 inches; May, last year, 3.42 inches; June, last year, 8.57 inches. So this month breaks the record of any month last year by 2.21 inches.

WEST BEND.—*Ph. Dorweiler.* Month remarkable for excess of rain. Roads very bad and crop prospect poor.

ERRATA IN MARCH REVIEW.

AFTON.—Mean temperature recorded 39.2° on page 8, should have been 40.0°. Mean maximum temperature recorded 50.3° on page 9, should have been 50.4°. Mean minimum temperature recorded 28.2° on page 9, should have been 29.6°. Total precipitation recorded .78 inch on pages 8 and 11, should have been .71 inch.

HAMPTON.—Mean temperature recorded 37.3° on page 7, should have been 37.6°. Mean maximum temperature recorded 46.1° on page 9, should have been 46.7°.

IDA GROVE.—Mean maximum temperature recorded 49.0 on page 9, should have been 49.1°.

IOWA FALLS.—Mean maximum temperature recorded 45.2° on page 9, should have been 45.3°. Maximum temperature on the 16th, page 9, should have been 47.0°. Maximum temperature on 24th, page 9, should have been 35.0°.

ODEBOLT.—Mean temperature recorded 39.0° on page 7, should have been 38.9°. Mean maximum temperature recorded 50.5° on page 10, should have been 50.2°.

OSCEOLA.—Mean temperature recorded 40.2° on page 8, should have been 41.6°. Mean maximum temperature recorded 50.0° on page 10, should have been 51.7°. Mean minimum temperature recorded 30.3° on page 10, should have been 31.6°.

VINTON.—Mean temperature recorded 39.3° on page 7, should have been 39.4°.

ALTA.—Total precipitation recorded .80 inch on page 7, should have been .81 inch.

WHITTEN.—Mean temperature recorded 33.2° on page 7, should have been 38.2°. Mean maximum temperature recorded 47.7° on page 10, should have been 47.8°.

MT. VERNON.—Mean temperature recorded 40.6° on page 7, should have been 40.5°. Mean maximum temperature recorded 51.2° on page 10, should have been 51.0°.

LARRABEE.—Mean temperature recorded 34.6° on page 7, should have been 34.8°. Mean minimum temperature recorded 24.0° on page 10, should have been 24.5°.

AMES.—Mean temperature recorded 38.6° on page 7, should have been 38.4°.

DENISON.—Mean temperature recorded 33.5° on page 7, should have been 38.5°.

LEON.—Precipitation on 22d, recorded .02 inch on page 11, should have been .20 inch. Precipitation on 23d, recorded .02 on page 11, should have been .20 inch. Total precipitation recorded 1.28 inches on page 8, should have been 1.86 inches. Total snow fall recorded 0 inches on page 8, should have been 6.0 inches.

TIPTON.—Precipitation on 23d, recorded 0, on page 12, should have been .20 inch. Total precipitation recorded 1.37 inches on page 7, should have been 1.57 inches.

ELDON.—Mean temperature recorded 45.0° on page 8, should have been 44.0°. Mean maximum temperature recorded 58.9° on page 9, should have been 56.7°. Mean minimum temperature recorded 31.0° on page 9, should have been 31.2°.

ERRATA IN APRIL REVIEW.

COLUMBUS JUNCTION.—Mean temperature recorded 52.3° page 7, should have been 51.8°. Mean minimum temper recorded 41.2° on page 8, should have been 40.2°.

EARLHAM.—Mean temperature recorded 50.0° on should have been 49.4°. Mean maximum temperature [illegible] 63.6° on page 8, should have been 62.6°. Maximum temperature on 24th, page 8, recorded 66.0°, should have been 60.0°

MONTICELLO.—Mean temperature recorded 48.8° on page should have been 48.4°. Mean maximum temperature recorded 63.9° on page 9, should have been 62.9°.

ODEBOLT.—Mean temperature recorded 48.0° on pa should have been 49.6°. Mean minimum temperature rec 33.8° on page 9, should have been 37.1°.

AFTON.—Minimum temperature recorded 27.0° on the 30th, page 7, should have been 26.0° on the 4th.

ALGONA.—Minimum temperature recorded 25.0° on the 30th, on page 6, should have been 24.0° on the 4th.

HARLAN.—Minimum temperature recorded 25.0° on the 30th, page 6, should have been 24.0° on the 4th.

WASHINGTON.—Total precipitation recorded 3.82 inches on pages 7 and 11, should have been 3.79 inches. Daily precipitation recorded .05 inch on 19th, page 11, should have been .08 inch.

WASHTA.—Total precipitation recorded 1.85 inches on pages 6 and 11, should have been 1.95 inches.

WAVERLY.—Precipitation on 30th, of .05 inch on page 11, should have been .03 inch.

CLIMATOLOGICAL DATA FOR MAY, 1903.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. JUNE, 1903. No. 6.

IOWA CROP REPORT JULY 1, 1903.

Reports from county and township crop reporters for July 1st have been tabulated, showing the following percentages of condition: Spring wheat, 88 per cent; corn, 77; oats, 87; barley, 89; rye, 98; flax, 85; meadows, 104; pastures, 107; potatoes, 96; apples, 70; plums, 49; grapes, 78.

Last year at corresponding date the percentages were as follows: Wheat, 97; corn, 92; oats, 95; rye, 98; barley, 97; flax, 99; potatoes, 108; meadows, 99; pastures, 107; apples, 65; grapes, 65.

A revised estimate of the area of corn planted this year shows 87 per cent, or an average decrease of 13 per cent, compared with the area planted in 1902.

JUNE TEMPERATURE AND RAINFALL.

The following table shows the mean temperatures and average rainfall for the state, for the month of June from 1890 to 1903, inclusive. The figures show that the month just closed was the coldest June on record for the period of 14 years, and also the driest except one, which was June 1894.

YEAR.	Temperature, degrees.	Rainfall, inches.
1890	72.7	7.76
1891	69.1	5.39
1892	69.2	5.19
1893	71.2	3.91
1894	73.2	2.67
1895	69.7	4.32
1896	69.1	3.11
1897	69.1	3.81
1898	71.4	4.72
1899	70.7	5.04
1900	69.7	3.98
1901	72.3	3.71
1902	65.2	7.16
1903	64.6	2.86
Average	69.8	4.54

WEATHER AND CROP CONDITIONS IN JUNE 1903.

The month of June as a whole was unseasonably cool and dry, the daily mean temperature being 5.6 degrees below normal, and the deficiency in the average rainfall 1.52 inches. The records show that it was the coldest June in the last fourteen years, and the driest, except one (June 1894). On the first of the month the soil was saturated by the excessive rains of the last decade in May, the rivers were at flood-tide, and many thousand acres of bottom lands were flooded. The change from this saturated condition was gradual, the drying process being retarded by light showers, cool and cloudy weather, with less than the normal amount of sunshine during the first decade. This was altogether more favorable than would have been a sudden change to hot and dry weather, causing an encrusted surface of the soil. The cool and dry weather prevalent the larger part of the month was favorable for wheat and oats, checking the tendency to rust and rank growth, but corn needed much warmer weather to quicken the germination and growth of this belated crop Notably good progress was made, however, in replanting the washed out fields, planting the previously saturated area, and cultivating the early planted corn on dry uplands. The seasonable weather prevalent about the close of the month caused a marked improvement in the appearance and prospects of this important staple, the early planted fields were fairly well cultiuated, and in size and color were much nearer the normal condition than was deemed possible at the outset. Clover cutting was begun near the middle of the month and the hay harvest was quite general at its close, with prospect of a very heavy yield of both clover and timothy. The minor crops, such as potatoes, garden truck and berries, were generally in excellent condition. Apples appeared to be doing better than was indicated earlier in the season. The prospects for all soil products were so much better at the close than at the first of the month that there was a general spirit of rejoicing over the brighter outlook.

NOTES AND COMMENTS.

Thunderstorms have been very frequent and unusually destructive to farm animals this season, and as in former years wire fences have served as efficient conductors for the deadly bolts. A case in point was reported from Jefferson county. Lightning struck a large maple tree, and from its base was conducted by a wire fence to a bunch of steers thirty rods distant. Five of the steers were prostrated by the shock, three being killed, and two badly injured. The insurance company paid $105.00 to adjust a loss which might have been prevented by use of ground wires costing less than a dime. This is a story oft-repeated, with some variations.

On the evening of July 2d, according to eastern news specials, after a period of intense heat, a terrific storm swept over New York City. In the upper part of the city the wind blew at one time at the rate of 72 miles an hour, causing an immense amount of damage. Three deaths were reported directly traceable to the force of the wind. The eastern papers and press dispatches called it a heavy gale, and that fairly described the windstorm. In the west, however, it is customary to term that sort of dis-

turbance "a deadly cyclone," or "an awful tornado," with stunning headlines in the newspapers. Those eastern scribes are rather moderate in their reports of such things, and it would be well if westerners would follow their example.

The *Scientific American* says that Point Reyes, an important United States weather bureau and storm signal station, located on the California coast some thirty-five miles north of San Francisco, holds the world's record for high, strong, continuous winds. Last year Point Reyes captured this honor from the weather stations of the earth, and again this month (May) has gone several notches higher on the meteorological scale. On May 18, 1902, the wind at Point Reyes attained a velocity of 102 miles and hour, and for several minutes was rushing along at the furious rate of 120 miles per hour. A fearful gale lasted for three whole days, and at one time the winds in a playful mood ripped the cups from the anemometer. This year, on May 14, the winds commenced to blow again with the greatest violence. For four days the velocity registered averaged more than sixty miles an hour. For nine days the average velocity was fifty-two miles an hour. The total number of miles recorded on the anemometer was 11,223 miles. This is the highest velocity of wind for the time on record in the world.

"It is very curious," said the old professor of physics, "to see how many market gardners there are to raise things under glass, make money out of the process, and yet do not know why their heating frames and their hothouses remain hot inside. Now, as a matter of fact, the heat mechanism of a hothouse depends on a well known proposition of physics. I suppose you are acquainted with the fact that the energy from the sun travels in the form of little waves. The energy does not come down to us in straight lines; it comes, as it were, in a zigzag manner, dancing from side to side as it comes along. If these waves are very short, light is the result; if they are a trifle longer, they take the form of heat. If the light waves strike anything on the way down they are very apt to be turned into heat. Now, the waves which form light are so short that they will readily pass through glass, but the waves which form heat are so long that they will not pass through. From this, therefore, you may see why a hothouse remains hot. The energy from the sun passes into the house through the glass roof in the form of light. Then it strikes the objects in the house and is turned to heat. But this heat cannot pass out through the glass. The heat waves are too long. So the light keeps coming in and the heat keeps accumulating, and soon the hothouse becomes very warm indeed, even on the coldest days in winter."—*Boston Globe.*

It is stated that the everglades of Florida are to be drained, thereby rescuing 600,000 acres of good, rich land from the swamp where it has been submerged as long as our knowledge of the peninsula recurs. Dr. Wiley of the Department of Agriculture places an approximate value of $300 an acre on this land and adds that it will be capable of producing more sugar than the entire island of Cuba. The everglades extend through the southern part of the peninsula, south of Lake Okeechobee, an immense body of water lying near the cen'er of the state. The region is flooded at intervals, but it is several feet above sea level and can be drained by digging an immense ditch to the ocean. This is not a difficult matter as the ground is soft. For that reason it may be a task to keep the ditch open. For cultivation waterflows are suggested. Rice, cane and tropical fruits can be grown, as the everglades are below the frost line. If undertaken, this gigantic scheme will at least have the result of adding a large tract to our agricultural estate. It is an experiment and $2,000,000 of Philadelphia capital is interested, according to the story.—*New York Commercial.*

THE PRAIRIE HOME.

Outward far the rolling landscape reaches,
Loamy billows capped with harvest foam,
Level is the view, and subtly teaches
Man to take the prairie for his home.

Here is beauty, here is silent power,
Here the hidden forces crux and rest,
Here dead centuries have shed their dower—
On the spreading prairies of the West!

Winds are roaming—man need never wander,
Born to earth, he has a rich estate;
Seedtime, harvest and his trust grows fonder,
Here he needs alone to work and wait.

—*Chas. W. Stevenson.*

EVOLUTION OF THE THERMOMETER.

It is probably not generally known that the thermometer was invented by Galileo. When we remember that we owe to this one man not only the foundations of physical science, but also in large measure the pendulum, the compass, the telescope and the microscope, it may lead to a certain amount of modesty in our appreciation of modern inventions.

Galileo, probably in 1596, invented the open air thermoscope. Ferdinand II., of Tuscany, first sealed the glass, making the instrument independent of atmospheric pressure. Many improvements were gradually made, especially in the endeavor to fix points on a definite scale, the freezing point of water being first used by Robert Hooke in 1664. Of the three thermometers still in use, Fahrenheit's thermometer was invented in 1709, Reaumur's instrument in 1730, and the scale of Celsius—the centigrade scale—in 1742. None of these thermometers, however, is now used in the form in which it was originally devised. It is a somewhat curious fact that the instrument constructed by the German, Fahrenheit, is used most exclusively by the English speaking people. That invented by the Frenchman, Reaumur, is used chiefly in the north of Europe, while that of the Swede, Celsius, is used in French speaking countries. The centigrade scale, the zero point of which is the freezing point of water, is now used nearly universally in scientific investigations. The main objection to its common use is the length of the degree, the interval between the freezing point and the boiling point of water being divided into 100 instead of 180 degrees, as on the Fahrenheit scale. This makes the length of a centigrade degree nearly twice—nine-fifths—that of the familiar Fahrenheit degree.—*Popular Science Monthly.*

A TYPHOON IN THE PHILIPPINES.

H. Phelps Whitmarsh in the *Atlantic Monthly:* Yesterday nature bore herself proudly; now she appears overwhelmed and tearful. The plumed bamboos which held themselves so haughtily are now spread and bent under the incessant beat of the rain, and cataracts run through their battered leaves. The fields have turned to lakes, the streams are rivers, the rivers are floods; and these roofs of bamboo and nipa are irrigating pipes guiding numberless jets inside the houses.

In the meantime the rain has grown heavier. At intervals cold gusts of wind are flung from the north and the horizon darkens with clouds more black than ever. The barometer, moreover, has fallen a degree. In these suspicious days of the colla, every white man looks at this sentinel of the atmosphere more often than a vain girl looks into a mirror. The barometer to me in my loneliness is a welcome companion. When it falls, I prepare myself for the worst, and when it rises I anticipate the end of the storm.

The rain falls heavier and heavier; the world, seen from my window, is a muddy flood and my house an ark. The barom-

eter is still falling. The dial hand already points to the remark "with winds from the northeast and northwest the baguio approaches." Soon I can hear the wind coming. With a sudden gust to which the house heels like a ship, it is upon us. A great guava tree falls with a crash outside, and the nipa shutters go flying to leeward. The wind converts the raindrops into projectiles which pierce the house at all points with the violence of hailstones.

Night falls early; dark, drenching and furious. "The waters are out," and the storm carries with it a terrible note. And the glass is still falling. Will it never end? Rumors of destruction come in from the forest at intervals of a minute, together with the crashings of torn branches and the blowings, it seems, of a hundred horns. Gusts of wind and water combined come howling over the flood and hurl themselves against the house. At each onset the building cracks and staggers more than ever like a storm-tossed craft.

But at last the monster seems to be seeking its prey in another direction, and turns slowly eastward, hungry for more ruins. Southward, then, unless the law of storms is wrong, it will cause the greatest ravages. The vortex, to which all the radii of this gigantic wheel of the baguio converge, will pass through the south of the archipelago.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.98 inches; highest observed, 30.44 inches, at Sioux City, on the 11th; lowest observed, 29.55 inches, at Sioux City on the 30th; range for state, 0.89 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 109 stations, was 64.6 degrees, which is 5.6° below normal. By sections the mean temperatures were as follows: Northern section 64.1 degree; central section 64.5 degrees; southern section 65.3 degrees. The highest monthly mean was 67.8° at Tipton; lowest monthly mean, 59.4° at Ogden. The highest temperature reported was 96°, at Cedar Rapids and Sigourney on the 26th and 30th; lowest temperature reported, 30°, at Denison, on the 4th. The average monthly maximum was 89.7°; average monthly minimum, 38.6°. Greatest daily range, 50° at Scranton; average of greatest daily ranges 34.1°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 125 stations, was 2.86 inches, which is 1.52 inches below normal. The averages by sections were as follows: Northern section, 2.84 inches; central section, 2.89 inches; southern section, 2.85 inches. The largest amount reported was 6.04 inches at Humboldt; least amount reported, .75 of an inch, at West Union. The greatest daily rainfall reported was 3.00 inches at Washta, on the 30th. Average number of days on which .01 of an inch or more was reported, 10.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 66 miles per hour, from the northwest, at Sioux City, on the 8th. Average number of clear days 13; partly cloudy, 10, cloudy, 7.

OBSERVERS' NOTES.

ALTA.—*David E. Hadden.* Compared with thirteen preceding Junes the month just closed was 5.4° cooler, and the precipitation was .91 of an inch below the normal.

AMANA.—*Conrad Schadt.* The Iowa river was at its highest on June 1st, being about six to eight inches above last year's flood mark.

BONAPARTE.—*B. R. Vale.* A seasonable month; too cool for corn till just at the close.

BRITT.—*Geo. P. Hardwick.* No serious storms except on morning of the last day, when high and damaging wind swept over south half of county; corn uneven and late; grain below average.

CLINTON.—*Dr. Luke Roberts.* Mean temperature 65.4°, which is 4.3° below normal, and 1.7° below June, 1902, which was then a record breaker as a cold June. The average of the first decade was 64°; second decade, 63.7°; third decade, 67.5°. Rainfall 1.66 inches, or 2.89 inches below normal. Very little fell after the 5th and crops were much in need of it before the close of the month.

COLUMBUS JUNCTION.—*J. B. Johnson.* On 1st and 2nd the Iowa river was higher than in 1881.

EARLHAM, R. F. D.—*Geo. Phillips.* Corn was smallest for years at close of month; small grain and grass never looked better.

ESTHERVILLE.—*Earle W. Peterson.* A severe windstorm swept through the northwestern part of Emmet county on afternoon of 24th; in its path, about three rods wide, all buildings were destroyed.

GRAND MEADOW.—*F. L. Williams.* The month was favorable to most crops; there were extreme variations between day and night temperatures.

HANLONTOWN.—*Miss G. M. Paschen.* There was frost on night of 11th which did some damage to corn and other tender vegetation on low ground.

HUMBOLDT.—*H. S. Wells.* Rainfall 6.04 inches; much low ground still unplowed; corn has made advance; haying begun; small fruit and apples good.

LARRABEE—*H. B. Strever.* Wet weather retarded field work first half of the month; frost on the 11th did little damage.

RIDGEWAY—*Arthur Betts.* Month was fine, with 333 hours of sunshine, though the temperature was 3 degrees below normal. I have been reporter since May, 1882, and never reported so small rainfall (1.22) for June. Northern lights were very beautiful on evening of 4th, passing beyond the zenith.

STOCKPORT—*C. L. Beswick.* Continued rainy weather the first six days and continued dry the last nine days of the month, with rain badly needed at close.

STORM LAKE—*L. E. Burdick.* Small grain rank; corn backward; potatoes commencing to rot. Rainfall for month 4.85 inches.

WASHTA—*H. L. Felter.* Rain 4.42 inches; a very heavy storm on night of 29th; lightning struck an elevator at Washta and burned it.

WAUKEE—*E. J. Leonard.* Rain 3.11 inches; month remarkably free from storms; only one heavy rain (1.61 inches) fell, on 18th; continuous northeast wind for nine days, from May 29th to June 6th.

WHITTEN—*Frank P. Butler, M. D.* Frost on morning of 12th but little damage resulting; rain on 30th was a great help to all vegetation, corn making rapid progress.

CLIMATOLOGICAL DATA FOR JULY, 1903.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. JULY, 1903. No. 7.

IOWA CROP REPORT, AUGUST 1, 1903.

Reports from township and county crop correspondents of the Iowa Weather and Crop Service have been tabulated, showing the following estimates of the condition of the staple crops on August 1, 1903: Spring wheat, 82 per cent; corn, 73; oats, 77; millet, 96; flax, 84; buckwheat, 89; pastures, 104; sorghum, 84; potatoes, 80; apples, 65; grapes, 80.

At corresponding date last year the estimates were as follows: Spring wheat, 84; corn, 93; oats, 83; flax, 91; potatoes, 107; apples, 66.

WEATHER AND CROP CONDITIONS, JULY, 1903.

July was characterized by frequent and sudden alternations from high to low temperatures. The daily mean for the month was about two degrees below normal, the first decade being unusually warm, the second decade unseasonably cool, and the third decade bringing the two extremes of temperature. The average rainfall for the state, 4.83 inches, was .91 of an inch above the July normal. The distribution was very unequal, the average of the northern section being 6.49, the central section 5.28, and the southern section 2.73 inches. The heaviest amounts of rainfall were reported at stations in the N. E. district. The most destructive storm of the month occurred on the afternoon of the 20th, sweeping across the state on a direct line from Lyon and Osceola southward to Adams, Taylor and Ringgold, its pathway varying in width from one to eight miles. At numerous points along this line the storm was accompanied by high winds and very heavy hail, causing almost total loss of growing crops within an area of more than three hundred square miles.

In portions of the southern section drouthy conditions prevailed for many days, causing some detriment to growing crops; but the closing week brought relief in form of generous showers. On the whole the month was favorable for haymaking and harvesting of wheat, oats, barley and rye. The hay crop proved to be one of the best ever produced in the state, and the greater part of it was secured in excellent condition. Wheat and oats were generally harvested in good condition, but on account of the rust and blight the yield has been disappointing, though the quality of the grain will be greatly superior to the output of last year. The corn crop made fairly good progress during the month, though the temperature was somewhat unfavorable about half of the time. The early planted portion of the crop reached the earing stage while the late planted corn was generally small and unpromising. The outlook for the crop as a whole was not encouraging at the close of July. Reports indicated generally favorable prospects for late potatoes, early apples, grapes and vegetables. Millet, buckwheat, flax and sorghum were rated good in condition.

CROP AND WEATHER NOTES.

The St. Louis correspondent of the *Northwestern Miller* says that all the wheat arriving at St. Louis is of so high a milling quality that the millers feel elated over the bright prospects of having at least the quality, if not the quantity, of wheat to grind this year. The lower river boats are bringing in sacked lots and every sample shown so far has been fully up to milling grade, besides being hard and perfectly sound.

It really takes a most extraordinary year to beat in a crop way a country that raises some crops over an area 3,000 miles long and 2,000 miles wide, says the *Minneapolis Journal*. Of the wheat crop of 1902, 362,000,000 bushels were winter sown and 307,000,000 spring wheat. The lower Missouri valley produced about 184,000,000 bushels, the upper Mississippi and Red river valley 187,000,000; the Pacific coast 61,000,000; the Atlantic coast states 42,000,000, and the Ohio valley and lake states 132,000,000. It is not in the natural order of things that weather conditions will be such as to ruin both winter and spring wheat over such a large area and with such marked difference in climate.

A news special, dated Crawford, N. H., July 28th, notes a remarkable fall in the temperature in the region of the White Mountains, as follows: With three inches of snow on Mount Washington, trees prostrate along the Crawford Notch carriage road, and Jackson Village cut off from the outside world by the blowing down of the telegraph and telephone poles, the record of unseasonable weather during this unusual summer is broken to-day. At the Summit House, on Sunday evening at 8 o'clock, the thermometer registered 30 degrees. Yesterday morning it was only 16 degrees above zero. A terrific northwest gale blew all night, the equal of which the Summit dwellers say they have not seen in years. With the wind came snow, and fully three inches cover the mountain top.

Alfalfa is comparatively a new plant in this country, but in Asia it was known and cultivated before the dates of the most ancient history. It grew in abundance in Assyria and Persia, and at an early day found its way to southern Europe, and thence with the Spanish conquerors to Mexico and Peru. It was grown to some extent, but not appreciated, in the eastern states, long before it was recognized as of material value anywhere in this country. In portions of South America it has escaped from the fields and grows wild over large areas. It is now grown largely in all the arid and semi-arid regions of the

world, and is everywhere recognized as the most valuable forage plant known for all sections where rainfall is scant. But it is by no means confined to arid sections, but is grown and esteemed where rainfall is abundant. Its most perfect development, however, seems to be where it can get sufficient moisture by means of its long tap root, and does not have to depend upon rains.—*Exchange*.

CLIMATE OF THE NORTHWEST.

The northwest leads in the great variety of its climatic conditions. Far removed from ocean influences, it has a climate all its own and of the extreme sort. No monotony about it. We have a taste of all climates found anywhere on earth and some which are found nowhere else. It is nature's grand experimental laboratory, the place where Leyden jars, electric batteries, refrigerators, furnaces and retorts, manipulated by the great chemist of the universe, evolve and liberate the snow-capped cumuli cloud mountain surcharged with its awful voltage of electricity, and burden of tropical humidity; where is cradled the cyclone demon of the air, the laboratory combination of mysterious forces; where is set free the blizzard, the incarnated spirit of vast polar seas and mighty icebergs; a climate whose furnaces give an equatorial heat and a tropical summer, and whose refrigerators invest us with an arctic temperature in winter. Intermingled with these extremes are other types—serene and peaceful days when the earth smiles and blushes at the heavens' tender caress, nights so calm and silent that were it not for the night cry or the whippoorwill, the chir-r of a tree toad or the distant barking of a dog the star set heavens might seem to look down upon an uninhabited world. Under these forceful and constantly changing climatic conditions the very best there is in man is being brought out and developed; he becomes of necessity virile, energetic, aggressive; the dolce far niente of perennial sunshine is to him unknown, and so mid the storm and the great wind, the heat and the cold, the turmoil and calm, there is being evolved—there is nowhere else—a type of manhood and womanhood unexcelled on earth.—*J. S. Trigg*.

FLOOD LESSONS.

A large section of the middle west has been this season visited by floods of greater magnitude than have been known for sixty years. The resulting loss of life has been great and the destruction of property almost immeasurable. Some facts, which in a general way have been known, yet but little heeded, have been terribly emphasized as a result of these floods. One of them is that the settlement and improvement of a country tend to a quick release of excessive rainfall, the universal system of draining, tiling and ditching incident to the reclamation of all wet lands insuring the rapid movement of the water to the streams and rivers, these augmenting the flood in the seagoing streams with a cumulative effect. Another fact which has been made very plain is that the general effect of man's work on the country has been in the way of narrowing the original waterways and obstructing the natural outlets for flood waters. This has been brought about by the desire of municipalities and railways to curtail as much as possible the length of their bridges and the filling up of ancient ravines to secure valuable building sites, it being shown that a western city, one of the worst sufferers by the late flood, had actually narrowed the main channel of the river which passed through it 150 feet in the manner above indicated, besides having filled up and obliterated numerous gulches and bayous on the one-time river bottom which were the safety valves for the flood seasons of fifty years ago. Another fact developed, and one which more particularly concerns the farmer, is that his low lands, the marsh and bog of the pioneer days, which of late years he has broken up and cropped and not tile drained, are now well under way back to the primeval bog conditions and will remain unprofitable land for him until he can either get it seeded down or properly underdrained. The last lesson is that there is no visible or permanent change in progress of climatic conditions. These remain as they always have been, cycles or periods with a marked tendency toward extreme heat, cold, drouth or flood following each other with a certain fixity of purpose, but according to no regular known periodicity. The high water marks of 1903 will furnish plenty of material for future thought and study.—*J. S. Trigg*.

THE RELATIONS OF FORESTRY TO ZOOLOGY.

It has been pointed out recently by H. A. Surface, professor of Zoology at Pennsylvannia State College, that there is a direct and important connection between forestry and zoology, and he gives several examples of how this connection exists. Aside from the clearing of forest growths which naturally drives the denizens of the woods from the cleared localities, he finds that the effect of forest destruction on streams is a far-reaching one. Clear streams, flowing perpetually through wooded country, are the natural haunt of the trout; but if the country in which these streams rise or have their courses is destructively cut over, the streams themselves become intermittent, muddy, and in some cases only a succession of warm and slime-covered pools in midsummer. As such they are fit only for the lurking places of the mud-sucker and the carp. In the larger streams and rivers which, under natural conditions, are the homes of the desirable game fishes, the black bass and pickerel, which pass the winter in deep pools in a state of partial hibernation or quietude, the changes are more to be deplored when the watershed is deforested. Floods arising from the destruction of the trees bring down immense quantities of silt, "washings," sand, etc., and deposit them in the deep pools, where the current runs slower, so that the quiescent fish are covered and destroyed. Another disastrous result comes from the washing of the fishes out of their places of winter abode, dashing them against rocks and ice and in some cases leaving them stranded to gasp out their lives after the water subsides.

The setting aside of forest reserves will not only keep the forest and the beauty of the landscape, but will restore game and song birds to their original haunts, protect the wild animals, and preserve the most desirable fishes—the trout, bass, and pickerel.—*Exchange*.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.96 inches; highest observed, 30.23 inches, at Dubuque, on the 31st; lowest observed, 29.53 inches, at Davenport, on the 17th; range for state, .70 inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by the records of 112 stations, was 72.9 degrees, which is 1.5° below normal. By sections the mean temperatures were as follows: Northern section, 71.0 degrees; central section, 72.9 degrees; southern section, 74.7 degrees. The highest monthly mean was 77.4°, at Keokuk; lowest monthly mean, 68 5°, at New Hampton. The highest temperature reported was 100°, at Thurman and Sigourney, on the 9th and 27th; lowest temperature reported, 40°, at Chester, on the 31st. The average monthly maximum was 92.7°; average monthly minimum, 46.4°. Greatest daily range, 39°, at Lansing, Clarinda, Earlham; average of greatest daily ranges, 31.3°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 124 stations, was 4.83 inches, which is .91 of an inch above normal. The averages by sections were as

follows: Northern section, 6.49 inches; central section, 5.28 inches; southern section, 2.73 inches. The largest amount reported was 12.72 inches at Elkader; least amount reported, .94 of an inch, at Belknap. The greatest daily rainfall reported was 5.12 inches, at Delaware, on the 10th. Average number of days on which .01 of an inch or more was reported, 9.

WIND AND WEATHER.—Prevailing direction of the wind, south; highest velocity reported, 48 miles per hour, from the northwest, at Sioux City, on the 1st. Average number of clear days, 17; partly cloudy, 9; cloudy, 5.

OBSERVERS' NOTES.

ALTA.—*David E. Hadden.* On the 20th a hailstorm lasting 7 minutes caused much damage west and southwest of town.

AMANA.—*Conrad Schadt.* Fine weather for harvesting and threshing; corn made good growth during month.

ATLANTIC.—*J. W. Love.* A severe storm of wind, rain and hail occurred at 4:30 P. M. on 20th, damaging crops, buildings, trees and electric lines.

BEDFORD.—*E. E. Healy.* A severe hailstorm on 20th destroyed corn in a wide belt.

BONAPARTE.—*B. R. Vale.* A very seasonable and satisfactory month; rain was needed at its close for corn and pastures.

BRITT.—*Geo. P. Hardwick.* A month of variable temperature, but no severe storms; wheat blighted and oats rusted badly.

CLINTON.—*Luke Roberts.* A good month for farmers. Rain 5.27 inches, which is 1.11 above normal. Mean temperature about normal; highest, 96°; lowest, 51°. Mean of first decade was 77.1°; second decade, 69.6°; third decade, 78.9°.

CORNING.—*Jerome Smith.* A destructive hailstorm on afternoon of the 20th, covered about one-third of the county.

CUMBERLAND.—*J. H. Reppert.* Much damage done to corn and small grain by wind and hail on 20th.

EARLHAM.—*Geo. Phillips.* Poorest show for corn crop for years; best hay crop.

FOREST CITY.—*J. A. Peters.* Harvesting grain begun on 25th, and about 80 per cent in shock by close of month. Early planted corn in silk.

FORT MADISON.—*Miss L. A. McCready.* July was a very dry month; no good rain between 5th of June and 29th of July. Oats very light and poor prospect for corn

GRAND MEADOW.—*F. L. Williams.* On 9th rain washed roads and fields badly; barley harvest begun on 14th; on 16th first field corn in tassel; oats badly rusted; wheat crop light.

GRINNELL.—*A. O. Price.* Fine month for harvest work; hay extra in yield and quality, secured in fine condition. Wheat, oats and barley in shock.

HANLONTOWN.—*Miss G. M. Paschen.* Haying commenced on 6th; barley harvested 13th; commenced oats harvest on 22d.

HUMBOLDT.—*H. S. Wells.* Rain, 5 39 inches; no high winds; corn and potatoes doing well.

OLIN.—*Nathan Potter.* First part of July was too wet for cultivating corn; last half of month all that could be desired for hay and grain harvest, but too cool for rapid growth of corn.

OSKALOOSA.—*Jos. Boyd.* A fine month for securing the hay crop.

RIDGEWAY.—*Arthur Betts.* A pleasant month; 358 hours of sunshine; growing weather. With good corn weather till September 15th, this part of Iowa will have a good corn crop.

WASHTA.—*W. L. Felter.* On July 3d water in small streams was highest ever known.

WAUKEE.—*E. J. Leonard.* Rain was well distributed through the month; heavy thunderstorms and high winds were lacking, and there has been very little uncomfortably hot weather.

LENOX.—*J. L. Hurley.* On the 20th a severe windstorm came with the hail, damaging windmills, barns and outbuildings. Two large barns north of town were blown to pieces and some parts scattered eighty rods. Corn almost a total failure in the hail strip from eight to twelve miles wide.

ERRATA IN MAY REVIEW.

ALBIA.—Mean maximum temperature recorded 69.9° on page 12, should have been 70.0°.

CLARINDA.—Mean temperature recorded 62.9° on page 11, should have been 63 0°. Mean maximum temperature recorded 74.0° on page 12, should have been 74.1°.

DELAWARE.—Total precipitation recorded 4.47 inches on pages 10 and 14, should have been 4.77 inches.

EARLHAM.—Mean temperature recorded 61.6° on page 11, should have been 60.0°. Mean maximum temperature recorded 74.2° on page 12, should have been 71.0°.

LANSING.—Mean temperature recorded 61 8° on page 10, should have been 62.0°. Mean maximum temperature recorded 73.3° on page 13, should have been 73.6°.

OSCEOLA.—Mean maximum temperature recorded 71.1° on page 13, should have been 71.2°.

BELATED REPORTS.

VILLISCA.—*June.* Mean temperature, 67.0; highest, 91° on the 30th; lowest, 42° an the 10th; greatest daily range, 33°. Total precipitation, 3.82 inches; greatest in 24 hours, 1.08 inches, on the 21st; prevailing direction, southwest. Number of clear days, 11; partly cloudy, 16; cloudy, 3; rainy, 10.

WEST BEND.—*June.* Mean temperature, 65.7°; highest, 88° on the 30th; lowest, 39° on the 11th; greatest daily range, 35°. Total precipitation, 3.03 inches; greatest in 24 hours, 1.72 inches on the 29th and 30th. Number of rainy days, 11.

BELLE PLAINE.—*June.* Mean temperature, 64.1° highest, 90° on the 30th; lowest, 38° on the 12th; greatest daily range, 30°. Total precipitation, 2.81 inches; greatest in 24 hours, 1.06 inches on the 22d; prevailing direction, southeast. Number of clear days, 15; partly cloudy, 12; cloudy, 3; rainy, 6.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. AUGUST, 1903. No. 8.

WEATHER CROP CONDITIONS, AUGUST, 1903.

August was cooler than usual, with a large excess of rainfall, humidity and cloudiness. The daily mean temperature for the state was 69.1°, which is 3.1° below normal, and exactly the mean of August, 1902. There have been two colder Augusts in the past thirteen years—in 1890 and 1897. The average rainfall, 6.64 inches, was 3.43 inches above normal, and the heaviest state average in any August of which we have records. The southern section received the larger amount, an average of 8.74 inches, the greater part of which fell in the last week of the month, when it was much needed and beneficial, though some local damage resulted from excessive downpours. For the state there was an average of twelve clear days, and nineteen cloudy or partly cloudy. Considerable progress was made during the fair weather periods in threshing and other farm operations. Haymaking was continued throughout the month, when the weather permitted, securing a large amount of aftermath, wild hay, and second crop of clover for seed and fodder. More than the usual amount of plowing was done, with generally favorable conditions of soil for this work. Threshing returns indicated generally light and unsatisfactory yield of wheat, oats and barley; the yield of timothy seed has been unusually heavy. The development of the corn crop was all that could be expected under the prevalent weather conditions. At the close of the month the early planted corn, about forty per cent of the whole area, had reached the roasting ear stage, or a little beyond, giving promise of reaching maturity within twenty days, under favorable conditions. The balance of the crop was in various stages of growth, indicating need of very good ripening weather for a full month or more to place the bulk of it beyond danger of harm by frost. The outlook for the crop as a whole was at that time very unsatisfactory. The late potato crop made fair growth in dry and sandy soil, but there were reports of damage by rot in many localities. The crop of early and fall apples gave good returns, especially in the northern half of the state; but winter apples were very unpromising. Pasturage made a heavy growth, giving assurance of abundant fall feed for stock.

NOTES.

As the apple in prime condition will soon be here again, it is well to remember, says the cooking club, that this fruit contains a larger percentage of phosphorus than any other fruit or vegetable. This phosphorus is admirably adapted for renewing the essential nervous matter of the brain. The acids are also of great value for people of sedentary habits, whose livers are sluggish in action, these actions serving to eliminate from the body noxious matters, which if retained, would make the brain heavy and dull, or bring about jaundice or skin eruptions. Some such experience must have led to the custom of using apple sauce with roast pork and similar dishes. The malic acid of ripe apples, either raw or cooked, neutralizes any excess of chalky matter engendered by eating too much. Apples are useful as a disinfectant for the system, and have considerable value as an antidote for tobacco and liquor. Under all conditions and in all cases there is no fruit so beneficial or harmless as the apple.—*Exchange.*

There has been some speculation as to the cause of the crop deterioration which occurred just before harvest this year. The *Commercial West* notes the remarkable deterioration which cut the crop down from 800,000,000 bushels, the earliest optimistic report of the "probable" crop made by the government, to 625,000,000, the present estimate. It is well known, and has been noted before in the *Modern Miller*, that the deterioration was not caused by a series of calamities in the way of frosts, drouths or insects, and in searching for an explanation the *Commercial West* advances the novel theory that the sun's rays were absorbed in the atmosphere and plant life did not receive enough heat and light. The theory is credited to one Duvigneaud, of a Minneapolis grain commission company, who discovered that the July sun was not sufficient to give the usual actinic effects in camera work and that photographic plates were under-developed, where the usual amount of time was allowed. The theory is strengthened by a professor in the Smithsonian Institute, who claims that this year there has been an unusual decrease in the transparency of the atmosphere, probably due to volcanic dust from Mt. Pelee, or to an overdose of moisture in the atmosphere.—*Modern Miller.*

BENEFITS OF FALL PLOWING.

Cultivation is probably the most important feature connected with the handling of soils. Nature has placed large quantities of plant food in our soils, and it depends upon our skill and knowledge how far we can make use of and work this mine for the benefit of our crops. Cultivation is vital, and the subject is so wide that one scarcely knows where to begin. For spring grains I try to plow in the fall. When the furrows are well and evenly set up and are frozen, and when the frost comes out, fertilization takes place and the soil is left in a fine granulous condition. Plant food is liberated and a warm seed bed is formed. When plowing for spring grain is left until the spring, our teams are plowing when they should be surface cultivating and drilling in the seed. Every day's delay in getting in grain after the soil is dry enough to work means fewer bushels at

threshing time. Soil plowed in the spring, too, is colder on the surface than that plowed in the fall, which involves slower germination and vegetation. As to the proper depth to plow, it seems to me that is a question which each farmer must decide for himself, according to his own soil, conditions and crop requirements. If the soil of a given field is deep, say ten or twelve inches, and that field were plowed in the fall for spring grain, I would try to plow it about seven inches deep. But if by some mischance that field were not plowed until the spring I would plow it lighter, as the deeper the plowing the colder the surface turned up. If that field were plowed in the fall for mangels, I would try for about eight inches. But if the surface soil of this field is only six or seven inches deep, I would try to plow it only five or six inches deep. In other words, the depth of the soil, the time of plowing and the nature of the crop grown are all factors in determining how deep to plow. I do not wish to bring any subsoil to the surface if I can avoid it. Sometimes, however, the surface soil is so shallow that some of the subsoil must necessarily be brought to the surface in plowing. If I have a deep soil I want to give the roots of the plants liberal feeding grounds, because they will, if allowed, strike down deeply. As to the question of frequency of plowing, it appears to me that that also depends upon soils and circumstances. Heavy, compact soils require most plowing than lighter ones. Such soils tend to get hard and bake and become inert, and hence require the plow to open them and improve their mechanical condition. The plow, too, is the surest and quickest way to destroy many sorts of weeds. Where the land is clean and the soil will permit it, surface cultivation with a disc or spring tooth often forms better seed-bed than the use of the plow.—*A. W. Pearl, in Farmers' Review.*

RAIN AS A PURIFIER.

The health department has often called the attention of the public to the fact that rain is a great purifier, and there is some highly interesting testimony to the same effect in a recent number of the *London Lancet* which is fortified by references to recent examination and analysis.

Beginning with June 13th London had a continuous rainfall for five days, the total precipitation being estimated at 3.8 inches. On the third day of the period a supply of raindrops was secured for an investigation, and it was found that the solid matters contained therein amounted to 9.1 grains per gallon. Among the constituents noted were common salt, ammonium sulphate, organic ammonia, soot and suspended matters and nitrates. The *Lancet* assures us that the quantity of ammonia sulphate, .625 grains, was remarkable, and that its chief origin is the consumption of coal. Salt contributed .8 grains and soot and suspended matter 5 grains. With this analysis and an estimate of 6,437,229,860 gallons for the total rainfall over the London country area as the basis of the calculation, it is figured that the enormous downpour "represents the washing out of no less than 3,738 tons of solid impurities, of which 330 tons consisted of common salt, 267 tons of soot and suspended matters." Another interesting computation is given as follows: "Regarding the combustion of one ton of coal to produce 20 pounds of ammonium sulphate (a very fair average) the quantity of coal represented by the storm would be 29,904 tons."

The *Lancet* adds that besides the purification which is shown by the analysis there is a bacteriological purification also, which of course is a very important factor in the beneficient work of the rain.—*Chicago Record.*

ERRATA IN JUNE REVIEW.

FT. MADISON.—Total precipitation recorded 2.49 inches on pages 7 and 10, should have been 3.49 inches.

LANSING.—Mean minimum temperature recorded 51.2° on page 9 should have been 51.7°.

STUART.—Mean temperature recorded 64.2° on page 6, should have been 64.4°.

Mean maximum temperature recorded 73.4° on page 9, should have been 73.5°.

REPORT OF SPRING FLOODS.

REPORT SHOWS TOTAL LOSS FROM FLOODS WILL REACH $40,000,000.

WASHINGTON, D. C., September 2.—Dr. Frankenfield of the United States weather bureau has completed and sent to the printer an exhaustive report on the floods of the Missouri and Kaw rivers. The report is the most comprehensive thing of the kind ever attempted by the government.

His report will show that the spring floods of 1903 in the Missouri and Kaw rivers and upper Mississippi were the most destructive in the history of the country and were the greatest in the volume of water, with the exception of 1844. The fact that a lesser volume of water in 1903 created greater havoc is due to the narrowing of the channels of the river by the march of civilization up and down the water courses and the reclamation of lowlands. Dr. Frankenfield corrects an erroneous popular impression that forests make rains. He says that while they do not make rains, they are valuable in that they retain the moisture. In recent years the denuding of the forests makes it possible for the water to reach the water courses much quicker than when there were extensive forests. This causes quicker rises in the water courses and enlarges the possibilities of destruction.

In support of the assertion that there was a greater volume of water in the flood of 1844 than in that at Kansas City of this year, Dr. Frankenfield says that the water was two feet higher at Kansas City than this year and three and a half feet higher at St. Louis. Recent years have seen the river at Kansas City reduced in width from 2,000 to 1,100 feet. This illustrates the contraction of the water course and the resultant increase in the speed of the current. There were sixteen bridges swept from their foundations by the Kaw river during this year's flood. Some of these were not more than 400 feet long and this is a further illustration of the contracting of the courses of streams. Present day construction of bridge approaches is tending all the time in the direction of solid embankments of masonry and these have the effect of a dam. This increases the back water and the height of the stream at these points.

The report asserts that the total loss from the floods in the upper river was in round numbers $40,000,000. This is neither speculative nor an estimate, but is based upon actual investigation by the observers of the weather bureau. The loss in the vicinity of Topeka, Des Moines and Kansas City was largely to crops, railroad rights of way and bridges, and to the commercial interests along the river. A loss of $11,500,000 was sustained between Hannibal and St. Louis on the Mississippi, and between Alton and Kansas City on the Missouri. The loss in the immediate vicinity of Kansas City was $15,500,000.

Usually the agricultural interests suffer greatest from the flood, but Dr. Frankenfield remarks that the high water of this year distributed its ravages with impartiality. The farming interests sustained about a third of the loss, the railroads another third and the balance was to the commercial interests of cities and the loss of personal property. The loss from the destruction and damaging of bridges alone amounted to $750,000. The total area overflowed by the spring floods was 3,500 square miles. As large an area has been overflowed before, but with less disastrous results. This year 320,000 acres of land in the "American" bottoms opposite St. Louis from Alton to the Kashaskia river were overflowed.

In the state of Missouri alone about 1,000,000 acres were submerged. The floods were severe tests to the levee system. On the Mississippi side the levees were badly broken from about Warsaw to Hamburg. The Hunt, Lima, Lake, Indian Grove and Sny levees suffered severely. The three first ran from Warsaw to the bluffs at Quincy, and the Sny continues the

chain to Hamburg for about fifty miles. The severe test applied to the Sny levee demonstrated its superiority for that sort of engineer construction work. It had a serious break in only one place and that was where the Alton railroad uses it as a right of way to get into Louisiana.

The Skunk river levee broke, putting 15,000 acres of land under water. Dr. Frankenfield says that a good portion of the water was drained off the land in time for late seeding and raising of fair crops. He comments on the great commercial loss because of the overflowing of large portions of the cities of Kansas City, Topeka and Des Moines. While this is not generally known, he asserts that in the city of Des Moines seven square miles were overflowed.—*Press Special.*

FARMERS AIDED BY SCIENCE.

No book is more certain of a large circulation than the "Year Book" of the Department of Agriculture. One of the most interesting articles in the new volume relates to the results of experiment station work. Our agricultural experiment stations now form the most complete system of agricultural research in the world and the results they attain are influencing our farmers to a large extent.

There are sixty of these stations, employing nearly 1,000 trained scientific and practical men; and they are in operation in every state and territory, including Alaska, Hawaii, Porto Rico and the Philippines. The stations have existed as a national enterprise for fourteen years and the outlay for agricultural investigation in that time has been at the rate of $1 for nearly $3,000 worth of farm products, which cannot be considered an extravagant outlay.

Here are some results of the work of the stations:

Our farmers spend over fifty million dollars a year for fertilizers and the stations therefore have given particular attention to this subject. Fraud and extravagant assertions about fertilizers have been largely eliminated from the business and thousands of farmers are buying fertilizers more intelligently and economically. They also know just what they are using in terms of nitrogen, phosphoric acid and potash with the reason for using them.

The annual loss to our farmers from waste of barnyard manure is estimated at seven million dollars. Many of the stations have given special attention to the economic use of manure on the farm, with the result that better methods for its care and use are being employed.

The successful introduction of Mansury barley, for which the Wisconsin station is mainly responsible, has increased the yield of barley over a wide region, with results worth millions of dollars.

Kaffir corn was introduced about fifteen years ago by the stations in California, Kansas and Oklahoma. It has been found specially suited to regions of scanty rainfall. The crop in Kansas alone in 1899 was valued at over six million dollars.

A variety of oats introduced by the Department of Agriculture and tested and improved by the Wisconsin and other stations has been widely distributed and is grown with an average yield wherever it is sown of from three to five bushels an acre.

The various macaroni wheats which have been tested under varying conditions by a number of the stations have proved so successful that the United States will probably produce all the macaroni it consumes in the course of a few years.

The investigations of the experiment stations in the southern states have convinced farmers that many varieties of forage plants may be more successfully grown in the south than was supposed and have laid the foundation for a wide development of the live stock and dairy industries of that region.

The Department of Agriculture and the Connecticut State Station, co-operating with local tobacco growers, have within the last three years demonstrated that a fine grade of Sumatra wrapper tobacco may be grown under shade in the Connecticut valley. Professor Whitney says that this discovery will increase the value of light lands of the Connecticut valley over 200 per cent.

Speaking of the work of the Minnesota station in breeding wheat, W. S. Harwood has recently written that it is not only quite possible, but is indeed an established fact, that wheats superior to the best the world has possessed may now be produced. By the use of the new wheats the crop of the hard wheat region of the northwest may be increased from three to five bushels to the acre.

The stations of the northwestern states have extended the limits of corn culture by proving, by careful selections of varieties and modified methods of culture, that this crop may be grown in regions heretofore believed to be unsuited to corn culture.

The stations have been prominent in the investigations which have led to the new system of forcing vegetables in the field and under glass for supplying the markets with fresh vegetables at all seasons of the year. For example, the winter culture of lettuce in eastern North Carolina is now yielding over $100,000 a year. The Ohio station discovered that onions started in the greenhouse or under frames from seed and then transplanted to the open field produced larger onions and earlier and heavier crops than by the usual methods of tillage and seeding. This discovery is changing the methods of onion culture.

These are only a few of the many ways in which the experiment stations are helping agriculture. Their investigations relating to protective measures against plant diseases and injurious insects, the storage and utilization of fodder crops, breeding and dairying, the protection of farmers against fraud and many other topics have been of the utmost value.—*New York Sun.*

CLIMATOLOGY OF THE MONTH OF AUGUST, 1903.

BAROMETER.—Mean pressure, 29.96 inches; highest observed, 30.19 inches, at Dubuque, Keokuk and Des Moines, on the 1st, 3d and 31st; lowest observed, 29.63 inches, at Sioux City, on the 24th; range for state, 0.56 inches.

TEMPERATURE.—The mean monthly temperature for the state, as shown by records of ninety-nine stations, was 69.1°, which is 3.1° below normal. By sections the mean temperatures were as follows: Northern section, 67.0°; Central section, 69.3°; Southern section, 70.9°. The highest monthly mean was 75.0°, at Logan; lowest monthly mean, 63.8°, at New Hampton. The highest temperature reported was 101°, at Logan, on the 24th; lowest temperature reported, 41°, at Ogden, on the 31st. The average monthly maximum was 91.6°; average monthly minimum, 47.3°. Greatest daily range, 45°, at Logan; average of greatest daily ranges, 31.4°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 110 stations, was 6.64 inches, which is 3.45 inches above normal. The averages by sections were as follows: Northern section, 5.51 inches; Central section, 5.67 inches; Southern section, 8.74 inches. The largest amount reported was 17.74 inches at Woodburn; least amount reported, 2.55 inches at Toledo. The greatest daily rainfall reported was 11.22 inches, at Chariton, on the 27th. Average number of days on which .01 of an inch or more was reported, 11.

WIND AND WEATHER.—Prevailing direction of the wind, southwest; highest velocity reported, 44 miles per hour, from the southeast, at Sioux City, on the 1st. Average number of clear days, 12; partly cloudy, 10; cloudy, 9.

ATMOSPHERIC PRESSURE.

OBSERVERS' NOTES.

ALTA.—*David E. Hadden.* Frequent and heavy rains during the month, with total of 6.28 inches; several destructive electric storms and some hail; bright aurora on evening of 21st.

AMANA.—*C. Schadt.* On the 1st 0.42 of an inch of rain fell in ten minutes—7:32 to 7:42 P. M. Weather has been too cool for corn, but favorable for harvest and threshing.

ATLANTIC.—*J. W. Love.* A very wet and cool August.

BELKNAP.—*A. W. Rankin.* Heavy rain, greatly needed, on 26th, 27th and 28th; damaging hailstorm on 28th.

BONAPARTE.—*B. R. Vale.* A cool but growing month; 7.53 inches of rain, but none too much; fall plowing begun and pastures improved.

BRITT.—*Geo. P. Hardwick.* Cool, with excessive cloudiness; no damaging winds; ground in good condition for plowing; much tiling being done.

CHARITON.—*C. C. Burr.* Rainfall in August 14.05 inches. The storm of the 27th (11.22 inches) was accompanied by excessive lightning and three barns were burned. The floods washed away bridges and covered lowlands, floating away hayricks which looked like steamboats going down the streams.

CLINTON.—*Dr. Luke Roberts.* Rainfall 4.79 inches, which is 1.77 above normal; mean temperature 2° below normal; no other August during the last twenty-five years gave a lower mean temperature; coldest day was the 30th; per cent of cloudiness high. It was not golden weather for maturing corn.

POSTVILLE.—*F. L. Williams.* The month was noted for cool nights and heavy rains; corn late and oats light.

HANLONTOWN.—*Miss G. M. Paschen.* Threshing from shock and fall plowing commenced on first of month; oats light, ranging from twenty to thirty-one pounds per bushel.

HOPEVILLE.—*M. T. Ashley.* About 5 P. M. on the 26th a terrific electrical storm occurred; three fires from effects of lightning were visible during the storm. The rainfall of the 26th and 27th made a total of 10.08 inches—the heaviest since this station was established.

JEFFERSON.—*Isaac Young.* Hail at Scranton on 14th destroyed several hundred acres of corn.

LEON.—*Millard F. Stookey.* The floods of the 26th and 27th swept away bridges and culverts, and damaged corn on bottom lands.

OLIN.—*Nathan Potter.* August has been cool, and the corn crop was delayed in ripening.

OSCEOLA.—*Mrs. S. Lewis.* Between 5:30 on the 26th and 5:30 on the 27th the amount of rainfall was 9.34 inches, of which amount 7.68 fell in thirteen hours.

RIDGEWAY.—*Arthur Betts.* The coolest August on record here, and the smallest daily range, but the mean minimum was lower in 1898 and 1902. There were 249 hours of sunshine, or 57 per cent. Pretty northern lights on 21st.

VILLISCA.—*C. E. Matteson.* An unusual month of thunderstorms and excessive rains and floods; much damage to crops on bottom lands.

WAUKEE.—*E. J. Leonard.* Cool and wet; rainfall, 9.33 inches; last year for August, 6.89 inches; farm work delayed and corn endangered by retarding its growth.

WOODBURN.—*C. B. McDonough.* Rainfall, 17.74 inches; greatest amount in twenty-four hours, 14.61, began at 6 P. M. on the 26th; much damage was done to railroad and country bridges.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. SEPTEMBER 1903. No. 9.

WEATHER AND CROP CONDITIONS.

September was cooler than usual, with some excess of rainfall, cloudiness and humidity. The daily mean temperature, 60.8° for the state, was 3.4° below normal. The average number of cloudy days was 10, and partly cloudy 6, with 14 days of clear skies and sunshine. On the whole the month was materially better in all the elements than September, 1902. Frosts were noted at numerous stations, in all districts, on 16th, 17th, 18th, 24th and 27th, ranging from light to heavy; but little damage resulted to farm crops except in quite limited areas. The main detriment caused by the cold and frosty period was the delay in bringing belated corn to full maturity. The period of most unfavorable weather and heaviest rainfall was from the 4th to the 16th. In the last half of the month there were about twelve days of ideal weather for maturing crops, harvesting, threshing and plowing. During this time corn made very good progress, and at the close of the month fully 80 per cent of the crop was well matured, the balance requiring one to two weeks of frostless weather and generally favorable conditions to make it safe. At the best there was but little expectation of bringing all of the belated portion of the crop to maturity, as some of it was still green and soft at the close of September. A considerable amount of the early corn was cut and put into shocks after the first appearance of frost. Fall pasturage was never better, and seldom as good at this time of the year. Fair progress has been made in harve ting the minor crops, and a good deal of second crop hay has been secured. Fall plowing is well advanced, much more than the usual acreage having been done with the soil in excellent conditlon. The potato harvest showed a very light yield, and much damage by rotting. The fall apple crop was fair, but winter apples are inferior in size and quality. On the whole September was a fairly satisfactory month, though below normal in tenperature and sunshine. The adverse features of the month were the natural sequence of the preceding abnormal spring and summer. There is much cause for congratulation and thankfulness, that under such unusual conditions the yield of staple crops will be sufficient to afford a liberal surplus for export to regions of less productiveness.

NOTES AND COMMENTS.

The weather records at Manila, P. I., show a total of 37 inches of rainfall in the month of June, 1903.

Abnormally wet seasons always insure poorer crops and smaller profits than abnormally dry ones. In a dry season a man is able to save what he raises, while in a wet one the loss is enormous on every hand.—*J. S. Trigg.*

Whi'e irrigation schemes are being promoted in the West, the Iowa farmer is making plans to tile his wet lands.

Corn experts are needed all along the northern limit of the corn belt to show to corn growers the folly of attempting to grow varieties of corn only suited to the more southern latitude of Kansas and Nebraska. One season with another, only corn which will mature in ninety or ninety-five days should be planted.—*J. S. Trigg.*

The health of the hog population of the country continues surprisingly good, says the *Chicago Live Stock World*. Sick pigs are abnormally scarce at market centers, an infallible indicator, and reports from producing districts are equally optimistic. The growing pig crop has doubtless not enjoyed a very strong diet. Old corn has been scarce and high priced and the new corn crop is late. Meanwhile the maturing pig has reveled in an abundance of clover, a condition that is largely responsible for his good health. Never before has such a wasteful abundance of this great legume been seen in the corn belt. A healthy pig, however, soon becomes invalided when allowed his fill of new corn, and at present prices there is every inducement to force him into market conditions as soon as grain is available. Because the porcine population is healthy now it does not follow that there is any assurance of a continuance of such conditions.

According to the bureau of statistics of the Department of Commerce, the value of the tropical and sub tropical products brought into the United States the past year was over $400,000,000. In 1895 the value of this class of merchandise imported was only $300,000,000; in 1875, $200,000,000, and in 1870, $140,000,000. Thus, the value of the tropical products brought into the country in the year just ended was about three times as much as in 1870, twice as much as in 1875, and one-third more than in 1895.

Tropical islands of the United States contributed nearly $50,000,000 worth of the $400,000,000 value of tropical products brought into the country last year. Over $26,000,000 of this was from Hawaii, more than $11.000,000 worth from the Philippines. In 1896 they contributed $19,000,000 worth to the tropical requirements of the country.

The hay crop of the United States in 1903, according to an estimate of the *Cincinnati Price Current*, has amounted to about 62,750,000 tons, which is about 3,000,000 tons larger than the crop of last year, and about 5,500,000 tons or nearly 10 per cent above the average of the past ten years. Compared to the

yield in 1902 this makes a shortage in the New England States of 3,847, and a gain in the group of states comprising New York, New Jersey, Pennsylvania, Ohio, Michigan and Indiana of 4.11 per cent, and in Illinois, Wisconsin, Missouri, Kansas and Nebraska a gain of 4.20 per cent. New York, Michigan and Indiana show slight losses, and New Jersey, Pennsylvania and Ohio slight gains.

Three New York firms have recently secured three African mahogany logs, all parts of the same tree, which brought at an auction sale in Liverpool the unprecedented sum for the produce of one tree of $15,728. The first measured 21 feet long, 38 inches deep at the butt and contained 1,386 square feet; the second's length was 23½ feet, depth at the butt, 44 inches, and it contained 2,441 feet; the length of the third was 25½ feet, it was 46 inches deep at the butt and contained 3,025 square feet. These logs are said to have produced the finest African mahogany veneers the United States has seen.

Dr. Kennedy, secretary of the Iowa Board of Health, says in a recent issue of the *Health Bulletin:* "We verily believe, and have often declared, from a personal experience and observation in Iowa covering more than forty-four years, that there is not a more invigorating and healthful climate in the world than in Iowa if people will only use common sense and observe the laws of hygiene in preparing to meet these frequent and sudden climatic and electrical manifestations. This is not said in the interests of any immigration company or commercial exchange, but is the honest conviction of the writer."

S. A. French, residing near Geneva, Franklin county, has succeeded in raising two crops of strawberries this season. The second crop was ripening October 5th and the berries are said to have a fine flavor and color.

The top of the building of the Philadelphia Hospital is to be used as a roof garden for the tuberculous patients. The hospital roof, 26 by 150 feet, is covered with a canvas roof, to which are attached sideflaps for use when protection from sun or rain is necessary, and will be fitted up with beds, so that the patients may be kept in the open air 24 hours of the day. Dr. Martin is quoted as saying that not only as a mere sleeping place and a space to work about in has this been planned. It is expected that flowers and shrubbery will be scattered on the roof, and that it will really be a garden, with walks and shade, attractive to the patients. In planning the construction of hospitals hereafter, will not architects have to allow for this excellent method of treating patients? And why only for the tuberculous? And why for the sick alone?—*American Medicine.*

THE RAINMAKER IN AUSTRALIA.

In connection with the droughts in Australia we have received abundant details of the efforts made to force rain from the unwilling clouds.

At a meeting of the Chamber of Commerce of Broken Hill, Thursday, July 2, the mayor submitted the formula given by Mr. J. J. Phelps, of Sydney, and his method was indorsed by several. The formula consists in using sulphuric acid and zinc. The hydrogen set free ascends with aqueous vapor "in spiral columns which are hollow when they reach the rainbelt in the atmosphere, and the cold air in that region rushes down to the warmer air below."

Any one can try this simple well-known chemical experiment for making hydrogen, but we have every assurance that no rain will result and no cold air will rush down and no rainbelt will be found in the atmosphere. This, in fact, was the experience of Mr. Allen and the Australian committee at Stephen Creek, which reported that "the experiments were not successful, owing to there being rather too much wind to allow the column of gas to ascend perpendicularly."

The failure of Mr. Allen was complete; the excuse was quite unphilosophical and unneccessary.

Previous to Mr. Allen's fiasco, a much more imposing attempt had been made by Dr. C. DeLacy McCarthy, who is said to be "a graduate of Trinity College, Dublin, who spoke with the utmost confidence on the question of the production of rain, saying: 'I will start to work on Wednesday, and you will have rain by Saturday.'"

The Government of South Australia, the Chamber of Commerce, and the water companies of Broken Hill had united in bearing the expense of a special train to bring Dr. McCarthy and five assistants and apparatus from Petersburg. He did not wish the details of his method known except that in general—

"He forces chemical fumes into the air for a great distance which create a vacuum in the fourth, fifth and sixth strata of air. The center of a heat storm is thus formed and the cold air descends, resulting in a heavy tropical rain The secret of the chemicals was given him by a man in America. He had improved on the system with the aid of a clever Japanese chemist. He changes his methods to suit varying conditions. It may require thirty-two hours of continuous work to achieve success. He produced rain in twenty-two hours in Victoria."

Dr. McCarthy delayed three days before beginning; meantime the sky clouded over and predictions were received from Mr. Barrachi, Director of the Meteorological Office, at Melbourne, forecasting rain within three days. McCarthy's experiments began on Wednesday, a furious dust storm prevailed with northwest winds; although the wind and dust were distressing, he announced that "the vacuum is working still far up," But the wind veered to the south and all chance of the predicted rain from the west seemed to disappear. Eventually, "on July 3, Dr. McCarthy suspended operations, saying that conditions were all against him." He expected to resume when favorable predictions should be published by the Meteorological Office.

A few days before this Mr. Rutter, with several local chemists, "Had sent up a column of hydrogen which was followed by clouds and light rain, and they felt certain that a heavy downpour would have resulted had they continued their efforts." Probably they realized that the clouds and light rain had nothing to do with their hydrogen gas.

In their extremity the Broken Hill people naturally clutched at the flimsiest straws, "listening even to Mr. F. J. Mars, engineer of the local electric light works, who urged that huge kites should be sent up carrying dynamite to be fired by electricity."

We have given much space to this interesting episode in the great Australian drought, as we hope it may prove to be the last occasion on which the rainmakers will attempt to delude the suffering people with their chemicals, their upper vacuum, their dynamite, and their false theories

The time has not yet come when man may plow the atmosphere for rain as he plows the soil for crops. If mines must be worked and towns built in arid regions, let the promoters of these schemes be required to build aqueducts and bore wells sufficient in advance to supply the needed water, not waiting until the droughts come and the people die. Every place on this globe has its rainy years and its dry years. Areas of cold and heat, wind and calm, rain and drought appear and move and disappear in regular succession. We must prepare for them and provide against disaster. We cannot control the weather, but we may control ourselves.—*U. S. Monthly Weather Review, July, 1903.*

UNPRODUCTIVE ACRES.

The unproductive acre on the farm is a different proposition from the unproductive cow in the dairy. Both are bad leaks, but with the cow which does not pay for her board regeneration is impossible, and she should be sent to the feed yard, but the unproductive acre cannot be thus got rid of and becomes a problem involving regeneration. It may be a hillside, poor soil, washing badly, for which one of two things may be done—it can be got into grass and kept there, or it may be planted with fruit or forest trees. The acre may be a strip all round the line fence grown up to weeds and bramble. This should be reclaimed by breaking up and seeding down. It may be a wet acre in the middle of the field which a little job of tiling will reclaim, or, if this cannot be done, it would grow a lot of nice willows. Then it may be an acre and perhaps more which has been so starved and robbed that oats a foot high or ten bushel of corn is all it will produce, in which case seed down with clover and give it twenty-five loads of barnyard manure to the acre. There is still another acre bordering the public highway which should be so treated that it will produce a ton or more of good hay each year instead of a useless mass of weeds and rubbish. We would not be looking for more land until these unproductive acres were reclaimed and utilized if we were in your place. So far as the old cow is concerned, see that Chicago gets her and not your neighbor or the local butcher.—*J. S. Trigg.*

MODERN FARM LIFE.

In the course of a speech before the farmers of Whitman county, Washington, Gov. Henry McBride said: "Farm life is not what it was twenty-five years ago. You have more of the comforts and conveniences of life. You are not so isolated. The building of railroads, the extension of the telegraph and telephone systems, the construction of highways, and increased mail facilities have brought the farmer in closer touch with the world at large. The farmer of today, especially in localities covered by the free rural delivery system, receiving as he does his daily mail, is as well posted and can feel the great throbbing pulse of humanity as well as the dweller in the city.

"This is in utter contrast with the loneliness pervading farm life in former years—a loneliness that tempted many a boy and girl cityward when, in many instances, it would have been much better for them had they remained in their old homes. With the rapid advancement along material lines—with better schools—with greater opportunities for social intercourse—with the opening up of all the avenues of information, thus bringing it in closer touch with the great outside world, farm life has become more attractive, and there is no longer danger of the urban population increasing at the expense of the rural. And this is well; for an intelligent, contented, sturdy and self-reliant class devoted to agricultural pursuits is one of the chief bulwarks of any state or nation."

CLIMATOLOGY FOR THE MONTH OF SEPTEMBER, 1903.

BAROMETER.—Mean pressure, 30.03 inches; highest observed, 30.40 inches, at Sioux City, on the 23d; lowest observed, 29.45 inches, at Sioux City, on the 12th; range for state, 0.95 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 104 stations, was 60.8°, which is 3.4° below normal. By sections the mean temperatures were as follows: Northern section, 59.0°; Central section, 61.1°; Southern section, 62.4°; The highest monthly mean was 66.2°; at Belknap; lowest monthly mean, 56.9°; at Forest City. The highest temperature reported was 94°, at Logan, on the 1st; lowest temperature reported, 28°, at Larchwood, on the 16th. The average monthly maximum was 84.8°; average monthly minimum, 33.6°. Greatest daily range, 51°, at Clarinda and Marshalltown; average of greatest daily ranges, 34.8°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 116 stations, was 3.81 inches, which is 0.61 of an inch above normal. The averages by sections were as follows: Northern section, 3.94 inches; Central section, 3.46 inches; Southern section, 4.09 inches. The largest amount reported was 8.79 inches, at Larrabee; least amount reported, 1.42 inches, at Waukee. The greatest daily rainfall was 4.09 inches, at Larrabee, on the 11th and 12th. Average number of days on which .01 of an inch or more was reported, 10.

WIND AND WEATHER.—Prevailing direction of the wind, south; highest velocity reported, 42 miles per hour, from the northwest, at Sioux City, on the 26th. Average number clear days, 14; partly cloudy, 6; cloudy, 10.

OBSERVERS' NOTES.

ALLERTON.—*Rex Shriver.* Corn was uninjured by frost during the month and dried up rapidly.

ALTA.—*David E. Hadden.* Unusually fierce lightning on morning and evening of 13th, with temperature at 40. First frost of season on 16th, mainly light, and killing only in exposed places; last decade of month brought ideal fall weather.

ATLANTIC.—*J. W. Love.* First frost on 16th, said to have been a benefit to corn; ducks fly southward on 13th.

BAXTER.—*W. T. Thorp.* No frost in this locality to do damage as yet.

BONAPARTE.—*B. R. Vale.* Rain 5.95 inches, following 5.44 the last six days of August. Too much moisture, but otherwise a seasonable month; vegetation luxuriant.

BRITT.—*Geo. P. Hardwick.* First half wet; last half more favorable to belated corn; whole season so cool and wet that

half a crop results; severe loss by hail on 13th in strip of country from east center to southwest corner.

CLEAR LAKE.—*John Cobb*. Quite hard frosts on 24th, but did not seem to kill anything.

EARLHAM, A. D.—*Geo. Phillips*. Corn made rapid progress last days of the month, and except a small area of very late planting was safe from danger of harm by frost.

ESTHERVILLE.—*Earle W. Peterson*. Up to last of month the corn remained unharmed by frost, and will be a better crop than was expected.

FOREST CITY.—*J. A. Peters*. Frosts on 18th and 24th did very little damage, and last week was favorable to corn.

GRAND MEADOW —*F. L. Williams*. Many fields of corn still green, and frost did little damage; most of it safe at close of month; pastures extra good; oats proved the poorest crop ever raised here.

GREENFIELD.—*J. G. Culver*. No frost sufficient to injure the tenderest vegetation; 70 per cent of corn safe at close of month, and will have more sound corn than last year.

GRINNELL.—*A. O. Price*. No killing frosts during the month; pastures seldom better; fall plowing nearly finished and ground in fine condition.

GRUNDY CENTER.—*E. S. King*. All corn past frost; very little harm done by frosts on 17th, 18th, 24th and 27th; fall work well advanced.

HANLONTOWN.—*Miss G. M. Paschen*. Corn cutting began 21st and mostly finished by 30th; not as large acreage as last year; upland corn good well filled ears; potatoes light and subject to rot.

HARLAN.—*C. A. Reynolds*. September has been a very acceptable month in this vicinity.

HOPEVILLE.—*M. T. Ashley*. No frost except very light on 17th and 18th; no vegetation hurt; much green corn at close of month needing ten days to ripen.

HUMBOLDT.—*H. S. Wells*. Quite favorable weather for ripening corn; threshing completed and grain little damaged.

LARRABEE.—*H. B. Strever*. Heavy rainfall during first half of month; frost on 16th did considerable damage to late corn.

OGDEN.—*E. Sayre*. No frost to kill tender vines up to 30th; corn was then doing finely.

OLIN.—*N. Potter*. First and last of month favorable for maturing the corn crop; middle period cold and cloudy with frosts on 18th that did damage on low ground.

PACIFIC JUNCTION.—*H. H. McCartney*. Frost on 16th was not killing on account of continued cloudy weather; 40° always shows white frosts in this locality if clear and calm at time.

RIDGEWAY.—*Arthur Betts*. Month was two degrees warmer than September, 1902; last decade was fine; killing frost of 18th was general hereabout, with temperature 27° to 33°; about 90 per cent of corn fields were deadened, and will be much soft corn; we had 234 hours sunshine, or 63 per cent; aurora on 26th.

SAC CITY.—*J. A. Sodestrom*. No damage by frost on 16th.

STOCKPORT.—*C. L. Beswick*. An unusual month; only four days in which wind was not in south, southeast or southwest.

TOLEDO.—*H. P. Giger*. On 17th frost was averted by clouding over a little about midnight; other frosts did not seem to do much harm.

WAUKEE.—*E. J. Leonard*. Except the rainy period, 4th to 14th, the month was generally clear and cool; light frost on 18th and 24th did no damage; most of corn well matured, but late portion needs a little more time.

WEST BEND.—*Ph. Dorweiler*. First half month rainy, and last half fine; no killing frost.

WHITTEN.—*Dr. Frank P. Butler*. Frost on 17th and 24th did but little damage to corn; the crop has never been in better condition in this section; potatoes rotting and a poor crop; fall pastures excellent; much fall plowing down.

ERRATA IN JULY REVIEW.

BELLE PLAINE.—Total precipitation recorded 3.47 inches on pages 6 and 10, should have been 4.47 inches.

DECORAH.—Mean temperature recorded 71.8° on page 6, should have been 71.5°. Mean maximum temperature recorded 81.6° on page 8, should have been 81.1°.

ESTHERVILLE.—Total precipitation recorded 7.21 inches on pages 6 and 10, should have been 7.71 inches.

FOREST CITY.—Total precipitation recorded 3.78 inches on page 6, should have been 3.79 inches.

IDA GROVE.—Daily precipitation recorded .96 inch on 18th, on page 10, should have been .98 inch. Total precipitation recorded 4.43 inches on pages 6 and 10, should have been 4.31 inches.

WILTON JUNCTION.—Total precipitation recorded 6.37 inches on page 7, should have been 6.35 inches.

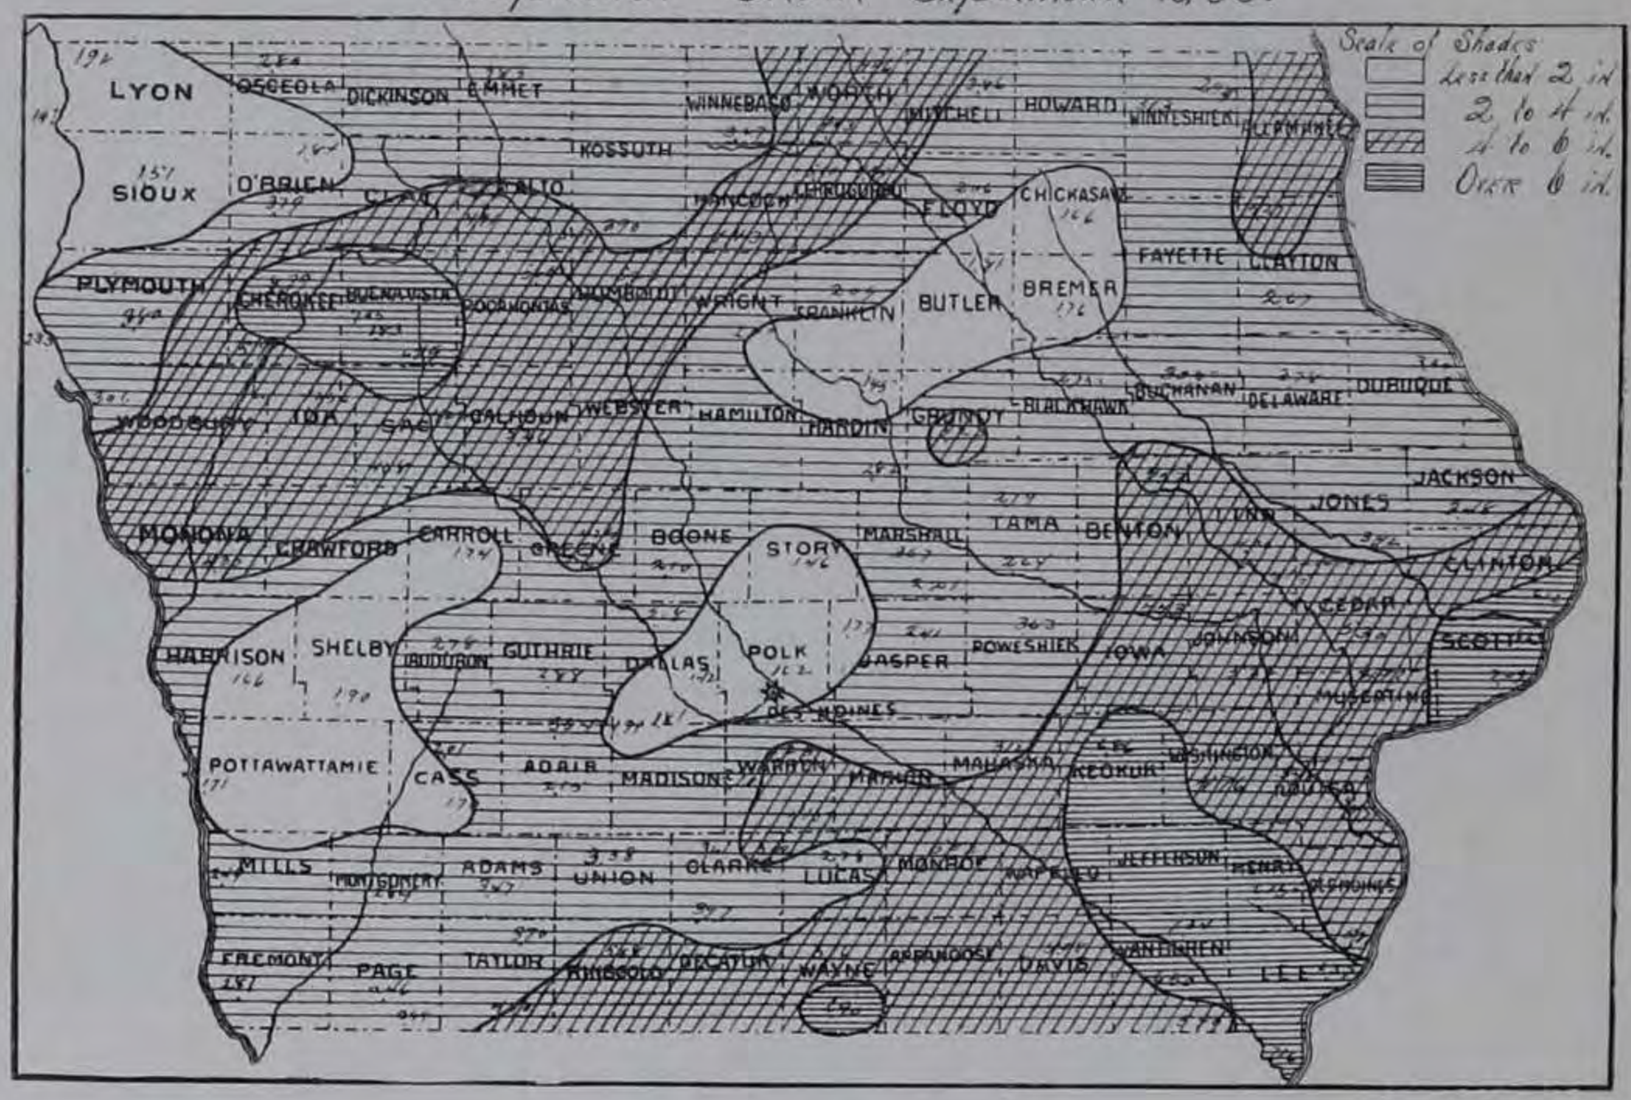
Precipitation Chart September 1903.



OCTOBER, 1903. No. 10.

CONTENTS.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

DES MOINES:
BERNARD MURPHY, STATE PRINTER
1903.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E R. Reeve
Algona	C. D. Pettibone
Allerton	Rex Shriver
Alta	D. E. Hadden
Alta (near)	W. J. Minard
Amana	Conrad Schadt
Ames	Exp. Station
Atlantic	J. W. Love
Audubon	Geo. E. Kellogg
Baxter	W. T Thorp
Bedford	E. E. Healy
Belknap	A. W. Rankin
Belle Plaine	S. P. Vandike
Bonaparte	Hon. B. R. Vale
Britt	G. P. Hardwick
Buckingham (Traer P. O.)	Dr. W. A. Daniel
Burlington	I. S Shoutz
Carroll	Moses Simon
Cedar Rapids	Electric Light and Power Co.
Chariton	C C. Burr
Charles City	C H. Priebe
Chester	C. H. Meredith

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. OCTOBER 1903. No. 10.

WEATHER AND CROP CONDITIONS.

October was an ideal autumn month. The mean temperature was slightly above and the rainfall below the normal, and the percentage of sunshine was higher than usual. The bulk of the rainfall came in the first seven days, and generally with but little disturbance of the elements. No trace of snow was reported during the month. The first general killing frost occurred on the 18th, at which time there was practically very little of value exposed to damage by freezing temperature. The greater portion of the late planted corn was fairly well matured before the middle of the month, and the percentage of soft and chaffy corn will be but little more than is found at the close of average seasons. Reports are received of very many fields planted as late as June 15th which were well ripened by October 10th and ready to be cribbed before the close of the month. The amount of fall plowing in the state at large is much greater than in recent years. A limited acreage of fall wheat and rye has been sown, and the conditions have been favorable for germination and growth, insuring a good stand. The fall pasturage was never better, being very green and succulent at the close of October. The dry weather was favorable for harvesting potatoes, apples, and all late maturing crops. The potato crop is generally light, with considerable damage by rot, though some localities report a fair yield. The yield of winter apples has been much below the average. Forage crops and garden truck have made excellent yield. As a whole October has been a remarkably fine month, making an exceptional record in view of the adverse weather conditions of the preceding season.

NOTES.

In the noted case of Frost vs. Corn, called for trial in the September term, the Clouds appeared as intervenors, causing postponement of the issue till the October term. And that "saved the bacon."

An interesting feature of Iowa's dairy exhibit at the World's Fair will be a statue in butter of John Stewart, the pioneer creamery man of this state. It will be life size, and will be kept frozen in a glass case throughout the summer.

The New York Sun estimates the value of the staple farm crops of America this year to be, in round numbers, $2,500,000,000. These figures do not include the large increment of value in the use of grain and forage for the production of beef, pork, mutton, dairy and poultry products, etc.

According to statistics compiled by the U. S. Commissioner of Education, the total enrollment of pupils in the common schools of the United States during the year was 15,925,887, or over 20 per cent of the entire population. The grand total of all educational institutions, public and private, is over 18,000,000 pupils. These astounding figures show the real greatness of this nation.

EXTRACTS FROM NATIONAL BULLETIN.

October, 1903, was warmer than usual in the Pacific coast and Rocky Mountain districts and over the northern and central portions of the country to the eastward, the average daily temperature excess ranging from 3° to 6° over the northern portion of the Lake region, in the upper Missouri Valley, over the western portions of the middle and northern Plateau districts and on the central and north Pacific coast. Nearly normal conditions prevailed in the Southern States, there being slight deficiencies in the south Atlantic and west Gulf districts.

There was less than the usual rainfall over the greater part of the Lake region, central Mississippi Valley, South Atlantic and east Gulf States, southern and western Texas, upper Missouri Valley, and generally throughout the Rocky Mountain and Pacific coast districts, the month being without appreciable rainfall in western North Dakota and in portions of New Mexico, Arizona, and southern California. The deficiency over a large part of the Lake region, east Gulf, and South Atlantic States ranged from 1 to more than 2 inches, while over the Florida Peninsula it was from 2 to more than 7 inches. In eastern Texas, portions of Kansas, southern Missouri, eastern Nebraska, Minnesota, the upper Ohio Valley, and in the middle Atlantic coast districts the rainfall was much heavier than usual, most of the districts named receiving from 4 to 6 inches, while in northern New York and the middle Atlantic coast districts amounts ranging from 6 to more than 12 inches are reported.

As a whole the month averaged mild and was generally favorable for farming operations, although plowing and fall seeding were delayed on account of dry soil, in portions of the central Mississippi and Ohio valleys, and late crops in the central and east Gulf States suffered from drought. The Middle Atlantic States experienced heavy rains and very high winds during the latter part of the first decade, causing damaging freshets in northern New Jersey and southeastern New York. Heavy and killing frosts occurred in the central and east Gulf and south Atlantic States from the 25th to the 28th, with freezing temperatures as far south as the northern portions of Mississippi, Alabama, Georgia and South Carolina.

SUN SPOTS AND ELECTRICAL STORMS.

British as well as American scientists attribute the electrical storms of October 31st to sun spots. The effect on the telegraph and telephone service was as noticeable in Great Britain, France and Switzerland as in the United States, and there were striking displays of aurora borealis in parts of Europe, as there were in Chicago on Saturday and Sunday nights.

Since the appearance of the great sun spot of February, 1892, the theory as to the relation of such spots to the earth has changed somewhat. In most particulars, however, the theories then advanced have been accepted. For example, it is conceded that during the prevalence of sun spots the earth's magnetism is intensified, and that auroral phenomena are more numerous.

The immense size of a sun spot which appeared in September, 1891, surprised astronomers. The enormous dimensions of the sun spot of February, 1892, were a still greater surprise, and there was that year greater interest in solar physics among scientists and students than in any previous year.

This sun spot, or aggregation of sun spots, was 148,500 miles in length and 87,750 miles in breadth, and covered an area of 10,000,000,000 square miles. It was visible to the naked eye for several days, and disturbed the people as greatly as it interested the astronomers.

There never was a better opportunity for observation, and then as now there was very general agreement that large spots on the sun were coincident with electric and magnetic disturbances on the earth. Since then experiments with the cathode ray and radium have led scientists to a better understanding of the relations between light and electrical phenomena.—*The Inter Ocean.*

THE RELATION BETWEEN BACTERIA AND SOIL.

An account of some interesting experiments made at the Agricultural Institute of Bonn-Poppelsdorf upon the nitrifying bacteria is contributed by Dr. Wohltmann to the last number of the Journal fur Landwirthschaft (Am. Mo. Rev. of Rev.)

All plants require nitrogen; but although an abundant supply exists free in the atmosphere, most of them are unable to use it, and depend upon what is found in chemical combination with other substances in the soil. If the soil is poor in nitrogenous compounds, there can not be a luxuriant growth of vegetation upon it. But peas, beans, and others of the family of leguminous plants contrive to form partnerships with certain kinds of bacteria which, in some way, act upon free nitrogen and change it chemically into compounds that can be used by the plants, and also change nitrogen compounds that are not available into compounds that can be used. These bacteria form nodules about as large as pin heads on the roots of the plants. On account of this characteristic, poor soil is often planted with peas, beans, etc , in order to enrich it by the compounds of nitrogen formed in this way.

Since 1898, the author has been making observations upon the appearance of these bacteria in the most varied soils of temperate, sub-tropical, and tropical climates, and has found that they are not constantly associated with plants of this family, but may either be present or entirely absent. For example, at the experiment station of Kwai, in East Africa, at an altitude of 1,650 meters above sea level, in a soil rich in humus and nitrogen, he found peas growing luxuriantly and blossoming, but without a single nodule on their roots. From these observations it seemed worth while to find out how the formation of root nodules varies in the most important cultivated plants according to the different soils and fertilizers used, and for this purpose about three hundred experiments were made with seedlings planted in eleven different kinds of soil common in the valley of the Rhine, and in soils mixed with three kinds of fertilizers.

In determining the effect of soil on the formation of nodules, the chief things considered were the condition of the plants, the amount of humus present, the amount of nitrogen, and the mineral constituents of the soil.

In general, the results supported the well-known rule that crude, uncultivated ground is poor in nodule-forming bacteria or lacks them entirely, and that the improved condition and productiveness of soil is correlated with increase of the bacteria, although there were some exceptions to this. With regard to the humus constituent of the soil, its warming and loosening properties act favorably for the development of nodule-forming bacteria, and the effect can be detrimental only when the amount of humus is very great. This is shown by certain chalky earths of the highlands, which, on account of their antiseptic properties, due to humus, may be free from bacteria.

The soils used for experimentation were made to vary greatly in the amount of nitrogen present, but, except for certain kinds of soil from the moors, it seemed that the amount of nitrogen made no difference with the presence or absence of these bacteria unassociated with plants. Rich nitrogenous earth formed by the decay of basaltic rocks was specially poor in them, and they were also lacking in poor alluvial soil and in red clay. Calcium carbonate and potassium phosphate in the soil exert a favorable influence upon the growth of the bacteria.

The author concludes that when the soil is rich in nitrogenous fertilizers, preferably ammonium nitrate, leguminous plants may be free from nodule-forming bacteria. Apparently, their association with the bacteria is not a necessity, but an expedient, and whenever there is a supply of nitrogenous matter in the soil they dispense with the bacteria and with the free nitrogen which the bacteria make available, and instead, use the nitrogen found in chemical combination in the soil. In that case, the plants would not make the soil richer in nitrogen, but would impoverish it like other cultivated plants. The presence or absence of nodules on the roots varies with the amount of nitrogen in available compounds in the soil, and the value of a fertilizer may be estimated from the number and size of the nodules upon the roots of the plants.—*Medical Herald.*

PROFESSOR PARVIN'S EARLY WEATHER RECORD.

The late Prof. Theo. S. Parvin was the pioneer voluntary meteorological observer in Iowa, and the records of his observations cover a full third of a century. He began the scientific study of the climate in 1839, at Muscatine, and continued the service at Iowa City after his removal to the latter place in 1860 to accept a professorship in the State University. In relation to his work in that line the *Cedar Rapids Republican* recently published the following interesting narration, by permission of Mr. Joseph Morcombe, who is engaged in writing the biography of Mr. Parvin:

"The journals to which reference is made and from which the best information is derived, reveal many new lines in which Mr. Parvin employed his industry. February 4, 1893, he notes revision of his meterological journal. This recalls to mind the fact that from his first residence in Iowa he made careful, daily observations of weather conditions. Several of the books containing these records are before us ruled into appropriate columns, containing several daily readings of the thermometer and barometer, direction and velocity of wind, hours of cloudiness and sunshine, etc. This was a purely voluntary labor, begun and kept up primarily for the benefit of the community and to disprove by actual figures the absurd stories current in the East of intense summer heat and arctic winters in the new territory beyond the Mi-sissippi. The government had not then adopted the wise policy of stationing trained observers over the country to collect data and to forecast general conditions. The

Masonic Poet, Rob Morris, of genial memory, somewhere in his reminiscent writing, tells of visiting his friend Parvin at his Iowa home and gives a humorous account of the enthusiastic devotion which led his host, clad only in the robes of the night, and in a frigid temperature, through the guest chamber and into the freezing air outside that he might not neglect reading his instruments.

"But this unique meteorological record had a use and value of which its compiler had no idea when reading his observations day by day. Copies of these records, with summaries and averages, were regularly furnished to and carefully preserved by the Smithsonian Institution at Washington. These constituted the only accurate and available data of the kind. When the southerners at the outbreak of the civil war destroyed Harper's Ferry and captured the arsenal at that place, it was determined by the federal government to create a depot for war supplies, which would be secure alike from foreign and domestic foes. The island in the Mississippi between the cities of Davenport and Rock Island, formerly the site of Fort Armstrong, was the chosen spot. But this selection brought out opposition from other interested localities and for a time threatened the plans of the government with congressional disapproval. The strong argument of those opposed to Rock Island was that the Mississippi was closed by ice for nine months of the year. But it fortunately occured to some friends of the new location that Parvin's records were at hand and could not be gainsaid and accordingly these were procured from the Smithsonian institution. The truth triumphed and the present great arsenal was located at a point evidently designed by nature for such an institution. Among the letters preserved among Mr. Parvin's papers, and dating from those early years are several received from leading scientists of the time, testifying to the value of these observations."

VALUABLE CORN TESTS.

A news special from Ames states that the I. S. C. Department of Agronomy has begun some experimental work to test the shrinkage of corn stored in cribs, and also the germinating qualities of seed corn under various conditions as to selection, storage, temperature and humidity. In the most important test as to shrinkage, the corn will be in the average condition of the crop when placed in farmers' cribs. A crib having capacity to hold 6,000 pounds will be built upon scales; and will be weighed daily at the time of filling, and weekly thereafter for a full year. The object of the seed corn experiment is to determine the effect of artificial heat, the effect of cold, and the common methods in use among corn producers,

Corn in three stages of development will be used in the tests—mature, immature and mediumly developed corn. Each class of corn will be stored in different storage conditions. Corn will be stored in the corn cribs, the attic, seed rooms, closed oat bins, under artificial heat, in the green house, the cellar, buried in the ground and sealed in air tight glass jars. Some will be hung by the husks, some shelled and stored in sacks, some taken in the spring from the shock, and some that has been left on the surface of the ground. In all these ways seed corn is kept by different men. It is the plan to determine what is the best and most practical way for Iowa farmers. The producing value of the seed is what counts. In the spring the value of the seed will be tested.

CLIMATOLOGY OF THE MONTH OF OCTOBER, 1903.

BAROMETER.—Mean pressure, 30.08 inches; highest observed, 30.58 inches, at Dubuque, on the 26th; lowest observed, 29.19 inches, at Sioux City, on the 6th; range for state, 1.39 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 105 stations, was 52.2°, which is 0.3° above normal. By sections the mean temperatures were as follows: Northern section, 50.7°; Central section, 52.1°; Southern section, 53.8°. The highest monthly mean was 57.7°, at Belknap; lowest monthly mean, 47.2°, at Belle Plaine. The highest temperature reported was 90°, at Chariton, on the 3d; lowest temperature reported, 16°, at Earlham, on the 27th. The average monthly maximum was 80.4°; average monthly minimum, 25.4°. Greatest daily range, 57°, at Carroll; average of greatest daily ranges, 39.7°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 115 stations, was 1.95 inches, which is 0.49 of an inch below normal. The averages by sections were as follows: Northern section, 2.12 inches; Central section, 1.78 inches; Southern section, 1.95 inches. The largest amount reported was 4.50 inches, at Harlan; least amount reported, 0.32 of an inch, at St. Charles. The greatest daily rainfall reported was 2.90 inches, at Ruthven, on the 6th. Average number of days on which .01 of an inch or more was reported, 5.

WIND AND WEATHER.—Prevailing direction of the wind, south; highest velocity reported, 58 miles per hour, from the west, at Sioux City, on the 7th. Average number of clear days, 19; partly cloudy, 6; cloudy, 6.

ATMOSPHERIC PRESSURE.

OBSERVERS' NOTES.

ALLERTON.—*Rex Shriver.* Heavy frosts of 18th, 24th and 27th killed vegetation generally, but corn was too well matured to be injured.

ALTA.—*David E. Hadden.* First week in October was wet and changeable; during balance of month this county enjoyed ideal Indian summer weather, clear, mellow and warm, which came opportunely for maturing corn and finishing fall work.

AMANA.—*Conrad Schadt.* Weather fine and pleasant, and corn had ample time to ripen; large part of crop husked and better than expected.

BONAPARTE.—*B. R. Vale.* Rain 3.78; a severe local storm and wind on night of 6th; warm weather since; much plowing done; pastures good; corn husking begun.

BRITT.—*Geo. P. Hardwick.* First half of month changeable but last half pleasant; corn being cribbed after 25th; pastures better than usual; potatoes scarce.

CLINTON.—*Dr. Luke Roberts.* Rainfall 1.85 inches, 0.55 below normal; temperature normal; sunshine in excess of normal; a good month for hardening corn and securing the crop and general outdoor work.

EARLHAM.—*Geo. Phillips.* The corn crop is 50 per cent be'ter than was thought possible sixty days ago.

CARROLL.—*Moses Simon.* A fine month; geraniums and other tender flowers still in bloom on 31st.

GRAND MEADOW.—*F. L. Williams.* First killing frost of season on 18th; corn ripened well and potatoes were fine; month was ideal for farm work.

GRUNDY CENTER.—*E. S. King.* More fall plowing than for years. Last half of month made fine corn; only about ten per cent soft.

HANLONTOWN.—*Miss G. M. Paschen.* Began husking corn on 23d, but some began about 14th; corn well dried out and promises a good yield.

JEFFERSON.—*Isaac Young.* Last half of month fine; considerable plowing and husking corn done.

OLIN.—*Nathan Potter.* October has been an ideal fall month; cribbing corn begun about 20th, and mostly in good condition.

PERRY.—*J. A. Harvey.* Total rainfall 2.35 inches; month very fine for the farmer.

RIDGEWAY. *Arthur Betts.* No rain after 17th, 241 hours of sunshine, or 72 per cent; second season of roses from 12th to 24th; roads dry and dusty; much hazy weather.

WAUKEE.—*E. J. Leonard.* Weather unusually fine, over two-thirds of the days absolutely cloudless; first killing frost here was on 9th and late corn was injured.

WEST BEND.—*Ph. Dorweiler.* An ideal month, the finest October on record.

WHITTEN.—*Frank P. Butler, M. D.* Twenty-one clear days, and the warmest October for years; this section has an immense corn crop and quality good; being rapidly harvested.

WILTON.—*J. M. Rider.* Last half of month very favorable for curing corn and farm work.

GRINNELL.—*A. O. Price.* Last half of month perfect; 90 per cent of fall plowing done; corn husking well advanced.

ERRATA IN AUGUST REVIEW.

BEDFORD.—Total precipitation recorded 7.46 inches on pages 8 and 11, should have been 9.46 inches.

CARROLL.—Mean temperature recorded 68.6° on page 7, should have been 68.7°.

COUNCIL BLUFFS.—Total precipitation recorded 13.09 inches on pages 8 and 11, should have been 15.09 inches.

EARLHAM.—Mean temperature recorded 67.8° on page 8, should have been 68.0°.

Mean minimum temperature recorded 56.2° on page 9, should have been 56.5°.

GUTHRIE CENTER.—Total precipitation recorded 5.65 inches on pages 7 and 11, should have been 5.05 inches.

WEST UNION.—Total precipitation recorded 6.19 inches on pages 7 and 12, should have been 6.14 inches.

BELATED REPORTS.

BELLE PLAINE.—September. Mean temperature, 58.8°, highest 84°, on the 3d; lowest 36°, on the 24th; greatest daily range 30°. Total precipitation, 3.79 inches; greatest in 24 hours, .90 inch. Number of clear days, 11; partly cloudy, 12; cloudy, 7; rainy, 10. Prevailing direction, southeast.

CHESTER.—September. Mean temperature, 57.8°; highest 82°, on the 3d; lowest 29°, on the 18th; greatest daily range, 33°. Total precipitation, 4.46 inches; greatest in 24 hours, 1.00 inch; prevailing direction, southwest. Number of clear days, 16; partly cloudy, 5; cloudy, 9; rainy; 14.

DENISON.—September. Mean temperature, 60.6°; highest 84°, on the 25th; lowest, 32°, on the 27th; greatest daily range, 38°. Total precipitation, 1.87 inches; greatest in 24 hours, .55 inch; prevailing direction, south. Number of rainy days, 8.

LEON.—September. Mean temperature, 62.4°; highest, 82°, on the 6th, 7th, 8th and 11th; lowest, 37°, on the 18th; greatest daily range, 32°. Total precipitation, 4.45 inches; greatest in 24 hours, 2.35 inches; prevailing direction, south. Number of clear days, 17; partly cloudy, 2; cloudy, 11; rainy, 11.

1903.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. McDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. NOVEMBER 1903. No. 11.

IOWA CROPS—FINAL REPORT, 1903.

AVERAGE YIELD PER ACRE; TOTALS FOR THE STATE; CURRENT FARM PRICES, DEC. 1, 1903.

Following is a summary of crop reports from correspondents of the Iowa Weather and Crop Service, showing the average yield per acre and totals of staple soil products, and the average prices at the farms or nearest stations December 1, 1903. In this showing of the value of the season's output of grain, forage, etc, no reckoning is made of the increment in value gained by consumption of soil products on the farms in the production of beef, pork, mutton, horses, butter, poultry, eggs, etc. Usually the prices obtainable for the crops at the close of the season do not express more than two-thirds of the actual value of the staple products of the soil.

THE CORN CROP.—In estimating the output of this crop the most difficult problem is to determine the extent of loss of acreage caused by floods and adverse weather conditions in the season of planting and cultivating. As a result of inquiry and careful computation it appears that the corn area actually cultivated and harvested this season is approximately 7,398,320 acres. The returns of township assessors show that the area planted in 1902 was 8,925,068 acres, and by comparison it is shown that the reduction this season amounted to about 1,526,748 acres. The average yield per acre for the state this year was 31 bushels, and the aggregate product is estimated at 230,511,310 bushels. The average farm price on December 1st was 36 cents per bushel, making the aggregate value $82 984,071. Last year the product was much inferior in quality though much larger in amount, and the value was computed at $83,000,000. The yearly average for 13 years has b en $69,633,000.

In respect to quality of the grain and actnal commercial value, the corn crop of this season is fully 20 per cent better than the output of 1902.

WHEAT.—Winter wheat acreage harvested 84,934 acres; yield per acre, 16 9 bushels. total yield, 1,435,380 bushels; average price 70 cents per bushel; total value $1,004,766. Spring wheat area harvested 752,488 acres; average yield 12.6 bushels per acre; total product 9,481,350 bushels; price per bushel 65 cents; total value $6,162,877. Aggregate value of wheat $7,167,643. Last year the value was $7,062,640. Average yearly value for past thirteen years, $10,524,000.

OATS.—The oats crop this season has been below the average in yield per acre and weight per bushel, as a result of adverse conditions. The area harvested was 3,822,882 acres; average yield 25.9 bushels per acre; total product, 99,012,660 bushels; aggregate value, at 30 cents per bushel, $29,703,798. Last season the product was 92,907,000 bushels, valued at $22,907. The average yearly output for thirteen years has been 117,118,000 bushels, and the value $25,420,000.

BARLEY.—Area harvested, 493,108 acres; yield per acre, 24 7 bushels; total product, 12,179,790 bushels; average price, 37 cents per bushel; total value, $4,506,522. The yield and value are about the thirteen-year average.

RYE.—Area harvested, 123 273 acres; average yield 15.6 bushels per acre; total product, 1,923,060 bushels; current price, 44 cents per bushel; total value, $846,146.

FLAX.—Area harvested, 40,823 acres; yield per acre, 8.7 bushels; total yield, 355,160 bushels; current farm price, 78 cents per bushel; total value, $277,024.

POTATOES —Area harvested, 113,433 acres; average yield, 5.38 bushels per acre; total product, 6,082,694 bushels; average farm price, 75 cents per bushel; value of product, $4,562,020. The total yield is about half the 13 year average; total value about the average of the 13 year period.

HAY.—(Tame). Average yield per acre, 1.9 tons; total product, 5,216,404 tons; current farm price, 5.75 per ton; value of crop, $29,994,323

HAY.—(Wild). Yield per acre, 1.3 tons; total product, 1.191,345 tons; average price, $4.95 per ton; total value, $5,-897,157. The hay crop as a whole (tame and wild) is nearly 900,000 tons in excess of the 13 year average.

PASTURAGE.—This most important soil product has been at its best in the recent wet seasons, when the cereal crops have suffered much detriment from excessive moisture. It is not measurable by the ton or bushel, and its value can only be estimated approximately by considering it as the basis of stock growing and dairying. From this point of view it will be a conservative estimate to figure the output of pastures and all other grazing lands at an average of $300 per farm. This makes a total value of $68,000,000 for the state.

Corn fodder in shock and fields is worth at least $10,000,000.

Sorghum, broom corn and sweet potatoes are worth about $750,000.

TABULATED CROP SUMMARY.

Crops.	Total Products.	Farm Values Dec. 1.
Corn	230,511,310 bus.	$ 82,984,071

NOVEMBER WEATHER AND CROPS.

November was unusually dry and seasonably warm, with less than the average amount of atmospheric disturbance. Conditions were favorable for farm operations, and excellent progress was made in cribbing the corn crop in good condition. The cobs contained more than the usual amount of moisture, but the dry weather and freezing temperature prevented damage by heating in the cribs. The small acreage of fall wheat and rye suffered no material injury from dry weather and freezing. The weather was highly favorable for stock feeding and pastures afforded good feed throughout the month. The supply of water for stock is ample for the winter.

NOTES AND COMMENTS.

All that is known about sun spots is that their appearance is due to terrific disturbances in the solar photosphere and that they are coincident with magnetic storms in the terrestrial atmosphere. To say that the latter are caused by the former is a very loose way of stating the case. The two phenomena are evidently connected, and both are probably caused by an identical and still undiscovered force of nature.—*Philadelphia Record.*

A San Francisco special dated November 7th, says: All hands stood aghast on the American bark Oregon while a tremendous waterspout, the mightiest ever reported, passed two miles astern of the vessel. The Oregon was then, September 12th, in south latitude 15 49 and longitude west 152.06 on her way from Newcastle, N. S. W., to this port with coal.

Captain Parker says there was a moderate breeze from the north and the air had a queer "feel" when the water two miles away was rushing and foaming up to an astounding height. This water eruption crossed the wake of the Oregon, and as it did so, rose higher and formed the spiral waterspout to the sky overhead. It was at least two miles high. Captain Parker estimates that in its most slender part the waterspout was six feet through. He says that for fully a mile around the base of the waterspout there was a frightful surf, higher by far than any breakers seen on the beaches. "If it should have happened to pass over the ship," says Captain Parker, "it would have torn masts and yards out of her and finally swamped her." Members of the crew were badly frightened during the progress of the unusual phenomenon.

Mr. Fred. M. Taylor, postmaster, Titusville, Fla., reports that on September 17th, during a thunderstorm shortly after sunset, each electrical discharge was accompanied by small typical strokes of only a few inches in length between neighboring rain drops. These were synchronous with the main discharge, and when they struck the hands or face produced a sharp stinging ensation.—*U. S. Weather Review, September 1903.*

Cablegrams from Europe, dated Nov. 30th, brought reports of damaging storms of rain, snow and sleet, covering Italy, Belgium and Great Britain. The barometric depression at Rome was the lowest recorded at the government station for the past twenty-five years. The disturbance extended to the coast of Algiers, where torrential rains, lasting thirty-four hours, caused great damage on land and sea.

In its insular possessions the United States has volcanoes to burn. The Philippines are abundantly supplied with them. Mayon, 8,970 feet high, has had twenty-two violent eruptions since 1776, destroying thousands of human lives and much property. One eruption, in 1897, continued nine months, and was quite destructive. Manila is frequently shaken by earthquakes radiating from volcanic centers.

What is the value of the product of the pastures and other grazing lands of the state? This is a problem to be solved by experts who have made a study of farm statistics. Our great herds of live stock obtain a large percentage of their living and growth in flesh by grazing in the pastures in spring and summer and in meadows and grain fields in other seasons of the year. This enormous output of the soil cannot be expressed in tons or bushels; it is marketed in form of beef, pork, mutton, wool, dairy products, etc. How much of the total value of the live stock industry should be credited to the grasses which are transformed into flesh? This is not an easy question.

THE AGRICULTURAL REPORT.

Secretary Wilson has submitted to the President his annual report of the Department of Agriculture for the year 1903, this being the seventh report made by Mr. Wilson since his acceptance of that office.

Secretary Wilson reviews at length the production and exports of American agricultural products. The increase in the exports of farm products for the half century ended in 1901, was from $147,000,000 at the outset to $952,000,000 in the closing year of the period. For the year 1903 the exports amounted to $878,000,000, an amount second only to the total for 1901.

Of grain and grain products, the export exceeded in value $221,000,000, and in the supply of animals, meats and meat products the value of exportation was $211,000,000.—Discussing the balance of trade, the secretary shows that the favorable balance to the credit of this country is due entirely to the farmers. The balance of trade in favor of farm products during the last fourteen years, no year excepted, aggregated $4,806,000,000. In products other than those of the farm during the same period, the balance of trade was adverse to this country to the extent of $865,000,000. Our farmers not only canceled this immense obligation, but placed $3,940,000,000 to the credit of the nation when the books of the international exchange were balanced. He concludes that "it is the farmers who have paid the foreign bond-holders."

Reviewing the magnitude of agricultural production, after giving the figures of the most important crops, Mr. Wilson states that the value of all farm products, not fed to live stock, for 1903 considerably exceeded their value in the census year, when it was given as $3,742,000,000.

According to the department's inventory of farm animals for January 1, 1903, the value of horses was over $1,000,000,000 and of mules nearly $200,000,000. The value of cattle of all kinds considerably exceeded $1,300,000,000, of sheep $168,000,000, and of hogs $365,000,000.

The secretary reports a gratifying extension in public education along meteorological lines. Regular courses of lectures or classes have been conducted by weather bureau officials in not less than twenty colleges and universities. Many of the representatives of this bureau have, moreover, delivered occasional addresses in other classes or colleges, and to teachers of schools. The demand for instruction on these subjects increases rapidly.

A distinct advance by the weather bureau is noted in the preparation of daily weather charts at their different levels, i. e., the sea level, and at the 3,500-foot and 10,000-foot planes. So far this improvement is confined to the barometric pressure, but it is most important to secure charts of the temperature on the two upper planes as well, and unfortunately these can be secured only by means of balloon and kite ascension.

PHYSIOLOGICAL EFFECTS OF DIMINISHED AIR PRESSURE.

In a communication published in *Science* for November, 1901 (page 696), Mr. H. H. Clayton, of Blue Hill Observatory, gives some observations on the number of his pulse-beats, noted during a recent ascent of Pike's Peak by railroad. The pulse increased from 78 beats per minute at Manitou (6,662 ft.) to 92 at the summit of the mountain (14,147 ft.). Mr. Clayton's note recalls some similar observations made by the writer in Peru in 1897, during two ascents of El Misti (19,200 ft.), then the site of the highest meteorological station in the world, established by Professor S. I. Bailey, and operated by the southern station of the Harvard College Observatory at Arequipa. Both ascents were made on mule back, so that no physical exertion was necessary. The first ascent was on October 7th, the start being from the Observatory (8,050 ft.) on October 6th. Although provided with clinical thermometers and with a sphygmograph, the writer suffered so severely from mountain sickness that he made very little use of his instruments. His temperature at 5:30 P. M., October 5th, twelve hours before leaving Arequipa, was 98°.4; his respiration 24, and his pulse 90. On the summit of El Misti the body temperature was 96°.4; the respiration 34, and the pulse 110. Twelve hours after arrival at Arequipa the figures were 98°.0, 24 and 85 respectively. A rather unsatisfactory sphygmograph curve was obtained on the summit.

The second expedition to El Misti was made on November 9, 1897, and on this trip the writer suffered much less from mountain sickness than on the previous one. At an altitude of 15,700 feet a short walk of about 100 yards was taken to the instrument shelter. Two stops were necessary on the way, to get breath. An hour after this exercise, the pulse was 128, the body temperature 97.°.0 and the respiration 30. The corresponding figures twelve hours before leaving Arequipa were 91, 98°.6 and 20. The night was spent at 15,700 feet. The body temperature immediately after waking in the morning was 96°.2; the pulse 112, and the respiration 30. Twenty minutes after reaching the summit, the temperature was 97°.2, the pulse 120, and the respiration 32. In an hour and a half the respiration was 35, the pulse and temperature remaining the same. In two hours the temperature was 96°.8, the pulse 112, and the respiration 34. Three fairly good sphygmograph curves were obtained on the summit. These curves possess some interest as being, so far as I have been able to learn, the first, with possibly one exception, to be secured at so great an altitude as 19,200 feet. At any rate, no curve from so great an altitude was reproduced until a copy of one of these tracings from the Misti summit was printed in an article by the writer in the *Journal of the Boston Society of Medical Sciences* for June, 1898.

On the second expedition to El Misti the descent was begun two hours and a half after reaching the top. At the hut at the base of the mountain (15,700 ft.), after walking to and from the shelter, the pulse was 130, but the respiration had decreased to 30 One hour after arriving at Arequipa the temperature was 98° 2, the pulse 116, and the respiration 22, and twelve hours after arrival the pulse had fallen to 82—about the writer's normal at the Observatory—and the respiration to 22, the normal being 20.

In counting the pulse on the summit it was quite unnecessary to place the finger on the wrist. The heart-beats could plainly be *heard*.—*R. DeC. Ward, in Science*.

MISSOURI RIVER CLOSED DECEMBER 1.

The channel of the Missouri river at Sioux City was closed by ice December 1st, which date is about four days earlier than the average closing at that point for the past twenty-six years. The earliest date in that period is December 12, 1896, and the latest January 20, 1889. The following table, compiled from local records by the Journal of that city, is of interest:

YEAR.	DATE OF CLOSING.
1878	December 12
1879	November 30 and December 8
1880	November 18
1881	December 30
1882	November 21
1883	November 30
1884	November 22
1885	December 5
1886	November 19
1887	November 27
1888	January 20, (1889)
1889	November 21 and January 1 (1890)
1890	January 4 (1891)
1891	November 25 and December 25
1892	December 17
1893	November 29
1894	December 28
1895	November 29
1896	November 12
1897	November 27
1898	November 22
1899	December 20
1900	November 20
1901	December 17
1902	December 5
1903	December 1

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 30.14 inches; highest observed, 30.65 inches, at Dubuque, on the 20th; lowest observed, 29.38 inches, at Dubuque, on the 11th; range for state, 1.27 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 105 stations, was 34.2 degrees, which is 0 1 below normal. By sections the mean temperatures were as follows: Northern section, 32 2 degrees; Central section, 34.0 degrees; Southern section, 36.3 degrees. The highest monthly mean was 39.0 at Osceola and Red Oak; lowest monthly mean, 30.0, at Estherville. The highest temperature reported, was 76°, at Pacific Junction, on the 1st; lowest temperature reported, 5° below zero, at Carroll and Audubon, on the 18th and 26th. The average monthly maximum was, 68.3; average monthly minimum, 3.1. Greatest daily range, 43, at Osceola; average of greatest daily ranges, 30.9.

PRECIPITATION.—Average precipitation for the state, as shown by records of 116 stations, was 0 52 of an inch, which is 0.85 of an inch below normal. The averages of sections were as follows: Northern section, 0.17 inch; Central section, 0.57 inch; Southern section, 0.82 inch. The largest amount reported was 1.74 inches, at Allerton; least amount reported, Trace, at Algona, Charles City, Forest City, Mason City, Northwood and Whitten. The greatest daily rainfall reported was 1.38 inches, at Washington, on the 10th and 11th. Average number of days on which .01 of an inch or more was reported, 3.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 43 miles per hour, from the northwest, at Sioux City, on the 9th. Average number of clear days, 13; partly cloudy, 8; cloudy, 9.

OBSERVERS' NOTES.

ALLERTON—*Rex Shriver*. Corn is nearly all in crib. The yield is fairly good but the quality is generally poor.

ALTA—*David E. Hadden*. November was comparatively dry and pleasant. The first snowfall of the season was on the 24th—amount one inch. Light aurora was noticed on the evening of 18th.

AMANA—*Conrad Schadt*. The weather was dry, affording sufficient time for the soft corn to dry out. Husking is about finished. Cold weather in the middle of month put a stop to plowing.

AUDUBON—*Geo. E. Kellogg*. First snow of the season fell on the 13th.

BONAPARTE—*B. R. Vale*. A dry and pleasant month. No storms and not excessively cold. Farm work progressed finely.

BRITT—*Geo. P. Hardwick*. Precipitation for the month, .05 inch, the least of any November during past seven years. Ground frozen after the 12th. The dry weather during the past weeks has been beneficial for unripe corn, nearly all of which has been gathered.

CHARLES CITY—*C. H. Priebe*. Unusually fine weather. Only a trace of snow during entire month.

CLINTON—*Luke Roberts* Rainfall, 0.78 inch, being a deficiency of 1.12 inches as compared with the normal. The mean and minimum temperature and the number of clear days were above normal. The first snow of the season fell on the 28th.

EARLHAM—*Geo. Phillips*. No snow on ground at close of month. Ten per cent of corn still in fields.

GRAND MEADOW (Postville P. O).—*F. L. Williams*. The month was very dry and favorable for farm work. Stock pastured all the month

GRUNDY CENTER—*E. S. King*. Corn all husked and fall work was never in better shape.

HANLONTOWN—*Miss G. M. Paschen*. The yield of corn averaged from 50 to 60 bushels per acre. Many farmers had finished husking by 21st.

JEFFERSON—*Isaac Young*. The ground froze on the 16th.

LEON—*M. F. Stookey*. The first snow of the season fell on the 13th.

MOUNT AYR—*A. F. Beard*. Thunder on the nights of 3d and 8th, and during the day of 4th.

OGDEN—*E. Sayre*. The first snow of the season fell on the 24th, amount 1.00.

RIDGEWAY—*Arthur Betts*. Thunder showers on the 9th. Ground frozen since the 22nd.

WASHINGTON—*Wm. A. Cook*. The first snow fell on the 13th.

WHITTEN—*Dr. Frank P. Butler*. The first month in over six years that there has been no precipitation to record.

ERRATA IN SEPTEMBER REVIEW.

AUDUBON.—Total precipitation recorded 2.78 inches on page 8 and 11, should have been 2.79 inches.

COLLEGE SPRINGS.—Mean temperature recorded 62.7° on page 8, should have been 62.1°.

DOWS.—Total precipitation recorded 2.00 inches on page 7 and 11, should have been 2.02 inches.

ROCKWELL CITY.—Mean temperature recorded 65.6° on page 7, should have been 60.6°.

TIPTON —Total precipitation recorded 5.30 inches on page 7, should have been 5.36 inches.

OMAHA, NEB.—Mean temperature recorded 63.2° on page 8, should have been 63 0°. Mean maximum temperature recorded 73.2° on page 10, should have been 73 0°.

BELATED REPORTS.

DENISON.—October. Mean temperature 51.0°; lowest 22° on the 18th; greatest daily range 49°; total precipitation .89 inch; greatest in 24 hours .63 inch on the 6th; number of rainy days 2.

ESTHERVILLE.—October. Mean temperature 50.2°; highest 79° on the 20th; lowest 24° on the 27th, greatest daily range 45°; total precipitation 2.49 inches; greatest in 24 hours 1.70 inches on the 7th; prevailing direction, southeast; number of clear days 16, partly cloudy 5, cloudy 10, rainy 8.

FAYETTE.—October. Mean temperature 49.4°; highest 79° on the 3rd; lowest 18° on the 27th; greatest daily range 41°; total precipitation 1.73 inches; greatest in 24 hours .90 inch on the 6th; preyailing direction, southeast; number of clear days 20, partly cloudy 3, cloudy 7, rainy 5.

SHELDON.—October. Mean temperature 51.0°; highest 79° on the 19th; total precipitation 3.31 inches; greatest in 24 hours 2.35 inches on the 6th; number of rainy days 3.

SPIRIT LAKE.—October. Mean temperature 51.2°; lowest 28° on the 26th; total precipitation 4.00 inches; greatest in 24 hours 4.00 inches on the 5th and 6th; number of rainy days 1.

STOCKPORT.—October. Total precipitation 3.47 inches; greatest in 24 hours 1.40 inches on the 2nd; prevailing direction, northwest; number of clear days 20, partly cloudy 5, cloudy 6, rainy 4.

VILLISCA.—October. Mean temperature 50.6°; highest 82° on the 2nd; lowest 25° on the 25th; greatest daily range 38°; total precipitation 1.27 inches; greatest in 24 hours .60 inch on the 6th; prevailing direction, northwest; number of clear days 20, partly cloudy 9, cloudy 2, rainy 4.

WAPELLO.—October. Mean temperature 53.0°; highest 79° on the 3rd; lowest 27° on the 26th; greatest daily range 27°; total precipitation 2.05 inches; greatest in 24 hours .80 inch on the 6th; prevailing direction, southwest; number of rainy days 4.

DECEMBER, 1903. No. 12.

MONTHLY REVIEW OF THE IOWA WEATHER AND CROP SERVICE

CONTENTS.

AND ANNUAL SUMMARY, 1903

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

DES MOINES:
BERNARD MURPHY, STATE PRINTER
1903.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. DECEMBER 1903. No. 12.

WEATHER AND CROPS—DECEMBER, 1903.

December, 1903, was extremely dry, the average precipitation for the state being .88 of an inch below normal, and in some localities the precipitation was little more than a trace. The mean temperature for the state, 19.6 degrees, was 3.9 degrees below the normal, but the month as a whole was very favorable for farm operations usual to the season, and for stock feeding. The dry weather was especially favorable for finishing husking and cribbing corn and also for drying the portion of the crop which contained more than the usual amount of moisture. The fields afforded good forage for grazing cattle, horses and sheep. The bare ground and freezing weather, however, caused some detriment to fall wheat and rye; but the acreage of these crops is very small. The month was generally favorable for the health of the people and all kinds of live stock.

THE CORN CROP.

The Bureau of Statistics of the Department of Agriculture, in its final report for 1903, estimates the total yield of the corn crop for the United States at 2,244,176,925 bushels. Iowa is credited with a total yield of 229,218,220 bushels, which amount is very close to the estimate made by the state crop service. In the state report, however, the area harvested was materially less than the estimate of the government bureau. This accounts for the difference in the average yield per acre as shown by the two reports.

The total value of the corn crop of the United States is estimated at $952,868,000. If the value of the corn fodder is included, the whole crop is worth more than a billion dollars.

AS TO WEATHER PREDICTIONS.

Cedar Rapids Republican, December 25, 1903: The weather predictions for Thursday were rain or snow, with colder in the northwestern portions of the state.

But yesterday morning there was hardly a cloud in the sky, the sun shone with the genial warmth that has characterized so many of the December days this year. This may lead some people to believe that the weather predictions do not amount to much after all.

Many people still believe that the weather predictions sent out by the government service partake of the mysterious and the uncanny work of so-called prophets. But such is not the case. The governmment observers simply take note of the trend of lows and highs, of storm areas and clearings. When a storm is formed in the northwest and sweeps onward toward the southeast, the government observers wire the information to Washington and the Washington scientists send warnings to the sections which are likely to be covered by the storm area, and estimate the time in which the storm may be expected. If a runaway engine starts from Belle Plaine it is possible to wire to Cedar Rapids to be on the lookout for it and to have the tracks cleared for the monster. That is what the weather service does. Nothing more. Of course before the engine gets to Cedar Rapids the steam may be exhausted and the fire in the firebox burned out. So it often happens with storms that are scheduled to arrive. They may be rained out or snowed out before they reach all the people in the territory in their track. Or a contrary current of air may swerve them out of the usual course. There are many things which may interfere. Or, when clear weather is predicted a local storm may be made out of local atmospheric conditions. But this does not invalidate the predicdictions as a whole.

IOWA WEATHER IS ALL RIGHT.

One rarely picks up a paper but what he notes the departure of citizens to some distant point to spend the winter. Like birds of passage many seek winter resorts to avoid the approach of severe weather. To find a dwelling place where blizzards come not and the flowers forever bloom has attractions for human beings as well as for birds. But then the most of us have to remain behind to keep our corner of the world moving, and keep it in some semblance of shape for ourselves and to welcome the return of the weary wanderers. What matters it though our faces are bronzed and the sand creeps into our bodies, we have the pleasure of conquering the elements and witnessing the most beautiful of contrasts. Human nature tires of the evenness of things be it ever so mild or enticing. We have in Iowa pleasant weather, fair weather, disagreeable weather, but weather that is generally moderate. It's the kind of weather that spices life. It helps to cool the over-arduous, tempers the fitful, cheers the despondent, moves the laggard along, and buries those who will not move with the greatest of all coverings that of oblivion. Iowa weather is as we want it; we wouldn't change it if we could.—*Estherville Enterprise.*

WORK OF A HAILSTORM.

Nature gets on an ugly fit once in awhile, and we have lately had an experience which showed her at about her worst. It was September and harvest time, when most of her cranky fits are supposed to be over, when, having given us all the summer programme of excessive heat, spiteful winds, a deluge of water and lightning wreck, we have come to regard her as satiated

and tired and rid of her beligerent moods, but just when the apples were hanging all ready for the pickers, when the corn was just right to cut up, when the beans were ready to pull and onions pulled and drying prior to sacking, along came a hailstorm one afternoon, not an ordinary sprinkle of hail, say the size of marbles, but a regular cleaning out of the weather clerk's ice box upstairs, great ragged, three cornered chunks of ice big and hard enough to make a dent a quarter of an inch deep in a pine board, and then, sure enough, it was all day with the nice crops—corn stripped clean all save the ears, making the field look like an army of Shanghai roosters plucked clean all save their tail feathers; apples smashed into cider pulp, and beans thrashed clean, and onions left as though they had been struck with a baseball bat. Five minutes did the business, and the writer of these notes knows just how a fellow feels who is dead sure that he has a good thing and finds after all that he has not got it. We expect hail in June, July and rarely in August, but the September hailstorm is the clipper when it comes. Being an optimist, however, we look on the bright side and have been figuring up how much we have saved by not having the corn to cut up and the other crops to harvest, and then we feel thankful that the hail did not shell the corn and leave us nothing but cobs and that it could not reach the potatoes. The prize acre of onions, yielding over 600 bushels, was the sorriest sight of the wreckr Practicing what we preach, we are not going to fret, but just try it again.—*J. S. Trigg in Rockford Register*

RECENT SOLAR RESEARCHES.

Two papers by French meteorologists, dealing with the suspected parallel between the eleven-year sunspot period and fluctuations in terrestrial temperatures, have recently been made accessible to American readers by "The United States Monthly Weather Review." In one of them M. Nordmann follows up a comparison made many years ago by Koeppen. He confines his inquiry to the interval between 1870 and 1900, and to stations lying within about twenty degrees of the equator. Taking the average of the annual temperatures for thirteen points, he finds a slight excess at the minimum stage of solar activity, and a deficit at the time of greatest sunspot abundance. Although the fluctuation is slight, it seems to be systematic, and it corresponds to that which Koeppen thought he had detected. The other paper translated for *The Monthly Weather Review* is a review of M. Nordmann's work by Professor Alfred Angot. Although objection is made to some of his compatriot's methods, the second writer reaches substantially the same conclusions as the first.

Much work has been done in the last thirty years by other meteorologists which points to a similar periodicity. Chambers found it in the drouths which afflict India. Some of his associates believed that they detected long range variations in the prevailing atmospheric pressure, which were related to temperature and rainfall. Meldrum showed that tropical cyclones in the Indian Ocean were more numerous at and near sunspot maxima, and Bigelow did the same for West India hurricanes. The latter investigator, who is attached to the Washington bureau, has presented a good deal of evidence to indicate that other features of the weather, outside of the tropics as well as inside, undergo a fairly regular alternation. These various statements have their vulnerable points. The more recent ones have not yet been thoroughly threshed by critics, nor fully verified. The mechanism by which terrestrial weather is influenced, if at all, is not made altogether clear. Yet as the matter stands to day there is increased reason for thinking that fluctuations occur in solar radiation, and that such changes are influential on the earth. The practical importance of further research, therefore, may be said to grow more apparent daily.

A line of inquiry has been pursued by Professor Langley for more than ten years which is exceedingly promising, He seeks to discover the variations in question by direct observation of the sun. Having obtained a telescopic image of that body, he examines it with a spectroscope and an instrument of his own invention whereby differences of temperature as small as a hundred-millionth of a degree can be detected. Various difficulties have beset this work. The apparatus is so delicate that a number of local influences interfere with its operation. Its testimony is also obscured by variable conditions in the earth's atmosphere, notably the presence of water vapor. Most of these sources of error and uncertainty have been slowly eliminated, however. In the latest report of the Smithsonian Institution Professor Langley intimates that it may be necessary to transfer the work to a mountain top, but he takes an encouraging view of the possibility of getting accurate results at the astro-physical observatory in Washington. After he is fully satisfied with the working of his instruments, which, by the way make records automatically, he should soon be in a position to say whether they give him clear indications of substantial changes in the sun's thermal output.

When once it has been proved that the bolometer will give unmistakable evidence of variations in heat emission, the next step will be to find out whether it can be utilized practically in weather forecasting. An investigation of colossal proportions will be necessary to determine whether perceptible consequences ensue at the earth's surface, and how much time intervenes between the observed cause and effect. These questions cannot be settled in a day. Possibly it may be found that the behavior of the magnets in well regulated observatories, or even that of simpler instruments of an allied nature which can be used at ordinary meteorological stations, will be more significant. At any rate, it is not incredible that better means of gaining an insight into coming weather changes will be available before the first quarter of the twentieth century has elapsed.—*New York Tribune.*

CLIMATOLOGY OF THE MONTH, DECEMBER, 1903.

BAROMETER.—Mean pressure, 30.12 inches; highest observed, 30 68 inches, at Des Moines, on the 14th; lowest observed, 29.60 inches, at Davenport on the 25th; range for state, 1.08 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 103 stations, was 19.6°, which is 3.9° below normal. By sections the mean temperatures were as follows: Northern section 16.0°; central section 19.7°; southern section 23.0°. The highest monthly mean was 26.2° at Glenwood; lowest monthly mean, 12.5° at Sibley. The highest temperature reported was 58°, at Hopeville, Mt. Ayr, Osceola and St Charles on the 31st; lowest temperature reported, 27° at Sibley on the 13th. The average monthly maximum was 48.8°; average monthly minimum, 15.3°. Greatest daily range 56° at Whitten; average of greatest daily ranges 40.5.°

PRECIPITATION.—Average precipitation for the state as shown by records of 118 stations, was 0.41 of an inch, which is 0.88 of an inch below normal. The averages by sections were as follows: Northern section, .49 of an inch; central section, .37 of an inch; southern section. 38 inches. The largest amount reported was 1.96 inches at Ridgeway; least amount reported, trace, at Storm Lake. The greatest daily rainfall reported was .68 of an inch at Ridgeway on the 25th. Average number of days on which .01 of an inch or more was reported, 4.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, fifty miles per hour, from the northwest, at Sioux City, on the 28th. Average number of clear days, 11; partly cloudy, 9; cloudy, 11.

OBSERVERS' NOTES.

ALLERTON.—*Rex Shriver.* Generally pleasant and dry; blizzard on 12th; good sleighing from 12th to 17th.

ALTA.—*David E. Hadden.* Very cold during the middle decade of the month; only two inches of snow, which soon disappeared; roads excellent.

ATLANTIC.—*J. W. Love.* A remarkably mild December, with no rain and very little snow; roads fine.

BONAPARTE.—*B. R. Vale.* A dry, cool month; roads good; fields in good condition and husking done. For 1903 the precipitation was 39.34 inches, as against 47.61 inches in 1902, and 16.34 inches in 1901.

BRITT.—*Geo. P. Hardwick.* Temperature below normal; no severe storms; live stock healthy and feeding in the fields; excess of surface water disappeared; corn all gathered, and about half a crop.

CARROLL.—*Moses Simon.* Cold wave 13th to 15th; balance of month fine; roads good.

CHARITON.—*C. C. Burr.* Month more like October than December; roads dry and smooth.

CLINTON.—*Dr. Luke Roberts.* A cold December and erratic in its high and low temperatures; mean, 5.5° below normal; maximum, 9.6° below normal; minimum, 9.9° below normal; rainfall also below normal.

ELKADOR.—*Charles Reinecke.* Mean temperature for 1903 was 46.3°; total precipitation for 1903 was 40.70 inches; total snowfall for 1903 was 32.5 inches; highest temperature for 1903 was 93° July 9th; lowest temperature, 19° December 13th.

GRAND MEADOW.—*F. L. Williams.* A drop of 40° in temperature occurred between 11 A. M. on the 12th and 4 A. M. on the 13th; month cold and dry; stock doing well.

GREENFIELD.—*J. G. Culver.* Temperature fell 45° in the 24 hours following 6 A. M. of the 25th.

GRINNELL.—*A. O. Price.* Month cool and dry; fine for stock; ground bare of snow except in patches; snow fall, 1.5 inches; or .15 of an inch melted.

HANLONTOWN.—*Miss G. M. Paschen.* Snow of first part of the month melted about the 20th; later snow nearly all melted on 31st; month colder than last year.

HOPEVILLE.—*M. L. Ashley.* A beautiful month; roads dry and dusty; stock wintering finely to date.

HUMBOLDT.—*H. S. Wells.* Weather very fine, and roads never better; stock healthy.

IDA GROVE.—*J. E. Conn.* Month very fine; clear with continued cold weather.

JEFFERSON.—*Isaac Young.* Snow all gone and ground freezing deep. This will remedy the soggy condition the fields were in during the past season.

MT. AYR.—*A. L. Beard.* An ideal month; very fine winter weather.

OLIN.—*Nathan Potter.* A good month for feeding stock; roads fine.

OSKALOOSA.—*Jos Boyd.* Month all that could be desired for feeding stock.

PACIFIC JUNCTION.—*H. H. McCartney.* Latter part of month characterized by N. N. W. winds; extremely warm for time of year; were they estray chinook winds?

RIDGEWAY.—*Arthur Betts.*—Coldest December on record at this station; good wheeling all the month; bright lightning on the 19th; 151 hours of sunshine, or 54 per cent; most of the warm waves culminated at night.

WASHTA—*H. L. Felter.* Corn husking about completed by December 10th.

WAUKEE.—*E. J. Leonard.* An excellent month; tempera ture reached zero on only five days; fine roads.

BELATED REPORTS.

CLEAR LAKE—November—Mean temperature 30.5° on the 1st; lowest—2 on the 26th; greatest daily range 29; total precipitation, Trace; greatest in 24 hours, Trace; prevailing direction, northwest; total snowfall, Trace; number of clear days 14, partly cloudy 11, cloudy 5, rainy 0.

OTTUMWA—November—Mean temperature 37.7°; highest 74° on the 1st; lowest 10° on the 26th; greatest daily range 30°; total precipitation .65 inch; greatest in 24 hours .61 inch on the 10th; total snowfall, Trace; prevailing direction, southeast. Number of clear days 5, partly cloudy 16, cloudy 9, rainy 3.

BELLE PLAINE—November—Mean temperature 31.9; highest 54° on the 12th; lowest 2° on the 26th; greatest daily range 27°; total precipitation .39 inch; greatest in 24 hours .18 inch on the 2nd; total snowfall 0.2 inch; prevailing direction, northwest. Number of clear days 12, partly cloudy 12, cloudy 6, rainy 5.

ERRATA IN OCTOBER REVIEW.

BELKNAP—Mean temperature recorded 57.0° on page 8 should have been 57.8°.

CLEAR LAKE—Mean maximum temperature recorded 62.0° on page 9, should have been 61.9°.

LENOX—Mean temperature recorded 51.8° on page 8, should have been 53.2°. Mean maximum temperature recorded 64.9° on page 10, should have been 64.5°.

OGDEN—Total precipitation recorded 1.80 inches on pages 7 and 11, should have been 2.00 inches.

ONAWA—Mean temperature recorded 50.2° on page 7, should have been 55.2°.

ERRATA IN NOVEMBER REVIEW.

AMANA—Mean temperature recorded 33.5° on page 8, should have been 34 5°.

ATLANTIC—Mean temperature recorded 36.2° on page 9, should have been 36.4°.

Mean minimum temperature recorded 27.0° on page 10, should have been 27.3°.

DELAWARE—Mean temperature recorded 31.4° on page 8, should have been 31.5°.

MT. PLEASANT—Mean temperature recorded 34.8° on page 9, should have been 35.8°.

Mean maximum temperature recorded 43.1° on page 11, should have been 45.1°.

WAVERLY—Mean temperature recorded 31.8° on page 8, should have been 32.8°.

Mean maximum temperature recorded 40.9° on page 11, should have been 42 3°.

Mean minimum temperature recorded 31.8° on page 11, should have been 32.8°.

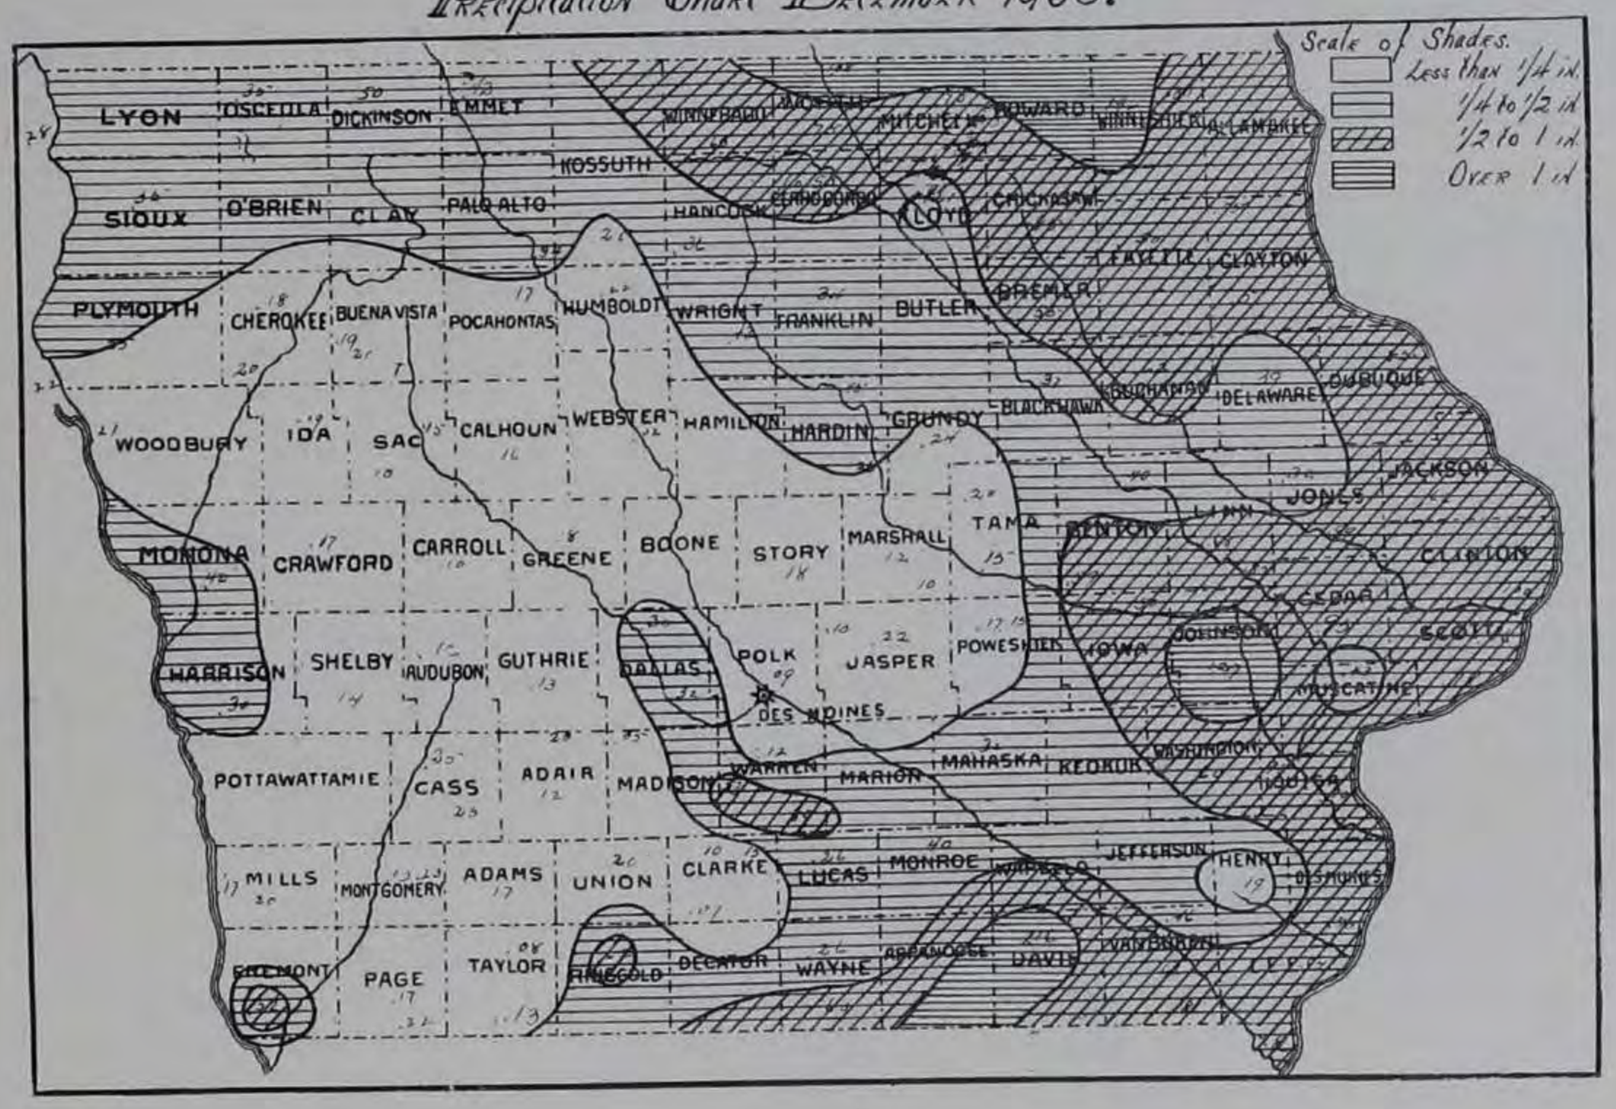
Precipitation Chart December 1903.



APPENDIX--ANNUAL SUMMARY, 1903.

CLIMATOLOGY OF THE YEAR 1903.

BAROMETER—The mean pressure for the year was 30.04 inches. The highest observed pressure was 30.68 inches on February 18th and December 14th at Des Moines; lowest pressure, 29.19 inches, on October 6th at Sioux City. Range for the state 1.49 inches.

TEMPERATURE—The mean temperature for the state was 47.3°, which is 0.3° below normal. The highest temperature reported was 101° on Aug. 24th at Logan. The lowest temperature reported was 27° below zero on December 13th at Sibley. Range for the year 128°.

PRECIPITATION—The average amount of rain and melted snow for the year, as shown by complete records of 95 stations, was 35.66 inches, which is 4.75 inches above the normal, and 8.65 inches below the average amount for 1902. The greatest amount recorded at any station for the year was 50.53 inches at Onawa. Least amount recorded 26.41 inches at Ames. The greatest monthly rainfall was 17.74 inches at Woodburn in August; least monthly amount, a trace at Afton and thirteen other stations in January, November and December; the greatest amount in any consecutive twenty-four hours was 11.22 inches at Cherokee, August 27th. The average number of days on which .01 inch or more of rain fell was 92.

WIND AND WEATHER—The prevailing direction of wind was northwest. Highest velocity reported, seventy-two miles an hour, in Sioux City, from the northwest and southeast on January 6th and May 21st. Average daily wind movement 210 miles. There were 156 clear days, 100 partly cloudy, and 109 cloudy days; as against 145 clear days, 111 cloudy and 109 partly cloudy in 1902.

CLIMATE AND CROP REVIEW.

COMPARATIVE DATA OF THREE ABNORMAL SEASONS, AND SUMMARY OF 1903.

The first three crop seasons of the new century—1901–1902–1903—may be classed as radically abnormal in respect to seasonal rainfall and temperatures, their records serving as striking illustrations of possible climatic extremes of this section. The season of 1901 was notable for extreme heat and aridity of air and earth, breaking all records of daily averages and maximum temperatures in the midsummer period. The droughty conditions continued until about May 1, 1902; then came heavy downpours, with streams bankfull and overflowing, and continued excess of precipitation for a period of about seventeen consecutive months, or until September 15, 1903. For reference and comparison the following table is appended, showing the average precipitation and mean temperatures for the state, for the six crop months—April 1st to September 30th—in the last three years; also the monthly normals for the same period.

PRECIPITATION, INCHES.

Years.	1903	1902	1901	Normal
April	2.98	1.71	1.79	2.89
May	8.55	5.39	2.35	4.13
June	2.86	7.16	3 17	4.50
July	4.83	8.67	2 34	4.23
August	6.64	6.58	1.29	3.43
September	3.81	4.35	4.77	3.30
Total for six months	29.67	33.86	16.25	22.48
Total for the year	35.39	43.82	24.41	31.42

MEAN TEMPERATURES—DEGREES.

April	49.8	48.2	49.9	49.3
May	61.6	63.8	60.7	60.4
June	64.6	65 2	72.3	69.6
July	72.9	73.1	82.4	74.2
August	69.1	69.1	73.8	71.8
September	60.8	59.1	63.3	63.6
Means	63.1	63.0	67.0	64.8

The records of the four critical crop months—May 1st to September 1st—show the marked difference in the rainfall and temperature of 1901 in comparison with the two following seasons. The total amounts for the four months were as follows: In 1901, 9.69 inches; in 1902, 27.80 inches; in 1903, 22.88 inches. The normal for the four months is 16.29 inches. The most favorable showing in these records is the fact that the rainfall in the crop season of 1903 was nearly 5.00 inches less than in the same period in 1902, indicating a return towards normal conditions.

The winter of 1903 was generally about normal and favorable for live stock and the usual farm operations of the season. The soil was very wet, and the ponds and streams were more than usually filled with water and ice. Fall wheat and rye wintered fairly well, though the covering of snow was generally light. March was warmer than usual, with somewhat less than the normal precipitation; but the excessive cloudiness and humidity retarded farm work except in dry, sandy soil. While the spring opened earlier than usual, the fields were too wet to allow an early start in farm work.

April was about normal in temperature and rainfall, but the prevalence of cloudy, misty and humid weather during the larger part of the month retarded the necessary drying of the surface. The usual farm operations were pursued under these adverse conditions, causing material reduction of the acreage of spring wheat, oats and barley. Pastures and meadows made an early start and the grain crops germinated readily, making a fairly good stand. A snowstorm with freezing temperature, at the close of the month, checked crop growth and injured the earlier varieties of apples, cherries and plums.

May was the wettest and most unfavorable month of the season. The soil at the outset was supersaturated, and the average rainfall for the state for the month was 8.55 inches. The distribution of this excessive amount of rainfall was variable, ranging at local stations from 2.88 to 15.45 inches; but the averages of each section was above 8 inches. The best conditions as to dryness of soil were in the Mississippi river districts. The great interior basins of the Des Moines, Iowa and Cedar rivers were subjected to very heavy floods about the close of the month, causing much delay in farming operations and damage to all crops. From about the 3d to the 18th conditions were at their best, and during that part of the month the plowing, planting and other farm operations were in progress on the drier lands, with only occasional interruption by showers. Most of the corn that was planted was put in during that period. The protracted and very heavy storms during the last decade rendered field work impracticable in more than four-fifths of the state. At the close of the month not more than two-thirds of the usual corn area had been planted. The germination was generally quick and satisfactory in the stand, but the fields soon became very foul from the lack of cultivation, and much more than the usual amount of replanting was necessitated as a result of washing and flooding the fields. The general condition of wheat, oats, rye, barley and meadows was better than seemed to be possible during prevalence of the storms.

June was unseasonably cool, but generally dry and more favorable for field work and crops than the preceding month. The mean temperature was about 5° below normal, and the rainfall was 1.52 inches below the average. The surface dried off slowly, and the cool weather was more favorable for small grain than for the rapid germination and growth of the belated corn. Good progress was made in replanting the washed out corn fields and in cultivating the early planted corn on the dry upland. Seasonable temperature about the close of the month caused a marked improvement in the appearance and prospects of this important staple, and in size and color it was much nearer the normal condition than was deemed possible at the outset. Clover-cutting was begun near the middle of the month, and haymaking was quite general at the close, the output being above the average.

July was characterized by frequent and sudden alternations from high to low temperatures. The daily mean for the month was about 2° below normal, the first decade being unusually warm, the second decade unseasonably cool, and the third decade bringing the two extremes of temperature. The average rainfall for the state, 4.83 inches, was .91 of an inch above the July normal. The distribution was very unequal, the average of the northern section being 6.49, the central section 5.28, and the southern section 2.73 inches. The heaviest amounts of rainfall were reported at stations in the N. E. district. The most destructive storm of the month occurred on the afternoon of the 20th, sweeping across the state on a direct line from Lyon and Osceola southward to Adams, Taylor and Ringgold, its pathway varying in width from one to eight miles. At numerous points along this line the storm was accompanied by high winds and very heavy hail, causing almost total loss of growing crops within an area of more than three hundred square miles. In portions of the southern section drouthy conditions prevailed for many days, causing some detriment to growing crops; but the closing week brought generous showers. On the whole the month was favorable to haymaking and harvesting of wheat, oats, barley and rye. The hay crop proved to be one of the best ever produced in the state, and the greater part of it was secured in excellent condition. Wheat and oats were generally harvested in good condition, but on account of the rust and blight the yield has been disappointing, though the quality of the grain will be greatly superior to the output of last year. The corn crop made fairly good progress during the month, though the temperature was somewhat unfavorable about half of the time. The early planted portion of the crop reached the earing stage while the late planted corn was generally small and unpromising. The outlook for the crop as a whole was not encouraging at the close of July.

August was cooler than usual with a large excess of rainfall, humidity and cloudiness. The mean temperature was 3.1° below normal, and the average rainfall, 6.64 inches, was 3.43 inches above normal. The southern section received the larger amount, an average of 8.74 inches, the bulk of it falling in the last week of the month (State Fair week). It was the wettest August of which we have records for the state. There were nineteen cloudy or partly cloudy days. During the fair weather periods considerable progress was made in threshing and other farm operations. Haymaking was continued throughout the month, when the weather permitted, securing a large amount of aftermath, wild hay, and second crop of clover for seed and fodder. More than the usual amount of plowing was done, with generally favorable conditions of soil for this work. Threshing returns indicated generally light and unsatisfactory yield of wheat, oats and barley; the yield of timothy seed has been unusually heavy. The development of the corn crop was all that could be expected under the prevalent weather conditions. At the close of the month the early planted corn, about forty per cent of the whole area, had reached the roasting ear stage, or a little beyond, giving promise of reaching maturity within twenty days, under favorable conditions. The balance of the crop was in various stages of growth, indicating need of very good ripening weather for a full month or more to place the bulk of it beyond danger of harm or frost. The outlook for the crop as a whole was at that time unsatisfactory. The late potato crop made fair growth in dry and sandy soil, but there were reports of damage by rot in many localities. The crop of early and fall apples gave good returns, especially in the northern half of the state; but winter apples were unpromising. Pasturage made a heavy growth, giving assurance of abundant fall feed for stock.

September was cooler than usual, the mean temperature being 3.4° below normal. Frosts occurred at numerous stations on the 16th, 17th, 18th, 24th and 27th, but little damage resulted to corn and other crops, except in limited areas on low ground. The main detriment caused by the cold and frosty period was the delay in bringing belated corn to full maturity. The period of most unfavorable weather and heaviest rainfall was from the 4th to the 16th. In the last half of the month there were about twelve days of ideal weather for maturing crops, harvesting, threshing and plowing. During this time corn made very good progress, and at the close of the month fully eighty per cent of the crop was well matured, the balance requiring two weeks of frostless weather and generally favorable conditions to make it safe. There was but little expectation of bringing all of the belated portion of the crop to maturity, as some of it was green and soft at the close of September. A considerable amount of the early corn was cut and put into shocks after the first appearance of frost. Fall pasturage was never better, and seldom as good at this time of year. Fair progress was made in harvesting the minor crops, and a good deal of second crop hay was secured. Fall plowing was well advanced, much more than the usual acreage having been done with the soil in excellent condition. The potato harvest showed a very light yield, and much damaged by rotting. The fall apple crop was fair, but winter apples were inferior in size and quality. On the whole September was a fairly satisfactory month, though below normal in temperature and sunshine. The adverse features of the month were the natural sequence of the preceeding abnormal spring and summer.

October was an ideal autumn month. The mean temperature was slightly above and the rainfall below the normal, and the percentage of sunshine was higher than usual. The bulk of the rainfall came in the first seven days, and generally with but little disturbance of the elements. No trace of snow was reported during the month. The first general killing frost occurred on the 18th, at which time there was practically very little of value exposed to damage by freezing temperature. The greater portion of the late planted corn was fairly well matured before the middle of the month. Reports were received of very many fields planted as late as June 15th which were well ripened by October 10th. The amount of fall plowing in the state at large was much greater than in recent years. A limited acreage of fall wheat and rye was sown, and the conditions were favorable for germination and growth, insuring a good stand. The fall pasturage was never better, being very green and succulent at the close of October. The dry weather was favorable to harvesting potatoes, apples, and all the late maturing crops. The potato crop was generally light, with considerable damage by rot, though some localities report a fair yield. The yield of winter apples was much below the average. Forage crops and garden truck made excellent yields. As a whole October was a remarkably fine month, making an exceptional record in view of the adverse weather conditions of the preceding months.

November was unusually dry and seasonably warm, with less than the average amount of atmospheric disturbance. Conditions were favorable for farm operations, and excellent prog-

ress was made in cribbing the corn crop. The cobs contained more than the usual amount of moisture, but the dry weather and freezing temperature prevented damage by heating in the cribs. The small acreage of fall wheat and rye suffered no material injury from dry weather and freezing. The weather was highly favorable for stock feeding and pastures afforded good feed throughout the month. The supply of water for stock was ample for the winter.

On the whole the crop season of 1903 was materially better than the preceding season, the quality of the output of the soil being much superior. The forage crops have been exceptionally heavy, and the fall months were favorable for securing the full benefit of the abundant yield of pasturage and fodder. There is much cause for congratulation and thankfulness that, under such unusual conditions, the yield of all staple crops has been sufficient to afford a liberal reward for the labor of the tillers of the soil of this most fertile state.

ERRATA IN 1902 ANNUAL.

CHARLES CITY.—Monthly mean temperature for June recorded 56.8° on page 19, should have been 64.0°. Mean annual temperature recorded 46.6° on pages 15 and 19, should have been 46.4°.

DE SOTO.—Monthly mean temperature for December recorded 22.2° on page 19, should have been 22.5°. Mean annual temperature recorded 22 2° on pages 15 and 19, should have been 22.5°.

GALVA.—Monthly mean temperature for December recorded 15.8° on page 19, should have been omitted.

GUTHRIE CENTER.—Monthly mean temperature for July recorded 73.0° on page 19, should have been 72 4°. Mean annual temperature recorded 48.9° on pages 15 and 19, should have been 46.8°.

MT. AYR.—Monthly mean temperature for December recorded 19.4° on page 19, should have been 21.1°. Mean annual temperature recorded 48.7° on pages 15 and 19, should have been 48.8°.

MT. VERNON.—Monthly mean temperature for July recorded 74.0° on page 10, should have been 73.9°.

SHELDON.—Monthly mean temperature for November recorded 36.8° on page 19, should have been 37.°0. Mean annual temperature recorded 45.4° on pages 15 and 19, should have been 45.5°.

GILMAN.—Monthly precipitation for February recorded .87 inches, on page 21, should have been .89 inches. Annual precipitation recorded 42.00 inches on pages 15 and 21, should have been 42.02 inches.

LACONA.—Annual precipitation recorded 54.17 inches on pages 15 and 21, should have been 53.97 inches.

LE CLAIRE.—Annual precipitation recorded 46.86 inches on pages 15 and 21, should have been 45.86 inches.

RED OAK.—Monthly precip'tation for December recorded 2.32 inches on page 21, should have been 2 52 inches. Annual precipitation recorded 47.36 inches on pages 15 and 21, should have been 47.56 inches

SAC CITY.—Monthly precipitation for October recorded 1.56 inches on page 21, should have been 1.16 inches. Annual precipitation recorded 42 77 inches on pages 15 and 21, should have been 42.37 inches.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. McDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve
Algona	Dr. F. T. Seeley

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. JANUARY 1904 No. 1.

WEATHER AND CROPS—JANUARY, 1904.

The month was colder than usual, with some excess of precipitation. The mean temperature for the State, 14 degrees, was 4.2 degrees below normal, and the average precipitation, 1.18 inches, was 0.21 of an inch above normal. During the first and second decades the temperature was seasonable, and the general weather conditions were very favorable for feeding stock and the usual farm operations of the winter season. The last decade brought wide-spread storms of snow, rain, sleet and ice, followed by extremely low temperature which continued through the balance of the month. The heavy coating of ice damaged fruit trees, vines, timber, telegraph and telephone wires and poles; also caused much suffering to farm animals, and great inconvenience to stock feeders. It was one of the worst storms of sleet and ice ever experienced in this State. The extent of damage to fruit cannot as yet be determined. Fall grain and the grasses were undoubtedly somewhat damaged by ice and extreme cold, but the covering of snow beneath the ice afforded some measure of protection.

EDITORIAL NOTES.

Farmers are being warned to test their seed oats very carefully before seeding this season. The average oats crop in this State last season was much below the standard in weight, and reports of numerous experiments indicate that the grain is generally very deficient in germinating power. Careful tests should be made at once; and no seed should be sown that is below the standard in weight and fertility.

The Cincinnati *Price Current* recently compiled from reports of the U. S. Department of Agriculture a table showing the production of corn in the United States, by states, for the past seven years. This table shows Iowa in the lead in corn production, with a margin of about 2,000,000 bushels better than the next best corn state, which is Illinois. Returns for the past ten years show a larger excess credited to Iowa.

In Great Britain, 1902 was the wettest twelve months for more than half a century. In London rain fell on 205 days, against an average of 166 days for previous years.

The United States now stands at the head of the list of exporting nations. For the calendar year 1903 the exports of domestic products from this country amounted to $1,457,565,783, exceeding the output from the United Kingdom by about $32,000,000. This foremost rank as an exporting nation has been attained within the last six years, and the products of agriculture have been the means whereby it has been achieved.

Efforts are being made to develop sugar beet production in Woodbury county the coming season. A local company will pay $4.50 per ton for the beets at the factory. The soil and climate of that section are well adapted to the industry.

The palace of agriculture at the St. Louis world's fair is double the size of the agricultural building at the Chicago exposition in 1893 It covers an area of eighteen acres, and it will be none too large for the display of farm products of this country.

A Maine paper mill is making from Illinois cornstalks a quality of paper that sells as high as eight cents a pound. That s heme seems likely to conserve the timber that is being consumed so rapidly in the pulp mills.

SEASONAL FORECASTS FOR A YEAR.

In his annual report for 1903, the Chief of the Weather Bureau, Prof. Willis L. Moore, briefly discusses the difficulties involved in the problem of seasonal forecasts for a year. We copy the following extract from this excellent report: It is a very difficult piece of science that is involved in the attempt to place the forecasts of the seasons for a year in advance upon a reliable basis, because it will be necessary to take account of several interrelated processes in nature, which depend upon the circulation of the atmosphere of the sun and of the earth. The science of meteorology is not to be confined to the atmosphere of the earth; because the changes in the action of the atmosphere of the sun precede the variations in the earth's air, which finally culminate in a certain type of season. Thus, wet and dry seasons, warm and cold summers and winters, and all the other climatic differences first depend upon the persistence of special high and low areas of pressure in one locality or another; these go back to the circulation of the great currents in the atmosphere, which seem to surge back and forth from one side of the earth to the other, or from the oceans to the continents; finally, these currents are probably due to the solar radiation, which itself changes with the output of energy from the interior of the sun. Thus, meteorology is really a very closely allied but difficult branch of solar physics, and it ought to be studied with the aid of a fully equipped observatory devoted especially to such researches. On the sun we count up the number of hydrogen flames or prominences seen on the edge of the disc from day to day, and, from a discussion of the thirty years' record in hand, they are known to vary strongly from year to year. Similarly, the faculæ and spots have their fluctuations in synchronous cycles, and these have been studied for

many years. Furthermore, the sun emits energy in the form of radiant light and invisible heat, and by means of suitable spectrum observations the variable amount of this light, and especially the invisible heat, can be registered from day to day and from year to year. The result of these records is to indicate that the sun is in fact a great, variable star, and that terrestrial weather changes in close synchronism with it. There is yet another register of the energy emitted by the sun to be found in the variations of the earth's electrical and magnetic fields, which is perhaps the most sensitive of all, and certainly the most accessible to our measures. The newly discovered action of ions in the atmospheres of the sun and the earth, respectively, which are now believed to be the basis of the electrical and magnetic manifestations, is affording much information upon this obscure subject, and it is full of promise in practical investigations. Langley has announced that the invisible radiant heat energy, as measured in his bolographs, varies from season to season and from year to year. The passage of an eclipse shadow through the atmosphere changes the atmospheric magnetism and electricity in the same way that day and night modify them—by cutting out the sun's rays. In short, the entire field of cosmical processes forms a complex problem which especially concerns the meteorologist, and by him should be studied out for the benefit of mankind, whose life and happiness depend so largely upon the weather. The Weather Bureau is so far convinced of the importance of finding out the laws of this cosmical physics, by which alone the problem can be conclusively solved, that it has been thought proper to found a research observatory at Mount Weather, on the crest of the Blue Ridge Mountains, about six miles from Bluemont, Va., and equip it suitably for these investigations. Professor Bigelow has recently been placed in charge of supervising the plans for its construction and development upon the best modern principles. It is evident that such an institution, having its beginning in the early years of the twentieth century, will have an increased usefulness as the years go by, if it is organized according to the demands of the best science. It will require fine instruments and able students if it is to command the respect of the scientific world. * * * * * *

Specifically, the plan in mind contemplates the development of an observatory as indicated in the following statement:

(1) An observatory building is in process of erection at Mount Weather, which is well adapted as a school of instruction and for making observations of the ordinary kind with the common meteorological instruments, barometers, thermometers, wind and rain gauges, nephoscopes, theodolites, and actinometers. The first floor is for administration, the second for living quarters, the third for laboratories, and the roof for observing.

(2) Plans are being prepared for a plant adapted to generate large quantities of hydrogen, for balloon ascensions, including a shop for the construction of balloons and kites. The ascensions will be limited to about four miles in height, our immediate purpose being to measure the temperatures and thermal gradients, which will e able us to construct daily isothermal charts on the two upper planes already described, so as to provide isotherms as well as isobars on the high levels. It is proposed to make a complete series of ascensions first at Mount Weather, and afterwards in different portions of the United States, in order to observe the temperature conditions in all classes of cyclones and anticyclones. We may attempt some high ascensions, up to ten or twelve miles from the ground, when our experience and other conditions warrant, but, since storm movements are practically limited to the strata within four miles of the ground, the first group of ascensions will be to moderate elevations.

(3) It seems important to install a high-grade bolometer for measuring the invisible solar radiation, which is thought by some students to be largely responsible for the actual temperature of the upper atmosphere. Also, a first-class spectro-heliograph is required for keeping a record of the solar prominences, faculæ, and spots prevailing at the time of making our weather forecasts. These two instruments are the essentials of an efficient solar physics observatory, and would require the services of an able student of physics to bring out the best results and discuss them efficiently in suitable reports.

THE MOON AND THE WEATHER.

Meteorologists in Russia have recently been annoyed by the systematic issue of long range weather forecasts by a civil engineer named Demtschinsky. The man has a periodical of his own for the promulgation of his theories, the most important of which is that the moon exercises a considerable influence upon temperature changes, air pressure and rainfall. His predictions appear in that publication and also in a number of newspapers. Though Demtschinsky may be honest in his beliefs, he does not appear to be averse to notoriety. He has allowed a rumor to go uncontradicted that there is a prospect of his being put in charge of the United States Weather Bureau at Washington! One effect of these predictions and stories is to puzzle volunteer observers for the established meteorological service and to paralyze their enthusiasm. In other ways, also, no doubt, the cause of science is hurt by Demtschinsky's utterances.

Professor Klossovsky, of the University of Odessa, has thus been impelled to undertake an elaborate review of the forecasts in question and the principles on which they are founded. He undermines the system itself at a number of points, and finally shows that only about 50 per cent of the predictions are verified. In other words, there is no more certainty of their fulfillment than about the result of tossing up a coin. Demtschinsky is virtually playing a game of "heads and tails." Of course, when the chances are even that he may be right or wrong, his assurances are valueless. Under the auspices of the American government the rate of verification is fully four out of five, or over 80 per cent. Professor Klossovsky has done valuable service in thus exposing the worthlessness of Demtschinsky's work. Not the least commendable feature of his review is a challenge with which it ends. The pseudo meteorologist is invited to consent to a plan whereby his system and his predictions shall be considered by a commission of experts. If he declines, his hesitation will be a significant confession of lack of confidence in his own divinations.

The truth is, Demtschinsky is far behind the times. In Europe and America the idea that the moon controls the weather has been suggested repeatedly during the last twenty or thirty years. The possibility has been investigated by numerous meteorologists of good reputation, and has been practically discarded. If the Russian engineer who has recently entertained the theory had read the books of Sprung, Van Bebber and Hann, he would have had his eyes open to his mistake. Several excuses for a short-lived faith in the hypothesis can be found, but it will not stand the test of application to all countries alike and for all periods of time. The matter has probably never been summed up more accurately than by Professor William C. Davis, of Harvard University. He says in his "Elementary Meteorology" that whatever slight excess of one weather element or another there may be at certain times of the lunation, it has no sufficient value for prediction. In his judgment, forecasts based upon the influence of the moon or planets "are no better than the forgotten predictions of astrology." Long range forecasts of practical value are likely to come before many years, but the moon does not promise any help in formulating them.

A discussion of this kind raises the question, What constitutes a trustworthy authority in science? Official position and university degrees count for something, but they are not vital. Neither does a fondness for studying natural phenomena--weather, disease, the movements of the stars or the habits of insects—make a man a true scientist. Education is important, careful and prolonged observation is needful, but the one great essential is the right method of testing theories which suggest themselves to fertile minds. The process calls for the exercise of a logical faculty possessed by comparatively few. No matter how distinguished the original discoverer of a new fact or the author of a new theory—be he Faraday, Pasteur, Schiaparelli or Ramsay—science demands independent corroboration before accepting the alleged revelation. It will approve no so-called law of nature that does not yield in the hands of others, properly trained, the same results as its earliest advocates announce. If the doctrine that the moon seriously influences the weather will not stand this test, it may be guesswork or superstition, but it is not science.—*New York Tribune.*

A FIVE-YEAR CENSUS PERIOD.

The decennial census, based as it is in the United States on constitutional requirement, is so firmly established that it will probably seem to many people at first glance like a great innovation to suggest that census statistics be collected, even in a limited way, every five years. Senator Hopkins' bill providing for an agricultural census every five years will therefore be apt to meet with much discussion. The proposal seems, nevertheless, an excellent one, and the work could probably be done under the newly created permanent census bureau with an expenditure small in comparison with that which such work has required in the past.

In some of the European countries, notably Germany and France, a complete enumeration of the population is had every five years. These countries feel, no doubt, greater need of accurate knowledge as to their growth, or possibly decline, in numbers, than we do in this country.

Though several of the European countries are much more accurate in their statistics of many social phenomena than we are, the United States holds a recognized position at the forefront for commercial and industrial statistics. An Englishman who recently published a book on American industry spoke, for example, of the great advantages Americans derive from their statistics "in competition with nations like our own (England), whose commercial statistics are half a century or more out of date." As our best farming lands fill up with settlers, and as closer figuring on our crops with reference to our position in the world's grain markets becomes necessary, the value of full agricultural statistics will increase.—*Chicago Record Herald.*

CLIMATOLOGY OF THE MONTH, JANUARY, 1904.

BAROMETER.—Mean temperature, 30.12 inches; highest observed, 30.66 inches, at Sioux City, on the 25th; lowest observed, 29.59 inches, at Davenport and Dubuque on the 7th and 22nd; range for state, 1.07 inches.

TEMPERATURE.—The monthly mean temperature for the State, as shown by records of 111 stations, was 14.0°, which is 4.2° below the normal. By sections the mean temperatures were as follows: Northern section, 10.1°; Central section, 14.1°; Southern section, 17.8°. The highest monthly mean was 21.6° at Red Oak; lowest monthly mean, 6.6° at Charles City. The highest temperature reported was 57°, at Red Oak, on the 19th; lowest temperature reported, 32° below, at Elkader and Fayette, on the 27th. The average monthly maximum was 45.4°; average monthly minimum, 23.2°. Greatest daily range, 49°, at Atlantic and Villisca; average of greatest daily ranges, 34.2°.

PRECIPITATION.—Average precipitation for the State, as shown by records of 122 stations, was 1.18 inches, which is 0.21 of an inch above the normal. The averages by sections were as follows: Northern section, 0.49 of an inch; Central section, 1.06 inches; Southern section, 2.00 inches. The largest amount reported was 3.68 inches, at Lacona; least amount reported, .02 of an inch, at Storm Lake. The greatest daily rainfall reported was 2.45 inches, at Belle Plaine, on the 20th. Average number of days on which .01 of an inch or more was reported, 6.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 50 miles per hour, from the southeast, at Sioux City, on the 18th. Average number of clear days, 12; partly cloudy, 8; cloudy, 11.

OBSERVERS' NOTES.

AFTON.—*N. W. Rowell.* The 25th and 29th, 18° below zero the coldest in ten years by one degree. Sleet that fell on 20th remained till after Feb. 1. Effect on fruit will be seen later.

ALLERTON.—*Rex Shriver.* Sleet on 20th damaged fruit and shade trees; remained over two weeks.

ALTA.—*David E. Hadden.* Intensely cold last decade of the month. Fine solar halo with brilliant parhelia and upper contact arch all forenoon of the 23rd.

AUDUBON.—*Geo. E. Kellogg.* Coldest day of the season was the 24th; temperature did not rise above 14° during the day.

BEDFORD.—*E. E. Healy.* Heavy sleet on the night of 20th did much damage to trees.

BELKNAP.—*A. W. Rankin.* Sleet storm on 20th caused much damage to trees and shrubbery.

BONAPARTE.—*B. R. Vale.* Cold at each extreme, but mostly a pleasant month. The rain on 20th did not freeze much.

BRITT.—*Geo. P. Hardwick.* Coldest January in eight years; about average snowfall.

CHARITON.—*C. C. Burr.* Sleet did great damage to trees and telegraph lines; some telephone plants destroyed.

CLARINDA.—*A. Van Sandt.* Sleet on 19th and 20th did some damage to trees.

CLINTON.—*Luke Roberts.* Mean temperature 3.8° below normal. Snowfall 7 inches, with 4 inches to commence on: Sleigh could be used every day in the month. There have been nine colder Januaries in the last 26 years. Nine days with temperature below zero.

CORYDON.—*Mrs. Clara Miller.* Ice formed on trees half to three-fourths inch thick, causing damage to fruit and shade trees.

GRAND MEADOW.—*F. L. Williams.* Last nine days of the month were bitter cold; roads good and stock doing well.

HOPEVILLE —*M. L. Ashley.* The sleet storm of the 20th was very bad, and difficult to estimate as to amount of precipitation.

HUMBOLDT.—*H. S. Wells.* Coldest January in ten years.

INDIANOLA.—*John L Silton.* Storm on 20th left a sheet of ice 1.3 inches, coating trees and vines with heavy layer, remaining firmly till end of month.

JEFFERSON.—*Isaac Young.* Grey circle tinged with crimson around the moon on night of 27th.

LEON.—*Millard F. Stookey.* Thunder and lightning on 20th; fruit and shade trees much damaged by sleet.

MT. AYR.—*A. F Beard.* Sleet on 20th caused much injury to trees, telephone wires and poles.

MT. VERNON —*Jos. W. Hubbard.* The ice on 20th caused much damage to trees and great peril to pedestrians.

RIDGEWAY.—*Arthur Betts.* Coldest January on record here, but a pleasant month; 61 per cent of sunshine.

VILLISCA.—*C. E. Matteson.* A fair and pleasant month up to 23rd; hail, snow and sleet the last week injured the peach crop.

WAUKEE.—*E. J. Leonard.* Month favorable till 20th; sleet and ice with zero weather balance of month.

WILTON.—*J. M. Rider.* Very heavy sleet on 20th, covering trees and wires with ice and icicles, making a beautiful scene; sleet remained until end of month.

ERRATA IN DECEMBER REVIEW.

ATLANTIC.—Mean temperature recorded 11.2° on page 8, should have been 11.3°.

BELKNAP.—Maximum temperature recorded 50° on the 31st, page 7, should have been 55° on the 2nd.

BELLE PLAINE.—Mean maximum temperature recorded 25.4° on page 8, should have been 25.5°. Mean temperature recorded 16.4° on page 6, should have been 16.5°.

CHARITON.—Mean temperature recorded 22.4° on page 7, should have been 22.3°.

CHARLES CITY.—Maximum temperature reported on the 7th, page 6, should have been the 6th.

COLLEGE SPRINGS.—Mean temperature recorded 25.0° on page 7, should have been 25.6°. Mean maximum temperature recorded 35.2° on page 8, should have been 36.5°.

COLUMBUS JUNCTION.—Mean temperature recorded 21.5° on page 7, should have been 21.6°.

CORNING.—Mean temperature recorded 23.2° on page 7, should have been 23.4°. Mean minimum temperature recorded 11.7° on page 8, should have been 12.1°.

EARLHAM.—Mean temperature recorded 21.5° on page 7, should have been 21.2°.

FOREST CITY.—Mean temperature recorded 13.8° on page 6, should have been 13.9°. Mean maximum temperature recorded 24.2° on page 8, should have been 24 3°. Maximum temperature recorded on the 7th, page 6, should have been the 6th.

GALVA.—Mean temperature recorded 19.0° on page 6, should have been 19.1°. Mean minimum temperature recorded 7.9° on page 8, should have been 8.2°.

GRINNELL [Near].—Mean temperature recorded 19.6° on page 6, should have been 19.1°.

HANLONTOWN.—Total snowfall recorded 3.2 inches on page 6, should have been 3.5 inches.

IOWA CITY.—Maximum temperature recorded on the 7th, page 6, should have been the 6th. Maximum temperature recorded 30° on page 8, on the 29th, should be 20°.

IOWA FALLS.—Maximum temperature recorded on the 7th, page 6, should have been the 6th.

MONTICELLO.—Total snowfall recorded 8 5 inches on page 6, should have been 9.5 inches.

OLIN.—Total precipitation recorded .99 inch on pages 6 and 10, should have been 1 09 inches. Total snowfall recorded 4.5 inches on page 6, should have been 8 0 inches.

ONAWA.—Mean temperature recorded 26.4° on page 6, should have been 24.0°. Mean minimum temperature recorded 18.2° on page 9, should have been 13.3°.

OSKALOOSA.—Mean temperature recorded 20.2° on page 7, should have been 19.0°. Mean minimum temperature recorded 10.0° on page 9, should have been 9.5°. Daily precipitation recorded .18 inch on the 11th, page 10, should have been .20 inch. Total precipitation recorded .32 inch on pages 7 and 10, should have been .34 inch.

PRIMGHAR.—Mean temperature recorded 16.7° on page 6. should have been 17.0°. Mean maximum temperature recorded 29.1° on page 9, should have been 29.8°.

RIDGEWAY.—Mean temperature recorded 16.3° on page 6, should have been 16.2°.

WATERLOO.—Maximum temperature recerded on the 7th and 24th, page 6, should have been 6th and 23d.

WHITTEN.—Mean temperature recorded 17.4° on page 6, should have been 17.8°. Mean minimum temperature recorded 6.8° on page 9, should have been 5.7°. Minimum temperature recorded 19° on the 25th, page 9, should have been 19°.

U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. FEBRUARY 1904. No. 2.

NOTES AND COMMENTS.

Iowa leads the states in the production of eggs, the yearly product being 100,000,000 dozen. Ohio comes next with 91,000,000 dozen; Illinois is third with 86,000,000 dozen, and Missouri fourth, with 85,000,000 dozen. The value of the combined poultry and egg product would be nearly double that of the precious metals.

It has been suggested that the recent bulge in the price of wheat is likely to cause an increase in the acreage of spring wheat in Iowa and other parts of the northwest. Unquestionably the time is favorable for expansion in the production of that cereal in sections of this state best adapted to its growth, but it is wise to exercise due caution in this matter. The crop should be seeded early as possible and more than the usual amount of care should be taken this season in procuring seed. Spring wheat is an uncertain crop in this section, at the best.

The coming farmer in the corn belt will demand his silo as much as he will his barn. Recent experiments show that silage is a very superior ration for the fattening steer as well as being almost indispensable as a ration for the dairy cow. The fact is that corn put in the silo and fed is worth so much more and will go so much further than corn fed the old way that its use will become almost imperative—*J. S. Trigg.*

The moon and the weather
May change together;
But the change of the moon
Does not change the weather.
If we'd no moon at all,
And that may seem strange,
We still should have weather
That's subject to change.

From "Notes and Queries."

Milton T. Ashley, voluntary observer at Hopeville, Clarke county, writes as follows: "I have made several tests of home-grown seed corn, and find none fit for use. The best samples showed only 67 per cent germination. Some corn shipped into the county and advertised for seed I tested. Two samples showed one good and the other worse than bad. I fear that too many of our farmers will trust to old time methods of selection of seed and be bitterly disappointed. This trouble is probably not local, but quite general, and the farmers need good counsel as to where and how to procure good seed."

From many sources we hear similar complaints as to the germinating quality of seed corn. No time should be lost in making preparations for the planting season, which is close at hand.

In this latitude February 2d—Candlemas Day in the church calendar, and "ground hog day" in old folk lore—is usually about the middle of the period of severest winter weather. This is the basis of the old proverbs

"At Candlemas Day another winter is on its way."
"Candlemas Day! Candlemas Day!
Half our fuel, half our hay."

On an average we have about six weeks of winter temperature after the 2d of February. South of this state, however, the rule would not hold good.

The coldest region on earth inhabited by man is in northeast Siberia, above the Arctic Circle, where the temperature sometimes falls to 90° below zero. The hottest region is in the great Sahara Desert of Africa. The wettest spot on earth, according to Davis, is at Cherrapunji, at an elevation of 4,435 feet on the southern slope of the Himalaya Mountains, north of the Bay of Bengal, India. The average annual rainfall is 474 inches, of which over 400 inches fall in the five months from May 1st to October 1st.

IN MARCH.

To the north the sun returning
Clears the dimness from the blue,
Paints the white out of the landscape,
Gilds the willow boughs anew.

Wintry storms may still blow fiercely,
There are balmy hours between,
When the breezes dance and whisper,
"This will make the wheat fields green."

Longer days and shorter shadows,
Less of gloom and more of cheer,
There's a hint that's half a promise,
That the spring will soon be here.

—*Lizzie Ferris, in the Inter-Ocean.*

EVAPORATION BY WIND.

It is a well-known physical principle, in use in a number of ways, that evaporation takes place more rapidly from a moist surface when the air above that surface is in more or less rapid motion. This holds good when the moist surface is that of the cultivated field and the wind blows over it. Prof. T. Russell, Jr., obtained the following results from experiments designed to show relative rate of evaporation as affected by rate of wind motion. Compared with the evaporation from a water surface when covered by still air, the evaporation from the same surface when the wind showed different velocities was as follows: Wind 5 miles per hour, evaporation 2.2 times. Wind 10 miles per hour, evaporation 3.8 times. Wind 15 miles per hour, evaporation 4.9 times. Wind 20 miles per hour, evaporation 5.7 times. Wind 25 miles per hour, evaporation 6.1 times. Wind 30 miles per hour, evaporation 6.3 times. These experiments were made when the temperature of the air was 84 degrees F. and the humidity was 50 per cent.—*Murray's Price Current.*

TEST THE SEED CORN.

Seed corn should never be planted until it has been tested to determine what per cent will germinate. While this is always advisable, perhaps it is more necessary this year than common for the reason that corn was slow in drying out last fall and extremely cold weather came unusally early.

Examination of a good many samples of corn in different parts of the State, and of some lots of seed corn purchased in the west, leads the Ohio Experiment Station to believe that there will be considerable more trouble than usual this year in getting a satisfactory stand. The safe thing to do is to test the seed early and have plenty of time to look elsewhere for seed of greater vitality, if occasion demands.

The station has recently tested eight different lots of corn including five varieties. Three of these tests were made with the same variety of corn, the selected seed of which had been carried through the winter in different ways, viz: In a large crib of corn six feet wide; overhead in crib spread out in a thin layer on the floor; in a room where the temperature was from sixty to seventy-two degrees.

Of the crib corn (selected ears) only sixty kernels out of a hundred germinated; of a similar corn kept overhead in crib, eighty-one kernels germinated; of that subjected to artificial heat, ninety-five out of the hundred germinated. This for corn which seemed quite mature at husking time.

Of the other corn tested, choice ears sent to the station in the pink of condition (supposedly so until the kernels were examined) showed as low as eighty per cent germinated.

It is quite probable that the low temperature of the early winter, coming while kernels and cob yet contained much moisture, is responsible for this state of affairs.

A convenient way to test corn is between sheets of moist paper or cloth, placed in a box of suitable size. Several lots may be tested at once and examined much more easily and quickly than when planted in sand. Simply keep the paper moist and where the temperature does not fall below 55 degrees. It should all germinate in from four to eight days, depending upon the sort of corn weather furnished.

Handled in this way it is possible to examine it daily and note the progress of germination.

There are different degrees of vitality in corn that will germinate. Many of the weak, spindling stalks which produce a small nubbin, or nothing at all, spring from seed of barely enough vitality to get the plant above the ground. Seed that will grow fairly well when conditions are favorable at seeding time will rot if cold, damp weather happens to prevail.

If possible use only such seed as has large, bright looking germs. Wrinkled and dull-colored germs have likely been injured by freezing. Plumpness at the tip is an evidence of vitality. Thin, shrunken kernels having sharp pointed tips should be rejected, as well as those having an excess of soft, white starch at either crown or tip.

The Station hopes that its suggestions given last fall have been followed by the corn growers of the state and that all have supplied themselves with the best seed corn obtainable and have taken good care of it. Choice seed corn is worth much more than anyone thinks of asking for it. Poor seed should be classed with the luxuries (?) which no corn farmer can afford.—*Ohio Experiment Station; C. G. Williams, Agriculturist.*

SEASONABLE WEATHER PROVERBS.

The following lines and couplets are copied from "Weather Folk Lore," recently published by the U. S. Weather Bureau. Pick out the proverbs that suit you best. They are all good—when they are verified.

The month that comes in good will go out bad.
A favorable January brings us a good year.
January warm, the Lord have mercy!
If grass grows in January, it grows the worse for it all the year.
Always expect a thaw in January.
If there is no snow before January, there will be the more in March and April.
A warm January, a cold May.
There is always one fine week in February.

If February gives much snow,
A fine summer it doth foreshow.

February rain is only good to fill ditches.
Thunder in February or March, poor sugar (maple) year.
Winds in March and rains in April promise great blessings in May.
As it rains in March, so it rains in June.
A dry and cold March never begs its bread.
March flowers make no summer bowers.
March comes in like a lamb and goes out like a lion.
March comes in like a lion, goes out like a lamb.
March in January, January in March, I fear.
March damp and warm will do the farmer much harm.
When March has April weather, April will have March weather.
March winds and April showers bring forth May flowers.
A cold April the barn will fill.
Moist April, clear June.
'Till April's dead, change not a thread (of clothing).
Dry May brings nothing
May damp and cool fills the barns and wine vats.
A hot May brings a fat churchyard.
A dry May is followed by a wet June.
Wet May, dry June.
Calm weather in June sets corn in tune.
A late spring, a great blessing.
Better late spring and bear, than early blossom and blast.
A late spring never deceives.
If the spring is cold and wet, then the autumn will be cold and dry.
A dry spring, rainy summer.
Early thunder, early spring.
Who doffs his coat on a winter's day will gladly put it on in May.

WEATHER AND CROPS—FEBRUARY, 1904.

February was unseasonably cold and dry. The mean temperature for the State was 14.8°, which is 4.8° below the normal. There has been but one colder February within the past fifteen years, and that was in 1899, when the mean for the State was 12.2°. February, 1900, scored the same temperature record as the past month. The average precipitation was .41 of an inch, which is .63 of an inch below normal. There was less than the usual amount of wintry storms of sufficient force to interfere with farm operations, travel and transportation. The roads were generally in fine order, and conditions were favorable for feeding stock. The temperature at the close of the month was quite moderate and spring-like, and the first appearance of migratory birds and fowls was noted in many localities. The limited area of fall wheat and rye was generally without covering of snow during the period of lowest temperature, and these crops undoubtedly suffered some damage. The damage to fruit is as yet undetermined.

CLIMATOLOGY OF THE MONTH.

BAROMETER—Mean pressure, 30.21 inches; highest observed, 30.85 inches, at Sioux City, on the 10th; lowest observed, 29.37 inches, at Davenport, on the 6th; range for State, 1.48 inches.

TEMPERATURE—The monthly mean temperature for the State, as shown by records of 107 stations, was 14.8 degrees, which is 4.8° below normal. By sections the mean temperatures were as follows: Northern section, 10.7°; central section, 15.0°; southern section, 18.8°. The highest monthly mean was 21.6° at Keokuk; lowest monthly mean, 7.2° at Estherville.

The highest temperature reported was 70°, at Keosauqua, on the 6th; lowest temperature reported, 26° at Fayette, on the 1st. The average monthly maximum was 51.3°; average monthly minimum, 14.4° below zero. Greatest daily range, 60.0° at Denison; average of greatest daily ranges, 41.0°.

PRECIPITATION—Average precipitation for the State, as shown by records of 118 stations, was 0.41 of an inch, which is 0.63 of an inch below normal. The averages by sections were as follows: Northern section, 0 63 inch; central section, 0 35 inch; southern section, 0.25 inch. The largest amount reported was 1.99 inches at Ridgeway; least amount reported, trace at Osceola and Thurman. The greatest daily rainfall reported was 0.84 of an inch at Ridgeway, on the 17th and 18th. Average number of days on which .01 of an inch or more was reported, 4.

WIND AND WEATHER—Prevailing direction of the wind, northwest; highest velocity reported, 61 miles per hour, from the northwest, at Sioux City, on the 2d. Average number of clear days, 10; partly cloudy, 9; cloudy, 10.

OBSERVERS' NOTES.

AFTON—*N. W. Rowell.* First robins appeared February 29th.

ALTA—*David E. Hadden.* Month cold and mostly cloudy; mean temperature, 5.2° below normal of past fourteen years.

AMANA—*C. Schadt.* Month cold, northwest wind prevailing. But little snow on ground and frost penetrated the ground, causing freezing in pipes several feet in depth. Ice formed on trees January 19th; did not melt until February 5th. Thunderstorm on 6th.

ATLANTIC—*J. W. Love.* A pleasant winter month and roads in good condition; lightning in southwest on morning of 29th, at 4 o'clock.

AUDUBON—*Geo. E. Kellogg.* On 29th observed wild geese flying northward.

BELKNAP—*A. W. Rankin.* Only half an inch of precipitation in February, and ground frozen two to four feet.

BONAPARTE—*B. R. Vale.* Uniformly solid month. Good roads, and conditions good for feeding stock. Thawing at close of month.

BRITT—No severe storms, and but little snow; roads fine and live stock wintering well.

CLINTON—*Luke Roberts.* Mean temperature 16.1°, or 5.9° below normal; rainfall, .95 of an inch, or 1.05 below normal. Wind, 5,000 miles; cloudiness, 60 per cent; first decade cold.

GRAND MEADOW—*F. L. Williams.* Mercury below zero fifteen days; dry and roads good most of month.

HANLONTOWN—*Miss G. M. Paschen.* Only a few drifts of snow remained at close of month.

HOPEVILLE—*M. L. Ashley.* Ducks flying northward on 29th; bluebirds here; but little of the frost thawed.

HUMBOLDT—*H. S. Wells.* No blizzards; month 2 degrees warmer than January.

IDA GROVE—*J. E. Conn.* Month very cold; the mean temperature, 13.7°.

LOGAN—*Mrs. M. B. Stern.* Month cold, with but little snow and no bad storms; fine winter weather.

OLIN—*Nathan Potter.* Good sleighing first half of the month.

RIDGEWAY—*Arthur Betts.* The month gave 170 hours of sunshine; rain on four dates; good month for the farmer; sleighing generally good. December, January and February gave thirty-five days below zero temperature, and twenty-five thawing days. January was the coldest month; mean for the winter, 13.5°.

TOLEDO—*H. P. Giger.* A curious thaw occurred on night of 22d-23d. The temperature at 7 P.M. of 22d was 29° and at 7 A.M. on 23d it was 25°. The maximum thermometer showed a rise of 11° and the minimum a fall of 15° during the night.

VILLISCA—*C. E. Matteson.* A dry and cold winter month; stock doing well; roads fine.

WASHTA—*H. L. Felter.* But little snow in patches at end of the month; zero or below on fourteen mornings; no bad storms.

CLIMATOLOGICAL DATA FOR FEBRUARY, 1904.

CONTENTS.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. MARCH 1904. No. 3.

NOTES AND COMMENTS.

During the eighteen months ended June 30, 1903, the amount of rainfall at the government laboratory in Georgetown, British Guiana, was 98.90 inches. The record includes not only the measurements of rainfall, but also the contents of chlorine and of nitrogen in the form of ammonia and nitric acid. The amount of chlorine was 244 pounds, equal to 402 pounds of common salt per acre, and 4.67 pounds of combined nitrogen.

The severe cold has no terrors for insect life. It has been shown by experiment that insects may be artificially or naturally frozen—subjected, indeed, to very low temperatures—without killing or even injuring them. Eggs, larvæ and pupæ, the stages in which most insects pass the winter, are perfectly immune to cold. One of the commonest evidences of this hibernation is to be seen when firewood is carried into the house and placed near the warm stove. It takes only a short time to bring out a swarm of ants that were sleeping in beetle borings, their common retreat.—*St. Nicholas.*

Many reports of correspondents from Illinois, Iowa and the Northwest indicate that the amount of plowing done last fall was much more than usual. An article in *Orange Judd Farmer*, describing Brookmont Farm, of 7,000 acres, in western Iowa says: Fall plowing is preferred for corn and all the land that can be prepared in the fall is plowed then. Fall-plowed ground becomes sufficiently warm for planting corn a week to ten days earlier than spring-plowed land. This means two weeks earlier maturing in the fall, an important difference in seasons of early frost. It requires a smaller number of teams to raise corn when the land is plowed in the fall, because then the hardest work of preparing the ground is not crowded into a few weeks in the spring. In a wet spring it is difficult to plow a large acre for corn without having to plow some of the land when too wet. In the thirty-one years that corn has been raised on Brookmont Farm it has been found that corn on fall plowed land has suffered less from the drought than that on land plowed in the spring. The past year (1903) corn has been planted in Brookmont Farm as follows: On fall plowing, 1,300 acres; on spring plowing, 2,560; listed, 140 acres; total, 4 000 acres.—*Murray's Price Current.*

Earthquake shocks occurred at various places in New England on the morning of March 21st. Professor Henry Shaler Williams, recently elected head of the department of geology at Cornell University, in discussing the phenomenon, said: "The earthquake undoubtedly was caused by a slip of a stratum on another, deep in the earth. One of the two faces moved, causing the jarring, although the faces moved only a few inches the earth's surface was disturbed for hundreds of miles. The earthquake caused a readjustment of the two faces. The tension was relieved, and probably there is no immediate danger of a recurrence."

The Minneapolis *Journal* says: "It is not unusual for the 'old residenter' to rise on cold winter mornings and speak contemptuously of the lack of severity of modern winters. He declares that the weaklings of this day and age would not be able to withstand the ravages of ancient winters. Now is he come to judgment. Away back in 1822 the weather attracted the attention of the authorities at Fort Snelling Accurate (for that time) records were kept, and have been tabulated by the Pioneer Fuel Company of Minneapolis. The months of December, January and February were grouped as representative winter months and the average mean temperatures were made up. They were classed as 'mild,' 'warm' and 'cold.' Warm winters were those showing an average mean temperature of 18 degrees above or more. Mild winters show an average mean temperature of between 12 and 18 degrees above zero, while the cold winters were those whose average for the three months was 12 degrees or below. Of a group of eighty-one seasons, brought down to date, twenty-five winters were classed as cold, thirty as mild, and twenty-six as warm."

FEEDING VALUE OF SOFT CORN.

Under the auspices of the animal husbandry section of the Iowa Experiment Station at Ames, some very valuable experiments have been made to determine the feeding value of soft corn for beef production. The results, as set forth in Bulletin No. 75, just issued, show a practical agreement between the chemical tests and the experimental tests, as to the composition and value of soft corn compared with the fully matured product. The following conclusions are deducted from the experimental work just completed:

1. That soft corn grown on the college farm in 1902, and containing 36 per cent of moisture at the beginning of the test, pound for pound, on a water free, or dry matter basis, was fully equal in feeding value to mature corn grown in 1900, when used for fattening cattle.

2. That cattle fed on such soft corn made nearly as heavy gains and finished equally as well as those fed on mature corn grown in 1900.

3. That when soft corn, similar to that used in this test, could be purchased for 30 cents per bushel, the prevailing mar-

ket price, gains on fattening cattle could be made at a cost of 3.03 cents per pound less than when mature corn, costing 50 cents per bushel, the prevailing market price, was fed under similar conditions.

4. That a study of the Chicago live stock market conditions, from January 1, 1903, to July 31, 1903, shows conclusively that the comparatively low price of beef cattle was not caused by an oversupply of half finished cattle. On the contrary, there was a larger number of well finished cattle marketed during that period for 1903 than for the corresponding period of any of the past ten years.

5. That the chemical analyses would indicate that the nutritive value of the corn grown in 1902 compares favorably with mature corn grown in other years when water free substance or dry matter serves as a basis of comparison.

6. That the amount of moisture present was the main difference so far as composition is concerned. That the amount of moisture depends mainly on the maturity of the corn when stricken by frost.

CONTROLLING SOIL TEMPERATURE.

With the winter's leave-taking we at once become vitally interested in the rapid warming up of the soil, because all persons that are concerned in crop production know that the growth of vegetation is dependent upon air, moisture and a certain amount of warmth. Early in the spring there is but little apprehension about the two first mentioned, warmth being the factor of first consideration.

It is scarcely necessary to say that the removal of water from the land by drainage is one of the quickest and most effective means of warming it. Unless provision has previously been made for the removal of free water the task of seeding will be an uphill one. However, under average conditions when the soil dries out with reasonable rapidity much may be done by the farmer to hasten a rise of temperature in the surface soil.

In his work on "Soils" King says that the thorough preparation of the seed bed is justified in a large measure by the warming effect which judicious, thorough tillage has. The development of a mulch over the ground lessens the loss of water from the surface by evaporation, and if by this means we can save the loss into the air of a few pounds of water per square foot we have avoided the withdrawal of an enormous amount of heat, owing to the fact that evaporation is a cooling process. Thorough tillage, therefore, not only saves moisture, but at the same time it permits the seed bed to warm up so that plant foods are freely liberated. The same warmth that liberates food also hastens germination, thus getting the plant into a condition to take advantage of the food being prepared.

It is not so important early in the spring that the ground should be warmed deeply, but better only so far as to provide ample available plant food for the start, and room enough for the first roots, and this is what early tillage does; the loose, open soil conducts neither the cold water up to become still colder by evaporation, nor the absorbed sunshine down where it is not yet needed. In effect this method converts the whole field into a hotbed or cold frame, and commences irrigation by saving water at the start. It does even more, for while it develops early a little soluble plant food, it holds in abeyance these processes in the deeper soil, which, by starting too early, would cause a needless loss by developing nitrates which may be leached away before the crop has its roots ready to use them.

In view of the importance of free surface tillage early in the spring as a means of warming up the soil it is impossible to urge with two much zeal the practice of freely discing or harrowing just as soon as the soil will work without puddling. Too many are inclined to let their old corn fields lie until they are inverted with the plow, which process often means a matter of a month or six weeks from the time plowing is started until it is finished. All this timesoil moisture is being evaporated at a rapid rate while the soil particles are not being raised to that temperature that brings about the most rapid germination after the crop is planted. Our advice is to start the harrows or discs just as soon as the land will work well, because when this is done time may be taken to plow properly, to cultivate thoroughly and to harrow well in the immediate preparation of the soil before planting. It is the duty of every corn grower to see to it that the first operation in the spring after tillage implements are taken from the sheds is to produce a mulch over the stubble, corn land or fall plowed fields.—*The Homestead.*

MARCH WEATHER AND CROPS.

The past winter was colder than usual, and the soil was very deeply frozen. March was a typical spring month in respect to temperature, though with less than the usual number and severity of wintry storms. There was a general prevalence of cloudiness, however, and the frost yielded very slowly, leaving the soil too wet for seeding operations, except in a few favored localities. Probably much less than the average percentage of March plowing and seeding was done in the State. The greater part of the precipitation came in the last decade of the month, which caused the principal hindrance to general field work. Farm stock wintered well, and there has been a great abundance of forage for cattle feeding.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.98 inches; highest observed, 30.58 inches, at Sioux City, on the 3d; lowest observed, 29.30 inches, at Sioux City, on the 24th; range for State, 1.28 inches.

TEMPERATURE.—The monthly mean temperature for the State, as shown by records of 116 stations, was 34.8 degrees, which is 2.4 degrees above normal. By sections the mean temperatures were as follows: Northern section, 32.4 degrees, which is 2.8 degrees above normal; central section, 34.9 degrees, which is 2.7 degrees above normal; southern section, 37.0 degrees, which is 1.1 degrees above normal. The highest monthly mean was 38.6, at Burlington, Guthrie Center, Glenwood, Keokuk, Osceola and Ottumwa; lowest monthly mean, 27.0 at Cresco. The highest temperature reported was 78.0 degrees at Ottumwa on the 23d; lowest temperature reported 3 degrees at Columbus Junction on the 3d. The average monthly maximum was 62.9 degrees; average monthly minimum, 4 6 degrees. Greatest daily range, 55.0 degrees at Sioux City; average of greatest daily ranges 36.8 degrees.

PRECIPITATION.—Average precipitation for the State as shown by records of 127 stations, was 2.18 inches, which is 0.35 of an inch above normal. The averages by sections were as follows: Northern section, 1.74 inches, which is 0.12 of an inch above normal; central section, 2.05 inches, which is 0.17 inch above normal; southern section, 2.74 inches, which is 0 77 inch above normal. The largest amount reported was 4.57 inches at Bedford; least amount reported, 0 50 inch, at Ida Grove and Sioux City. The greatest daily rainfall reported was 2.35 inches at Bedford on the 30th. Average number of days on which .01 of an inch or more was reported, 7.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 68 miles per hour, from the northwest, at Sioux City, on the 2d. Average number of clear days, 8; partly cloudy, 8; cloudy, 15.

OBSERVERS' NOTES.

AMANA—*Conrad Schadt.* No farm work done; hardly a vestige of growing vegetation; thunderstorm on 24th and 30th.

ATLANTIC—*J. W. Love.* Robins on the 1st; bluebirds and larks on 5th.

AUDUBON—*Geo. E. Kellogg.* Some wheat sown on 1st; heaviest snowfall of the winter on 13th.

BONAPARTE—*B. R. Vale.* Precipitation, 2.73 inches; muddy fields and bad roads; no farm work done; subsoil not very wet.

BRITT—*Geo. P. Hardwick.* First larks observed on 16th; robins, 18th; bluebirds, 29th; frogs croaking 31st; too cold for seeding; ground frozen deep.

CLINTON—*Luke Roberts.* Mean temperature normal, but was 7.6° colder than March, 1903; precipitation, 1.61 inches, or 2 inches above normal; 1.06 inches came in form of snow on 24th, with strong wind.

ELKADER—*Chas. Reinecke.* Ice went out of the Turkey river March 1st.

FOREST CITY—*J. A. Peters.* No seeding done in March; frost still in the ground.

GRAND MEADOW. *F. L. Williams.* Month very disagreeable and backward; no field work done; roads bad; stock doing well.

GRUNDY CENTER—*E. S. King.* Only five clear days; no farm work done; stock wintered well.

HANLONTOWN—*Miss G. M. Paschen.* Ducks seen on 6th; birds came first of the month.

HUMBOLDT—*H. S. Wells.* Rain, 1.19 inches; March came in warm and went out cold; roads bad last half of month.

JEFFERSON—*Isaac Young.* On 24th lightning struck residence of Thomas Lynch, of Cooper; badly damaged; no oats sown yet.

KEOSAUQUA—*J. H. Landes.* Thunderstorm and wind on 24th caused considerable loss in south part of county.

LOGAN—*Mrs. M. B. Stern.* Weather very changeable, but no bad storms; rather dry winter and spring.

OLIN—*N. Potter.* First half of month fine, up to 13th; last half changeable, with mud; spring backward, and no farm work done.

PACIFIC JUNCTION—*H. H. McCartney.* On the 2d, at 2 P.M., temperature was 68°; at 7 P.M. it had fallen to 20°; strong wind from southeast changed to gale from northwest, almost in a moment. Fall in temperature of 62° between 2 P. M. on 2d to 7 A.M. on 3d.

RIDGEWAY—*Arthur Betts.* Only 149 hours of sunshine; big snowstorm on 13th and 14th, but an agreeable month; wild geese and robins came early in the month.

ROCK RAPIDS—*W. C. Wyckoff.* Seeding began on 29th on ridges and up near State line; stopped by rain on 30th.

WAUKEE—*E. J. Leonard.* An inch more snow fell in March than in February; since January 1st have had 17.5 inches of snow; coldest day of winter was January 25th; temperature ranged 8° to 18° below zero.

BELATED REPORTS.

COLLEGE SPRINGS—February. Mean temperature 20.7°; highest 49° on the 5th and 22d; lowest -2° on the 4th; greatest daily range 32°; prevailing direction, northwest. Number of clear days 18, partly cloudy 4, cloudy 7.

INDEPENDENCE—February. Mean temperature 9.8°; highest 50° on the 6th; lowest -20° on the first; total precipitation 40 inches; greatest in 24 hours .35 inch on the 17th. Total snowfall 4 0 inches; prevailing direction, northwest; number of rainy days 2.

KNOXVILLE—February. Mean temperature 18.1°; highest 56° on the 6th; lowest -10° on the first; greatest daily range 38°; total precipitation .45 inch; greatest in twenty-four hours .20 inch on the 27th; total snowfall 3.0 inches. Number of clear days 10, partly cloudy 8, cloudy 11, rainy 4. Prevailing direction, northwest.

SHELDON—February. Mean temperature 12.6°; highest 54° on the 5th; lowest -18° on the 8th; greatest daily range 39° total precipitation .31 inch; greatest in 24 hours .25 inch on the 17th; prevailing direction, south; total snowfall 3.1 inches. Number of clear days 16, partly cloudy 6, cloudy 7, rainy 3.

WINTERSET—February. Mean temperature 18.3°; highest 45° on the 23d; lowest -7 on the 11th; greatest daily range 33°; prevailing direction, east; number of clear days 8, partly cloudy 7, cloudy 14.

ERRATA.

GREENFIELD—August, 1903. Daily precipitation of .53 inch recorded on the 27th, page 11, should have been 2.56 inches.

OTTUMWA—December, 1903. Mean temperature recorded, 25.0° on page 7, should have been 24.5°.

ERRATA IN JANUARY REVIEW.

AFTON—Mean temperature recorded 18.4° on page 8, should have been 18.2°. Mean maximum temperature recorded 27 4° on page 9, should have been 27.1°. Highest temperature recorded on the 9th, page 8, should have been the 7th.

BRITT—Total snowfall recorded 3.6 inches on page 7, should have been 4.6 inches.

CORYDON—Mean minimum temperature recorded 5.3° on page 9, should have been 5 4°.

EARLHAM—Total precipitation recorded 1.31 inches on pages 8 and 11, should have been 1.37 inches.

GILMAN—Total precipitation recorded .85 inch on pages 7 and 11, should have been 1.03 inches. Daily precipitation on 10th and 11th recorded .01 inch on page 11, should have been .10 inch.

GRAND MEADOW—Mean maximum temperature recorded 19.0° on page 9, should have been 19.1°.

GREENFIELD—Highest temperature recorded on the 7th, page 8, should have been on the 8th.

HAMPTON—Mean temperature recorded 10.5° on page 7, should have been 10.8°.

KEOSAUQUA—Mean temperature recorded 15.0° on page 8, should have been 14.8°.

LARRABEE—Mean temperature recorded 12.2° on page 7, should have been 11.9°. Mean maximum temperature recorded 22.5° on page 9, should have been 21.9°.

OLIN—Maximum temperature recorded 41° on the 7th, on page 7, should have been 42° on the 19th.

PRIMGHAR—Mean temperature recorded 10 3° on page 7, should have been 10.4°. Mean maximum temperature recorded 19.2° on page 10, should have been 19.3°.

STUART—Mean temperature recorded 16.9° on page 7, should have been 17.0°. Mean maximum temperature recorded 25.7° on page 10, should have been 25.8°.

WAPELLO—Maximum temperature recorded 41° on the 7th, on page 8, should have been 47° on the 19th.

WATERLOO—Total snowfall recorded 6.0 inches on page 7, should have been 5.0 inches.

ERRATA IN FEBRUARY REVIEW.

BELKNAP—Mean minimum temperature recorded 11.7° on page 8, should have been 11.3°. Mean temperature recorded 19.2° on page 7, should have been 19.0°.

CLARINDA—Maximum temperature recorded on the 24th, page 7, should have been 23rd.

GRUNDY CENTER—Total precipitation recorded .48 inch on page 6, should have been .58 inch.

IDA GROVE—Maximum temperature recorded on the 5th, page 6, should have been on the 5th and 6th. Minimum temperature recorded -12 on the 8th, page 6, should have been -15 on the 19th.

IOWA FALLS—Mean temperature recorded 13.0° on page 6, should have been 10.7°. Mean maximum temperature recorded 25.2° on page 8 should have been 20.5°.

KEOSAUQUA—Minimum temperature recorded on the 1st, page 7, should have been 1st and 2d.

NORTHWOOD—Mean temperature recorded 11.0° on page 6, should have been 10.8°. Mean maximum temperature recorded 21.7° on page 9, should have been 21.3°.

PRIMGHAR—Minimum temperature recorded -13° on the 11th, page 6, should have been -17° on the 8th.

SIBLEY—Mean temperature recorded 8.2° on page 6, should have been 8.6°.

SIOUX CENTER—Total snowfall omitted on page 6, should have been 2.5 inches.

THURMAN—Mean temperature recorded 20.2° on page 7, should have been 20.0°. Mean minimum temperature recorded 10.8° on page 9, should have been 10.3°.

WEST BEND—Mean temperature recorded 10.7° on page 6, should have been 11.0°. Mean maximum temperature recorded 21.7° on page 9, should have been 22.3°.

CONTENTS.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. APRIL 1904. No. 4.

APRIL WEATHER AND CROPS.

This has been an abnormally cold month, the records of 115 stations indicating a monthly mean temperature of 44.1°, which is 5.2° below the normal. It was the coldest April for the State at large, of which we have records covering all districts. At Des Moines the coldest April in any previous year of record was in 1881. The temperature of the past month, however, was notably equable from first to last, the rise being moderate, and barely sufficient in the last week to start fruit buds and foliage. This retarded germination and possibly lessened danger of serious damage by sudden change from warm to excessively cold weather. The rainfall was 0.74 of an inch above normal, the larger part of which came about the 7th and 8th, and between the 22nd and 25th. There were some dry periods, and sufficient amount of sunshine to afford ample opportunity for seeding and preparing the ground for planting corn. Seeding of spring wheat, oats and barley begun generally from the 1st to the 4th, and that work was practically completed in the larger part of the State about the 20th to 23rd. Germination of seed was unusually slow, but at the close of April there were indications of a good stand, except on low, wet fields. Fruit buds appeared healthy and promising, but there were but a few blossoms visible prior to the first of May. The pastures and meadows were unusually late in starting, and there was but little grass for stock at the end of the month. On the whole, though the growth of vegetation was much belated, the month was more favorable for the farmer than the corresponding month in 1903.

NOTES AND COMMENTS.

Under the new drainage law, the citizens of Wright county propose to open several big ditches that will have an aggregate length of twenty-five miles, which will make tillable several thousand acres of land now under water.

Experiments with various feed stuffs, made in Oklahoma last winter, proved that the greatest gains were made by cattle fed on alfalfa hay and corn meal.

More than ever this year the country needs a bumper crop. It is the one thing necessary to put an end to all pessimism and bring prosperity greater than we have known before.—*Minneapolis Journal*.

Professor Carleton, cerealist of the U. S. Department of Agriculture, who has recently made a report on oat culture in Kansas, says that the farmers have shown an increasing disposition to disregard all spring sown grains, because of the danger to them from hot weather.

WIND—VELOCITY AND PRESSURE.

Haswell's Hand-Book for Engineers, a standard and reliable authority, gives the following as to velocity and force or pressure of wind per square foot of surface, in pounds.

Miles per Hour.	Feet per Minute.	Pounds Pressure per Square Foot.
10	880	.500
15	1320	1.125
20	1760	2.000
25	2200	3.125
30	2640	4.500
35	3080	6.125
40	3520	8.000
45	3960	10.125
50	4400	12.500
60	5280	18.000
80	7040	32.000
100	8800	50.000

DRAINAGE AND DROUGHTS.

An Omaha reader takes exception to our statement that the drainage of marshes and lakes in no perceptible degree diminishes the rainfall of the territory where located and that the cultivation of a semiarid region in no way increases the rainfall, and he presents some plausible arguments to show that our contention is wrong. Here are a few facts for our friends to consider: Lower California is an arid desert. Still it has the Pacific ocean on one side and the gulf on the other. Why should it be dry when such an enormous evaporation under a tropical sun is always in operation? The records show conclusively that n all the territory west of the one hundredth degree of west longitude the settlement of the country and the cultivation of the soil have in no manner increased the average rainfall. Take the Mississippi Valley, the territory which this statement is tended to cover, and where does the water come from which makes up the average of thirty to thirty-five inches per annum which the states of Minnesota, Iowa, Illinois and Missouri receive? Take the State of Iowa, to illustrate. To give this State one inch of rain would require the evaporation of the water of a lake twenty by twenty-seven and one-half miles in area and eight feet in depth, or a river a mile wide, eight

feet deep and 550 miles in length. The yearly rainfall of thirty-one inches in this State, would make a lake 110 miles long, fifty miles wide and twenty-six feet deep; and if all the water in all the rivers, creeks, lakes, ponds and sloughs in the State was vaporized and returned to the earth in the form of rain it would give less than one inch of rainfall. Now, whence comes the rainfall we get? From the Gulf of Mexico. The Mississippi Valley, if one could see it pictured out in relief, would be seen to be a vast trough reaching from northern Minnesota to the Gulf of Mexico, up which the moisture laden clouds are driven by the south winds, assuring a permanent and reliable rainfall and making the valley the garden spot of America. Had there been a range of mountains like the Rockies flung across the lower part of this valley, all that part of it which lay at the north would have been an arid desert. For the past two years all the northern part of this valley, better drained than it has ever been before—millions of acres of swamp lands reclaimed by drainage and put under cultivation, and lake beds converted into cornfields—has been deluged with such an excess of rainfall that all the drainage done was utterly insufficient to dispose of surplus water. It is now well settled that timber grows in any given territory because it rains there and that it does not rain because the timber grows. The facts justify a repetition of the phrase, "While drainage will dry up the earth it will not dry up the heavens," for the reasons above stated.—*J. S. Trigg's Farm Notes.*

OUR GOOD SOIL AND CLIMATE.

We who live in America and in the corn belt little realize how much we have to make us thankful. First there is the soil, which is richer than England has or Scotland, except in favored spots. Next there is the climate. Granted that our climate has in it violent extremes and is trying to live in if we do not fit it right, yet it means well and really blesses us. I never knew how much we have to make us glad until I shivered in England, France and Scotland for nearly two months of their summer.

It was a constant wonderment to me that things grew so well as they did with so little heat. Coming home, the maize standing rank and green, twice as high as the fences, looks mighty good to me. And this sets me thinking. Corn grows mostly from the sun. True, there must be soil and water in that soil, but sun power makes the golden grains and sunbeams coiled up within those grains are ready to give out again their stores of energy or warmth in winter time. That sun that pours down its fervent rays i not to be lightly spoken of. It comes to bless. It is our own fault if he overcomes us. To eat simply, drink properly, hot water at meal times and little at other times, to dress comfortably and to take exercise regularly out of doors will be to insure robust health during the hottest weather.

And those heated nights when the corn blades whisper to each other and the katydids cry warnings from out the thickness of the trees, they are a blessing, too. It is your own fault if you swelter in stuffy chambers. There is the Great Outdoors calling to you. Provide each of you a cot that you can take out beneath the trees, sleep there or under canvass, see if you do not find your sins forgiven in the morning and new store of li e and energy in you.

This is the glorious good land here and the sun shines!

Thank God for the heat that fills the cribs with gold!—*Joseph E. Wing, in Breeders Gazette.*

FARMING WITH ELECTRICITY.

In the application of electricity to every day work Germany has, perhaps, gone farther, than any other nation. Electrically heated and operated cooking and laundry apparatus is in common use there, but the most striking single development is the electrical farm.

Take for example, the Quendnau farm, which covers 450 acres and its dairy handles 1,000 gallons of milk daily. Every part of the farm is lighted by electricity, and is in telephonic communication with every other part. The dairy has an electrical churn; the barn contains electrically operated feed and carrot cutting machines, and even the grindstone is turned by a small belt from the shaft connected with the barn motor.

The water pumping apparatus is run by electricity, all the buildings are lighted by incandescent lamps and there is an electrical indicator at the doors of all the houses. The farm has also its own threshing and grist mill, the machinery of which is turned by a current from the miniature central station and finally there is a small sawmill, which gets its power from the same station. On the farm are all kinds of electrical agricultural machines.

The power of all these various operations—lighting, heating, telephones, churning, cutting, grinding, pumping, threshing and sawing—comes from a 50-horsepower stationary engine working two dynamos. From this station the power is distributed to all parts of the farm, and the switchboard is so plainly marked that the ordinary farm hand can regulate the supply to fit the need.—*London Answers.*

CLIMATOLOGY OF THE MONTH, APRIL, 1904.

BAROMETER.—Mean pressure, 30.05 inches; highest observed, 30.61 inches, at Des Moines and Dubuque, on the 3d; lowest observed, 29.13 inches, at Des Moines on the 8th; range for State, 1.48 inches.

TEMPERATURE.—The monthly mean temperature for the State, as shown by records of 115 stations, was 44.1°, which is 5.2° below normal. By sections the mean temperatures were as follows: Northern section 42 4°, which is 4.9° below normal; Central section 44.4°, which is 4 4° below normal; Southern section 45.5°, which is 6.7° below normal. The highest monthly mean was 47.8° at Ottumwa; lowest monthly mean, 40.2° at Sibley. The highest temperature reported was 86°, at Sigourney and Forest City on the 22d and 23d; lowest temperature reported 13°, at Primghar on the 11th. The average monthly maximum was 77.1°; average monthly minimum 20 9°. Greatest daily range, 48° at Forest City; average of greatest daily ranges 37.2°.

PRECIPITATION.—Average precipitation for the State, as shown by records of 126 stations, was 3 63 inches, which is 0.74 of an inch above normal. The averages by sections were as follows: Northern section 2.73 inches, which is .11 of an inch above normal; Central section 3 48 inches, which is .58 of an inch above normal; Southern section 4.68 inches, which is 1.57 inches above normal. The largest amount reported was 8.97 inches at St. Charles; least amount reported, 1.52 inches at Elkader. The greatest daily rainfall reported was 3.11 inches at Sigourney on the 25th. Average number of days on which .01 of an inch or more was reported, 7.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 56 miles per hour, from the northwest, at Sioux City, on the 11th. Average number of clear days, 15; partly cloudy, 6; cloudy, 9.

OBSERVERS' NOTES.

ALLERTON.—*Rex Shriver.* Latter part of April, warm enough to start grass and foliage.

ALTA.—*David E. Hadden.* April was unusually cool, and the season is fully two weeks late.

AMANA.—*Conrad Schadt.* Cold, unseasonable weather, with frequent frosts; field work much delayed.

ATLANTIC.—*J. W. Love.* Farm work much hindered by cold and wet weather.

BAXTER.—*W. S. Thorp.* At close of April, plowing for corn was two thirds completed; small grain was coming up and grass was short.

BONAPARTE.—*B. R. Vale.* Cold month; vegetation two weeks later than normal; rains not excessive, but cold and mixed with snow; much cloudy weather.

BRITT.—*Geo. P. Hardwick.* Frost in ground at end of month; Spring ten days late; no bloom yet.

CHARITON.—*C. C. Burr.* Continued wet and cold, with frequent frosts.

CLINTON.—*Luke Roberts.* Month abnormally cold; no cherry trees in bloom at close of the month. There were 13 mornings, from 2nd to 21st, when water froze. The mean temperature was 44 1°, being 7.9° below normal. This breaks all April records during the past 26 years. The rainfall was 3.40 inches, which is half an inch in excess of normal.

CORYDON.—*Mrs. Clara Miller.* Snow fell on the night of the 19th and was not quite all gone on evening of 21st.

FLORENCE.—*J. H. DuBois* Seeding was mostly done by the 23d, except the last week it was unusually cold for April.

FOREST CITY.—*J. A. Peters.* Seeding begun April 4th, much delayed by rains and cold weather; oats about all in by the 23d; last ten days fine for work.

GREENFIELD.—*J. G. Culver.*—On the 23d lightning struck a tree 20 feet south of J. C. Mason's house and broke nearly every window on the south side of the house; the glass was broken to bits and fell outward; 100 feet south a window was broken and another 150 feet northeast, in these cases the glass fell inside. No one hurt.

GRUNDY CENTER.—*E. S. King.* The daily mean was 5.5° colder than in April, 1903. Small grain seeding commenced on the 6th and finished about the 23d.

HANLONTOWN.—*Miss G. M. Paschen.* Some seeding done April 6th; then delayed by rain till the 14th. Some potatoes planted on the 19th. Early gardens were up by the 30th.

INWOOD.—*G. M. Larsen.* Heaviest snow of the season fell on night of the 19th, the amount being 3.5 inches. Last week of the month was fine.

MOUNT VERNON.—*Jos. W. Hubbard.* Temperature below normal; season late, but favorable at the close.

RIDGEWAY.—*Arthur Betts.* Coldest April on record; last ten days delightful; 262 hours of sunshine; anemones on 16th, and buttercups, 25th; 8 days totally devoid of clouds.

VINTON.—*T. F. McCune.* Season a little late; small grain up and doing well; may be light; leafing backward. Garden stuff up in most places.

WHITTEN.—*F. P. Butler.* Very cold until last few days; seeding all finished, and plowing for corn well along.

ERRATA.

INDEPENDENCE—February—Total precipitations recorded .40 of an inch, on page 5, in March Review under belated reports, should have been .45 of an inch.

MARSHALLTOWN—February—Total snowfall omitted on page 6, should have been 5.0 inches.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. MAY 1904. No. 5.

IOWA CROP REPORT, JUNE 1, 1904.

ACREAGE OF STAPLE CROPS, AND AVERAGE CONDITION OF CROPS, FRUIT AND LIVE STOCK.

Reports received June 1st from county and township correspondents of the State Weather and Crop Service show the following results as to the number of acres and average condition of staple farm crops; also the condition of fruit and live stock.

CORN.—Total number of acres, 9,052,450;—an increase of about 7 per cent as compared with the average of the past six years, and 1,500,000 acres in excess of the area actually harvested in 1903. The average condition of corn about June 1st was 90 per cent, or about fifteen points above the estimated condition at corresponding date last year.

WHEAT.—The area of spring wheat sown this season appears to be only 775,040 acres, a decrease of about 377,000 acres as compared with the acreage in 1902. The winter wheat acreage is about 71,030 acres, Condition of spring wheat, 94 per cent; winter wheat, 85 per cent.

OATS.—Area seeded, 4,018,980 acres; a decrease of about 190,000 acres compared with the acreage of 1901, or about 5 per cent below the normal area. The condition is placed at 92 per cent.

BARLEY.—Area seeded, 493,370 acres; decrease since 1901, about 38,300 acres. Condition June 1st, 93 per cent.

RYE.—Area seeded, 99,590 acres; decrease since 1901, about 25,000 acres. Condition June 1st, 91 per cent.

FLAX —Area seeded, 51,370 acres; decrease since 1901, 23,130 acres. Condition of crops, 85 per cent.

POTATOES.—Area planted, 113,250 acres; condition 95 per cent. Acreage about normal.

MEADOWS.—Area 2,797,640 acres; an average of recent years. Condition 96 per cent. Condition of pastures 97 per cent.

CONDITION OF FRUIT.—Apples, 91; plums, 89; peaches, 48; grapes, 87; cherries, 83; strawberries, 94; raspberries, 88; blackberries, 77 per cent.

CONDITION OF LIVE STOCK.—Cattle, 94; swine, 93; sheep, 97; horses, 95; foals, 93; spring pig crop, 85 per cent.

CONDITION OF CROPS JUNE 1, 1903.—Corn, 75; wheat, 93; oats, 93; barley, 96; rye, 94; potatoes, 91; flax, 84; meadows, 109; pastures, 107; apples, 70; cherries and plums, 35 per cent.

MAY WEATHER AND CROPS.

Though the month of May was generally regarded as unseasonably cold, the records for the state show that the average daily temperature (59.6°) was about normal, the daily deficiency being only 0.8°. The average rainfall, 3.78 inches, was .35 of an inch below normal, the northern section receiving the larger average amount. In portions of the west central district, and in some of the southern counties, there were some heavy downpours, which caused much delay in planting, the great excess of moisture being due in large part to the saturated condition of the subsoil, resulting from abnormal rainfall in the preceding season. On the whole it was a favorable month, with sufficient warmth and moisture for grass and small grain, and general conditions favorable for farm work and the germination of the better qualities of seed. Except in quite limited areas, the corn crop was planted about as early as usual, and the soil was in very good condition. The month was especially favorable for the growth of grass in meadows and pastures, and for the small grain crops on well drained lands. The hay crop is well assured; oats and spring wheat stooled out fairly well; potatoes made a fine start; garden truck was well advanced at close of the month, and the fruits promised a better yield than has been produced in recent years.

NOTES AND COMMENTS.

In his farm notes J. S. Trigg says: "The predictions of any man thirty days ahead on the weather are absolutely valueless." And so say all men of sense who have given due thought to the subject.

The *Evening Wisconsin* says: "The grass crop never looked more promising in the northern states, and as that crop amounts to much more in value than the cotton crop thoughtful observers should not forget this prominent blessing."

The *Rockford Register* says: "The state can well afford to have Professor Holden make some more corn trips next September and tell the farmers how to save seed corn. There are enough of them having to replant their fields this spring so that they will listen to him "

In "Notes on Science," by Prof. John L. Tilton, published in the *Indianola Herald* of May 12, 1904, we find the following interesting paragraph: Those who were at the track meet last Saturday were treated to a miniature tornado. The whirlwind was first noticed on the tennis court, then west of the fence and trees it reformed and pas ed slowly across the ball park in a northwesterly direction beyond the grounds. There was a cloud of dust probably twenty feet in diameter whirling violently around in a direction opposite to the hands of a watch as one looks down; but through the center was a vertical clearer space with distinct boundaries in which the streaks of dust indicated an upward movement. This center reached upward into the air to perhaps twice the height of ladies' hall, where it looked as if it terminated in a point. It occupied perhaps ten minutes in traversing a distance of four hundred yards. It is to be regretted that no cameras were at hand to photograph it.

RELATION OF RAINFALL AND AGRICULTURE.

When the annual rainfall is under eighteen inches, agriculture can seldom be safely practiced without irrigation. Grazing then becomes the chief occupation, as is now the case over a large extent of our western plains, between the 98° meridian and the Rocky Mountains; and the people return in a measure to the roving life characteristic of the aboriginal inhabitants of semi-arid regions. When the rainfall is less than twelve inches a year, the region is reduced to a desert, and the water supply is too small to be of service in irrigation, unless in small areas, or on the banks of large rivers. On the other hand, the tropical regions where the rainfall rises above a hundred inches in a year are so luxuriantly overgrown as to make their occupation a difficult matter. The general rainfall of the eastern part of our country or of western Europe, with annual total varying from forty to eighty inches equably distributed through the year, is an amount under which human occupations are best developed.

The distribution of rainfall through the year is a matter of great moment. The northwestern part of the United States is favored in having the average value of the precipitation in successive months comparatively equable; droughts are exceptional, but when occurring are found in one season about as frequently as another. In Florida, the summers are wet and the winters are comparatively dry. In eastern Nebraska, there is a similar distribution of rainfall from dry winters to wet summers. In California, the reverse is true; the summers have a continuous drought, making the ground dry and dusty; the winters are cloudy and wet. These variations will be found to depend chiefly on the system of the general winds.

The irregularity in the monthly rainfall is an important matter, especially in regions where the annual supply is moderate. Even in the well-watered States east of the Mississippi, a deficiency in the summer rainfall sometimes causes droughts; for example, the southern Atlantic States had in September, 1888, 1.84 inches; while the same month of the preceding year had 9.47, or over five times as much; this variation appears to result chiefly from the variation in number, paths, and activity of cyclones in different years. On the margin of the western plains, where the total rainfall is hardly enough for agriculture, the departures from the normal monthly fall are of more serious import: a succession of rainy seasons tempts settlers further and further west, and when a series of dry years follows, the distress occasioned by the failure of crops becomes a calamity.

In India, where the year is divided into three seasons, the cold, the hot, and the wet seasons, the crops are preserved in the dry season by irrigating canals fed from rivers rising in the mountains, or in a smaller way by water pumped up from the rivers; if the waters in the rivers is insufficient, or if the rains arrive too late or are deficient, famine results, and the people of that great country die by the thousands. In more recent years, with the improvement of the irrigating canals, and with the better means of transportation of the plenty of one province to supply the need of another, the danger from this source is lessened.—*Davis' Meteorology.*

MIDWINTER IN WESTERN ONTARIO.

Mr. A. G. Seyfert, of Stratford, Ontario, writes to the U. S. Monthly Weather Review, under date of January 26, 1904, giving account of the rigors of the past winter in that portion of Canada. He says:

Not within the memory of the oldest inhabitant has western Ontario experienced such an unprecedentedly severe winter as this. Instead of the usual autumn rainfall, fine weather prevailed up to the middle of November, when it turned cold and commenced to snow, and has continued almost incessantly to the present time. Four feet of snow on the level and drifts in many places four times that depth result. Country roads are blockaded, and communication almost entirely cut off. Railroads are in but little better condition. The main lines are kept open, but many of the branches are cempletely snowed under and abandoned for the present. Every effort is being put forth in fighting the elements to keep the roads open, but never did such conditions prevail since railroads were first built in this province. The high winds, the intense cold, and the enormous quantity of snow are more than human agencies can overcome. The local papers are full of details of all sorts of accidents and fatalities attributable to the weather conditions. Roofs breaking down from the weight of the snow, people frozen to death within sight of their homes, freight trains loaded with live stock in snow drifts until the strongest animals only survived; is the tale that could be prolonged indefinitely.

During the two and a half months of this remorseless climate he mercury has been but once or twice above the freezing point, and for days many degrees below zero all day. One of the most serious features of this condition of affairs is the water famine with which most of the farmers have to contend. The

rainfall had been below the average when the winter set in, and since then none has fallen and the water supply of most of the farmers is exhausted, causing great inconvenience and in many cases much suffering.

February is usually the worst winter month in this latitude, and if this is the case this year untold privations will have to be endured before the end is in sight.

A QUICKENED GULF STREAM.

If the stories told by mariners about the heightened velocity of the Gulf Stream in the last few days be correct, an explanation of the phenomenon ought not to be hard to find Surface currents in the ocean result from the action of the wind. The water which issues from the Gulf of Mexico and flows northeastwardly from the southern extremity of Florida comes originally from that portion of the Atlantic lying near the equator. The trade winds of one hemisphere, blowing from the northeast, and those of the other hemisphere, blowing from the sontheast, co-operate in forcing the upper layers of the sea into the belt of calms, where the water acquires a westward montion. By the intervention of the continent the current is split, and the direction which is then taken is materially altered, but the impetus imparted by Nature's great marine pumping engine is not lost. In all probability the freer discharge which has just been reported means that this piece of invisible mechanism has, temporarily at least, been working a little harder than usual.

The trade winds, like all other winds, result from differences in atmospheric pressure. Near the equator the barometer usually reads much lower than it does twenty or twenty-five degrees away. These high and low pressure systems oscillate northward and southward with the seasons, but their organization is maintained the year round. Variations in the amount of difference — in what the meteorologists call the "gradient" — are also observed, and it may be asssumed that one has recently occurred which has tended to increase the velocity of the winds. Such an effect might be produced in either one of two ways. There might have been a diminution of pressure near the equator, or there might have been an unusual banking up of the air along the tropics. Owing to the lack of observatories at sea, it will probably be impossible to say which of these two influences has operated. International barometric charts show, however, that over the continents and islands departures of this sort from average conditions are not at all uncommon.

A deficiency or an excess of atmospheric pressure in one part of the globe must be compensated for somehow elsewhere. The volume of the air remains the same. It is the distribution only that changes. In time it will doubtless be possible to correlate eccentricities observed simultaneously in widely separated regions. The discovery of one would thus serve to explain the other to some extent, and possibly come to have a prophetic value. Interpretation and forecasting would also be facilitated, perhaps, if a part of this strange behavior of the atmosphere could be connected with the changes in the amount of solar radiation, or with marked differences in the ease with which the sun's heat is able to penetrate the earth's gaseous envelope. Researches having that object in view are in progress in this country and in Europe. It is not yet possible to say what will be the result, but it is excusable to hope that the researches will prove fruitful.—*N. Y. Tribune.*

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29 93 inches; highest observed, 30.26 inches at Dubuque, on the the 3d; lowest observed, 29.53 inches, at Davenport, on the 8th; range for state, .73 of an inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 114 stations, was 59.6 degrees, which is 0.8° below normal. By sections the mean temperatures were as follows: Northern section, 58.2°, which is 1.1° below normal; Central section, 59.9°, which is 0.3° below normal; Southern section, 60.6°, which is 1.4° below normal. The highest monthly mean was 62.4°, at Burlington, Onawa, Keokuk and R dgeway; lowest monthly mean, 56.4° at Sibley. The highest temperature reported was 93°, at Ridgeway, on the 22d; lowest temperature reported, 27°, at Charles City on the 15th. The average monthly maximum was 85.8°: average monthly minimum, 34.3°. Greatest daily range, 47°, at Monticello and Northwood; average of greatest daily ranges, 37.3°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 126 stations, was 3.78 inches, which is 2.35 of an inch below normal. The averages by sections were as follows: Northern section, 4.01 inches, which is .19 of an inch above normal; Central section, 3.41 inches, which is .68 of an inch below normal; Southern section, 3.92 inches, which is .43 of an inch below normal. The largest amount reported was 8.15 inches at Onawa; least amount reported, 1.50 inches at Clear Lake. The greatest daily rainfall reported was 3.33 inches at Florence, on the 24th and 25th. Average number of days on which .01 of an inch or more was reported, 8.

WIND AND WEATHER.—Prevailing direction of the wind, southeast; highest velocity reported, 41 miles per hour, from the south, at Sioux City, on the 4th. Average number of clear days, 13; partly cloudy, 10; cloudy, 8.

OBSERVERS' NOTES.

ALLERTON.—*Rex Shriver.* Corn was nearly all planted at close of month.

AUDUBON.—*Geo. E. Kellogg.* Nearly six inches less rainfall this month than in May, 1903.

BAXTER.—*W. T. Thorp.* Small grain looking fine; prospects good for fruits.

BONAPARTE.—*B. R. Vale.* Rain, 4.17. Corn planting was very tardy. Corn culture was hardly begun at end of month.

BRITT.—*Geo. P. Hardwick.* Corn was planted in favorable conditions from 9th to 24th; grain thin from poor seed; fruit prospects mostly poor.

CLINTON.—*Luke Roberts* May mean temperature slightly above normal; rainfall about two inches below normal. A month of ideal weather for farm work; but one frost (on 15th) that was harmless; though late vegetation was in good condition, except where poor seed was planted.

DOWS.—*A. C. Fuller*. A severe wind squall and electrical storm occurred on the 24th, at 9 P. M., causing considerable damage in some localities.

FOREST CITY.—*J. A. Peters*. Though dry, the crops look fine at close of the month. Some corn replanted on account of wire worms.

HANLONTOWN.—*Miss G. M. Paschen*. Corn planting begun on 4th; on 5th the ground white with hail; planting finished about 21st. Oats in good condition but thinner than usual.

HOPEVILLE.—*M. T. Ashby*. Close of the month finds fields wet and clammy, with considerable plowing to do and much planting to be done.

HUMBOLDT.—*H. S. Wells*. More corn planted than last year, but not so much wheat.

IDA GROVE.—*J. E. Conn*. An exceptionally fine month; crop prospects good.

INWOOD.—*G. M. Larsen*. A fair month; promise of a large crop of grain and fruit.

LARRABEE.—*H. B. Strever*. Wind caused some damage to outbuildings at Meriden on afternoon of the 5th. Several barns were damaged.

OLIN.—*N. Potter*. May has been an ideal month for farm work. Conditions are normal.

PACIFIC JUNCTION —*H. H. McCantney*. Ground has been saturated to extent of retarding planting, but crops are starting well.

RIDGEWAY.—*Arthur Betts*. A perfect May; entirely frostless; 312 hours of sunshine; thirteen days calm; no gales nor windstorms.

WAUKEE.—*E. J. Leonard*. Rainfall 3.46, or less than one-third the amount in May, 1903; too cool and cloudy for normal growth of crops.

ERRATA IN MARCH REVIEW.

COLLEGE SPRINGS.—Maximum temperature recorded 66° on the 2d, page 8, should have been 70° on the 9th.

DENISON.—Total precipitation recorded 1.95 inches on pages 7 and 11, should have been .83 inch.

INDIANOLA.—Mean temperature recorded 36.0° on page 8, should have been 36.4°. Mean minimum temperature recorded 26.4° on page 9, should have been 27.0°. Minimum temperature recorded 12° on the 3d, page 8, should have been 3d and 26th.

EARLHAM.—Mean maximum temperature recorded 45.3° on page 9, should have been 45.2°.

GALVA.—Letter indicating number of days missing, page 7, omitted should have been [F].

KEOSAUQUA.—Mean temperature recorded 36.7° on page 8, should have been 36 8°.

ONAWA.—Maximum temperature recorded 63° on the 2d, page 7, should have been 66° on the 9th.

THURMAN.—Maximum temperature recorded 66° on the 2d, page 8, should have been 68° on the 9th. Total snowfall omitted, on page 8, should have been 3.0 inches

WASHINGTON.—Maximum temperature recorded 60° on the 23d, page 8, should have been 65° on the 21st.

WILTON JUNCTION.—Maximum temperature recorded 60°, on the 24th, page 7, should have been 61° on the 21st.

ERRATA IN APRIL REVIEW.

ALBIA.—Minimum temperature recorded on the 13th, page 7, should have been 14th.

COLLEGE SPRINGS.—Letter indicating number of days missing, page 7, omitted, should have been [D].

CORNING.—Total snowfall recorded 3.0 inches, page 7, should have been 2.0 inches.

HUMBOLT.—Minimum temperature recorded 20° on the 16th, page 6, should have been 18° on the 3d.

INWOOD.—Minimum temperature on page 6, omitted, should have been 22° on the 3d.

ZEARING.—Mean temperature recorded 43.3° on page 6, should have been 43.4°.

BELATED REPORTS.

KNOXVILLE.—April.—Mean temperature 46.2°; highest 76° on the 30th; lowest 23° on the 16th; greatest daily range 34°; total precipitation 5.54 inches; greatest in 24 hours 1.90 inches on the 25th; prevailing direction, northeast; number of clear days 13, partly cloudy 5, cloudy 12, rainy 7.

ROCK RAPIDS.—April.—Mean temperature 43.2°; mean maximum temperature 55.5°; mean minimum temperature 31.0°: highest 75° on the 30th; lowest 18° on the 17th; greatest daily range 41°: total precipitation 1.11 inches; greatest in 24 hours .55 inch on the 22d; number of clear days 19, partly cloudy 9, cloudy 2, rainy 3.

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. JUNE 1904. No. 6.

IOWA CROP CONDITION, JULY, 1904.

Following is a summary of reports received from correspondents of the State Weather and Crop Service, estimating the condition of the staple farm crops July 1, 1904. The reports generally show that the stand of corn and oats is materially lighter than the average, owing to defective seed; and all crops are several days later than usual, as a result of the late advent of spring. The general condition, however, is several points better than at the corresponding date last year, as will be seen by the figures below:

CONDITION JULY 1, 1904: Corn, 90 per cent; spring wheat, 91; winter wheat, 87; oats, 91; barley, 93; rye, 94; flax, 89; meadows, 90; pastures, 94; potatoes, 101; apples, 85; plums, 7 ; grapes, 89.

CONDITION LAST YEAR: Corn, 77 per cent; spring wheat, 88; oats, 87; barley, 89; rye, 98; flax, 85; meadows, 104; pastures, 107; potatoes, 96; apples, 70; plums, 49; grapes, 78.

JUNE WEATHER AND CROPS.

The month of June was cooler than usual, with less than the normal amount of rainfall, and a large percentage of cloudiness in portions of the state. The daily average temperature was 2.5 degrees below normal. The precipitation was quite unequally distributed; the northern section receiving an average of 4 53 inches, the central section 2.74, and the southern section 3.08 inches. The week ending June 6th brought excessive rains in all parts of the state, except portions of the east central district. The wet and cloudy weather of that week caused much delay in the cultivation of corn, and in large portions of the state the fields became weedy and the growth of corn was considerably retarded by cold nights and wet, cloudy weather. The second week was generally very favorable for field work and the growth of crops, the days being bright and warm with ideal conditions for cleaning out the corn fields. The week ending the 20th was also favorable, though the temperature was below normal. There was but little interruption of work, and fair progress was noted in the growth of all crops. From the 20th to the close of the month the average temperature was abnormally low, and there was more than usual cloudiness in the larger part of the state. Despite all drawbacks, however, the corn crop advanced steadily, and at the close of the month the fields were generally clean and the stand was but little below the average of the past fifteen years. The month as a whole was favorable especially for small grain, which headed out about the usual time, though short in straw, giving promise of a much better crop than was harvested in 1902 or 1903. The hay crop was well advanced and fairly good, especially in quality. Potatoes and garden vegetables were usually promising.

NOTES AND COMMENTS.

In a large part of Iowa the crop of cherries has been much larger than usual. The strawberry crop also has been very good, but not up to the standard in flavor. Plums, peaches and blackberries are much below the average in condition. Raspberries and gooseberries, quite fair crops

Under the new drainage law, petitions are being filed in the offices of various county auditors asking for the authorization of drainage ditches to be dug through lands subject to overflow and too wet for cultivation, to promote the public health and welfare of the people. A timely bulletin has been issued by the Iowa Experiment Station at Ames, entitled "Drainage Conditions in Iowa," which will serve as a valuable handbook for farmers, drainage engineers and students. A copy may be secured by addressing a note to Director C. F. Curtiss, Ames, Iowa.

About everything grown in the way of green forage has been tried for filling the silo, and the result of all the experiments is that no crop so well fills the bill, taking ease and economy of handling and value as ensilage, as our common field corn cut when the ears are well glazed. This makes the silo fit into the ordinary farm economy all through the corn belt.—*J. S. Trigg.*

The application of the dynamo to water power gives every waterfall, no matter where located, a money value. Wise men recognizing this fact are picking up all available water powers, for they will all be used in the near future.—*J. S. Trigg.*

FORECASTING THE WEATHER.

The American people like to be humbugged. Next to the gold brick and green goods artist, the long range weather forecaster is the biggest fake on the market. There is not a man living today who can give the slightest clue as to whether next July will be wet or dry, abnormally hot, or unusually cold, and whoever attempts to do so is simply playing on the credulity of the public. The average fakir's long range forecasts consist of a series of violent storms, tornadoes, hot waves, cold spells and hailstorms, which, if one-fourth of them arrived, would make all Iowa a howling wilderness in a short quarter of an hour. Even the milder tempered gentry have the happy faculty of

making such an indefinite forecast that it can not be applied to any locality or any date. There is not a farmer in Iowa who would not be absolutely ruined if he planned his work for one season in accordance with the predictions of these false prophets. He would have to contend with frosts up to the first of June and beginning again in August, floods during the entire season, weather that would scorch vegetation like a blast from a furnace and a sharp cold spell every third day.

To be sure these forecasts hit it once in a while. One who is guessing all the time can not fail occasionally to hit it. His guess is worse than useless if he does not succeed at least every other time and a great many of them do not do this good. Neither of the long range prophets will explain to the scientific world the basis upon which he makes his forecasts, and this refusal of itself would justify the charge of fraud and chicanery if there were no other thing against them.

The officials of the United States Weather Bureau, on the other hand, take the public into their confidence. They openly admit that there is much about the science of forecasting that they do not know and may never learn. They do not claim absolute accuracy for their forecasts but over 80 per cent of them are verified. Predictions are usually made for only thirty-six hours in advance and any one conversant with the facts knows that at present that is as far ahead as our knowledge will warrant any one in predicting. The day may come when scientists may be able to tell something about the coming seasons by reference to the peculiar action of sun spots, but this problem is just being taken up and several years must elapse before anything of moment can be announced. The most these scientists hope to do is to foretell whether a season will be unusually hot, or abnormally cold, whether the rains will be abundant, or drouth prevail. Detailed forecasts for each day, months in advance, will probably never be attempted, as that feature is at present believed to be quite infeasible. In the meantime don't be running after false gods—*Afton, Iowa, Star-Enterprise.*

CULTURE OF FORESTS.

The Pennsylvania Railroad company is engaged in planting locust trees with a view of supplying crossties in the future. Last fall 50,000 trees were planted at Conewago, Pennsylvania, and now as many more are being planted. Next fall, it is said, the company will plant 200,000, and in the following spring 650,000. The forest will cover three square miles, and, it is estimated, will furnish 5,000,000 ties within twenty-five years. This is an excellent work, and is evidence of a wise and farsighted policy. Tree planting is neglected by individuals because forest trees are of slow growth and the benefit or profit is too remote to tempt one to set out forests. But in the case of such a corporation as the Pennsylvania Railroad company the case is different. Such a corporation is supposed to be immortal, and the management, if it is prudent, is always looking to the future. Iron and steel have been tested as substitutes for wooden crossties, but without success. Wood is manifestly the best material for this use, and there is scarcely any use which has caused a more general and deplorable devastation of the forests of the United States as the demand of the railroads. The time is rapidly approaching when the natural supply must fail or become too expensive. Some of the western railroad companies have for some years back been planting trees along their right of way. On the fertile lands of the prairies trees make rapid growth, and, while a sufficient supply can not be produced this way, enough can be grown to make it worth while.

The Pennsylvania company is going about the work in the right way. Large areas of rough land, suitable for the purposes of a forest, can be obtained at a slight cost, and a forest once grown will continue, under proper management, to yield ties and perpetuate itself indefinitely. Careful trimming from the time the young trees begin to grow will train them into proper shape, and thus a single tree will yield more ties than those which have had no pruning. The Pennsylvania company has also selected the very best tree for the purpose. The locust is one of the most rapid-growing of the hardwood trees, and one locust tie will probably outlast a half dozen of oak or chestnut. In fact the locust is regarded as the most durable of all our native woods, and a railroad track laid upon locust ties would be almost as permanent as if the ties were of iron.—*Baltimore Sun.*

CLIMATIC FACTORS IN RAILROAD ENGINEERING.

A thesis on the above subject has been prepared by R. M. Brown as a part of his course in general climatology at Harvard University and has been published in the Journal of Geography for April, 1903. The struggle of railroads against climatic conditions has been recorded so fully during the past century as to become exceedingly instructive, and the influence of the various climatic factors is presented one by one in Mr. Brown's memoir.

As to heavy precipitation he notes that the rainy seasons are often followed by droughts, and this alternation destroys all woodwork either by shrinkage and splintering or by the growth of fungi. Railroad ties decay when there is a good supply of moisture and when the temperature is between 32 degrees and 150 degrees. Data on these points are given for India, South Africa, Central Africa and Central America.

The diseases that are considered peculiar to climate, such as cholera, malarial fevers and yellow fever, offer difficulties that must be overcome. The experiences of numerous large railroad undertakings are mentioned. The droughts that occur in some locations require the building of huge tanks, while in other cases one must go a long distance to obtain pure water. Outdoor work can not well be done in the rainy weather and laborers accustomed to hot dry weather lose many days in the rainy season.

The floods and damages by heavy rains are matters of great importance and "are registered on the books of the construction companies with unceasing regularity. * * * The history of every road that traverses the belt of heavy precipitation is a story of continual struggle against floods." In regions of heavy rainfall land slips are frequent and a long list of these is given by the author

The ballast on the roadbed appropriate to the long, dry season is not appropriate to the heavy rain season. In general, the ballast produces dust haze sufficient to obscure the approaching train; the dust also penetrates the machinery, causing hot axles and other damage. In America and England, under most conditions, stone ballast is the more expensive, but in India the climate reverses this rule.

In regions of moderate precipitation, whether of rain or snow, the length and weight of the freight trains is determined by the weather; thus, on the Pennsylvania railroad west of Pittsburg, the load assigned to an engine is 1750 tons in good weather and 1225 in bad weather. On the Union Pacific road the snow offers great obstacles; about 2 per cent of the entire expense of the road is credited to the removal of snow and repairs of snow sheds. The Iquique railroad of Chili reports increased cost of working during fogs which produce slippery rails.

In regions of light precipitation, or drought, railroad ties decompose; the danger of fire is increased, and burning bridges cause wrecks of trains. In the Arabian deserts the railroad operators suffer comparatively little from disease. On the Transcaspian road the lack of good water brought about

disease. On the Iquique road it is necessary to convey water in tanks and in some cases distilled water was carried forty miles on mules.

In regions of high altitude the rarefaction of the air causes much trouble to the operators, but on the other hand the absence of germs prevents the decay of organic matter. In the report of work on the railroad up the Jungfrau, Doctor Kronecker stated that mountain sickness sets in at altitudes varying with different persons, but that it a tacks all persons as soon as they indulge in the least muscular effort above 10,000 feet. Persons in good health can stand being passively transported up to 12,000 feet without inconvenience; a prolonged sojourn may, however, be disastrous. On the Callao, Lima and Oroya railroad many thousands of laborers lost their lives. "So difficult was it to work in the rarefied air at high altitudes that riveters did not average a week's work each and many returned on the next train." On the other hand, in building the Sierra Leone railroad the number of deaths and invalids was wonderfully low, but the climate had an enervating effect and there were frequent absences on leave. In the upper portions of the railroads, such as the Jungfrau, snow avalanches are a serious obstacle, but may be avoided by burrowing under or by underground tunnels. Many railroads are abandoned during the snow season. Not only in Switzerland but also in the Rocky Mountain region snow sometimes overpowers all human efforts.

In regions of severe winter cold another class of obstacles is met with, namely, the formation of ice. Although deep and frozen rivers and lakes may be traversed by railroads, yet when the breakup comes in springtime there is a period when such transportation must cease and when boa!s are also impossible. The experiences of the Transsiberian road and the Canadian Pacific are given with some detail. The average number of days during which work is possible on account of the snow and ice and the frozen ground is very limited. At Lake Baikal the soil is unworkable from October to April; at Vladivostock, the number of days when the temperature is below freezing is 150, and, in general, on the Transsiberian railroad the total number of working days in a year is about 100. A general tabulation of the number of working days in each month of the year, for various portions of the United States, would perhaps elucidate many of the problems relating to the labor question.—*Monthly Weather Review, April, 1903.*

CLIMATOLOGY OF THE MONTH OF JUNE, 1904.

BAROMETER—Mean pressure, 29.96 inches; highest observed, 30 26 inches, at Des Moines and Dubuque on the 26th and 27th; lowest observed, 29.44 inches, at Sioux City on the 3d; range for state, 0.82 inch.

TEMPERATURE—The monthly mean temperature for the state, as shown by records of 114 stations, was 67.1°, which is 2.5° below normal. By sections the mean temperatures were as follows: Northern section, 65.7°, which is 2.6° below normal; central section, 67.5°, which is 2.0° below normal; southern section, 68.2°, which is 3.1° below normal. The highest monthly mean was 70.6° at Monticello; lowest monthly mean, 63.7° at Sibley. The highest temperature reported was 94° at Clinton, Larrabee, Ridgway and Ruthven on the 23d and 24th; lowest temperature reported, 35° at Charles City on the 2d. The average monthly maximum was 88.1°; average monthly minimum, 45.9°. Greatest da ly range, 45 at Pocahontas; average of greatest daily ranges, 33.4.

PRECIPITATION—Average precipitation for the state, as shown by records of 126 stations, was 3.45 inches, which is 1.05 inches below normal. The averages by sections were as follows: Northern section, 4 53 inches, which is .15 inch below normal; central section, 2.74 inches, which is 1.56 inches below normal; southern section, 3.08 inches, which is 1.23 inches below normal. The largest amount reported was 8.35 inches at Humboldt; least amount reported, .44 inch, at Gilman. The greatest daily rainfall reported was 3.67 inches at Charles City on the 19th. Average number of days on which .01 of an inch or more was reported, 7.

WIND AND WEATHER—Prevailing direction of the wind, southeast; highest velocity reported, 58 miles per hour, from the northwest, at Sioux City, on the 28th. Average number of clear days, 13; partly cloudy, 10; cloudy, 7.

OBSERVERS' NOTES.

ALLERTON—*Rex. Shriver.* An ideal month for all crops; fruit generally good.

ALTA—*David E. Hadden.* June cool, with rainfall about 2 inches below normal of preceding 14 years.

AMANA—*Conrad Schadt.* Month was cool and dry, favorable for small grain, but not so good for corn and grass.

ATLANTIC—*J. W. Love.* Did not have one clear day in June, and nights were cool; severe storm and some hail on the 20th, but not much damage resulted. Crops are doing well.

BONAPARTE—*B. R. Vale.* Rain 4.41 inches, against 2.30 in June, 1903. Up to date we have 1.48 inches in excess of last year, but crops are much better. Month too cool for corn.

BRITT—*Geo. P. Hardwick.* But three clear days in June; corn acreage large, but stand thin. Oats short and thin; meadows and pastures below average; potatoes good.

CARROLL—*Moses Simon.* Lightning struck and burned dwelling of M. Yegge on night of 28th, causing $1,000 damage. No one hurt.

CHARITON—*C. C. Burr.* No floods or severe storms in June; nights abnormally cool.

CLARION—*J. H. DuBois.* Clover in blossom June 11th, strawberries ripe 13th; new potatoes on 18th; oats heading 20th.

FOREST CITY—*J. A. Peters.* Corn varies from four to twenty-four inches high; too cool and cloudy for corn; hay crop good.

GRAND MEADOW—*F. L. Williams.* June dry and cool; all crops except corn look well; potatoes extra good.

GREENFIELD—*J. D. Culver.* Rainfall much less than usual but was well distributed, and none of the crops suffered.

GRINNELL—*A. O. Price.* Rainfall in June 1.22 inches. The least amount in a long period.

GRUNDY CENTER—*E. S King.* All crops were ten days late June 1st, but were up to date on 30th; corn knee high on average and three-fourths laid by; grass short.

HANLONTOWN—*Miss G. M. Pashen.* Corn crop not making good progress; small grain looks well; early potatoes, peas and beens fit for use.

HUMBOLDT—*H. S. Wells.* Rainfall for June 8.35 inches; corn plowing hindered, but the crop is all right where it has been worked; hay crop made.

IDA GROVE—*J. E. Conn.* A fine growing month; small grain looks well; hay crop heavy; good rains, but no bad storms.

INWOOD—*G. M Larsen.* Fair conditions the entire month; nights rather too cool for corn; prospect good for large crop of grain.

JEFFERSON—*Isaac Young.* Hail did some damage on the 19th near Churdan; some windmills damaged; lightning killed some cattle in south part of county.

MONTICELLO—*C. E. Heisey.* June was very dry; only .90 of an inch of rain; showers went around us; grass brown, early potatoes short; corn better than ever before.

MOUNT VERNON—*Rev. J. W. Hubbard.* Temperature and rainfall below normal; hay crop light; small grains promise well; fruits abundant.

OLIN—*Nathan Potter.* Rain only 1.42 inches; cold June weather; a fine month for cultivating corn; all crops normal.

ONAWA—*C. G. Perkins.* Hailstorm on 29th did considerable damage.

OSAGE—*G. D. Pattengill.* On the 18th, from 1:30 to 2:30 P. M , the rainfall was 2.90 inches.

OSKALOOSA—*Jos. Boyd.* June was cool and free from severe storms.

POCAHONTAS—*F. E. Hronek.* On night of 28th a hailstorm caused much damage in a strip 3 to 5 miles wide and 8 to 10 long. Damage to corn 10 to 40 per cent.

RIDGEWAY—*Arthur Betts.* A very pretty June; 315 hours of sunshine; terperature normal; vegetation has made rapid growth and is of good color; 16 days calm.

WAUKEE—*E. J. Leonard.* June remarkably free from severe storms; small fruit abundant; crops doing well.

ERRATA IN MAY REVIEW.

CRESCO—Minimum temperature recorded on the 15th, page 7, should have been 10th and 15th.

DENISON—Maximum temperature recorded on the 22d, page 8, should have been 22d and 24th.

NEW HAMPTON—Mean temperature recorded 56.9 on page 7, should have been 57.0. Mean maximum temperature recorded 69 8 on page 10, should have been 69.9. Number of days missing omitted on page 7, should have been (c).

OSCEOLA—Mean temperature recorded 60.0 on page 8, should have been 59.9. Mean minimum temperature recorded 48.6 on page 10, should have been 48.5.

ROCKWELL CITY—Total precipitation recorded 3.65 inches on pages 8 and 11, should have been 3.70 inches.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve
Algona	Dr. F. T. Seeley
Allerton	Rex Shriver
Alta	D. E. Hadden
Alta (near)	W. J. Minard

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. JULY 1904. No. 7.

IOWA CROP REPORT, AUGUST 1, 1904.

Tabulated reports received from correspondents of the Iowa Weather and Crop Service show the following estimates of the condition of the staple crops on August 1, 1904:

Spring wheat, 75 per cent; corn, 88 per cent; oats, 89 per cent; flax, 94 per cent; pastures, 96 per cent; potatoes, 101 per cent; apples, 73 per cent; grapes, 86 per cent.

At corresponding date last year the estimates were as follows: Spring wheat, 82 per cent; corn, 73; oats, 77; flax, 84; pastures, 104; potatoes, 80; apples, 65; grapes, 80.

Compared with the estimates of condition on July 1, 1904, spring wheat shows a decline of 16 points, on account of the serious attack of rust and blight during the latter part of July. The estimates are two points lower on corn and oats as compared with the July rating. As a matter of fact, however, the general outlook of the corn crop is better than it was about the first of July, though it is still relatively about eight to ten days later than usual.

Secretary Greene, of the Iowa Horticultural Society, gives the following report of the fruit crop for August 1, 1904:

Summer apples, 62 per cent; fall apples, 64; winter apples, 54; peaches, 10; American plums, 60; domestic plums, 38; Japan plums, 45; grapes, 82 per cent. The best crop of apples is grown this year in the eastern part of the State.

JULY WEATHER AND CROPS.

This has been the coldest July since 1891, when the mean temperature for the state was 68.6°. The mean for this month, 70.6°, was 3.6° below the normal. The warmest period was the second decade. The average rainfall for the state, 4.41 inches, was .18 of an inch above normal. The northern section received an average of 3.77 inches; central section, 4.47; southern section 5.00 inches. Rain in measurable quantity fell at one or more stations in the state every day during the month. And yet the average number of clear days was 16, partly cloudy, 9, and cloudy, 6. Generally there was sufficient sunshine to promote plant growth. The days were warm, and nights unusually cool. The heaviest storm of the month, in respect to amount of rainfall, occurred on the night of the 19th; but the excessive downpour was limited to a few counties. On the whole the month was favorable for crops and field work. Corn was laid by from the 4th to the 15th,—about a week later than usual. During the showery period in the early half of the month spring wheat and oats were attacked by rust. The wheat crop was damaged seriously, but oats were not very badly injured. The latter half of the month was favorable for harvest operations and most of the small grain was in shock or stack before August 1st. Haying progressed quite favorably and though the yield was lighter than the average the quality was superior, and most of it was secured in good order. Corn made notably fine progress, despite the cool weather, and at the close of the month that crop was much more advanced than was deemed possible earlier in the season. Potatoes, garden truck, apples, small fruit and all minor crops made normal advancement.

WHEN CORN IS TASS'LING OUT.

There is music in the breezes
  As they rustle thru the corn,
There is grandeur in the sunrise
  As it dries the dew each morn;
There is gladness 'mongst the people
  And the farmers fairly shout—
There is always joy in Iowa
  When the corn is tass'ling out!

There is singing in the hayfield
  And along the dusty roads,
Where the farm boys drive the wagons
  With their fresh and fragrant loads;
The housewives sing so gaily
  As their tasks they go about—
There is heaps of joy in Iowa
  When the corn is tass'ling out!

Over yonder in the stack yard
  Rise the swelling yellow cones,
And the stackers toil and listen
  For the dinner bell's sweet tones,
While they laugh and greet each other
  With a lusty, ringing shout—
There's a pile of joy in Iowa
  When the corn is tass'ling out!

And the waving, nodding tassels
  Tell a story, short, but true,
Of the happy times a-coming,
  Of the debts a-coming due;
How we'll meet 'em and pay 'em.
  Every one without a doubt—
There's prosperity in Iowa
  When the corn is tass'ling out.

—J. F. Dalton, in Manson Democrat.

AS TO SEED CORN.

Throughout the corn belt there was last spring a vigorous effort made by some of the agricultural experiment stations to instruct the growers of corn in regard to their seed corn, its selection, planting, etc. While much good was thus no doubt accomplished, the right time to do this sort of work is in the fall of the year, at the time when the seed corn should be gathered from the field. Once knowing what to select for seed, the winter care of it is really a simple matter, bearing in mind the fact that to insure a perfect germination of seed corn it should be picked before frost and kept where it will not freeze until planted, for it is frost which is the principal destroyer of the vitality of seed corn.—*Trigg's Farm Notes.*

NOTES.

In Iowa corn is grown principally for the grain. In Franklin county, Missouri, the cob is more valuable in the market than the shelled corn grown thereon. The variety produced in that region is known as the cob-pipe corn, and the factories in that section manufacture cob-pipes for shipment to all parts of the world. In Iowa dry cobs are used for kindling fires, for which purpose they are sold in towns for about a dollar per load. So corncobs end in smoke, whether sold at the pipe factory or for fuel.

Our American maize is growing upon the world. Its merits as a wholesome food are just beginning to be understood. In every way corn, employing the word in the sense peculiar to America, is a staff of life. Where its use is most abundant the finest type of men and women is raised and domestic animals are unsurpassed in vigor. Corn is nutritious, compact in bulk, easily transported, and one of the least perishable of foodstuffs. It contains in itself the elements that will sustain life for an indefinite period. In this age of rapid commercial communication there should be no famine as long as such a large surplus of corn is available. Corn is cheap, in fact, too cheap. It is worth relatively more than it sells for. The price is not likely to go too high, for its production in this country, great as is the yield, could easily be doubled. From every point of view corn is one of the greatest of nature's gifts to man, though as yet imperfectly appreciated.—*St. Louis Globe-Democrat.*

THE MISCHIEF OF WRONG THEORIES.

During the past century there has been such steady progress in all branches of science that the more intelligent portion of the community has abandoned those notions with regard to astrology, alchemy, spontaneous generation, witchcraft, and other philosophies that were formerly accepted by the most learned. The diffusion of education has raised the children of the present generation above the level of the philosophers of a former generation. And yet we have seen it demonstrated again and again that the popular majority does not fully appreciate the extent of our present knowledge of the laws of the weather, and is still liable to resort to unscientific methods in hope of accomplishing that to which science has not yet attained.

We have seen communities in America and Australia carried away with the idea that cannonading can produce rain, or in Europe that the ringing of church bells or the offering of prayers can avert droughts and floods. In southern Europe the agriculturists are but just recovering from the strange belief that hail can be prevented by shooting rings of smoke toward the clouds. During the past ten years a wealthy engineer of Russia has devoted his fortune to the conversion of the people to his idea that the moon controls the weather, and so seriously does his advocacy of this error affect the uneducated agricultural community that the director of the weather service at Odessa (Klossovsky) has gone to the trouble of publishing an elaborate statement of the errors in fact and theory committed by this engineer. He shows very clearly that Demtchinsky's method of predicting the weather by lunar periods amounts to nothing more than predicting an average condition, an average which very rarely occurs, whereas the departures from it are very frequent. The verifications of these predictions are like the combinations in an ordinary game of chance, where there is an equal number of heads and tails, or hits and misses.

As the collection of meteorological statistics depends so largely upon the voluntary work of thousands of upaid observers, it is to be feared that the good work we are doing in America may be seriously interrupted if erroneous views are allowed to have an influence in this country as profound as they seem to have in southern Russia.

We can not repeat too often and too clearly the general proposition that meteorology is to be advanced only by studying in details the effects on the atmosphere of insolation, radiation, the diurnal rotation and annual revolution of the earth, and the presence of continents and oceans.—*Monthly Weather Review.*

THE PLANETARY WEATHER PROPHETS.

The prophets who profess to believe that variations in temperature and precipitation are due to movements of the planets have come to grief out in California. According to the most recent issue of "The United States Monthly Weather Review," they promised the farmers an abundance of rain last winter, but their hopes were not realized in the southern part of the State. There is no reason to imagine that the authors of these fallacious assurances are particularly dejected over the result, but the failure of the prediction is influencing public opinion in a wholesome manner. Remarking upon the disappointment, The San Diego *Times* says: "We are thrown again upon the Weather Bureau, with added experiences in discounting old-time signs as interpreted by that wonderful array of weather-wise men who annually find their way into print to demonstrate what they can not predict about the weather."

The methods of the planetary forecasters—those of them who are honest, at least—are defective in several ways. They seldom sit down a year after their predictions have been issued and make a rigid comparison between the promise and the actual facts. Such a proceeding would be instructive in the extreme, though highly discouraging. They also neglect to formulate any system of mechanism whereby the planets can do the work imputed to them. They usually exhibit a singular ignorance of well established and fundamental laws. One of these men, for instance, mentions in a letter to the Weather Bureau the usual prevalence of easterly winds in Southern California last winter, and thinks that they were the result of some magical celestial influence. There is a much more simple way to account for them. Observation at government stations shows that there was an unusually high atmospheric pressure in the centre of the continent for several months, beginning with November, and a deficiency along the Pacific Coast. Now, the air always flows from a high area toward a low one, and the velocity is proportional to the "gradient." The latter having been steeper than is common, the movement should have been more vigorous than ordinary. The abnormal prevalence of easterly winds and the deficiency in precipitation in the vicinity of San Diego and Los Angeles, therefore, were closely related

to the severity of the winter in the eastern half of the country, which was due primarily to differences in pressure between the heart of the continent and the Atlantic Coast.

One of the most important advances made in meteorology in the last few years is the revelation that simultaneous changes occur in pressure in widely separated regions. In a recent number of "Nature" W. J. S. Lockyer gave striking illustrations of the barometric seesaw. Going back through an interval of over thirty years, he showed that when the pressure was sensibly higher than the average in India it would almost invariably be below the mean in South America. Between the areas which exhibit opposite conditions the boundaries are not yet well defined, nor is the duration of an abnormal state of things always the same. The interval apparently varies from one year to four. There does not appear to be a regular periodicity from which couclusions regarding the future can safely be drawn. Nevertheless, there is a significance in the single fact that the opening of a new chapter of history in one locality is often attended by a corresponding change in another, remote from the first. The phenomenon needs more study before it can be turned to account practically, but it seems to point to a thoroughly rational system of long range forecasting. It will not enable the expert to predict what will happen on a particular day, but it may possibly assist him to reach a fairly accurate conclusion of the general character of a period several months in length.

Caution must be exercised in attempting to explain sustained departures from the average of many years over a large area. Compensating excesses or deficiencies in other parts of the globe are perfectly intelligible because there is only just so much atmosphere. Accumulations here mean scarcity there. It is conceivable, of course, that exceptional obscurity in one locality, say, from an abundance of volcanic dust, might thus destroy the balance by cutting off some of the sun's heat in one locality. There is a stronger probability, however, that fluctuations in the output of solar energy will some day be logically connected with the observed effect. Any one who is familiar with the extent and violence of the disturbances which occur on the sun will find such a suggestion more credible than the notion that diminutive bodies, whose surfaces undergo no apparent change, have any appreciable influence.—*N. Y. Tribune.*

CLIMATOLOGY OF THE MONTH.

BAROMRTER.—Mean pressure, 29 98 inches; highest observed, 30.32 inches, at Dubuque, on the 2d; lowest observed, 29 69 inches, at Davenport on the 11th; range for state, 0.63 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 119 stations, was 70.6°, which is 3.6° below normal. By sections the mean temperatures were as follows: Northern section 69.1°, which is 3.9° below normal; Central section 71.0°, which is 3.1° below normal; Southern section 71.70°, which is 3.9° below normal. The highest monthly mean was 74.0° at Keokuk; lowest monthly mean, 66.5° at Cresco. The highest temperature reported was 100°, at Marshalltown on the 17th; lowest temperature reported, 38°, at Fayette on the 2d. The average monthly maximum was 93.1°; average monthly minimum, 46.8°. Greatest daily range, 43°, at Logan; average greatest daily ranges 33.4°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 117 stations, was 4.41 inches, which is 0.16 of an inch above normal. The averages by sections were as follows: Northern section, 3.77 inches, which is 0.41 below normal; Central section, 4.47 inches, which is 0.38 above normal; Southern section, 5.00 inches, which is 0.54 above normal. The largest amount reported was 11.97 inches at Thurman; least amount reported, 1.28, at Plover. The greatest daily rainfall reported was 7.73 inches at De Soto on the 19th. Average number of days on which .01 of an inch or more was reported, 10.

WIND AND WEATHER.—Prevailing direction of the wind, southwest; highest velocity reported, 42 miles per hour, from the northwest, at Sioux City on the 3d. Average number of clear days, 16; partly cloudy, 9; cloudy, 6.

OBSERVERS' NOTES.

ALTA.—*David E. Hadden.* July mean temperature was 3° below normal, and rainfall about 1.50 inches less than average of preceding fourteen years.

AMANA.—*C. Schadt.* Nights were cool, and weather very favorable for ripening grain and harvesting, with sunshine and rain enough to promote growth of corn.

ATLANTIC.—*J. W. Love.* Corn has made rapid growth, though nights were cool.

BONAPARTE.—*B. R. Vale.* Rain, 4.43 inches, but latter half of month was dry; good harvest weather after the 10th.

BRITT.—*Geo. P. Hardwick.* Wind and hail on 14th and 17th lodged grain and blew off apples. Wheat barley and potatoes good.

CHARITON.—*C. C. Burr.* No severe storms; temperature did not rise above 90 in July.

CLINTON.—*Luke Roberts.* A fine month for all crops, out of door work and personal comfort. Rain, 3.18, barely enough for crops; corn, potatoes and fruit doing well; grain and hay mostly secured.

COLUMBUS JUNCTION.—*J. B. Johnston.* On the 30th a severe electric storm caused damage to buildings and live stock.

FOREST CITY.—*J. A. Peters.* Harvesting oats began about 23d; early corn in tassel on 25th; oats about one-third in shock at close of month.

GRAND MEADOW.—*F. L. Williams.* Month was generally favorable for crop growth; barley crop heavy; oats and wheat rusted; pastures extra good; hay light; corn late.

GRINNELL.—*A. O. Price.* Perfect harvest month and all matured crops secured in fine condition.

HANLONTOWN.—*Miss G. M. Paschen.* Haying began the 6th; harvest of oats, 28th; heavy storm night of 29th damaged small grain and corn; some damage by hail.

IDA GROVE.—*J. E. Conn.* Corn doing well; haying nearly done; fruit crop good.

INWOOD.—*G. M. Larson.* The month was very favorable for farm work; abundant crop of good hay put up; corn looking well.

LOGAN.—*M. B. Stern.* Month changeable, cool and warm, but crops have grown finely.

OLIN.—*Nathan Potter* Good month for farm work, which was well advanced at its close.

POCAHONTAS.—*F. E. Hronek.* Excellent weather for haying and harvesting; corn tasseling and silking at close of month.

RIDGEWAY.—*Arthur Betts.* Coolest July on record here; 341 hours of sunshine; just enough rain, and crops are promising; hard windstorm on the 18th, with some damage to orchards, etc.

WAUKEE.—*E. J. Leonard.* Storm on 19th was severest in years; more rain fell in ten hours (6.80) than fell in May and June.

BELATED REPORTS.

FAYETTE.—May. Mean temperature 57.0°; mean maximum 70.0°; mean minimum 44.1°; maximum temperature 87° on the 20th and 22d; minimum 30° on the 10th; greatest daily range 39°; total precipitation 4.99 inches; greatest in 24 hours 1.16 inches on the 25th; number of rainy days, 7.

FAYETTE.—June. Mean temperature 65.3°; mean maximum 77.8°; mean minimum 52.8°; maximum temperature 88° on the 23d; minimum temperature 40° on the 9th; total precipitation 2.02 inches; greatest in 24 hours .83 inches on the 23d; number of rainy days 8.

VILLISCA.—June. Mean temperature 66.6°; mean maximum 79.0°; mean minimum 54.1°; maximum temperature 88° on the 21st; minimum temperature 43° on the 30th; greatest daily range 35°; total precipitation 2.73 inches; greatest in 24 hours .57 inches on the 20th; number of rainy days 11; clear 10; partly cloudy 16; cloudy 4; prevailing direction of wind, southwest.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. AUGUST 1904. No. 8.

AUGUST WEATHER AND CROPS.

The average temperature of August, 1904, was exactly the same as August, 1903, 1902 and 1891. The mean was 2.7° below the August normal. In the northern section it was 67.3°; central section, 69.2°; southern section, 70.7°. The month was mostly clear and warm by day, though unseasonably cool at night. The average rainfall was normal for the state, but in its distribution the larger amount was received in the south and eastern districts, where it was most needed. The bulk of the rainfall came about the 17th to 21st and the 29th. There were, on the average, 17 clear days, 8 partly cloudy, and 6 cloudy, affording an ample amount of fair weather for harvesting, stacking, threshing, cutting wild hay, millet, etc., and fall plowing. In all these farm operations very good progress was made. The pastures were revived and made green as in June by the copious showers in the latter half of the month. The corn crop made fair advancement during the month, though in view of its belated condition its progress was not as rapid as seemed desirable. The most advanced portion of the crop was well filled and dented at the close of the month. Reports at that time indicated that about one-third of the crop, with favorable conditions, would be mature by September 20th, while the balance required abundant warmth and sunshine until October 1st to be safe from harm by killing frost. The crop was unusually rank, green, and heavily eared. The minor crops were in good condition. Potatoes made heavy yield, and early apples were especially good and abundant. The yield of tomatoes and green corn for canning has been better than usual. Garden truck, cucumbers for pickling and melons yielded abundantly.

THE WEATHER SERVICE.

The *American Cultivator*, one of the ablest agricultural journals in America, says:

"The weather-reporting service, particularly in New England and the Middle States, has been excellent this summer, and has proved decidedly of use during the hay harvest. Year by year the department workers and their correspondents are adding to their efficiency as the result of experience.

"The time has come, arrived long ago, in fact, when farmers can rely quite safely upon the reports given out. A farmer who is naturally a good judge of local weather signs, and who has learned how to study the government weather reports including the weather conditions in other parts of the country, has a decided advantage in planning his farm work.

"Local signs by themselves are not very reliable, and do not usually indicate the weather long in advance. But the government weather men are often able to predict fairly well several days in advance, owing to the reports of weather in other sections, and its known rate of advance and length of duration. Those who still doubt the usefulness of these reports should compare them for awhile with the judgments of those who depend wholly upon observation of the sky and similar means. For long-time predictions the station reports will no doubt show the better average of correctness.

"The careful observer will soon learn to strike a balance between the reports and local indications, and will get the full usefulness of each. The study of weather signs, and also the charts and reports, should be an item in the public school course of every town."

SELECTED NOTES.

All the gold in America—the greatest hoard of yellow metal ever gathered in any country—could not buy one year's harvest of our corn and wheat. To buy one season's wheat crop would take all the gold mined in this country in six years. In the past seven years all the gold mines of the world have only produced enough to buy one year's yield of our six cereals. The cereal, cotton and hay crops, more than one hundred and fifty million tons, could not be bought with all the money in the country, as our stock of money—gold, silver and paper—has not yet reached the stupendous total of two and three-quarter billion dollars.—*Wall Street Journal.*

It has been ascertained that not less that 4,000,000 acres of land in the state of Iowa, much of it under cultivation, would be greatly benefited by drainage, while Minnesota has probably as much more. These wet lands are the best lands when the water is got rid of. This needed drainage is now well under way in both states. Huge ditchers operated by steam and gasoline engines are at work making main waterways sometimes twenty miles in length, while smaller machines are putting in laterals and feeders. Later tile drains on the farms tributary to these ditches will relieve these choice lands from the plague of standing water and make possible the production of the finest of crops.—*J. S. Trigg.*

Of course not all of the carbonic acid in the air is secured, nor indeed all of that which enters the cellular air pass ges of the green parts of the plant, and hence it follows that very much larger volumes of air than have been stated must be brought into close contact with the growing clover in order to meet its needs. This air, however, can not come into intimate relations with the green chlorophyll-bearing cells of the clover in the field without of necessity permitting the evaporation of large quantities of water from the plants; and this brings us to realize how imperative is the demand for water by rapidly growing crops. The writer has found, for example, by direct measurement that the air passing three feet above a clover field, and at a moderate rate,

even as early as May 30th, in Wisconsin, when the air temperature is only 52.48 F., may have its relative humidity increased from 44 to 48 per cent by the moisture taken from the field; and this means that 3,510 pounds of water are required to make even the observed change of humidity in a volume of 152,600,000 cubic feet of air, which is the amount required to carry to the clover crop its carbon, supposing all the carbon which the air contained to be utilized.—*Prof H. F. King.*

GREAT VALLEYS FOR GREAT NATIONS.

The following article from the columns of the *New Orleans Picayune* contains matter of interest, especially for geographic students:

The Mississippi Valley is the most extensive and the most fertile and productive agricultural region on the globe. It is in the north temperate zone, and, therefore, it possesses climates best suited for the residence of people of the white race, and consequently, is the most favorable to the development of the highest civilization. Covering an area of nearly two million square miles, it embraces conditions capable of sustaining a dense population, and there is no question that it is destined to become the seat of power of the greatest nation that has ever inhabited the earth.

All great nationalities grow up in valleys, because it is only in such situations that food products and the other material requisite for the maintenance and employment of a large population can be found. The Valley of the Nile was the seat of a great Egyptian power. The Valley of the Euphrates was the heart of the Babylonian Empire. The great nations of India and China grew up in the wide valleys along their mighty rivers. In modern times when ocean transportation is so available food products and other raw material can be carried to the countries that do not possess them, but it may be laid down as a rule that the greatest nations grow up in locations where their populations can be most cheaply fed and most advantageously employed.

It has been frequently suggested that the Valley of the Amazon, in South America, is to be at some time in the future the seat of one of the world's greatest national powers. It contains two million square miles, while the Amazon itself is the greatest river on our globe, with numerous navigable tributaries. All such prophecies are vain, because the mouth of the mighty river lies immediately under the equator, and the whole of the valley's area is in the torrid zone.

United States Consul Louis H. Ayme, in a report to the Department of Commerce, at Washington, gives an account of a recent journey of exploration made by him to Manaos at the mouth of the Rio Negro, a large tributary that comes into the main river from the north. He reports that the Amazon river may be divided into three parts: "The lower Amazon, extending as far as Manaos, where the Rio Negro flows into it, a distance of about 900 miles; the upper Amazon, from Manaos to Iquitos, near the Peruvian boundary, a distance of perhaps 1,800 miles, and the Peruvian Amazon region, with navigable rivers for a distance of 1,600 miles and more. This amazing river system, which empties into the Atlantic, through a series of mouths 180 miles wide, more than twice as much water as the Mississippi carries in flood, and which stains the ocean for a distance of 600 miles, lies in a broad, flat valley elevated but a few inches above flood level, with an inclination of only about 1 foot in 5 miles. This valley almost always flooded, is covered with vast forests, in which at sparse intervals are found occasional hard-wood trees of some value. This depression, at least 30 miles wide, has a swift, very deep river running through it, with a breadth of from 2 to 6 miles. The thick forest growing up out of the water forms the so-called "banks." Here and there are patches of slightly elevated ground on which Indian huts are erected. To make this huge river and to sustain the growth of the vast matted forest, rain—much rain—is needed, and it is a fact that more rain falls in this region than in any other of like extent in the world. As one sails or steams up the great river there are seen occasional patches of green, level vegetation, for all the world like wondrously fertile meadows, and it is not difficult to imagine great flocks of cattle feeding on them, until the sight of a capybara or tapir, more than knee deep in the green ooze, informs one of the real consistency of that tempting and solid-looking meadow; it is little better than a swamp.

In these extraordinary forests there are found some of the most beautiful and valuable woods in the world, as well as fruits, nuts, oils, balsams and gums, but—and this but is unsurmountable—they are found as rarely as diamonds in the gravel or gold nuggets in the streams. There is a false impression existing that rubber trees, ebony, rosewood, and all the rest are found in great groves or clusters, like our pine or oak forests. The fact is that these trees are solitary. When two of them are only a quarter of a mile apart (and remember that the quarter-mile is not open space, but thick-matted, almost impenetrable swamp forest) they are considered close together; if they are a mile apart they are not considered to be very far distant from each other. Nor does this huge forest produce any great quantity of food for human beings. The staple articles of food for the dweller on the Amazon is dried pirarucu, a huge, fat river fish, and "farinha," the starch of the manioc root.

In all that vast region which lies under a tropical sun the only towns are Para, at the mouth of the Amazon, and Manaos, 900 miles up the river at the confluence of the Rio Negro, and in every other direction there are no settlements, and only a few scattered tribes of natives, who move about from tree to tree of the dense forest when they can no longer remain upon the flooded lands.

If the Valley of the Amazon were in a temperate zone, it would be sought and settled by the whites, who would control its river floods by levees, cut down its forests, cultivate its lands, and build towns and cities. But under a tropical sun and in a climate which is deadly to all people of the white race, the Valley of the Amazon is as hopeless of such a future as are the valleys of the Congo and the Niger.

The only parts of South America that are fit for the habitation and development of the white races are the countries in the lofty mountain region of the Pacific coast, and Argentina, the southern part of Brazil, Paraguay and Uruguay. South America is not likely to ever give rise to any great dominating power, because the requisite physical and climatic conditions are lacking. Only a small portion comparatively of South America lies in a temperate zone, and, therefore, North America will continue to dominate the hemisphere.

WHEAT RUST.

In an article on "Wheat Rust," Prof. W. M. Hays, who is one of the greatest authorities on wheat cultivation, discusses the subject very exhaustively.

Professor Hays says that the rusts of cereal grains are caused by a class of minute parasite plants, which do not produce flowers or seeds, but their means of reproduction are by spores. There are several species of these pestiferous plants, the life histories of which are not fully worked out; but it is certain that their spores live over winter and germinate on the surface of the leaves of wheat and other members of the grass family.

The only outward evidence of the presence of these plants is their heads or seed-like spores. The bodies of the plants are mere slender branching threads, growing through the tissues of the leaves and stems of plants. Sometimes they grow throughout the plant without forming spores. Their thread-like branches extend out under the plant's skin, there developing some little round spores so numerous, that as they grow and

swell, they push up the underskin of the plant and burst it open. The patches on leaf or stem being evidence of the presence of yellow or black masses of spores.

These rust parasites use the food that belongs to the kernel of the wheat in producing both the spores and the thread-like bodies of the rust plants. It may be that the parasite has other injurious effects on the growing grain than the mere absorption of its food, but of this little is known. The amount of spores showing is evidently not always the index to the amount of injury done.

But when there are large amounts of rust spores there is certain to be considerable damage. This subtle disease is always present and all our fields are exposed to it, as all towns are constantly exposed to the germ of consumption. In favorable seasons the rust diseases do not spread rapidly and each wheat plant has none or so little that its vitality is not sapped; just as men do not succumb to consumption in the high altitudes and dry atmospheres of some southern states. In moist warm seasons, on the other hand, the rust multiplies rapidly and the large, soft wheat plants are compelled to support such a burden of these internal foes that their vigor is seriously impaired, just as the human family when placed in damp, unhealthful conditions is much more liable to succumb to germs of tuberculosis.

As a man or a cow will thrive under favorable conditions with a small amount of tubercular germs in the system, so a wheat plant will fatten up its berries if burdened with only a few of the thread-like bodies of its parasite. But if the conditions are unfavorable the man or the cow grows poor; and with bad conditions the wheat can not fatten up its berries; or, if the rust develops early in the life of the host plant, it sets but few berries and we have but few shrunken kernels.

Little is known, it seems, as to whether one species of rust under certain climatic conditions is worse than another, but appearance of spores before harvest is generally heralded as an unusually bad omen, and whether the presence of dark-colored spores is more significant of injury than yellow spores is not well understood. It is true, however, that the dark spores usually appear later in the season on the stubble of the grain and live over the winter. In a year of cool weather at the ripening season the effect of rust is often over-estimated as proven at threshing time.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 30.03 inches; highest observed, 30 34 inches, at Dubuque and Des Moines, on the 23d and 26th; lowest observed, 29.60 inches, at Davenport, on the 19th; range for state, 0.74 inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 115 stations, was 69.1°, which is 2.7° below normal. By sections the mean temperatures were as follows: Northern section, 67 3°, which is 3.2° below normal; central section, 69.2°, which is 2.4° below normal; southern section, 70.7°, which is 2.9° below normal. The highest monthly mean was 73.3° at College Springs; lowest monthly mean, 65.0° at New Hampton and Sibley. The highest temperature reported was 97°, at Mt. Ayr and Waukee, on the 13th; lowest temperature reported 35°, at Earlham, on the 8th. The average monthly maximum was 91.4°; average monthly minimum, 44.0°. Greatest daily range, 45° at Rock Rapids; average of greatest daily ranges, 35.1.

PRECIPITATION.—Average precipitation for the state, as shown by records of 126 stations, was 3.43 inches, which just equals the normal. The averages by sections were as follows: Northern section, 2.89 inches, which is 0.16 inch below normal; central section, 3.24 inches, which is 0.29 inch below normal; southern section, 4.15 inches, which is 0.45 inch above normal. The largest amount reported was 6.75 inches at Fort Dodge; least amount reported, 0.66 inch, at Sibley. The greatest daily rainfall reported was 4.00 inches at Fort Dodge on the 29th. Average number of days on which .01 of an inch or more was reported, 7.

WIND AND WEATHER.—Prevailing direction of wind, southwest; highest velocity reported, 42 miles per hour, from the south, at Sioux City, on the 3d. Average number of clear days, 17; partly cloudy, 8; cloudy, 6.

OBSERVERS' NOTES.

ALTA.—*David E. Hadden.* The rainfall for August was .88 inch above the 14 years' normal; temperature about normal.

ALLERTON.—*Rex Shriver.* Favorable month for all kinds of work; fall pastures starting well; apple crop good.

AMANA.—*C. Schadt.* First and second decades very dry and favorable for threshing; corn made good progress.

AMES.—*Thos. S. Hunt.* Corn backward at close of August, needing 3 or 4 weeks without frost.

ATLANTIC.—*J. W. Love.* A peculiar month; only one thunderstorm in August; light, harmless frost on morning of 8th.

BONAPARTE.—*B. R. Vale.* Rain 4.40 inches, well distributed; temperature below normal; pastures good.

BRITT.—*Geo. P. Hardwick.* Generally fair, with no severe storms; cool nights, with two light frosts on low lands (8th and 22d); wheat rusted badly; oats yielding 28 to 30 bushels, of good quality; barley about same; corn uneven.

CHARITON.—*C. C. Burr.* A month of bright, pleasant days and cool nights; corn needing 30 days after close of August.

CLINTON.—*Luke Roberts.* Mean temperature of August 2.4° below normal; rainfall 2.34 inches in excess of normal; crops made good growth; lightning did some damage in this county.

FOREST CITY.—*J. A. Peters.* Light frost in low places on 8th; no damage; not over 25 per cent of corn in full roasting ears at close of month.

GREENFIELD.—*J. G. Culver.* Two brilliant meteors on evening of 10th, between 9:30 and 11.

GRINNELL.—*A. O. Price.* Weather fine for stacking and threshing; clear days prevailed.

HAMPTON.—*E. C. Grenelle.* Frost observed in several places on morning of 8th and 22d; no damage.

HANLONTOWN.—*Miss G. M. Paschen.* Threshing from shock begun on the 11th. Oats good quality and average 40 bushels per acre.

HOPEVILLE.—*M. T Ashley.* Month closed with corn late; will require a full month of warm weather to mature the crop.

IDA GROVE.—*J. E. Conn.* Exceptionally fine weather; warm days and cool nights; corn doing well and pastures good.

INDIANOLA.—*John L. Tillon.* On 17th lightning struck a barn six miles west of town, set it on fire and killed a boy.

INWOOD.—*G. M. Larsen.* August generally fair; nights were cool; oats and barley make good yield; wheat damaged by rust and poor; large fruit crop; lightning has done much damage.

KEOSAUQUA —*J. H. Landes.* Remarkably cool nights have been most marked features of the month.

LARRABEE.—*H. B. Strever.* On the 17th lightning struck barn of Jas. Main, a few miles northeast of Cherokee. Martin Main was killed instantly.

OLIN.—*N. Potter.* Rain sufficient for fall pasture and for fall plowing; corn has done well, but is ten days late.

RIDGEWAY.—*Arthur Betts.* Warmest August since 1901, with 354 hours of sunshine; rainfall light, more than half falling on 9th; a pretty fog-bow observed on the 20th; mirages on the 2d and 6th; crops will compare favorably with 1893.

ZEARING.—*H. E. Burkhart.* Four miles northwest of town about 15 acres of corn killed by frost, on the 8th; shock threshing all done by 31st.

ERRATA IN JULY REVIEW.

EARLHAM.—Total precipitation recorded 6.23 inches on pages 7 and 11, should have been 6.33 inches.

ESTHERVILLE.—Maximum temperature recorded on the 17th, page 7, should have been on the 16th.

FLORENCE.—Total precipitation recorded 4.54 inches on pages 7 and 11, should have been 4.00 inches. Amounts on 13th and 19th, should have been .03 inch, instead of .30 inch.

HARLAN.—Mean temperature recorded 71.4° on page 8, should have been 71.0°.

MT. AYR.—Mean maximum temperature recorded 84.3° on page 10, should have been 84.1°.

SIGOURNEY.—Minimum temperature recorded 51° on the 1st, page 7, should have been 46° on the 2d.

WAUKEE.—Minimum temperature recorded 52° on the 1st and 2d, page 8, should have been 1,2, 23d.

ATLANTIC.—Mean temperature recorded 70.6° on page 7, should have been 70.5°. Mean maximum temperature recorded 83.6° on page 9, should have been 83.3°.

GALVA.—Mean maximum temperature recorded 82.0° on page 9, should have been 82.4°. Mean temperature recorded 69.8° on page 8, should have been 70.0°.

IDA GROVE.—Mean temperature recorded 72.4° on page 8, should have been 72.2°. Mean maximum temperature recorded 83.9° on page 9, should have been 83.6°.

MARSHALLTOWN.—Mean maximum temperature recorded 84.4° on page 10, should have been 84.3°.

MASON CITY.—Mean minimum temperature recorded 60.2° on page 10, should have been 60.3°. Mean temperature recorded 70.3° on page 7, should have been 70.4°.

CRESCO.—Maximum temperature recorded on the 17th, page 7, should have been 17th and 18th.

BELATED REPORTS.

MONTEZUMA, July.—Total precipitation, 5.13 inches; greatest in 24 hours, 3.10 inches on the 19th; number of rainy days, 6.

VILLISCA, July.—Mean temperature, 70.6°; mean maximum, 82.4°; mean minimum, 58.9°; 59.8°; maximum temperature, 92° on the 16th, 17th and 18th; greatest daily range, 34; total precipitation, 7.70 inches; greatest in 24 hours, 3.05 inches on the 19th; number of rainy days, 8; clear, 17; partly cloudy, 12; cloudy, 2; prevailing wind from the southwest.

NORTHWOOD, July.—Mean temperature, 69.3°; mean maximum, 80.5°; mean minimum, 58.1°; maximum temperature, 91° on the 17th; minimum, 47° on the 2d; greatest daily range, 35; total precipitation, 5.00 inches; greatest in 24 hours, 1.00 on the 6th and on the 17th; number of rainy days, 11; clear, 16; partly cloudy, 9; cloudy, 6; prevailing direction of wind from the northwest.

U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. McDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. SEPTEMBER, 1904. No. 9.

SEPTEMBER WEATHER AND CROPS.

The average temperature of September was about normal for the state, the southern and central sections showing an excess, and the northern section a small deficiency. The coldest period was from about the 11th to the 22d. The average rainfall for the state was 2.78 inches, which amount is about 0.52 of an inch below the normal for September. In its distribution there was much inequality, ranging from less than a tenth of an inch at one station in the northwest to over eight inches in the southeast district. The southeast and northeast districts received the heaviest rainfall. The week ending September 12th was normal in temperature and sunshine, with very light rainfall, and generally favorable conditions for ripening the belated corn crop, a considerable portion of which was well dented with husks and blades putting on the brown shade of autumn. The week ending the 19th brought several days of good ripening weather, but much anxiety for the safety of the immature portion of the corn crop was caused by the occurrence of light to heavy frosts on the mornings of the 12th, 14th and 15th, the cold wave extending to all districts in the state. A few stations also reported frost on the 21st. The lowest temperature recorded was 30° at four stations. The observed effects proved that the frosts were not "killing," and that the damage to the corn crop was limited to late planted fields in the bottom lands of the central valleys of the state. Broadly stated, the actual damage by frost affected less than one-fourth of the area planted, and the shrinkage of the frosted portion of the crop was probably less than 20 per cent. This would indicate possible loss of 5 per cent of the crop for the state, as the direct result of frost. The cold weather of that period, however, retarded the development of the crop, and made it desirable to extend the ripening weather beyond the 1st of October. During the month good progress was made in the usual farm operations, such as plowing, seeding fall wheat and rye, harvesting potatoes, apples and millet, and threshing small grain. The yield of potatoes and fall apples has been very satisfactory. The grape crop is heavy, and there has been a good yield of plums. The growth of all kinds of garden truck has been unusually heavy. The pastures have been much better than usual for September. At the close of the month it was estimated that ninety per cent of the corn crop was practically safe, giving promise of more than the average output of merchantable corn.

A VALUABLE SERVICE.

That the government climate and crop service as conducted under the auspices of the weather bureau of the United States Department of Agriculture is playing an important part in the economic conditions of the farmer is forcibly called to mind in the review of the annual Iowa report for the year 1903 as it has been issued by the director of the Iowa bureau at Des Moines. It is interesting to note that during the year there were issued 10,000 copies of the 1902 report, 32,000 monthly reviews, 70,000 weekly climate and crop bulletins, not to mention an appendix of 185 pages in connection with the annual report. This shows the magnitude of the service in one state from the standpoint of printed matter distributed.

Fortunately, in Iowa, the state and the federal goverments have been enabled to unite their forces, thus insuring better results to the farmer by virtue of this consolidated service. It is interesting to note that at the end of the fiscal year ending June 30, 1904, there were 50,000 rural patrons of telephones in Iowa who were daily receiving the benefit of the climate and crop service. In addition to these there were 7,000 farmers getting the reports from the bureau through the mails direct, not to mention the tens of thousands who had the information placed before them through the agency of the daily press.

The Iowa service has six regularly equipped stations in different portions of the state, from which accurate information regarding climatic changes is always available. In addition to this there are 132 correspondents in various portions of Iowa who are in close touch with local conditions and report weekly their observations to the main office at Des Moines, from which the officials of the service are enabled to summarize the important details in making up their weekly crop reports.

Every year farmers are learning the value of this service. With the advent of the telephone and the rural mail their value to the man in the country is to be rapidly enhanced until the time is here when no progressive farmer will be without daily, and, if necessary, hourly information relative to possible climatic changes.—*Chicago Drovers Journal.*

NOTES AND COMENTS.

According to a recent report of the U. S. consul at Halifax, the province of Nova Scotia has been scorched by one of the worst droughts in its history, the most disastrous effects being suffered in the eastern portion. It will cause much privation, and possible hunger.

Macaroni wheat escaped rust in the Dacotas, and this fact is likely to enlarge the area of that grain in future years. If good bread may be made of the flour, its rust-resisting quality will insure its commercial value.

In a flash of lightning the air is simply heated momentarily to the point of incandescence along the path of the discharge. This is the accepted scientific theory as to the nature of the electric spark or flash.

The moon affects the tides and is an aid to courting but, she has not a thing to do with the weaning of babies and calves or the planting of potatoes.—*J. S. Trigg.*

If the fertilization of the soil is the main thing sought, try mammoth clover, plowing the whole thing under the second year. It is the cheapest method of renovating a wornout field there is to be found.—*J. S. Trigg.*

The brief summer season of the north country is a miracle worker. Out of the long winter paralysis, the snow banks, the chill and dilatory spring, with May frosts and snowstorms, the grip of the cold is broken at last, and heat, moisture, electricity and seventeen hours of sunshine get in their work. Grain, fruit and flower then go on a wild sixty mile an hour race, and the garden of Eden replaces the arctic winter waste. Such wheat, such oats, such flax, such potatoes and garden truck, and life on the farm one mad rush to save and gather the abundance before the geese start south and the praties freeze in the ground! Three months of heaven to offset nine months of purgatory! The Finn, the Russian and the Norseman take kindly to these conditions.—*J. S Trigg.*

WEATHER AND CROPS IN UNION COUNTY.

The close of this year of crop reports finds us with clear skies and warm air. This has been a whole season of anxie y as to the outcome of our crops. Today finds our corn crop ripening except the belated plantings, and even this is turning color in husk and blade, and with present indications is likely in this part of the state to make corn. Taking it altogether we have an average crop for ten years. Hay not so good as last year, but oats equally as good. Potatoes much better, and, corn very much better; and during all the year pastures have been fine. The rainfall last year, from May to September, inclusive, was 37.43 inches, while this year it was only 19.01 inches; and yet for the farmer this has been as wet a season as last. This is from the fact that we had frequent rains, and some quite heavy. We have had no great downpour at any one time. In May last year we had 11.90 inches while this year we had 4.20. In August, 1903, we had 12 34; this year, 4.66 inches. This excess for 1903 is from two great rains, one in May and one in August. The average temperature has been lower this year than last. With the promise of high p ices for farm products (except meats) the farmers are quite as well off as they have been in the best seasons.

N. W. Rowell,
Vol. Observer.

Afton, Iowa, October 1, 1904.

CROP SEASONS AT RIDGEWAY.

Observer Arthur Betts, of Ridgeway, Winneshiek county, has tabulated meteorological data for the crop season—April 1st, to October 1st, for seven years. The figures below show the mean temperature in degrees, precipitation in inches, and total hours of sunshine for the six months period in the years named:

YEAR.	Mean Temperature.	Precipitation.	Sunshine.
1898	67.7	13.59	1,657
1899	66.8	19.70	1,561
1900	69 4	23 43	1,715
1901	69 8	20.47	1,704
1902	66.0	30.86	1,378
1003	66.4	25 04	1,436
1904	67.1	18.45	1,584
Average	67.6	21.65	1,562

FAKE FORECASTS.

In ordinary mercantile business it is quite a common experience for the manufacturer of a good article that is rapidly growing in popular favor to find counterfeits or infringements on his patent springing up like mushrooms, and sometimes offering very serious and illegitimate rivalry. The Weather Bureau has gone through a very similar experience. In 1870 there were, we believe, no long-range forecasters known to the country, except the ordinary farmers' almanacs, and we doubt whether any but the most credulous placed any faith in them. I have often told of the confession of one of these almanac weather makers, who with a twinkle in his eye said that after the proper astronomical part of the almanac was completed, and when he was in the spirit for writing up the weather, he would sit down and make it up for a year ahead, or so long as he felt in the mood. He fully understood that some people can be gulled sometimes, but we all know that we can not fool all the people all the time. So far as we recall the names of those who have distinguished themselves for making popular weather predictions based on principles that are contrary to all our knowledge of meteorology, the list runs somewhat as follows: Venor, 1875–1890; Hicks, 1890 to date; Dunne, 1892 to date; Foster, 1885 to date; Elmer, 1903 to date; Snavely, 1902–1904.

While these have been active in the United States, the rest of the world has also had its varied experiences. In England, Mr. Hugh Clements and his great expounder, Hon. William Digby, have vexed the printer with an imposing volume and the public with daily predictions in the local newspapers. These authors speak as confidently about the moon as Rev. Mr. Hicks does about Vulcan, Jupiter and the other planets, real and imaginary. Italy and Austria have gone through a sad experience with vortex-ring cannons for driving away hail. Russia has enjoyed the gratuitous services of Demtschinsky and his predictions based upon the moon.

In general, it would seem that weather predic ion and long-range forecasts are so greatly desired that everyone is willing to give a man a fair show. The wonder is that the indefinite utterances of these oracles can be accepted as forecasts, or that their flat failure when they do not become definite should not have consigned them to oblivion. Recall, for instance, the sad work of Falb, who in 1895 predicted terrible earthquakes and storms, possibly indicating the approaching end of the world, thereby frightening the whole of Spanish America, so that no work could be done for weeks and the whole community was thrown into a hopeless state of panic. Recall the prediction made about 1880 of an awful storm that would scourge the Gulf and South Atlantic States. Many of the intelligent inhabitants and nine tenths of the less intelligent were frightened by the prediction, and allowed it to entirely alter their ordinary lives and business.

Who was it that in 1901 started a newspaper paragraph, purporting to come from some responsible person, predicting a hurricane for the coast of New Jersey on a certain date? So great was the anxiety that it was necessary for the Secretary of Agriculture to issue a counteracting telegram showing that the original was certainly a fake. A community even of the most intelligent, cool-headed people is likely to be carried off its feet by enthusiasm for some hero, or by a mania for some financial scheme, or to be stampeded by fright. Emotions are contagious, and it is necessary for a community to protect itself against injurious popular movements, just as it would protect itself against injurious contagious diseases. Freedom of individual action is the ideal on which we have built up our republic; but when that freedom of action threatens the existence of the republic it must be restrained, moderately, if you will, and wisely, but still sufficiently to protect the public from danger. We would not for a moment countenance the publication of numerous nautical almanacs differing considerably in the pre-

diction of exact positions of the sun, moon, and stars, because we know that only one of these can be right, and that the others would certainly lead to errors in navigation that would endanger the lives of thousands of persons. The community does not allow either druggists or physicians to operate without first giving satisfactory evidence that they are competent to handle the drugs that they deal in. Every state has its laws relative to the licensing of steam engineers, since a steam engine in incompetent hands would be a menace to the lives of many.

Wherever the life and property of the citizens are at stake, the government of the people, by the people, and for the people, must necessarily look after their interests, and the time must soon come when a general law will forbid the publication of weather predictions and storm warnings, especially those of a sensational character, by any others than properly licensed persons.—*U. S. Monthly Weather Review.*

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 30.04 inches; highest observed, 30.55 inches at Dubuque on the 21st; lowest observed, 29.71 inches at Sioux City on the 28th; range for state, 0.84 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by the records of 114 stations, was 64.0°, which is 0.4° above normal. By sections the mean temperature was as follows: Northern section, 61.8°, which is 0.5° below normal; central section, 64.3°, which is 1.1° above normal; southern section, 65.6°, which is 0.2° above normal. The highest monthly mean was 68.6° at Belknap; lowest monthly mean, 59.0° at Sibley. The highest temperature reported was 94° at Wilton Junction on the 11th; lowest temperature reported, 30° at Atlantic, Earlham, Hanlontown and Rock Rapids on the 14th, 15th and 21st. The average monthly maximum was 88.9°; average monthly minimum, 34.7°. Greatest daily range, 54° at Estherville; average of greatest daily range, 36.5°.

PRECIPITATION.—Average precipitation for the state, as shown by the records of 122 stations, was 2.78 inches, which is 0.52 of an inch below normal. The averages by sections were as follows: Northern section, 2.67 inches, which is .74 inch below normal; central section, 2.13 inches, which is 1.13 inches below normal; southern section, 3.53 inches, which is 0.28 inch above normal. The largest amount reported was 8.33 inches at Keokuk; least amount reported, .09 of an inch at Ida Grove. The greatest daily rainfall reported was 3.01 inches at Keokuk on the 18th and 19th. Average number of days on which .01 of an inch or more was reported, 7.

WIND AND WEATHER.—Prevailing direction of the wind, south and southwest; highest velocity reported, 39 miles per hour from the northwest at Sioux City on the 1st. Average number of clear days, 13; partly cloudy, 8; cloudy 9.

OBSERVERS' NOTES.

AFTON.—*N. W. Rowell.* A month of great anxiety to all; we have alternated between hope and fear as sunshine and shadows came and went. But a kind Providence has so tempered the winds that no blighting frost has fallen. Our corn crop is secure and our pastures green, with ripe fruit upon tree and vine. Let us give thanks.

ALTA.—*David E. Hadden.* The mean temperature for September was about 1° below the normal; no killing frost occurred during the month.

AMANA.—*C Schadt.* Weather favorable for maturing corn; no real killing frost; only about 5 per cent lost by late planting from effect of frost on the 15th on low ground; grapes, plums and apples abundant.

AMES.—*Thos. S. Hunt.* Corn is now well out of danger.

ATLANTIC.—*J. W. Lovell.* A moderately warm September; first ice formed on 14th; corn is nearly all safe.

BONAPARTE.—*B. R. Vale.* Rain 6.73 inches; too wet for farm work or the good of the corn; subsoil full of water; pasture good.

BRITT.—*Geo. P. Hardwick* Frost damaged corn on low lands and slightly on high lands; injured about 35 per cent. Thunder and windstorm on the 28th damaged corn and light buildings.

CHARITON.—*C. C. Burr.* Month passed without a killing frost; on 15th frost did some harm to corn on low land; some corn yet needs ten days to ripen; pastures better than average.

CLINTON. *Luke Roberts.* Mean temperature 2° above normal; rainfall .55 of an inch below normal; per cent of cloudiness, 50; frost affected corn only in places and but slightly; crop as good as in 1903, possibly better.

DECORAH.—*F. H. Baker.* There was a light frost on 15th.

EARLHAM.—*Geo. Phillips.* Month closed with no damage by frost; corn now safe except very late planted.

CLARION.—*J. H. DuBois.* Frost on 15th killed leaves of tender vines; apple, plum and potato crop very large.

FOREST CITY.—*J. A. Peters.* No killing frost in September; frost on the 15th damaged corn only on low land and creek bottoms; ground in good condition for plowing.

GRAND MEADOW.—*F. L. Williams.* There being no killing frost was favorable to corn; corn cutting well advanced, and fall work well along.

GREENFIELD.—*J. G. Culver.* No frost sufficient to injure vegetation except in few places on lowest bottoms; very little damage to corn.

GRINNELL.—*A. O. Price.* No serious damage by frost; large amount of corn cut; plowing well advanced.

GRUNDY CENTER.—*E. S. King.* A variable month; corn practically safe; potatoes yield 200 to 300 bushels per acre.

HOPEVILLE.—*M. L. Ashley.* Eighty per cent of corn safe at close of month; late fields need 10 to 15 days of good weather.

INWOOD.—*G. M. Larsen.* Month favorable for corn, and crop will be heavy; pastures good.

KEOSAUQUA.—*J. H. Landes*. Five rainstorms, each attended with fierce electric disturbance, causing loss of stock and buildings in different parts of the county.

LARRABEE —*H. B. Strever*. Corn touched by frost on low lands on 21st; bulk of crop safe at end of month.

LOGAN.—*Mrs. M. B. Stern*. Frost on 15th killed very tender precipitation, but did not do much injury to corn.

MT. VERNON.—*J. W. Hubbard*. Season closes favorably; small grains and root crops good; corn crop large, with an unusual per centage of soft ears.

OLIN.—*Nathan Potter*. A fine month; frost damaged corn on low land; apple and po ato crops large.

RIDGEWAY.—*Arthur Betts*. Warmest September since 1898; sunshine 262 hours; on night of 5th nine fires were kindled by lightning in sight of this station. Hail on 17th, and hailstones averaged size of plums.

WAUKEE.—*E. J. Leonard*. Month free from heavy storms; some corn frosted on low lands, but bulk of crop is now safe.

WAVERLY.—*H. S. Hoover*. Upland corn untouched by frost; last ten days worked wonders in ripening corn.

WHITTEN.—*Frank P. Butler*. Frost did but little damage and corn is now practically safe.

BELATED REPORT.

BELKNAP—*August*. Mean temperature 71.8°; highest 91° on the 13th; lowest 50° on the 9th; greatest daily range 26°; total precipitation 4.25 inches; greatest in 24 hours 1.80 inches; number of clear days 25, partly cloudy 2, cloudy 4, rainy 5; prevailing direction, south.

ERRATA IN AUGUST REVIEW.

MASSENA.—Minimum temperature recorded 43° on the 8th, page 7, should have been 40° on the 26th. Total precipitation recorded 4.23 inches on page 7, should have been 4.03 inches.

WILTON JUNCTION.—Maximum temperature recorded on the 12th, page 8, should have been on the 12th and 13th.

LOGAN.—Maximum temperature recorded on the 14th and 15th, page 8, should have been on the 14th.

OSAGE.—Maximum and minimum temperature on the 1st, page 10, omitted, should have been 75 and 54 respectively. Maximum temperature recorded 89° on the 12th, page 7, should have been 90° on the 24th.

VOLUME XV. OCTOBER, 1904. No. 10.

OCTOBER WEATHER AND CROPS.

October was warmer and drier than usual, the daily mean temperature being about 1° above normal, and the average rainfall for the state 0.73 of an inch below normal. The northern section received the largest amount, the average being about 0.29 of an inch above the October normal. The first frost of the month occurred on the morning of the 6th, and was heavy enough to kill vines and most of the cornstalks remaining green in the northern half of the state. In the southern half that frost was light, causing no damage. The first general killing frost covering the state occurred on the morning of the 23d, all crops being safe at that time. The bulk of the rainfall came in the first and second decades—mainly between the 5th and 20th, the balance of the month being dry and favorable for farm work, for drying out the corn crop and harvesting the minor crops. No better weather could be desired for preparing corn for cribbing than was prevalent from the 20th to 31st. Good progress was made in harvesting the corn during the last week, though the heavier ears contained considerable moisture. But the weather was cool by night, though moderate and clear by day. The heavy potato crop was harvested in good condition, the quality of the product being unusually good. Pastures were very good throughout the month. Good progress has been made in fall plowing. The small acreage in fall wheat and rye showed an excellent growth and good stand. On the whole October was a very mild and favorable month, crowning a fairly productive crop season.

NOTES AND COMMENTS.

October brought an abundant supply of health-giving ozone, with the delightful glow and warmth of the temperate zone. There is nothing in the torrid zone that equals the Indian summer of this latitude.

What will be the character of the coming winter? That question is frequently propounded to observers of the Weather Bareau, and it's easily answered. It will be an open winter—sure! It will be open on all sides and above, for free entrance of all the winds that blow; for boreal blasts, blizzards, snow flurries from the north and west, and for some balmy breezes from Gulfland. It will be an old-fashioned winter; that is to say, it will be quite like some of the fashions of winter that prevailed in the pioneer years between the 40's and 70's. Whether severe or mild its prototypes may be noted in the old-time records. There will be some sudden changes, intermittent temperatures, and a goodly number of bright, cold, crisp and health-giving days. All in all, it will be good winter for indoor social enjoyment, for hearing lectures, attending institutes and meetings for mental and moral improvement. It will be a good winter for taking account of stock and preparing for next season's business. This is fully as specific as any of the long-range prognostications.

At the recent session of the International Geographic Congress, held in Washington, D. C., Commander Robert E. Peary, U. S. N., served as president and made the opening address. Referring to the rapid progress made in recent years, he said; "Wireless telegraphy is an accomplished fact today, not an experiment, and the atmosphere of the globe in a short time will throb incessantly with countless messages." He referred to the isthmian canal as the grandest project, the greatest engineering, financial, and diplomatic problem of the age, and added; "A fearless master hand has at a stroke cut the Gordian tangle that has hitherto defied the ablest statesmen and financiers of the world, and the nations today accept without question the Panama canal as a fact."

With deep regret announcement is made of the death of Isaac Young of Jefferson, Greene county, one of the faithful voluntary observers and crop reporters of the climate and crop service of Iowa. His death occurred on the evening of September 21st, after a brief illness. In all things he was faithful until the end.

By joint action of the boards of supervisors of Monona and Harrison counties a great drainage ditch is to be dug, at an estimated cost of $258,000, which will reclaim 86,000 acres of land that is now too wet for cultivation. It is likely to be a very profitable enterprise, from a sanitary as well as a financial point of view. Within a few years the rich land thus brought into cultivation will grow the heaviest crops produced in those counties. The soil is practically inexhaustible. The reclaimed tract may produce four to five million bushels of corn per year.

Will Chamberlain, in his "Wayside Notes," says: As a weather prophet, Bob White is a profound fizzle. He does not belong to the Hicks school, because he makes no claims to weather prognostications. His "More Wet" is his personal clarion, and has no relations to storms in any sense of the word, The quail is very neat and trim little gent of the by-ways.

It is the surplus water in the soil that injures crops, and this is removed by tile drainage. No moisure is drained from the soil by tiling that would be helpful to plant growth.

United States Consul Winslow says that Belgium has eleven large mills that grind American corn exclusively, and that the product of these mills is used for bread making. One large bakery turns out 10,000 loaves of bread weekly made of a mixture of 25 per cent corn flour and 75 per cent rye or wheat. Over 800 bakeries in Berlin are selling bread made of this same mixture. Commenting on this statement an exchange says: "The short wheat crop and the probable advance in the price of bread will afford the corn grower an unusual good opportunity this year to start a propaganda in the United States for the more general use of corn as food. If it has been possible to lead Europeans into using corn it ought to be even less difficult to do the same thing in this country. A more general use of corn would not only largely benefit the western states, which are the chief producers of this cereal, but would be a blessing to poor people the country over who find their slender incomes hardly equal to the feeding of large families on such an expensive luxury as white bread.

The molasses, gluten and sugar feeds and the multitude of other balanced and mixed feeds which have developed of very late years are constantly growing in importance and in the appreciation in which they are held in the trade. At the same time, millfeeds are as highly esteemed as ever they were, and it cannot justly be said that they have suffered at all in the estimation of the public by the increasing use of the multitude of special feeds which have come to the front. This is explainable by two reasons; one that millfeeds are quite largely used as a basis for various mixed foods, and the other that the practice of feeding stock in a special and careful way has made immense strides in the last five years. Once bossy got grass in season and hay out of season, and if she succeeded in annexing a bran mash on the side or a dessert of cut up pumpkins or whole turnips she regarded herself as a lucky if not pampered animal. Nowadays, all this is changed. The farmer has his sharp eye glued on the analyses and tests of the agricultural colleges and state boards of agriculture, and the consequence is that the bill of fare which the progressive farmer serves up to his stock and poultry rivals the menu of the average country hotel for length and variety. All this is pleasant for the live stock and profitable for the farmer, and, at the same time, gives wide scope to the feed business, which daily assumes greater and greater importance. Nor is the end of this movement by any means in sight, for it is based upon the purely business principle of securing the best possible results from a given investment.—*Flouer and Feed.*

UNRELIABLE WEATHER PROPHETS.

The following article clipped from the editorial columns of the *Homestead* is scientifically sound, and worthy of a careful reading:

Nothing could be of greater practical value to the farmer than a reliable prognostication of the weather for a year or even for a single season. Such a prediction would be a controlling factor in the decision of many important questions regarding crops and farm management. If the character of the weather as to temperature, humidity, sunshine, wind and rainfall could be foretold with accuracy, the farmer could well afford to invest a generous sum each year in the forecasts.

Many intelligent and generally well-informed persons will tell you that certain men whom they can name have solved this problem; that their predictions from year to year have been marvelously verified by the results, and that their publications are worthy of attention and study.

When the prognostications of these long-range weather forecasters are examined they are almost invariably characterized by two features, either of which would condemn them as being worthy the credence of educated people. One of these is their pretended dependence on astronomical or astrological conditions; the other is their general character, varying enough as to either time or locality to be valueless and unsusceptible of being tested.

Astrology has no standing as a science. It makes its appeal to the ignorant and superstitious. Astronomy is one of the genuine sciences and its conclusions are everywhere received with respect; but any astronomer of standing will tell you that there is no body of astronomical knowledge on which long-range weather predictions, or weather forecasts of any character, can be based. There is a supposed connection between the variations in the size and character of sun-spots and atmospheric and magnetic conditions on the earth; but the problem has not yet been worked out; and any writer who leads his readers to infer that it has been even partially solved is either uninformed or mendacious.

The professional long-range weather prophet makes his forecasts so indefinite and general that he can and actually does claim any storm of any character at any place within several days of his assigned dates as being a substantial fulfillment of the prediction. The futility of such logic is seen when it is remembered that some kind of an atmospheric disturbance is occurring in some part of the United States almost every day in the year. Like our "equinoctial storms" of fall and spring, give the weather prophet's storm a leeway of three or four days each way, six or eight days in all, and it will be pretty sure to come along, according to programme.

In its very nature, the weather depends on an infinite variety of causes, conditions and combinations between them. It is not susceptible of reliable long-range prediction. The weather forecasts now published by the government are mainly reliable because they are made in accordance with known scientific principles. They are based on observed phenomena, calculated on actual movements of storm centers. They are not always verified by results in every part of the territory they cover; but they are infinitely more valuable than any long-range forecasts made. It is safe to give the long-range weather prophet a wide berth.

THE WEATHER AND THE ALMANACS.

The way to determine the value of long-range weather forecasts is to compare them with the records, noting misses as well as hits. They ought to score about 50 per cent of verification by the law of chance, even if the storm dates were drawn from a lottery wheel. From an almanac published by one of the planetary weather prophets the following extracts have been clipped covering the period from October 20 to November 7, 1904:

OCTOBER—"Fourth storm period. This period runs from the 20th to 25th, central on the 22d. The disturbing factors at this time are the Vulcan equinox, the Mercury disturbance, the opposition of Jupiter, with moon on the celestial equator and full. Things to be expected. It is probable that some of the most marked disturbances of the month will occur at this time. Low barometer and rapid change to warmer may be expected in all western sections as early as the 21st. Rain with probable thunderstorms will quickly follow, and during the 22d, 23d and 24th, a series of storms will pass over the country from west to east. Mercury will begin his work of thick cloudiness, mist and sleet northward at this time. Earthquake disturbances will be felt in many parts of the globe not far from the 24th."

"Fifth storm period.—This period is central on October 27th and 28th. Some energetic storms, especially on and about the

lakes and North Atlantic will appear at this time. Rain will turn to sleet and snow northward," etc.

NOVEMBER—"First storm period. This period covers the first six days of the month, having its center on the 3d. In most western extremes the weather will turn quite warm. From about the 3d to the 6th these conditions will develop into cloudiness and rain and pass eastwardly across the country. The culmination of the period will fall on and touching the 5th, about which day rain, with possible thunder, will turn to colder and snow in the north and be followed by rising barometer, high westerly winds and much colder."

Now it is scarcely necessary to refer to the weather maps, covering the period from October 20th to November 8th, to be assured that these almanac forecasts were not verified in Iowa. During that period there has been a steady prevalence of most delightful Indian summer weather over the greater part of the western half of the United States, and most of the time throughout the northern states. The almanac maker did not correctly decipher the wireless messages sent by Jupiter and the other planets. Storms were sweeping over some other portions of the earth, and even over portions of this continent, not only on the specified storm days of the almanac, but also on all the days in October, and all other days in the year. So of course all long-range forecasts may be verified by allowance of a liberal range of time and locality. But—*cui bono.*

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 30.06 inches; highest observed, 30.54 inches at Dubuque on the 6th; lowest observed, 29.46 inches at Davenport and Dubuque on the 21st; range for state, 1.08 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 111 stations, was 53.1°, which is 1.0° above normal. By sections the mean temperatures were as follows: Northern section, 51.1°, which is 0.4° above normal; central section, 53.0° which is 1.6° above normal; southern section, 55.2°, which is 0.7° above normal. The highest monthly mean was 58.4° at Belknap; lowest monthly mean, 49.2° at Estherville. The highest temperature reported was 96° at Waukee on the 4th; lowest temperature reported, 16° at Earlham on the 27th. The average monthly maximum was 81.9°; average monthly minimum, 23 2°. Greatest daily range, 51° at Waukee; average of greatest daily range, 36.9°.

PRECIPITATION.—Average precipitation for the state as shown by records of 120 stations, was 1.67 inches, which is 0.73 of an inch below normal. The averages by sections were as follows: Northern section, 2.50 inches, which is .29 inch above normal; central section, 1 60 inches, which is .78 inch below normal; southern section, 0.90 inch, which is 1.73 inches below normal. The largest amount reported was 4.43 inches at Sioux Center; least amount reported, .14 inch at Bonaparte and Corydon. The greatest daily rainfall reported was 3.00 inches at Olin on the 9th. Average number of days on which .01 of an inch or more was reported, 6.

WIND AND WEATHER.—Prevailing direction of the wind, southeast, south, and northwest; highest velocity reported, 52 miles per hour from the northwest at Sioux City on the 21st. Average number of clear days, 15; partly cloudy, 8; cloudy, 8.

OBSERVERS' NOTES.

ALTA.—*David E. Hadden.* October rainfall occurred during the middle decade; last decade was ideal weather; frost on the 6th was only heavy in low places; first general killing frost came on night of 22d.

AMANA.—*C. Schadt.* Weather very favorable for ripening and drying corn, and a considerable part of the crop is harvested; despite apparently unfavorable season nearly all crops have been abundant; fall sown fields look green and healthy; first killing frost October 23d.

ATLANTIC.—*J. W. Love.* A very fine month for farm work; farmers husking corn and report heavy yield of good quality. Ducks made southward flight on 2d and wild geese the 4th.

BAXTER.—*W. L. Thorp.* Corn matured without damage by frost.

BONAPARTE.—*B. R. Vale.* A royal month for farm work and maturing the corn crop; rainfall 0 14 inch—the lowest record in years.

BRITT.—*Geo. P. Hardwick.* First killing frost here on October 6th, with but few mornings of frost temperature; corn husking begun the 25th, though much was unfit to crib.

CHARITON.—*C. C. Burr.* Month favorable for farm operations, and work is well advanced; some corn being cribbed.

CLINTON.—*Luke Roberts.* A very fine month with 20 clear days and no killing frost until 23d; rainfall only 0.59 inch—the least October rainfall in the last 26 years, except in 1897 when it was only 0.37 of an inch.

FOREST CITY.—*J. A. Peters.* Very little corn cribbed; not dry enough; first killing frost here October 6th.

GARDEN GROVE.—*F L. Williams.* Very favorable month for ripening corn; but little in crib yet; pastures fine as in June; plowing well along.

GRINNELL.—*A. O. Price.* First killing frost October 23d; weather fine; corn dry enough to crib.

GRUNDY CENTER.—*E. S. King.* A remarkable month; best kind of weather for corn and harvesting potatoes; some begun to crib corn on the 19th.

HANLONTOWN.—*Miss G. M. Paschen.* Corn husking begun last week in October. About one third soft, one third sound, and balance rotten.

HUMBOLDT.—*H. S. Wells.* Corn all right and turning out good; pastures still good.

IDA GROVE.—*J. E. Conn.* An exceptionally warm and dry October; corn husking begun on the 20th.

INWOOD.—*G. M. Larsen.* A fine month. Good yield and quality of corn; considerable clover threshing.

LARRABEE—*H B. Strever.* Frost killed corn on 6th, but flowers were in bloom till 23d.

LEON—*M. F. Stookey.* Freezing temperature forming ice on night of 21st-22d. Not much frost on account of wind.

LOGAN—*Mrs. M. B. Stern.* A remarkable month for mildness; killing frost came later than usual.

OLIN—*Nathan Potter.* An ideal month for fall work; corn-picking began with better crops than usual.

RIDGEWAY—*Arthur Betts.* Coolest October since 1898; 212 hours sunshine; first killing frost on 6th; very heavy thunder on 10th, struck in several places.

SHELDON—*A. W. Beach.* First killing frost on 6th; corn all safe; husking generally begun on 24th.

STOCKPORT—*C. L. Beswick.* Least rainfall for any month since these records begun, over three years ago.

WAUKEE—*E. J. Leonard.* Fine month for maturing corn; no frost sufficient to kill tomato vines till 23d, and frost every night after that except one.

WHITTEN—*Frank P. Butler.* Morning of 23d ice formed; it was the first killing frost; the one the 6th was light.

ZEARING—*H. E. Burkhart.* Frost of the 6th did no damage; corn being cribbed last of month, and yield reported to average 50 bushels per acre.

BELATED REPORTS.

SIGOURNEY—*August*. Mean temperature 70.8°; highest 95° on the 13th; lowest 46° on the 8th; greatest daily range 36°; total precipitation 3 62 inches; greatest in 24 hours 1.47 inches; prevailing direction, northwest. Number of clear days 18, partly cloudy 9, cloudy 4, rainy 8.

SIGOURNEY—*September*. Mean temperature 65.6°; highest 94° on the 10th; lowest 36° on the 15th; greatest daily range 33°; total percipitation 2.99 inches; greatest in 24 hours .69 inch; prevailing direction, southwest. Number of clear days 5, partly cloudy 17, cloudy 8, rainy 10.

ROCKWELL CITY—*September*. Mean temperature 62.2°; highest 90° on the 28th; lowest 38° on the 14th, 15th, 19th; greatest daily range 42°; total precipitation 1.75 inches; greatest in 24 hours .55 inch. Number of clear days 14, partly cloudy 10, cloudy 6, rainy 4.

WAPELLO—*September*. Mean temperature 67.6° highest 89° on the 17th; lowest 40° on the 15th; greatest daily range 31°; total precipitation 4.24 inches; greatest in 24 hours 1 51 inches; prevailing direction, southeast. Number of clear days 16, partly cloudy 11, cloudy 3, rainy 6.

AFTON—*September*. Mean temperature 65.2°; highest 86° on the 1st, 10th, 28th; lowest 35° on the 15th; greatest daily range 34°; total precipitation 2.80 inches; greatest in 24 hours 1.08 inches; prevailing direction, southwest. Number of clear days 15, partly cloudy 9, cloudy 6, rainy 7.

MAQUOKETA—*September*. Mean temperature 62 0; highest 90° on the 10th; lowest 30 on the 15th; greatest daily range 44°; total precipitation 3 99 inches; greatest in 24 hours 1 52 inches; prevailing direction, northwest. Number of clear days 11, partly cloudy 5, cloudy 14, rainy.

ERRATA IN SEPTEMBER REVIEW.

CHARITON.—Maximum temperature recorded on the 28th, page 7, should have been 10th and 28th.

CRESCO—Mean temperature recorded 60.4° on page 7, should have been 60.8°.

CLARINDA.—Maximum temperature recorded on the 29th, page 7, should have been the 28th.

ESTHERVILLE.—Maximum temperature recorded on the 18th, page 7, should have been the 17th.

SIOUX CENTER.—Mean temperature recorded 61.2° on page 7, should have been 61.0°. Mean Maximum temperature recorded 74.5° on page 10, should have been 74.1°

CONTENTS.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

Afton ..... Hon. N. W. Rowell
Albia ..... E. R. Reeve
Algona ..... Dr. F. T. Seeley
Allerton ..... Rex Shriver
Alta ..... D. E. Hadden
Alta (near) ..... W. J. Minard
Amana ..... Conrad Schadt
Ames ..... Exp. Station
Atlantic ..... J. W. Love
Audubon ..... Geo. E. Kellogg
Baxter ..... W. T. Thorp
Bedford ..... E. E. Healy
Belknap ..... A. W. Rankin
Belle Plaine ..... S. P. Vandike
Bonaparte ..... Hon. B. R. Vale
Boone ..... Carl Fritz Henning
Britt ..... G. P. Hardwick
Buckingham (Traer P. O.) ..... Dr. W. A. Daniel
Burlington ..... I. S. Shontz
Carroll ..... Moses Simon
Cedar Rapids ..... Electric Light and Power Co.
Chariton ..... C. C. Burr
Charles City ..... *Clarence J. Root
Clarinda ..... A. S. Van Sandt
Clear Lake ..... E. C. Schrader
Clinton ..... Luke Roberts
College Springs ..... A. M. Finley
Columbus Junction ..... J. B. Johnston
Corning ..... Jerome Smith
Corydon ..... Miss May Miller
Cresco ..... L. G. Krumm
Cumberland ..... Agent C., B. & Q. R'y
Davenport ..... *J. M. Sherier
Delaware ..... Wm. Ball
Decorah ..... F. H. Baker
Denison ..... Prof. W. C. Van Ness
Des Moines ..... *Geo. M. Chappel
De Soto ..... R. D. Minard
Dows ..... A. C. Fuller
Dubuque ..... *Orin Parker
Earlham, R. F. D. ..... Geo. Phillips
Elkader ..... Chas. Reinecke
Estherville ..... Earle W. Peterson
Fayette ..... R. Z. Latimer
Florence (Clarion P. O.) ..... H. Du Bois
Forest City ..... J. A. Peters
Fort Dodge ..... Tobin College
Ft. Madison ..... Miss L. A. McCready
Galva ..... C. E. B. Roberts
Gilman ..... Jas. L. Wylie
Glenwood ..... J. P. Jackson
Grand Meadow (Postville P. O.) ..... F. L. Williams
Greene ..... J. L. Cole
Greenfield ..... J. G. Culver
Grinnell ..... Prof. J. S. Buck
Grinnell (near) ..... A. O. Price
Grundy Center ..... Ed King
Guthrie Center ..... D. G. Beardsley
Hampton ..... E. C. Grenelle
Hanlontown ..... Miss G. M. Paschen
Harlan ..... C. A. Reynolds
Hopeville ..... M. T. Ashley
Humboldt ..... H. S. Wells
Ida Grove ..... J. E. Conn
Independence ..... E. F. Wulfke
Indianola ..... Prof. J. L. Tilton
Inwood ..... Geo. M. Larsen

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. NOVEMBER, 1904. No. 11.

IOWA CROPS—FINAL REPORT, 1904.

TOTAL YIELD FOR THE STATE—VALUE OF SOIL PRODUCTS AT FARM PRICES DECEMBER 1ST.

Despite somewhat adverse conditions at the outset, and belated growth of the cereal crops, the final report for the season of 1904 makes a satisfactory exhibit of the agricultural resources of the state. The warmth and dryness of the autumn made partial amends for low temperature and slow progress during the summer.

CORN.—The area planted this season was 9,052,450 acres. The loss of acreage from various causes was relatively small compared with recent seasons, and it is probable that practically about nine million acres were harvested. The average yield for the state appears to have been about 36 bushels per acre. The total yield is 323,853,330 bushels, which is 93,342,000 above the yield last year and the largest crop produced since 1900. During the past fifteen years there have been two larger crops; viz.: 345,000,000 bushels in 1900, and 335,000,000 bushels in 1901. This year's output is 62,000,000 bushels above the fifteen year average.

The average price per bushel, at the farms December 1st, was about thirty-five cents; total value of the crops, $113,348,665.

WHEAT.—This crop was badly damaged by rust and blight. The area of winter wheat was about 71,030 acres, and the average yield 14.3 bushels per acre; total yield, 1,017,000 bushels. The acreage of spring wheat was 775,040 acres; yield 9.1 bushels per acre; total output for the state, 7,080,430 bushels. Farm prices, winter wheat 92 cents; spring wheat, 86 cents. Total value of wheat crop, $7,024,809.

OATS.—Area seeded, 4,018,980 acres; yield per acre 29.4 bushels; total bushels, 118,435,570. The farm value, 26 cents; total value December 1, $30,793,284.

RYE.—Area seeded, 99,590 acres; yield per acre, 15 bushels; total yield, 1,517,090 bushels. Value, at 54 cents per bushel, $819,228.

BARLEY.—Area seeded, 493,370 acres; yield per acre, 25 bushels; total yield, 12,317,710 bushels. Value, at 34 cents per bushel, $4,188,021.

FLAX. Area, 51,370 acres; yield, 11 bushels per acre; total yield, 591,140 bushels. Va'ue, at $1.15 per bushel, $679,811.

POTATOES.—Yield per acre, 125 bushels; total output, 14,255,680 bushels. Value, at 28 cents per bushel, $3,991,590.

HAY (TAME).—Area harvested, 2,797,640 acres; total yield, 4,499,090 tons. Value, at $5.62 per ton, $25,284,885.

HAY (WILD).—Total amount cut, 1,091,590 tons. Value, at $4.50 per ton, $4,912,155.

PASTURAGE AND GRAZING.—The value of pasturage and grazing, harvested by live stock, in pastures and in grain fields, cornfields and meadows after harvest, is placed at $90,000,000, or about $400 per farm of 160 acres. This is believed to be a very low estimate, for reasons set forth in a separate article.

TABULATED CROP SUMMARY.

CROPS.	Total Products.	Farm value December 1st.
Corn	323,853,330 bushels	$113,348,665
Wheat	8,097,430 bushels	7,023,809
Oats	118,435,570 bushels	30,793,284
Rye	1,517,090 bushels	819,228
Barley	12,317,710 bushels	4,188,021
Flax	591,140 bushels	679,811
Potatoes	14,255,680 bushels	3,991,590
Hay (tame)	4,499,090 tons	25,284,885
Hay (wild)	1,091,590 tons	4,912,155
Pasturage and grazing (cornfields, etc.)		90,000,000
Buckwheat (estimated)		250,000
Sweet potatoes		850,000
Sorghum and broom corn		260,000
Timothy seed		950,000
Clover and millet seed		175,000
Flax seed		679,810
Fruits and garden truck		7,500,000
Total soil products		$291,207,258

In this estimate no account is made of the profits derived from the consumption of the staple crops in the dairy and live stock industry.

The average farm value of milch cows is $28, and of horses, $92 per head.

NOVEMBER WEATHER AND CROPS.

The month was unusually warm and the driest November on record for the state. The mean temperature, as shown by records of 110 stations, was 41.0 degrees, which is 6.3 degrees above normal. The average in 1902 was .2 of a degree higher and 2.9 degrees higher in 1899. The average precipitation for the state at 119 stations was .15 of an inch, which is 1.25 inches below normal. Nine stations reported no rain in measurable amount. Practically all the precipitation fell on the 9th and 10th, and the average number of clear days was twenty. The conditions were ideal for husking corn and drying out the surplus moisture. At the close of the month the bulk of the crop was harvested. Conditions were also favorable for fall plowing and general farm work of the late autumn period. The pasturage was better than usual, though the fields were brown. Winter wheat and rye suffered some damage for want of moisture.

FINAL CROP REPORT, 1904.

TOTAL YIELD AND AVERAGE PER ACRE—BY COUNTIES.

VALUE OF PASTURAGE AND GRAZING.

In net value the grass crop is easily foremost among the soil products of this state. Conservative figures show that the hay crop, both cultivated and wild, was worth on December 1st, $30,197,040, at the low prices current at the farms on that date. But pasturage and grazing can not be measured by the ton or bushel, and the value must be estimated by taking into account the value of the farm animals and the output of the dairy industry. Here is one statement of the problem to be solved: If the grass crop when made into hay is worth $30,000,000, cut from less than 4,000,000 acres, what is the relative value of over 8,000,000 acres in pastures harvested by stock seven months in the year, plus the immense amount of grazing obtained from about 16,000,000 acres of grain fields, corn fields, meadows, etc., after harvest and through a portion of the winter season? It is not an exaggerated statement to say that pasturage and grazing count three fold the value of the hay crop in the production of live stock and in the dairy. According to the United States census the value of live stock and dairy products disposed of in Iowa in 1899 was approximately $150,000,000. Unquestionably two thirds of that amount must be credited to pasturage and grazing. That would signify a total value of about $100,000,000, or a little over $430 per farm.

MRS. MILLICENT B. STERN.

This office has been saddened by receipt of a note announcing the death of Mrs. Millicent B. Stern, who passed away at her home in Logan, November 12, 1904, in the 84th year of her age. She was the wife of Jacob T. Stern, who served as volunteer weather observer from 1860 till his decease in 1892. For the period of about twelve years the station has been kept with rare fidelity by Mrs. Stern, whose record bore evidence of the possession of a bright intellect until the final summons came. The records of the Logan station are of inestimable value to the people of that place and the state at large.

THE MUSKRAT AS A LONG-RANGE WEATHER PROPHET.

A valued correspondent inclosed the following clipping from a Minnesota paper, requesting the opinion of the editor of this publication as to the reliability of the muskrat as a true prophet of the character of the coming winter. The writer said: "I know from personal experience that the muskrat builds larger houses some years than others, but I had attributed it to the abundance or lack of material."

Following is the clipping referred to:

BEMIDJI, Minn., Dec. 2.—The muskrat as a weather prophet never misses. The little animals have about completed their winter building now and their houses are flimsy affairs, a sure sign of an open winter. The Indians and old settlers have more confidence in the little furry creatures than in human weather prognosticators. They say muskrats can tell months ahead what the weather will be and in Northern Minnesota they have shown their foresight by building thin walls to their winter homes.

REPLY.

DEAR SIR,—I am in receipt of your letter of the 3d inst., and the clipping relative to the muskrat as a long-range weather prophet. Responding to your request, I venture the opinion that the muskrat is quite like his biped brother of the human species—he works under stress of necessity. If his house is thinner than usual just now, it is due to the fact that October and November were phenomenally mild; the muskrat was out enjoying the sunshine. Possibly he had heard some of the talk that the climate is changing and the winters are growing milder since the old pioneer days. He concluded that the good time had come—sure, and what's the use building thick houses any more? From this point of view we may regard thin muskrat houses as signs of mild autumns, and not as sure indications that the coming winters will be of the same sort. When zero pinches the musky rodent may wish he had thatched up betimes in better shape. Really, now, I don't believe the animal, however strong his instinct may be, knows any more about the coming winter than the almanac-maker, or other long-range weather fakir.

Very respectfully,
J. R. SAGE.

WEATHER BUREAU STATION AT CHARLES CITY, IOWA.

A new Weather Bureau station was opened at Charles City, Floyd county, Iowa, on November 1, 1904. The longitude of Charles City is 92° 38′ W., latitude 43° 04′ N. and elevation 1015 feet above mean sea level. The city is situated in the valley of the Cedar River, and is partially surrounded by hills ranging in height from 50 to 68 feet above street level. The station is located one block from the river. It is furnished with a full instrumental equipment, the wind instruments and electrical sunshine recorder being mounted on a 50 foot steel tower, in the base of which the thermometer shelter is suspended. The rain gauges have a ground exposure in the yard. Two observations will be taken daily and the usual records kept.

CLARENCE J. ROOT,
Assistant Observer, Weather Bureau.

CONCERNING WEATHER FORECASTS.

Benjamin Franklin was a pioneer in meteorology, as well as in the correlated science of electricity. His kite experiment, demonstrating the identity of lightning with artificial electric sparks, gave him world-wide fame; but no less important from a scientific point of view, and of greater practical value, was his discovery of the rotary circulation of winds in the general storms of the Atlantic coast, and a progressive movement in a northeasterly direction. By inquiries addressed to numerous correspondents and travelers in the colonies he reached the conclusion that the northeast storms of that region began at extreme southwest points about a day earlier than at Boston. From a careful study of the mass of facts thus laboriously collected he formulated his tentative philosophy of storms.

Franklin's contemporaries, and the people generally, were not deeply impressed by this new theory. There was nothing spectacular about it, appealing to the popular imagination like his famous kite-flying experiment performed amid thunder and lightning. He was a century in advance of his age. And the bulk of the people were biased by the teachings of the oldtime astrologers that the moon is the dominant force, with the planets as adjuncts, in the production of storms and weather changes. But Franklin was unique among the philosophers of the eighteenth century. Though a great reader of books and current literature, in scientific studies he consulted chiefly the book of nature. His methods were characterized by simplicity and directness. He was richly endowed with the genius of common-sense. He gave little heed to the occult doctrines and mysticisms of ancient philosophy. To him the vaporings of the oldtime astrologers were of less value than the soughing of the east wind, which was a portent of a coming storm from the westward.

In the field of meteorology Franklin was essentially an explorer, setting up landmarks for guidance of future investigators. Following his line of research, in the first half of the nineteenth century a number of able scientists brought some measure of order out of chaos, and were able to discern regular lawful sequence in the apparently erratic sweep of wind currents and storm-eddies. With the rapid advance of settlements to the westward, and construction of railways and telegraph lines, conditions were made favorable for collecting and making a scientific analysis of climatic data. This was done by scores of observers and scientists under the auspices of the Franklin Institute of Philadelphia, and the Smithsonian Institution, aided in some measure by the government. Upon the foundation thus prepared the structure of the National Weather Bureau was begun in 1870. From a small beginning, with an initial expenditure of $20,000, this branch of the public service has been enlarged in its scope until it has become of vital importance to all interests and all classes of people. The annual appropriation for its support is about a million and two hundred thousand dollars, and this great Bureau has won the admiration of the civilized world. Its field of observation now embraces the continent from the Arctic circle to the northern coast of South America. And today marine interests, inland commerce and agriculture share about equally the benefits of the service.

It is a Bureau of applied science, with ample provision for original research. It is both progressive and conservative—proving all things and holding fast that which is good. It has been founded upon well-attested scientific principles. All the discoveries and generalizations in meteorology made by the most eminent scientists of America and Europe have been utilized and reduced to practical form in the work of the forecast division. Inventive skill has been called into requisition to construct instruments for recording automatically the most minute changes in atmospheric pressure, temperature, humidity, precipitation, wind velocity and direction, sunshine, etc. These complex and almost infallible instruments have been installed at about 200 regular stations within the territory covered by this service, in charge of thoroughly trained observers who have become experts in this line. Simultaneous observations are collected by telegraph twice daily, and oftener when needed; and by this means the forecast officials are enabled to note the actual weather conditions in all parts of the continent. On prepared maps lines are drawn showing areas of low and high pressure, noting differences of temperature and direction of wind at the various stations. Storm centers are thus located, and the graphic pictures show the area of disturbance, energy and direction of movement. Upon this basis of actual conditions, thus graphically presented to the eye of the official in charge the forecast is made as to the weather changes that are likely to occur in the different parts of the country within the coming twenty-four, thirty-six or forty-eight hours.

In the methods of forcasting there is nothing even remotely akin to occult science or the practice of astrology. No storm forecast is issued until a storm actually appears, or is in the initial stage of development. When the weather map reveals the outlines of a storm at the far west or northwest the problem to be solved by the forecaster relates to its probable future course, its velocity of translation, its increase or decrease in extent and force, and the disturbance of elements likely to be caused during its progress across the continent. This is something of a complex problem, requiring in its solution a very thorough study and the application of well established principles of meteorological science. Due consideration must be given to the results of experience and observation of weather processes in previous storms, but that does not insure perfect accuracy of the forecast. There are different types of storms, and those belonging to a certain type of form and combination of lows and highs on the map frequently display very eccentric behavior in their translational movement. Nature's great law of diversity holds true in the weather to a remarkable degree. No exact duplicate of any general storm has been issued. And this extreme variability of movement, under quite similar conditions at the outset, has prevented an overproduction of perfectly successful weather forecasters. It is indeed marvelous that in this country, with its widely variant storm-types, they have achieved from 80 to 90 per cent of accuracy in their work.

Well now, having made so good a record at short range, why not extend the period a full week or month? This is a question often propounded. The answer of experience is that those who venture further usually fare worse. Just beyond what is shown on the daily weather chart is an illimitable realm of uncertainty, wherein those who enter must walk by faith not by sight. Forecasters take large risks if they attempt to hit storm centers offhand, or by random shots; to hit even at short range they must take very deliberate aim with the weather map as a rest.

Unquestionably there is a general desire for an extension of the range of forecasts, to cover the near future, and if possible the coming season. If some explorer in meteorology and astronomy should discover a fundamental law, whereby he could accurately calculate the time of arrival, the force and pathway of all storms for weeks and months in advance, and could warn the people of future floods or drouths in defined localities, he would at once take rank as the greatest scientist in the world. And then if he would reveal the secret of his discovery for the benefit of future generations, he would be honored as the greatest of philanthropists as well as the wisest of mankind. But alas, up-to-date this great man has not arrived, and as yet we have not even a postal card notification of the date of his coming.

In ancient times astrologers worked a profitable "graft" to satisfy the public demand for knowledge of the future, representing that all human events, and even weather changes, were due to the influence of the moon and planetary bodies, and that they alone knew how to read the celestial cipher. Isaiah, the great Hebrew prophet, referred to that guild in rather uncomplimentary terms, as "Stargazers, astrologers, and monthly prognosticators." Since the middle ages this practice has fallen into disrepute, but we have some "modern instances" indicating a survival of the superstitious beliefs which formed the basis of old-time astrology. Our modern stargazers and monthly prognosticators refer in mysterious phrase to the moon, Mercury, Venus, Saturn and even the hypothetical Vulcan, as the powers of the air which brings storms and all weather changes and earthquakes. These men peddle their long-range forecasts in almanacs and other publications, profiting by practice on human credulity and ignorance of natural laws. Their alleged predictions are usually very indefinite as to the exact date of arrival of storms, and their line of travel when they arrive; and by skillful ambiguity of language they may claim a verification if a storm crosses the continent anywhere between Hudson's Bay and the Gulf of Mexico, at any time within an alleged storm period of three to five days.

Some of the ablest scientists of this country and Europe have devoted much time and labor to the study of this problem. They have consulted weather records of all countries, taking note of the dates of heavy storms, making comparison with the position of the moon and planets, to determine if there in any discoverable connection between the movement of those minor bodies and the sweep of storm-eddies in earth's atmosphere. The consensus of opinion has been that there is no foundation of fact or philosophy for that system of long-range forecasts. So thus far there has been an entire failure to establish a scientific and practical basis for any kind of trustworthy predictions as to the occurrence of storms, floods or drouths in specified localities and at certain dates in future months or seasons. Though such foreknowledge is very desirable, yet at the pre-

sent stage of human progress it is beyond possibility of realization. In this field of scientific research the wisest students have been most deeply sensible of the limitations of human knowledge; but charlatans and pretenders claim to hold a key to mysteries in earth and the heavens that are hidden to the balance of mankind. Quackery in meteorology as well as in medicine is indicated by the extravagant pretensions of its practictioners.

Modern astrologers, following closely the lines of their ancient prototypes, give the sun a minor or passive role, while the moon and planets form an all-star aggregation in the ever-shifting scenes of earth's drama. To each planet is assigned some specialty act on the stage, each producing a different type of weather; and when two or three act in conjunction the complex results are startling. In the program as presented by a long-range almanac the leading role in developing regular storm periods is given to "Vulcan", though that hypothetical planet modestly keeps out of sight. The almanac says: "The Vulcan period is the foundation and frame work around which all storm disturbances grow."

According to this almanac the planet Mercury is in control of the sprinkling apparatus, causing mist and drizzles in summer, and damaging sleet in winter. Just how Mercury produces such an effect on the earth is one of the curious things in occult science. The almanac says: "Mercury moves and operates at such distance from the sun as to admit of much vapor and humidity. At the same time its nearness to the sun causes perpetual evaporation and steam and vapor in its atmosphere and skies, and this is in some as yet indefinable way communicated to our own and other planets in our system. * * * This peculiar infection infused into the sun by the Mercury perturbation, we hold, may reasonably take on such forms as to be thrown out by the solar energy, being reconverted into something like its original elements in our own globe and atmosphere. Hence our thick prolonged cloudiness, our mist and drizzling rains and sleet storms during the Mercury disturbances.

This abstruse statement translated into plain English signifies that the planet Mercury when it gets into a "disturbance," throws water into the face of the sun, and that body retaliates by turning his hose on the whole planetary family! That relieves great Jupiter Pluvius from some measure of blame for excessive humidity.

Another extract from the almanac will throw more light on this problem. It says: "The disturbances of each and all the planets are communicated to all the rest of the planets, not directly, but through the perturbations caused by the planetary equinoxes to the sun. * * * When the plane of each planet's equator cuts the sun, this force is violently antagonized, the center of energy is put out of balance in the great solar orb, and perturbing waves react upon all bodies in our system, resulting in the phenomena which we witness in our earth and skies and which we denominate as meteorological."

There we have the gist of the system,—straight! The planents are dynamos revolving swiftly in space, each projecting from its equator tremendous electric force. When that equinoctial stream of planetary thunder and lightning strikes the sun squarely in the face it makes old Sol hot, and of course he strikes back! Who wouldn't? It's no very pleasant thing to be cut in the face by that sort of electric buzzsaw! This theory accounts not only for terrestrial storms and extreme heat, but also for the great spots that appear occasionally on the sun's face. The noxious planetary equinoxes cause all that disfigurement. Science is a great thing when it aids us in solving such problems as that! In reading over this almanac's dramatic story of how the planets are continually "perturbing" the sun, and how the sun hurls it back at all creation, one is reminded of a lot of boys poking sticks into a mammoth hornet's nest, and the stinging "reactionary disturbance" issuing from that previously passive body!

Really, it is difficult to treat such ludicrous matter with becoming dignity and seriousness. The chapter of the almanac descriptive of "Each planet's peculiar phenomena" is absolutely irresistible as a mirth-provoker to any reader who possesses a sense of the ridiculous and some elementary knowledge of meteorology and astronomy. One is impressed by the evident earnestness of the author, and yet it seems that he must be too intelligent to believe in his absurdly fantastic theories. They are no more believable than the myths and legends of the ancients. It is inconceivable that a learned astronomer and meteorologist actually believes that the sun is passive except when it is "perturbed" by some planet's equinox; that mists and vapors are injected and infused into the sun by Mercury's perturbation, and then thrown out by solar energy to form mists and sleet on earth; and that during the so-called "Jupiter period" the carrying capacity of earth's atmosphere becomes disordered and weakened, so that it cannot transport and diffuse humidity, thereby causing consuming drouths in places and destructive cloudbursts in other localities. One who actually believes that kind of absurdity is beyond the reach of influence by evidence and argument. The bare statement of such propositions is a sufficient refutation.

Students in the primary class in meteorology learn that the ever-changing phenomena of the weather are all referable to the action of the sun upon the earth and its atmosphere, vapors and gases; that the constantly radiated energy of the sun supports heat, light and electric force in the solar system. The planets possess no form of independent energy whereby they may "perturb" the sun and increase its potency. Gravitation is only a name given to the statical relation of all matter in the universe, and it is a physical constant. There is absolutely no proof of any "perturbation" or increase in storm energy when the sun crosses the equator of the earth or any other planet. That is merely a hypothesis, supported by a priori assumptions and occasional coincidences. People often confound coincidence with consequence.

Planetary weather forecasts are too-far fetched to be practicable. The prophets in that line work at the wrong end of the problem. When there is more than the usual degree of heat or storminess, they peer into the nebular spaces to see what caused the disturbance on earth, and then allege that it was done by Jupiter, or was the malign work of Saturn, which in their philosophy causes epidemics and pestilential contagious diseases. Possibly also they may in time discover that it is due to Saturnian potency that we have rings and combines in human affairs; why not?

True science, in the last analysis, is plain common sense applied to the study of nature's problems. In erecting philosophical structures the foundation should rest on the earth. Begin with facts as the solid basis of theories. Reason from the known to discover the unknown. In forecasting a storm, observe the good old recipe of the cook book for cooking a hare—first catch your storm, and then predict its future course and time schedule. A storm in hand (i. e., on the map), is worth two in some nebular hypothesis! It's mighty easy forecasting storms if one is allowed a broad range as to the exact locality and a long range as to the date. Storms are coming and going all the time, somewhere; on all dates as well as the specified days of the almanac's storm period.

It is probably true that cyclones or storm eddies, are as much in evidence one day as another, considering the earth as a whole. So one may safely predict storms for every day in the year with the certainty that they will rage somewhere. It would keep the moon and planets mighty busy with their equinoxes to maintain the continual stream of atmospheric eddies flowing over the face of the earth. But really the moon and planets are not charged with that duty. In respect to light, heat and power of gravitation these bodies are infinitesimal as compared with the sun, which is the prime cause of weather phenomena on earth.

J. R. SAGE.

CLIMATOLOGY OF THE MONTH OF NOVEMBER, 1904.

BAROMETER.—Mean pressure, 30.10 inches; highest observed, 30.56 inches, at Sioux City, on the 11th; lowest observed, 29.49, inches, at Davenport, on the 28th; range for state, 1.07 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 110 stations, was 41.0°, which is 6.3° above normal. By sections the mean temperatures were as follows: Northern section, 39 3°, which is 7.0° above normal; Central section, 40.7°, which is 6.1° above normal; Southern section, 43.1°, which is 5.4° above normal. The highest monthly mean was 45.8°, at St. Charles; lowest monthly mean, 37.4° at Maquoketa. The highest temperature reported was 80°, at Ruthven and Waukee, on the 18th; lowest temperature reported, 4°, at Britt, on the 30th. The average monthly maximum was 71.1°; average monthly minimum, 9.6°. Greatest daily range, 56°, at Rock Rapids, average of greatest daily ranges, 37.8°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 119 stations, was 0.15 of an inch, which is 1.25 inches below normal. The averages by sections were as follows: Northern section, 0.17 of an inch, which is 1.19 inches below normal; Central section, 0.15 of an inch, which is 1.28 inches below normal; Southern section, 0.14 of an inch, which is 1.30 inches below normal. The largest amount reported was 0.50 of an inch, at Bonaparte and Glenwood; least amount reported, none, at Rockwell City. The greatest daily rainfall reported, was 0.50 of an inch, at Bonaparte and Glenwood, on the 9th and 10th respectively. Average number of days on which .01 of an inch or more was reported, 1.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 43 miles per hour, from the northwest, at Sioux City, on the 29th. Average number of clear days, 20; partly cloudy, 6; cloudy, 4.

OBSERVERS' NOTES.

ALLERTON.—*Rex Shriver.* Weather during the month has been unusually fine.

ALTA.—*David E. Hadden.* An ideal November. One of the finest on record here. The daily mean temperature of the month was 8° above the average of the preceding 14 years. There was only one storm of rain and snow during the month and the greatest number of clear days and the least number of cloudy days on record.

AMANA.—*Conrad Schadt.* Indian summer weather prevailed throughout the month. The nights were cool and often foggy and the days mild and hazy. The ground seems to be as dry as ever at this time of the year. The roads are as dry, hard and even as paved streets.

ATLANTIC.—*J. W. Love.* This has been the finest November of which I have any record. Pasturage good for this season of the year. Roads never were in better condition. Dandelions in bloom on the 29th.

AUDUBON.—*Geo. E. Kellogg.* First snow of season on the 10th.

BONAPARTE.—*Hon. B. R. Vale.* A pleasant and profitable month. Only .64 inch of rain since September 27th.

BRITT.—*Geo. P. Hardwick.* An ideal month. But one cloudy day.

CHARITON.—*C. C. Burr.* November was a month of sunshine; no storms. Farm work is well advanced. Water for stock is getting to be an object, surface water being exhausted; but a trace of rain during the entire month.

CLINTON.—*Luke Roberts.* The month was almost rainless and cloudless.

FOREST CITY.—*J. A. Peters.* The most delightful November for years—no snow. Most of corn cribbed and fall work on farm well finished.

GRUNDY CENTER.—*E. S. King.* A very remarkable month for lack of storms.

IOWA FALLS.—*J. B. Parmelee.* A twelve-year record does not show such fine weather for November.

LARRABEE.—*H. B. Strever.* November has been very mild and clear, enabling farmers to carry forward fall work at a good pace.

MOUNT VERNON.—*Rev. Jos. W. Hubbard.* Remarkable for clear skies, moderate temperature and small amount of rainfall.

OSKALOOSA.—*Jas. Boyd.* November was a very dry and pleasant month. The least precipitation I have recorded for the past 14 years.

RIDGEWAY.—*Arthur Betts.* Wild geese going south on 17th. There were 13 days without a cloud and 15 days of uninterrupted sunshine. Drouth conditions prevailed.

ROCK RAPIDS.—*W. C. Wyckoff.* Finest fall in 23 years.

SHELDON.—*A. W. Beach.* First snow on 9th. Ground not frozen to prevent plowing.

WASHTA.—*H. L. Felter.* Unusually fine weather all during the month. All clear days but one. Could plow up to the 30th.

WAUKEE.—*E. J. Leonard.* Weather remarkably fine all the month. One light rain and no snow. Only 3 cloudy days and 2 partly cloudy since October 21st, or 36 clear days out of 41.

WAVERLY.—*H. S. Hoover.* No snow until the 29th; then only a trace.

BELATED REPORTS.

NORTHWOOD—September—Total precipitation 1.40 inches; greatest in 24 hours .50 inch on the 1st; prevailing direction, northwest; number of clear days 10, partly cloudy 9, cloudy 12, rainy 5.

CLEAR LAKE—October—Mean temperature 51.6°; highest 76° on the 16th; lowest 26° on the 25th and 27th; greatest daily range 25°; total precipitation 2.65 inches; greatest in 24 hours 1.25 inches; prevailing direction southeast; number of clear days 8, partly cloudy 17, cloudy 6, rainy 4.

NORTHWOOD—October—Total precipitation 2.30 inches; greatest in 24 hours .80 inch; number of rainy days 4.

SPIRIT LAKE—October—Mean temperature 50.4°; highest 78° on the 16th; lowest 22° on the 24th; greatest daily range 40°; total precipitation 2.38 inches; greatest in 24 hours .97 inch; prevailing direction, south; number of clear days 10, partly cloudy 7, cloudy 14, rainy 4.

WHAT CHEER—October—Mean temperature 55.2°; highest 86° on the 4th; lowest 24° on the 29th; greatest daily range 49°; total precipitation .27 inch; greatest in 24 hours .22 inch; number of rainy days 2.

Alta (near)	W. J. Minard
Amana	Conrad Schadt
Ames	Exp. Station
Atlantic	J. W. Love
Audubon	Geo. E. Kellogg
Baxter	W. T. Thorp
Bedford	E. E. Healy
Belknap	A. W. Rankin
Belle Plaine	S. P. Vandike
Bonaparte	Hon. B. R. Vale
Boone	Carl Fritz Henning
Britt	G. P. Hardwick
Buckingham (Traer P. O.)	Dr. W. A. Daniel
Burlington	I. S. Shontz
Carroll	Moses Simon
Cedar Rapids	Electric Light and Power Co.
Chariton	C. C. Burr
Charles City	*Clarence J. Root
Clarinda	A. S. Van Sandt
Clear Lake	E. C. Schrader
Clinton	Luke Roberts
College Springs	A. M. Finley
Columbus Junction	J. B. Johnston
Corning	Jerome Smith
Corydon	Miss May Miller
Cresco	L. G. Krumm
Cumberland	Agent C., B. & Q. R'y
Davenport	*J. M. Sherier
Delaware	Wm. Ball
Decorah	F. H. Baker
Denison	Prof. W. C. Van Ness
Des Moines	*Geo. M. Chappel
De Soto	R. D. Minard
Dows	A. C. Fuller
Dubuque	*Orin Parker
Earlham, R. F. D.	Geo. Phillips
Elkader	Chas. Reinecke
Estherville	Earle W. Peterson
Fayette	R. Z. Latimer
Florence (Clarion P. O.)	H. Du Bois
Forest City	J. A. Peters
Fort Dodge	Tobin College
Ft. Madison	Miss L. A. McCready
Galva	C. E. B. Roberts
Gilman	Jas. L. Wylie
Glenwood	J. P. Jackson
Grand Meadow (Postville P.O.)	F. L. Williams
Greene	J. L. Cole
Greenfield	J. G. Culver
Grinnell	Prof. J. S. Buck
Grinnell (near)	A. O. Price
Grundy Center	Ed King
Guthrie Center	D. G. Beardsley
Hampton	E. C. Grenelle
Hanlontown	Miss G. M. Paschen
Harlan	C. A. Reynolds
Hopeville	M. T. Ashley
Humboldt	H. S. Wells
Ida Grove	J. E. Conn
Independence	E. F. Wulfke
Indianola	Prof. J. L. Tilton
Inwood	Geo. M. Larsen
Iowa City	Prof. A. A. Veblen
Iowa Falls	J. B. Parmelee
Keokuk	*Fred Z. Gosewisch
Keosauqua	Prof. J. A. Landes
Knoxville	Casey & Bellville
Lacona	Agent C., B. & Q. R'y
Larrabee	H. B. Strever
Lenox	J. L. Hurley
Le Mars	Dr. T. E. Cole
Leon	Millard F. Stookey
Little Sioux	G. H. Gibson
Logan	Glenn H. Stern
Maquoketa	Frank W. Keeney
Marshalltown	Branch S. Jones
Mason City	J. S. Mills
Massena	Fred. T Knott
Montezuma	C. J. Griffin
Monticello	C. E. Heisey
Mount Vernon	Rev. J. W. Hubbard
Mt. Ayr	A. F. Beard
Mt. Pleasant	Prof. J. W. Edwards
New Hampton	A. F. Kemman
Newton	Hon. J. P. Beatty
Northwood	Dr. E. R. Young
Odebolt	E. Starner
Ogden	C. L. Zollinger
Olin	Hon. Nathan Potter
Omaha, Neb	*L. A. Welsh
Onawa	C. G. Perkins
Osage	G. D. Pattingill
Osceola	Mrs. S. Lewis
Oskaloosa	Jos. Boyd
Ottumwa	Dr. W. B. La Force
Pacific Junction	Agent C., B. & Q. R'y
Perry	J. A. Harvey
Plover	J. S. Smith
Pocahontas	F. E. Hronek
Red Oak	J. S. Cole
Ridgeway	Arthur Betts
Rock Rapids	W. C. Wyckoff
Rockwell City	C. M. Randall
Ruthven	F. M. Fitzgerald
Sac City	Frank Stouffer
St. Charles	C. W. Minard

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. DECEMBER, 1904. No. 12.

DECEMBER WEATHER AND CROPS.

December was nearly normal as to temperature and precipitation. The mean temperature for the state was half a degree above normal, and the precipitation 0.15 of an inch above the average. The first decade was dry and fair, with ideal conditions for finishing corn husking, and the usual farm operations of the early winter period. For about half the month the ground was well covered with snow, which afforded protection to winter grain and the grasses during the coldest weather. The bulk of the precipitation ca e in form of snow and sleet, and fell mostly on the 11th, 16th, 26th and 27th. But one severe storm visited the state, and that was the blizzard that swept over all sections from the 26th to the 28th. It was unusually severe, causing blockades of railways in many localities. Farm animals, not well sheltered, suffered severely, and newspaper reports indicate some loss of valuable stock As a whole December was a fairly good and pleasant winter month.

EDITORIAL NOTES.

In the production of a ton of apples the soil loses less than thirty cents' worth of nitrogen, potash and phosphoric acid. The bulk of the crop is the product of sunshine, air and water.

A ton of butter, worth bout $500, robs the soil of less than one dollar's worth of crop growing material while a ton of wheat takes away $7 50 worth of fertility.

In the final crop report of the Illinois Board of Agric lture, that state is credited with 7,825,000 acres of corn. The average yield was 36 bushels per acre. The total yield for that state was 281,700,000 bushels. The government statistician credited Illinois with 9,428,000 acres, and a total yield of over 344,000,000 bushels. The state report of acerage planted was based on the returns of assessors, and is more likely to be correct than estimates of crop reporters on the basis of the census of 1899.

Again the astronomers note the appearance of a comet sweeping into the domain of old Sol's planetary system. And now if there should be anything unusual in the line of weather on our planet, the "star gazers and monthly prognosticators" may attribute it to the perturbing influence of this new celestial nomad. Who knows but it had a hand in getting up that blizzard which came with the expiring gasps of the old year?

In the annual report of the U. S. Department of Agriculture for 1904, Secretary Wilson makes a summary of the value of agricultural products as follows:

"After a laborious and careful estimate of the value of the products of the farm during 1904, made within the census scope, it is safe to place this amount at $4,900,000,000, after excluding the value of farm crops fed to live stock in order to avoid duplication of values. A similar estimate made for 1903 gives $4,480,000,000, and the census total for 1899 is $3,742,000,000. It is by no means to be admitted that these figures represent fully the value of the wealth produced on farms. Within the limits of ascertainable values, the farms of 1904 produced an aggregate wealth with a farm valuation that was 9.65 per cent above the product of 1903, and 31.28 per cent above the figures for the census year 1899. An occupation that has produced such an unthinkable value as one aggregating nearly $5,000,000,000 within a year may be better measured by some comparisons. All of the gold mines of the entire world have not produced since Columbus discovered America a greater value of gold than the farmers of this country have produced in wealth in two years; this year's product is over six times the amount of the capital stock of all national banks; it comes within three-fourths of a billion dollars of equaling the value of the manufactures of 1900, less the cost of materials used; it is twice the sum of our exports and imports for a year; it is three times the gross earnings from the operations of the railways; it is four times the value of all minerals produced in this country."

Mr. Carl Fritz Henning, volunary observer at Boone, Iowa, who is a recognized local authority on birds, contributed an interesting article to the *Boone Republican* relative to the wholesale destruction of English sparrows during the blizzard, December 27th and 28th. He attributed this unusual fatality among these hardy "tramps of our streets" to the fact that the blizzard was preceded by heavy mist and sleet, which covered the ground and trees with thick ice, rendering it impossible to obtain their usual supply of food.

CLIMATOLOGY OF THE MONTH OF DECEMBER, 1904.

BAROMETER.—Mean pressure, 30.07 inches; highest observed 30.52 inches, at Dubuque and Sioux City, on the 3d; lowest observed, 29 09 inches, at Dubuque on the 27th; range for state, 1.43 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 114 stations, was 23 4 degrees, which is 0.5° above normal. By sections the mean temperatures were as follows: Northern section 20.6° which is 0.5° above normal; central section 23.5°, which is 0.3° above normal; southern section 26.1° which is 0 4° above normal. The highest m nthly mean was 29.9° at Keokuk; lowest monthly mean, 18.2°

at Forest City. The highest temperature reported was 67°, at Albia on the 22d; lowest temperature reported 19°, at Elkader on the 14th, The average monthly maximum was 55 5°; average monthly minimum, -8.8°. Greatest daily range, 57° at Maquoketa; average of greatest daily ranges 36.8.

PRECIPITATION.—Average precipitation for the state, as shown by records of 119 stations, as 1 44 inches, which is 0 15 of an inch above normal. The averages by sections were as follows: Northern section, 1.19 inches, which is 0.16 inch below normal; central section, 1.66 inches, which is 0.32 above normal; southern section, 1.48 inches, which is 0.32 inches above normal. The largest amount reported was 3.68 inches at Newton; least amount reported, .06 inch at Storm Lake. The greatest daily rainfall reported was 2 53 inches at Newton on the 27th. Average number of days on which .01 of an inch or more was reported, 5.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 57 miles per hour, from the northwest, at Sioux City on the 27th. Average number of clear days, 12; partly cloudy, 7; cloudy, 12.

OBSERVERS' NOTES.

AFTON.—*N. W. Rowell.* The blizzard commenced at 8 P.M. on 26th and continued to the 28th; the worst in my ten years' record.

ALLERTON.—*Rex Shriver.* The blizzard on the 27th blocked roads and paralyzed traffic.

ALTA.—*David E. Hadden.* Ideal weather most of the month; the blizzard on 27th raged all day, but was quickly followed by fine weather.

ATLANTIC.—*J. W. Love.* Month was very mild except during the heavy wind and snowstorm on 27th.

BONAPARTE.—*B. R. Vale.* Precipitation, 2.25 inches; a pleasant month with a bad storm on 27th; ground bare and without frost at close of month.

BRITT.—*Geo. P. Hardwick.* The summer of 1904 was cool; autumn warm and late, with insect life until close of December; very high wind, blizzard and drifting snow on 27th and 28th.

CHARITON.—*C. C. Burr.* On 26th had light sleet, some rain with thunder, followed by one of the worst blizzards on record.

CLARINDA.—*A. Van Sandt.* Storm of the 26th-28th was a hard one, with wind 35 to 40 miles, and snow drifts above fences.

CLINTON.—*Luke Roberts.* Temperature normal; precipitation 2.85 inches. Most of it coming on 26th and 27th.

CRESCO.—*L. G. Krumm.* The blizzard on 27th was the worst in recent years; the papers say it was the worst since 1873.

ELKADER.—*Chas. Reinecke.* Mean temperature for the year, 44.4°; total precipitation 25.36 inches; highest temperature 93° on July 17th; lowest, 32° below zero on January 27, 1904; total snowfall for the year, 44 inches.

ESTHERVILLE.—*Earl W. Peterson.* Beginning on the 26th at 3 P. M., we had the worst blizzard that has visited this place during the past twelve years; storm ceased during night of 27th.

GREENFIELD.—*J. G. Culver.* A blizzard, commencing 9 P. M. on the 26th and ending on the 28th, was the worst storm for years; roads and railway lines badly blocked by drifts.

HAMPTON.—*E. C. Grenelle.* Hard blizzard all day the 27th; worst since 1880.

HANLONTOWN.—*Miss G. M. Paschen.* The blizzard on the 27th was the most severe storm in this section since 1885. Drifts ten feet high where wind had full sweep, and objects were invisible four rods distant.

HOPEVILLE.—*M. L. Ashley.* Very severe storm on 27th and roads were blockaded.

HUMBOLDT.—*H. S. Wells.* Precipitation for year, 28 26 inches.

INDEPENDENCE.—*E. F. Wulfke.* On 27th the heaviest blizzard in 20 years visited this section; all roads blocked.

LARRABEE.—*H. B. Strever.* The month was mild and pleasant, except during the blizzard on 27th.

LOGAN.—*Glen H. Stern.* Fierce blizzard visited Logan on 27th; drifts in places 5 feet deep.

OLIN.—*N Potter.* Roads were blockaded two days by storm on 27th.

POCAHONTAS.—*F. E. Hronek.* The blizzard on 27th reminded us of old times; not enough snow to do much damage.

RIDGEWAY.—*Arthur Betts.* Warmest of eight Decembers, except in 1900. There were 148 hours of sunshine. The blizzard on 27th was the worst since December 11 and 12, 1899.

SHELDON.—*A. W. Beach.* A splendid month; only one bad storm, and that lasted but 24 hours.

STOCKPORT.—*C. L. Beswick.* A fine month, except on 26th and 27th, the latter being equal to any bad day on record here.

WATERLOO.—*M. L. Newton.* The storm on 27th was the worst in 20 years.

WAUKEE.—*E. J. Leonard.* The sensational feature of the month was the blizzard on the 27th; stock suffered much and roads drifted full in many places.

WAVERLY.—*H. S. Hoover.* A very heavy blizzard all day the 27th and snow drifted badly.

WHAT CHEER.—*R. S. Alexander.* Worst blizzard in years on 27th and 28th; terrific wind; roads blocked several days.

BELATED REPORTS.

LENOX—November—Mean temperature 42.2°; highest 68° on the 2d, 3d and 18th; lowest 11° on the 30th; greatest daily ra ge 35°; total precipitation .11 inch; greatest in 24 hours .11 inch; total snowfall, trace; prevailing direction, south; number of clear days 27, partly cloudy 1, cloudy 2, rainy 1.

EARLHAM—November—Mean temperature 40.2°; highest 72° on the 3d and 17th; lowest 7° on the 30th; greatest daily range 45°; total precipitation .13 inch; greatest in 24 hours .13 inch; total snowfall, trace; prevailing direction, southwest; number of clear days 25, partly cloudy 3, cloudy 2, rainy 1.

GREENFIELD—November—Mean temperature 42.1°; highest 70° on the 3d and 19th; lowest 8° on the 30th; greatest daily range 35°; total precipitation .24 inch; greatest in 24 hours .24 inch; total snowfall .3 inch; prevailing direction, south; number of clear days 26, partly cloudy 3, cloudy 1, rainy 2.

OTTUMWA—November—Mean temperature 44.6°; highest 78° on the 19th; lowest 16° on the 30th; greatest daily range 37°; total precipitation .13 inch; greatest in 24 hours .13 inch; prevailing direction, northwest; number of clear days 21, partly cloudy 5, cloudy 4, rainy 1.

† Above normal. ‡ Received too late to be computed with means. *a*. One day missing; *b*, two days, etc. § Not supplied with self-registering instruments.

ERRATA IN OCTOBER REVIEW.

Clarinda—Maximum temperature recorded on the 5th, page 7, should have been the 4th.

Belknap—Number of days missing marked as [H], page 7, should have been [G].

Marshalltown—Mean temperature recorded 51.6° on page 8, should have been 52.1°. Mean maximum temperature recorded 64.6° on page 10, should have been 65.6°.

Clear Lake—Mean temperature recorded as 51.6° on page 8 of the November Review, should have been 51.0°.

ERRATA IN NOVEMBER REVIEW.

Clear Lake.—Mean minimum temperature recorded 30.2° on page 11, should have been 30.3°.

Delaware.—Minimum temperature recorded 37° on the 15th, page 11, should have been 35°.

Independence.—Minimum temperature recorded 28° on the 25th, page 11, should have been 22°. Mean minimum temperature recorded 27 4° on page 11, should have been 27.2°. Mean temperature recorded 39.2° on page 10, should have been 39.0°.

New Hampton.—Mean temperature recorded 40.7° on page 9, should have been 39.0°.

Wapello.—Maximum temperature recorded 43° on the 9th, page 12, should have been 45°. Mean maximum recorded 54.6° on page 12, should have been 54.7°.

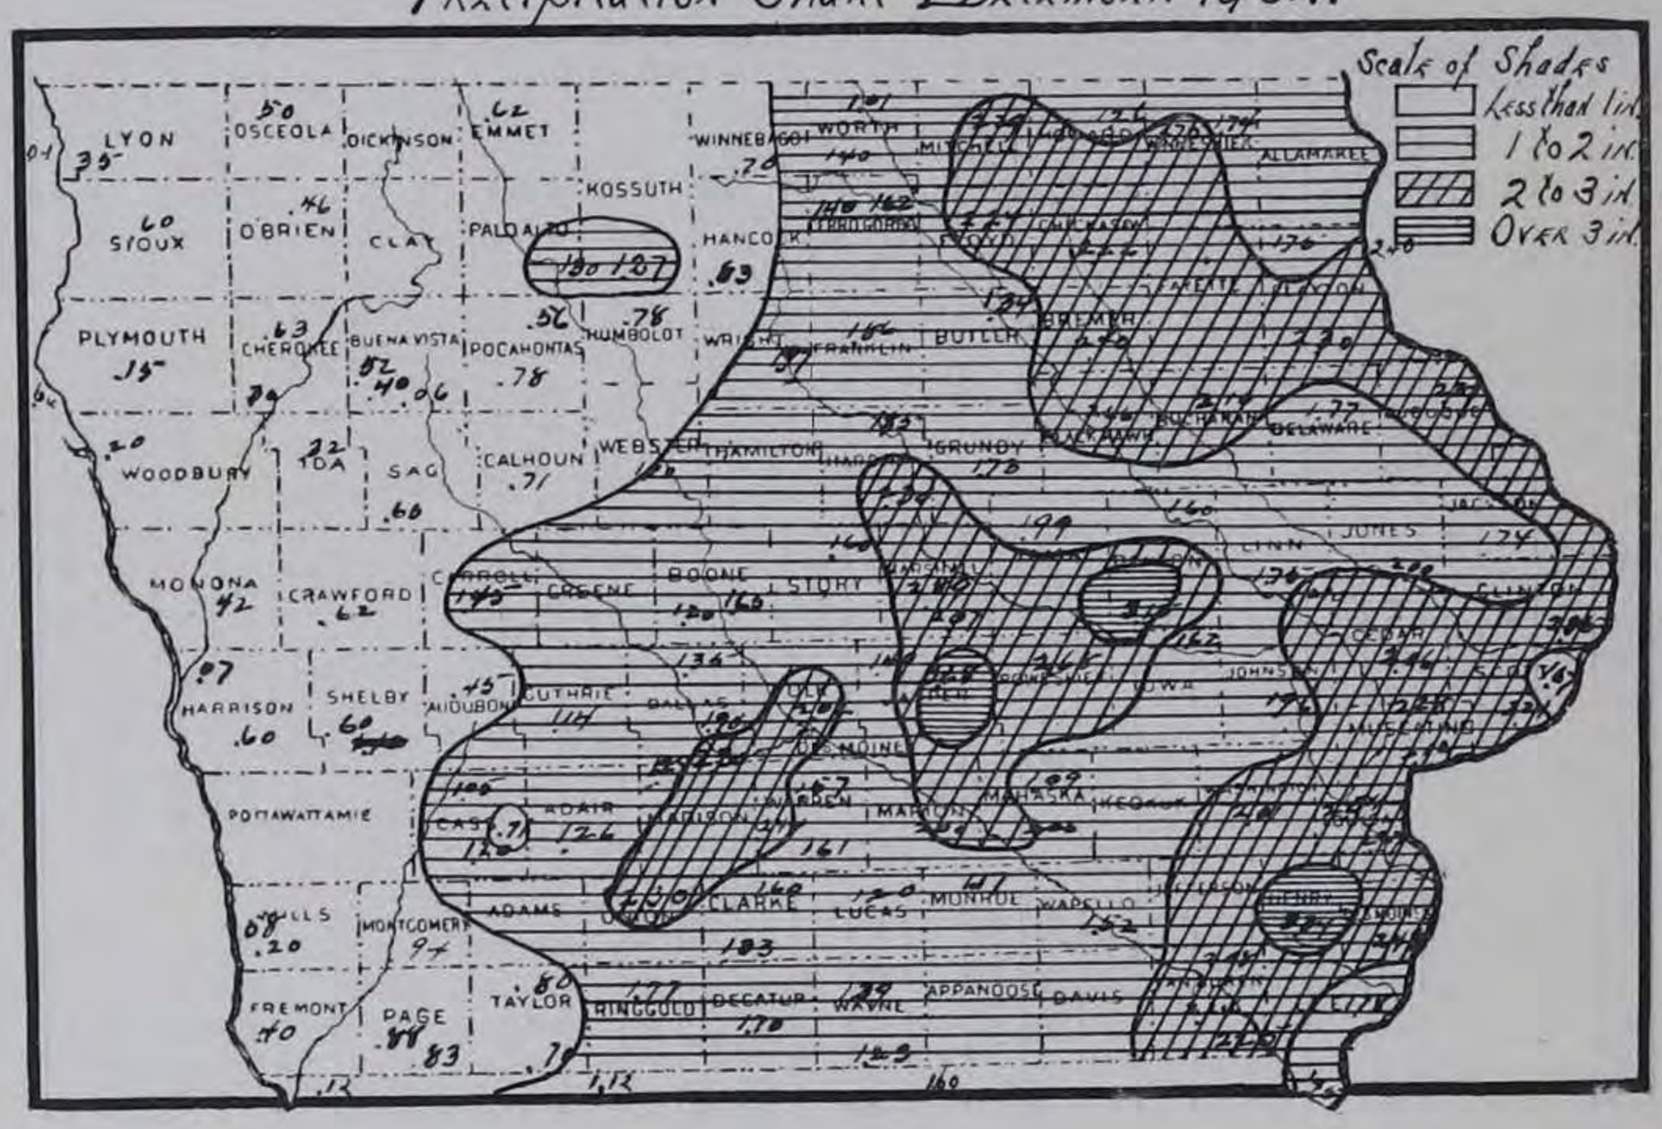
Precipitation Chart December 1904.



APPENDIX.

ANNUAL SUMMARY, 1904.

CLIMATOLOGY OF THE YEAR 1904.

BAROMETER.—The mean pressure for the year was 30.04 inches. The highest observed pressure was 30.85 inches on February 10th, at Sioux City; lowest pressure, 29.09 inches on December 27th, at Dubuque. Range for the state 1.76 inches.

TEMPERATURE.—The mean temperature for the state was 46.8, which is 0.4 below normal. The highest temperature reported was 100° on July 17th, at Marshalltown. The lowest temperature reported was 32° below zero on January 27th, at Elkader and Fayette. Range for the year 132°.

PRECIPITATION.—The average amount of rain and melted snow for the year, as shown by complete records of 96 stations, was 28.74 inches, which is 2.68 inches below the normal, and 6.92 inches below the average amount in 1903. The greatest amount recorded at any station for the year was 38.93 inches, at Keokuk. Least amount recorded 19.34 inches, at Vinton. The greatest monthly rainfall was 11.97 inches, at Thurman in July; least monthly amount, none, at Rockwell City, in November. The greatest amount in any 24 consecutive hours was 7.73 inches, at De Soto, July 19th. The average number of days on which .01 of an inch or more of rain fell was 75.

WIND AND WEATHER.—The prevailing direction of wind was northwest. Highest velocity reported, 68 miles an hour, in Sioux City, from the northwest on March 2d. Average daily movement, 216 miles. There were 164 clear days, 97 partly cloudy, and 105 cloudy days; as against 156 clear days, 100 partly cloudy, and 109 cloudy days in 1903.

CLIMATE AND CROP REVIEW—1904.

The year 1904 was cooler than usual, the mean temperature being 46.8° which is 0.4° below normal. The average precipitation was 28.74 inches, which is 2.68 below normal.

The winter was colder than usual. In January the average daily temperature was 14°, which is 4.2° below the state normal. The lowest temperature recorded was 32° below zero, on January 27th, at Elkader and Fayette. In February the mean temperature was 4.8° below normal, and the lowest was 26° below zero on the 1st. The soil was frozen to an unusual depth. March brought moderate temperature, but the prevalence of cloudiness prevented rapid thawing of the soil, and the ground was generally too wet for seeding operations.

April was abnormally cold, the records of 115 stations showing a daily deficiency of 5.2° in temperature. The average rainfall was 3.63 inches, which is an excess of .74 of an inch above the April average. There were some dry periods, however, with sufficient sunshine to afford ample opportunity for seeding and preparing the ground for planting corn. Seeding of spring wheat, oats and barley begun generally from the 1st to the 4th, and that work was practically completed in the larger part of the state about the 20th or 23d. Germination of seed was unusually slow, but at the close of April there were indications of a good stand, except on low, wet fields. Fruit buds appeared healthy and promising, but there were only a few blossoms visible prior to the 1st of May. The pastures and meadows were unusually late in starting, and there was but little grass for stock at the end of the month. On the whole, though the growth of vegetation was much belated, the month was more favorable than the corresponding month in 1903.

May was nearly normal, the daily mean temperature showing a deficiency of only 0.8°. The average rainfall, 3.78 inches, was .35 of an inch below the May normal. In portions of the west central district, and in some of the southern counties, there were some heavy downpours, which caused much delay in planting, the great excess of moisture being due in large part to the saturated condition of the subsoil, resulting from abnormal rainfall in the preceding season. On the whole it was a favorable month, with sufficient warmth and moisture for grass and small grain, and general conditions favorable for farm work and the germination of the better qualities of seed. Except in quite limited areas, the corn crop was planted about as early as usual, and the soil was in very good condition. The month was especially favorable for the growth of grass in meadows and pastures, and for the small grain crops on well drained lands. The hay crop was well assured; oats and spring wheat stooled out fairly well, potatoes made a fine start; garden truck was well advanced at close of the month, and the fruits promised a better yield than has been produced in recent years.

June was cooler than usual, with less than the normal amount of rainfall, and a large percentage of cloudiness in portions of the state. The daily average temperature was 2.5 degrees below normal. The precipitation was quite unequally distributed; the nothern section receiving an average of 4.53 inches, the central section 2.74, and the southern section 3.08 inches. The week ending June 6th brought excessive rains in all parts of the state, except portions of the east central district. The wet and cloudy weather of that week caused much delay in the cultivation of corn, and in large portions of the state the fields became weedy and the growth of corn was considerably retarded by cold nights and wet, cloudy weather. The second week was generally very favorable for field work and the growth of crops, the days being bright and warm with ideal conditions for cleaning out the corn fields. The week ending the 20th was also favorable, though the temperature was below normal. There was but little interruption of work, and fair progress was noted in the growth of all crops. From the 20th to the close of the month the temperature was abnormally low and there was more than usual cloudiness in the larger part of the state. Despite all drawbacks, however, the corn crop advanced steadily, and at the close of the month the fields were generally clean and the stand was but little below the average of the past fifteen years. The month as a whole was favorable especially to small grain, which headed out about the usual time, though short in straw. The hay crop was well advanced and fairly good, especially in quality. Potatoes and garden vegetables were usually promising.

July was unseasonably cool, the mean temperature being 3.6° below normal. The warmest period was the second decade. The average rainfall for the state, 4.41 inches, was .18 of an inch above normal. The northern section received an average of

3.77 inches; central section 4.47; southern section 5 00 inches. Rain in measurable quantity fell at one or more stations every day during the month. And yet the average number of clear days was 16, partly cloudy, 9, and cloudy, 6. Generally there was sufficient sunshine to promote plant growth. The days were warm, and nights unusually cool. The heaviest storm of the month, in respect to rainfall, occurred on the night of the 19th, but the excessive downpour was limited to a few counties. On the whole the month was favorable for crops and field work. Corn was laid by from the 4th to the 15th,—about a week later than usual. During the showery period in the early half of the month spring wheat and oats were attacked by rust. The wheat crop was damaged seriously, but oats were not very badly injured. The latter half of the month was favorable for harvest operations and most of the small grain was in shock or stack before August 1st. Haying progressed quite favorably and though the yield was lighter than the average the quality was superior, and most of it was secured in good order. Corn made notably fine progress, despite the cool weather, and at the close of the month that crop was much more advanced than was deemed possible earlier in the season. Potatoes, garden truck, apples, small fruit and all minor crops made normal advancement.

The average temperature of August, 1904, was exactly the same as August, 1903, 1902 and 1891. The mean temperature was 2.7° below the August normal. In the southern section it was 67.3°; central section, 69.2°; southern section, 70.7°. The month was mostly clear and warm by day, though unseasonably cool at night. The average rainfall was normal for the state, but in its distribution the larger amount was received in the south and eastern districts, where it was most needed. The bulk of the rainfall came about the 17th to 21st and the 29th. There were, on the average, 17 clear days, 8 partly cloudy, and 6 cloudy, affording an ample amount of fair weather for harvesting, stacking, threshing, cutting wild hay, millet, etc., and fall plowing. In all these farm operations very good progress was made The pastures were revived and made green as in June by the copious showers in the latter half of the month. The corn crop made fair advancement during the month, though in view of its belated condition its progress was not as rapid as seemed desirable. The most advanced portion of the crop was well filled and dented at the close of the month. Reports at that time indicated that about one-third of the crop, with favorable conditions, would be mature by September 20th, while the balance required abundant warmth and sunshine until October 1st to be safe from harm by killing frost. The crop was unusually rank, green and heavily eared. The minor crops were in good condition. Potatoes made heavy yield, and early apples were especially good and abundant. The yield of tomatoes and green corn for canning has been better than usual. Garden truck, cucumbers for pickling and melons yielded abundantly.

The average temperature of September was about normal for the state, the southern and central sections showing an excess, and the northern section a small deficiency. The coldest period was from about the 11th to the 22d. The average rainfall for the state was 2.78 inches, which amount is about 0.52 of an inch below the normal for September. In its distribution there was much inequality, ranging from less than a tenth of an inch at one station in the northwest to over eight inches in the southeast district. The southeast and northeast districts received the heaviest rainfall. The week ending September 12th was normal in temperature and sunshine, with very light rainfall, and generally favorable conditions for ripening the belated corn crop, a considerable portion of which was well dented, with husks and blades putting on the brown shade of autumn. The week ending the 19th brought several days of good ripening weather, but much anxiety for the safety of the immature portion of the corn crop was caused by the occurrence of light to heavy frosts on the mornings of the 12th, 14th and 15th, the cold wave extending to all districts in the state. A few stations also reported frost on the 21st. The lowest temperature recorded was 30° at four stations. The observed effects proved that the frosts were not "killing," and that the damage to the corn crop was limited to late planted fields in the bottom lands of the central valleys of the state. Broadly stated, the actual damage by frost affected less than one-fourth of the area planted, and the shrinkage of the frosted portion of the crop was probably less than 20 per cent. This would indicate possible loss of 5 per cent of the crop for the state, as the direct result of frost. The cold weather of that period, however, retarded the development of the crop, and made it desirable to extend the ripening weather beyond the 1st of October. During the month good progress was made in the usual farm operations, such as plowing, seeding fall wheat and rye, harvesting potatoes, apples and millet, and threshing small grain. The yield of potatoes, and fall apples has been very satisfactory. The grape crop was heavy, and there has been a good yield of plums. The growth of all kinds of garden truck has been unusually heavy. The pastures have been much better than usual for September. At the close of the month it was estimated that ninety per cent of the corn crop was practically safe.

October was warmer and drier than usual, the daily mean temperature being about 1° above normal, and the average rainfall of the state was 0.73 of inch below normal. The northern section received the largest amount, the average being about 0.29 of an inch above the October normal. The first frost of the month occurred on the morning of the 6th, and was heavy enough to kill vines and most of the cornstalks remaining green in the northern half of the state. In the southern half the frost was light, causing no damage. The first general killing frost covering the state occurred on the morning of the 23d, all crops being safe at that time. The bulk of the rainfall came in the first and second decades—mainly between the 5th and 20th, the balance of the month being dry and favorable for farm work, for drying out the corn crops and harvesting the minor crops. No better weather could be desired for preparing corn for cribbing than was prevalent from the 20th to the 31st. Good progress was made in harvesting the corn during the last week though the heavier ears contained considerable moisture. But the weather was cool by night, though moderate and clear by day. The heavy potato crop was harvested in good condition, the quality of the product being unusually good. Pastures were very good throughout the month. Good progress was made in fall plowing. The small acreage in fall wheat and rye showed an excellent growth and good stand. On the whole, October was a very mild and favorable month, crowning a fairly productive crop season.

The month was unusually warm and the driest November on record for the state. The mean temperature, as shown by records of 110 stations, was 41.0°, which is 6.3° above normal. The average in 1902 was .2 of a degree higher and 2.9° higher in 1899. The average precipitation for the state at 119 stations was .15 of an inch, which is 1.25 inches below normal. Nine stations reported no rain in measurable amount. Practically all the precipitation fell on the 9th and 10th, and the average number of clear days was twenty. The conditions were ideal for husking corn and drying out the surplus moisture. At the close of the month the bulk of the crop was harvested. Conditions were also favorable for fall plowing and general farm work of the late autumn period. The pasturage was better than usual, though the fields were brown. Winter wheat and rye suffered some damage for want of moisture.

The first decade of December brought continued fine weather with favorable conditions for gathering the corn and cribbing

the entire crop. The season as a whole was favorable for the production of a fair output of the staple crops. Though germination and growth were belated, the warmth and dryness of the autumn brought ample compensation to the patient and faithful tillers of the soil.

ERRATA IN ANNUAL SUMMARY, 1903.

BAXTER.—Annual temperature on page 16, omitted, should have been 47.6°.

BEDFORD.—Annual temperature on page 16, omitted, should have been 48.8°.

BELLE PLAINE.—Dec.—Mean temperature recorded 16 4° on page 6, should have been 16.5°.

CHARITON.—Dec.—Mean temperature recorded 22.4° on pages 7 and 21, should have been 22.3°.

CHARLES CITY.—Feb.—Mean temperature recorded 18.8° on page 21, should have been 19.8°.

COLUMBUS JUNCTION.—Dec.— Mean temperature recorded 21.5° on pages 7 and 21, should have been 21.6°.

CORNING.—Dec.—Mean temperature recorded 23.2° on pages 7 and 21, should have been 23.4°.

DECORAH.—Annual mean temperature recorded 44 7° on page 21, should have been 44.9°.

EARLHAM.—May.—Mean temperature recorded 60.6 on page 21, should have been 60.0°.

Mean temperature for December, and annual mean temperature recorded 21.5° and 46 7°, respectively, on pages 7 and 21, should have been 21.2° and 46.6°.

FOREST CITY—Dec.—Mean temperature recorded 13.8° on pages 6 and 11, should have been 13.9°.

GALVA.—Dec.—Mean temperature recorded 19.° on pages 6 and 21, should have been 19.1°.

GRINNELL (near).—Dec.—Mean temperature recorded 19.6° on pages 6 and 21, should have been 19.1°.

GRUNDY CENTER.—Mean temperature for June and annual mean temperature recorded 60.6° and 47.3° on page 21, should have been 63.6° and 46.4°, respectively.

HAMPTON.—Sept.—Mean temperature recorded 61.05° on page 21, should have been 61.4°.

INDEPENDENCE.—March.—Mean temperature recorded 37.6° on page 21, should have been 37.4°.

MOUNT VERNON.—Annual mean temperature recorded 47.4° on page 21, should have been 47.5°.

ONAWA.—Dec —Mean temperature recorded 26.4° on pages 6 and 21, should have been 24.0°.

Annual mean temperature recorded 49.3° on page 21, should have been 49.1°.

OSKALOOSA.—Dec.—Mean temperature recorded 20.2° on pages 7 and 21, should have been 19 9°.

Annual temperature recorded 48.5° on page 21, should have been 48.4°.

OTTUMWA.—Nov.—Mean temperature on page 21, omitted, should have been 37.7°.

Dec.—Mean temperature recorded 25.0° on pages 7 and 21, should have been 24.5°.

PACIFIC JUNCTION.—Annual temperature recorded 49.5° on page 21, should have been 49.1°.

PRIMGHAR.—Dec.—Mean temperature recorded 16.7° on pages 6 and 21, should have been 17.0°.

RIDGEWAY.—Dec.—Mean temperature recorded 16.3 on page 6 and 21, should have been 16.2°.

KEOSAUQUA.—June.—Mean temperature recorded 65.0° on page 21, should have been 65.1°.

LE MARS.—Dec.—Mean temperature recorded 19.8° on page 6 and 18.8° on page 21, should have been 20.2°.

Annual temperature recorded 45.7° on page 21, should have been 45 6°.

Dec.—Minimum temperature on 3d, page 9, recorded -5 should have been 15°.

Dec.—Mean minimum temperature recorded 8.8° on page 9, should have been 9.5°.

LEON.—June.—Mean temperature recorded 64.2° on page 21, should have been 66.2°.

Annual temperature recorded 49.7° on page 21, should have been 49.9°

RUTHVEN.—Sept.—Mean temperature recorded 60.6° on page 21, should have been 60.0°.

VILLISCA.—March.—Mean temperature recorded 40.6° on page 22, should have been 40.2°

WATERLOO.—Annual temperature recorded 46.7° on page 22, should have been 46.6°.

WHITTEN.—Dec.—Mean temperature recorded 17.4° on pages 6 and 22, should have been 17.8°.

BELLE PLAINE.—March.—Total precipitation recorded 2.00 inches on page 23 should have been 2.10 inches.

Annual precipitation recorded 34.33 inches on pages 16 and 23, should have been 34.43 inches.

CLEAR LAKE.—Annual precipitation omited, page 23, should have been 36.18 inches.

GRINNELL (near)—Total precipitation for July recorded 3.97 inches on page 23, should have been 3.79 inches.

IDA GROVE.—July.—Total precipitation recorded 4.41 inches on page 23, should have been 4.31 inches.

LEON—Dec.—Total precipitation on page 23, omitted, should have been .60 inch.

Annual precipitation on pages 16 and 23, omitted, should have been 34.30 inches.

OLIN.—Dec.—Total precipitation recorded .99 inch on pages 6, 10 and 23, should have been 1.09 inches.

Annual precipitation recorded 35 53 inches on pages 17 and 23, should have been 35.63 inches.

OSKALOOSA.—Dec.—Total precipitation recorded .32 inches on pages 7, 10 and 23, should have been .34 inch.

Annual precipitation recorded 28.01 inches on pages 17 and 23, should have been 28.03 inches.

OTTUMWA.—Dec.—Total precipitation on pages 7 and 23, omitted, should have been .81 inch.

RUTHVEN.—Nov.—Total precipitation on page 24, omitted, should have been Trace.

SAC CITY.—Nov.—Total precipitation on page 24, recorded .16 inch, should have been .26 inch.

Annual precipitation recorded 36.24 inches on pages 17 and 24, should have been 36.34 inches.
