THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. DECEMBER 1903. No. 12.

WEATHER AND CROPS—DECEMBER, 1903.

December, 1903, was extremely dry, the average precipitation for the state being .88 of an inch below normal, and in some localities the precipitation was little more than a trace. The mean temperature for the state, 19.6 degrees, was 3.9 degrees below the normal, but the month as a whole was very favorable for farm operations usual to the season, and for stock feeding. The dry weather was especially favorable for finishing husking and cribbing corn and also for drying the portion of the crop which contained more than the usual amount of moisture. The fields afforded good forage for grazing cattle, horses and sheep. The bare ground and freezing weather, however, caused some detriment to fall wheat and rye; but the acreage of these crops is very small. The month was generally favorable for the health of the people and all kinds of live stock.

THE CORN CROP.

The Bureau of Statistics of the Department of Agriculture, in its final report for 1903, estimates the total yield of the corn crop for the United States at 2,244,176,925 bushels. Iowa is credited with a total yield of 229,218,220 bushels, which amount is very close to the estimate made by the state crop service. In the state report, however, the area harvested was materially less than the estimate of the government bureau. This accounts for the difference in the average yield per acre as shown by the two reports.

The total value of the corn crop of the United States is estimated at $952,868,000. If the value of the corn fodder is included, the whole crop is worth more than a billion dollars.

AS TO WEATHER PREDICTIONS.

Cedar Rapids Republican, December 25, 1903: The weather predictions for Thursday were rain or snow, with colder in the northwestern portions of the state.

But yesterday morning there was hardly a cloud in the sky, the sun shone with the genial warmth that has characterized so many of the December days this year. This may lead some people to believe that the weather predictions do not amount to much after all.

Many people still believe that the weather predictions sent out by the government service partake of the mysterious and the uncanny work of so-called prophets. But such is not the case. The governmment observers simply take note of the trend of lows and highs, of storm areas and clearings. When a storm is formed in the northwest and sweeps onward toward the southeast, the government observers wire the information to Washington and the Washington scientists send warnings to the sections which are likely to be covered by the storm area, and estimate the time in which the storm may be expected. If a runaway engine starts from Belle Plaine it is possible to wire to Cedar Rapids to be on the lookout for it and to have the tracks cleared for the monster. That is what the weather service does. Nothing more. Of course before the engine gets to Cedar Rapids the steam may be exhausted and the fire in the firebox burned out. So it often happens with storms that are scheduled to arrive. They may be rained out or snowed out before they reach all the people in the territory in their track. Or a contrary current of air may swerve them out of the usual course. There are many things which may interfere. Or, when clear weather is predicted a local storm may be made out of local atmospheric conditions. But this does not invalidate the predictions as a whole.

IOWA WEATHER IS ALL RIGHT.

One rarely picks up a paper but what he notes the departure of citizens to some distant point to spend the winter. Like birds of passage many seek winter resorts to avoid the approach of severe weather. To find a dwelling place where blizzards come not and the flowers forever bloom has attractions for human beings as well as for birds. But then the most of us have to remain behind to keep our corner of the world moving, and keep it in some semblance of shape for ourselves and to welcome the return of the weary wanderers. What matters it though our faces are bronzed and the sand creeps into our bodies, we have the pleasure of conquering the elements and witnessing the most beautiful of contrasts. Human nature tires of the evenness of things be it ever so mild or enticing. We have in Iowa pleasant weather, fair weather, disagreeable weather, but weather that is generally moderate. It's the kind of weather that spices life. It helps to cool the over-arduous, tempers the fitful, cheers the despondent, moves the laggard along, and buries those who will not move with the greatest of all coverings that of oblivion. Iowa weather is as we want it; we wouldn't change it if we could.—*Estherville Enterprise.*

WORK OF A HAILSTORM.

Nature gets on an ugly fit once in awhile, and we have lately had an experience which showed her at about her worst. It was September and harvest time, when most of her cranky fits are supposed to be over, when, having given us all the summer programme of excessive heat, spiteful winds, a deluge of water and lightning wreck, we have come to regard her as satiated

and tired and rid of her beligerent moods, but just when the apples were hanging all ready for the pickers, when the corn was just right to cut up, when the beans were ready to pull and onions pulled and drying prior to sacking, along came a hailstorm one afternoon, not an ordinary sprinkle of hail, say the size of marbles, but a regular cleaning out of the weather clerk's ice box upstairs, great ragged, three cornered chunks of ice big and hard enough to make a dent a quarter of an inch deep in a pine board, and then, sure enough, it was all day with the nice crops—corn stripped clean all save the ears, making the field look like an army of Shanghai roosters plucked clean all save their tail feathers; apples smashed into cider pulp, and beans thrashed clean, and onions left as though they had been struck with a baseball bat. Five minutes did the business, and the writer of these notes knows just how a fellow feels who is dead sure that he has a good thing and finds after all that he has not got it. We expect hail in June, July and rarely in August, but the September hailstorm is the clipper when it comes. Being an optimist, however, we look on the bright side and have been figuring up how much we have saved by not having the corn to cut up and the other crops to harvest, and then we feel thankful that the hail did not shell the corn and leave us nothing but cobs and that it could not reach the potatoes. The prize acre of onions, yielding over 600 bushels, was the sorriest sight of the wreckr· Practicing what we preach, we are not going to fret, but just try it again.—*J. S. Trigg in Rockford Register.*

RECENT SOLAR RESEARCHES.

Two papers by French meteorologists, dealing with the suspected parallel between the eleven-year sunspot period and fluctuations in terrestrial temperatures, have recently been made accessible to American readers by "The United States Monthly Weather Review." In one of them M. Nordmann follows up a comparison made many years ago by Koeppen. He confines his inquiry to the interval between 1870 and 1900, and to stations lying within about twenty degrees of the equator. Taking the average of the annual temperatures for thirteen points, he finds a slight excess at the minimum stage of solar activity, and a deficit at the time of greatest sunspot abundance. Although the fluctuation is slight, it seems to be systematic, and it corresponds to that which Koeppen thought he had detected. The other paper translated for *The Monthly Weather Review* is a review of M. Nordmann's work by Professor Alfred Angot. Although objection is made to some of his compatriot's methods, the second writer reaches substantially the same conclusions as the first.

Much work has been done in the last thirty years by other meteorologists which points to a similar periodicity. Chambers found it in the drouths which afflict India. Some of his associates believed that they detected long range variations in the prevailing atmospheric pressure, which were related to temperature and rainfall. Meldrum showed that tropical cyclones in the Indian Ocean were more numerous at and near sunspot maxima, and Bigelow did the same for West India hurricanes. The latter investigator, who is attached to the Washington bureau, has presented a good deal of evidence to indicate that other features of the weather, outside of the tropics as well as inside, undergo a fairly regular alternation. These various statements have their vulnerable points. The more recent ones have not yet been thoroughly threshed by critics, nor fully verified. The mechanism by which terrestrial weather is influenced, if at all, is not made altogether clear. Yet as the matter stands to day there is increased reason for thinking that fluctuations occur in solar radiation, and that such changes are influential on the earth. The practical importance of further research, therefore, may be said to grow more apparent daily.

A line of inquiry has been pursued by Professor Langley for more than ten years which is exceedingly promising, He seeks to discover the variations in question by direct observation of the sun. Having obtained a telescopic image of that body, he examines it with a spectroscope and an instrument of his own invention whereby differences of temperature as small as a hundred-millionth of a degree can be detected. Various difficulties have beset this work. The apparatus is so delicate that a number of local influences interfere with its operation. Its testimony is also obscured by variable conditions in the earth's atmosphere, notably the presence of water vapor. Most of these sources of error and uncertainty have been slowly eliminated, however. In the latest report of the Smithsonian Institution Professor Langley intimates that it may be necessary to transfer the work to a mountain top, but he takes an encouraging view of the possibility of getting accurate results at the astro-physical observatory in Washington. After he is fully satisfied with the working of his instruments, which, by the way make records automatically, he should soon be in a position to say whether they give him clear indications of substantial changes in the sun's thermal output.

When once it has been proved that the bolometer will give unmistakable evidence of variations in heat emission, the next step will be to find out whether it can be utilized practically in weather forecasting. An investigation of colossal proportions will be necessary to determine whether perceptible consequences ensue at the earth's surface, and how much time intervenes between the observed cause and effect. These questions cannot be settled in a day. Possibly it may be found that the behavior of the magnets in well regulated observatories, or even that of simpler instruments of an allied nature which can be used at ordinary meteorological stations, will be more significant. At any rate, it is not incredible that better means of gaining an insight into coming weather changes will be available before the first quarter of the twentieth century has elapsed.—*New York Tribune.*

CLIMATOLOGY OF THE MONTH, DECEMBER, 1903.

BAROMETER.—Mean pressure, 30.12 inches; highest observed, 30 68 inches, at Des Moines, on the 14th; lowest observed, 29.60 inches, at Davenport on the 25th; range for state, 1.08 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 103 stations, was 19.6°, which is 3.9° below normal. By sections the mean temperatures were as follows: Northern section 16.0°; central section 19.7°; southern section 23.0°. The highest monthly mean was 26.2° at Glenwood; lowest monthly mean, 12.5° at Sibley. The highest temperature reported was 58°, at Hopeville, Mt. Ayr, Osceola and St Charles on the 31st; lowest temperature reported, 27° at Sibley on the 13th. The average monthly maximum was 48.8°; average monthly minimum, 15.3°. Greatest daily range 56° at Whitten; average of greatest daily ranges 40.5.°

PRECIPITATION.—Average precipitation for the state as shown by records of 118 stations, was 0.41 of an inch, which is 0.88 of an inch below normal. The averages by sections were as follows: Northern section, .49 of an inch; central section, .37 of an inch; southern section. 38 inches. The largest amount reported was 1.96 inches at Ridgeway; least amount reported, trace, at Storm Lake. The greatest daily rainfall reported was .68 of an inch at Ridgeway on the 25th. Average number of days on which .01 of an inch or more was reported, 4.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, fifty miles per hour, from the northwest, at Sioux City, on the 28th. Average number of clear days, 11; partly cloudy, 9; cloudy, 11.

OBSERVERS' NOTES.

ALLERTON.—*Rex Shriver.* Generally pleasant and dry; blizzard on 12th; good sleighing from 12th to 17th.

ALTA.—*David E. Hadden.* Very cold during the middle decade of the month; only two inches of snow, which soon disappeared; roads excellent.

ATLANTIC.—*J. W. Love.* A remarkably mild December, with no rain and very little snow; roads fine.

BONAPARTE.—*B. R. Vale.* A dry, cool month; roads good; fields in good condition and husking done. For 1903 the precipitation was 39.34 inches, as against 47.61 inches in 1902, and 16.34 inches in 1901.

BRITT.—*Geo. P. Hardwick.* Temperature below normal; no severe storms; live stock healthy and feeding in the fields; excess of surface water disappeared; corn all gathered, and about half a crop.

CARROLL.—*Moses Simon.* Cold wave 13th to 15th; balance of month fine; roads good.

CHARITON.—*C. C. Burr.* Month more like October than December; roads dry and smooth.

CLINTON.—*Dr. Luke Roberts.* A cold December and erratic in its high and low temperatures; mean, 5.5° below normal; maximum, 9.6° below normal; minimum, 9.9° below normal; rainfall also below normal.

ELKADOR.—*Charles Reinecke.* Mean temperature for 1903 was 46.3°; total precipitation for 1903 was 40.70 inches; total snowfall for 1903 was 32.5 inches; highest temperature for 1903 was 93° July 9th; lowest temperature, 19° December 13th.

GRAND MEADOW.—*F. L. Williams.* A drop of 40° in temperature occurred between 11 A. M. on the 12th and 4 A. M. on the 13th; month cold and dry; stock doing well.

GREENFIELD.—*J. G. Culver.* Temperature fell 45° in the 24 hours following 6 A. M. of the 25th.

GRINNELL.—*A. O. Price.* Month cool and dry; fine for stock; ground bare of snow except in patches; snow fall, 1.5 inches; or .15 of an inch melted.

HANLONTOWN.—*Miss G. M. Paschen.* Snow of first part of the month melted about the 20th; later snow nearly all melted on 31st; month colder than last year.

HOPEVILLE.—*M. L. Ashley.* A beautiful month; roads dry and dusty; stock wintering finely to date.

HUMBOLDT.—*H. S. Wells.* Weather very fine, and roads never better; stock healthy.

IDA GROVE.—*J. E. Conn.* Month very fine; clear with continued cold weather.

JEFFERSON.—*Isaac Young.* Snow all gone and ground freezing deep. This will remedy the soggy condition the fields were in during the past season.

MT. AYR.—*A. L. Beard.* An ideal month; very fine winter weather.

OLIN.—*Nathan Potter.* A good month for feeding stock; roads fine.

OSKALOOSA.—*Jos Boyd.* Month all that could be desired for feeding stock.

PACIFIC JUNCTION.—*H. H. McCartney.* Latter part of month characterized by N. N. W. winds; extremely warm for time of year; were they estray chinook winds?

RIDGEWAY.—*Arthur Betts.*—Coldest December on record at this station; good wheeling all the month; bright lightning on the 19th; 151 hours of sunshine, or 54 per cent; most of the warm waves culminated at night.

WASHTA.—*H. L. Felter.* Corn husking about completed by December 10th.

WAUKEE.—*E. J. Leonard.* An excellent month; tempera ture reached zero on only five days; fine roads.

BELATED REPORTS.

CLEAR LAKE—November—Mean temperature 30.5° on the 1st; lowest—2 on the 26th; greatest daily range 29; total precipitation, Trace; greatest in 24 hours, Trace; prevailing direction, northwest; total snowfall, Trace; number of clear days 14, partly cloudy 11, cloudy 5, rainy 0.

OTTUMWA—November—Mean temperature 37.7°; highest 74° on the 1st; lowest 10° on the 26th; greatest daily range 30°; total precipitation .65 inch; greatest in 24 hours .61 inch on the 10th; total snowfall, Trace; prevailing direction, southeast. Number of clear days 5, partly cloudy 16, cloudy 9, rainy 3.

BELLE PLAINE—November—Mean temperature 31.9; highest 54° on the 12th; lowest 2° on the 26th; greatest daily range 27°; total precipitation .39 inch; greatest in 24 hours .18 inch on the 2nd; total snowfall 0.2 inch; prevailing direction, northwest. Number of clear days 12, partly cloudy 12, cloudy 6, rainy 5.

ERRATA IN OCTOBER REVIEW.

BELKNAP—Mean temperature recorded 57.0° on page 8 should have been 57.8°.

CLEAR LAKE—Mean maximum temperature recorded 62.0° on page 9, should have been 61.9°.

LENOX—Mean temperature recorded 51.8° on page 8, should have been 53.2°. Mean maximum temperature recorded 64.9° on page 10, should have been 64.5°.

OGDEN—Total precipitation recorded 1.80 inches on pages 7 and 11, should have been 2.00 inches.

ONAWA—Mean temperature recorded 50.2° on page 7, should have been 55.2°.

ERRATA IN NOVEMBER REVIEW.

AMANA—Mean temperature recorded 33.5° on page 8, should have been 34 5°.

ATLANTIC—Mean temperature recorded 36.2° on page 9, should have been 36.4°.

Mean minimum temperature recorded 27.0° on page 10, should have been 27.3°.

DELAWARE—Mean temperature recorded 31.4° on page 8, should have been 31.5°.

MT. PLEASANT—Mean temperature recorded 34.8° on page 9, should have been 35.8°.

Mean maximum temperature recorded 43.1° on page 11, should have been 45.1°.

WAVERLY—Mean temperature recorded 31.8° on page 8, should have been 32.8°.

Mean maximum temperature recorded 40.9° on page 11, should have been 42 3°.

Mean minimum temperature recorded 31.8° on page 11, should have been 32.8°.

Precipitation Chart December 1903.

APPENDIX--ANNUAL SUMMARY, 1903.

CLIMATOLOGY OF THE YEAR 1903.

BAROMETER—The mean pressure for the year was 30.04 inches. The highest observed pressure was 30.68 inches on February 18th and December 14th at Des Moines; lowest pressure, 29.19 inches, on October 6th at Sioux City. Range for the state 1.49 inches.

TEMPERATURE—The mean temperature for the state was 47.3°, which is 0.3° below normal. The highest temperature reported was 101° on Aug. 24th at Logan. The lowest temperature reported was 27° below zero on December 13th at Sibley. Range for the year 128°.

PRECIPITATION—The average amount of rain and melted snow for the year, as shown by complete records of 95 stations, was 35.66 inches, which is 4.75 inches above the normal, and 8.65 inches below the average amount for 1902. The greatest amount recorded at any station for the year was 50.53 inches at Onawa. Least amount recorded 26.41 inches at Ames. The greatest monthly rainfall was 17.74 inches at Woodburn in August; least monthly amount, a trace at Afton and thirteen other stations in January, November and December; the greatest amount in any consecutive twenty-four hours was 11.22 inches at Cherokee, August 27th. The average number of days on which .01 inch or more of rain fell was 92.

WIND AND WEATHER—The prevailing direction of wind was northwest. Highest velocity reported, seventy-two miles an hour, in Sioux City, from the northwest and southeast on January 6th and May 21st. Average daily wind movement 210 miles. There were 156 clear days, 100 partly cloudy, and 109 cloudy days; as against 145 clear days, 111 cloudy and 109 partly cloudy in 1902.

CLIMATE AND CROP REVIEW.

COMPARATIVE DATA OF THREE ABNORMAL SEASONS, AND SUMMARY OF 1903.

The first three crop seasons of the new century—1901-1902-1903—may be classed as radically abnormal in respect to seasonal rainfall and temperatures, their records serving as striking illustrations of possible climatic extremes of this section. The season of 1901 was notable for extreme heat and aridity of air and earth, breaking all records of daily averages and maximum temperatures in the midsummer period. The droughty conditions continued until about May 1, 1902; then came heavy downpours, with streams bankfull and overflowing, and continued excess of precipitation for a period of about seventeen consecutive months, or until September 15, 1903. For reference and comparison the following table is appended, showing the average precipitation and mean temperatures for the state, for the six crop months—April 1st to September 30th—in the last three years; also the monthly normals for the same period.

PRECIPITATION, INCHES.

Years.	1903	1902	1901	Normal
April	2.98	1.71	1.79	2.89
May	8.55	5.39	2.35	4.13
June	2.86	7.16	3 17	4.50
July	4.83	8.67	2 34	4.23
August	6.64	6.58	1.29	3.43
September	3.81	4.35	4.77	3.30
Total for six months	29.67	33.86	16.25	22.48
Total for the year	35.39	43.82	24.41	31.42

MEAN TEMPERATURES—DEGREES.

April	49.8	48.2	49.9	49.3
May	61.6	63.8	60.7	60.4
June	64.6	65 2	72.3	69.6
July	72.9	73.1	82.4	74.2
August	69.1	69.1	73.8	71.8
September	60.8	59.1	63.3	63.6
Means	63.1	63.0	67.0	64.8

The records of the four critical crop months—May 1st to September 1st—show the marked difference in the rainfall and temperature of 1901 in comparison with the two following seasons. The total amounts for the four months were as follows: In 1901, 9.69 inches; in 1902, 27.80 inches; in 1903, 22.88 inches. The normal for the four months is 16.29 inches. The most favorable showing in these records is the fact that the rainfall in the crop season of 1903 was nearly 5.00 inches less than in the same period in 1902, indicating a return towards normal conditions.

The winter of 1903 was generally about normal and favorable for live stock and the usual farm operations of the season. The soil was very wet, and the ponds and streams were more than usually filled with water and ice. Fall wheat and rye wintered fairly well, though the covering of snow was generally light. March was warmer than usual, with somewhat less than the normal precipitation; but the excessive cloudiness and humidity retarded farm work except in dry, sandy soil. While the spring opened earlier than usual, the fields were too wet to allow an early start in farm work.

April was about normal in temperature and rainfall, but the prevalence of cloudy, misty and humid weather during the larger part of the month retarded the necessary drying of the surface. The usual farm operations were pursued under these adverse conditions, causing material reduction of the acreage of spring wheat, oats and barley. Pastures and meadows made an early start and the grain crops germinated readily, making a fairly good stand. A snowstorm with freezing temperature, at the close of the month, checked crop growth and injured the earlier varieties of apples, cherries and plums.

May was the wettest and most unfavorable month of the season. The soil at the outset was supersaturated, and the average rainfall for the state for the month was 8.55 inches. The distribution of this excessive amount of rainfall was variable, ranging at local stations from 2.88 to 15.45 inches; but the averages of each section was above 8 inches. The best conditions as to dryness of soil were in the Mississippi river districts. The great interior basins of the Des Moines, Iowa and Cedar rivers were subjected to very heavy floods about the close of the month, causing much delay in farming operations and damage to all crops. From about the 3d to the 18th conditions were at their best, and during that part of the month the plowing, planting and other farm operations were in progress on the drier lands, with only occasional interruption by showers. Most of the corn that was planted was put in during that period. The protracted and very heavy storms during the last decade rendered field work impracticable in more than four-fifths of the state. At the close of the month not more than two-thirds of the usual corn area had been planted. The germination was generally quick and satisfactory in the stand, but the fields soon became very foul from the lack of cultivation, and much more than the usual amount of replanting was necessitated as a result of washing and flooding the fields. The general condition of wheat, oats, rye, barley and meadows was better than seemed to be possible during prevalence of the storms.

June was unseasonably cool, but generally dry and more favorable for field work and crops than the preceding month. The mean temperature was about 5° below normal, and the rainfall was 1.52 inches below the average. The surface dried off slowly, and the cool weather was more favorable for small grain than for the rapid germination and growth of the belated corn. Good progress was made in replanting the washed out corn fields and in cultivating the early planted corn on the dry upland. Seasonable temperature about the close of the month caused a marked improvement in the appearance and prospects of this important staple, and in size and color it was much nearer the normal condition than was deemed possible at the outset. Clover-cutting was begun near the middle of the month, and haymaking was quite general at the close, the output being above the average.

July was characterized by frequent and sudden alternations from high to low temperatures. The daily mean for the month was about 2° below normal, the first decade being unusually warm, the second decade unseasonably cool, and the third decade bringing the two extremes of temperature. The average rainfall for the state, 4.83 inches, was .91 of an inch above the July normal. The distribution was very unequal, the average of the northern section being 6.49, the central section 5.28, and the southern section 2.73 inches. The heaviest amounts of rainfall were reported at stations in the N. E. district. The most destructive storm of the month occurred on the afternoon of the 20th, sweeping across the state on a direct line from Lyon and Osceola southward to Adams, Taylor and Ringgold, its pathway varying in width from one to eight miles. At numerous points along this line the storm was accompanied by high winds and very heavy hail, causing almost total loss of growing crops within an area of more than three hundred square miles. In portions of the southern section drouthy conditions prevailed for many days, causing some detriment to growing crops; but the closing week brought generous showers. On the whole the month was favorable to haymaking and harvesting of wheat, oats, barley and rye. The hay crop proved to be one of the best ever produced in the state, and the greater part of it was secured in excellent condition. Wheat and oats were generally harvested in good condition, but on account of the rust and blight the yield has been disappointing, though the quality of the grain will be greatly superior to the output of last year. The corn crop made fairly good progress during the month, though the temperature was somewhat unfavorable about half of the time. The early planted portion of the crop reached the earing stage while the late planted corn was generally small and unpromising. The outlook for the crop as a whole was not encouraging at the close of July.

August was cooler than usual with a large excess of rainfall, humidity and cloudiness. The mean temperature was 3.1° below normal, and the average rainfall, 6.64 inches, was 3.43 inches above normal. The southern section received the larger amount, an average of 8.74 inches, the bulk of it falling in the last week of the month (State Fair week). It was the wettest August of which we have records for the state. There were nineteen cloudy or partly cloudy days. During the fair weather periods considerable progress was made in threshing and other farm operations. Haymaking was continued throughout the month, when the weather permitted, securing a large amount of aftermath, wild hay, and second crop of clover for seed and fodder. More than the usual amount of plowing was done, with generally favorable conditions of soil for this work. Threshing returns indicated generally light and unsatisfactory yield of wheat, oats and barley; the yield of timothy seed has been unusually heavy. The development of the corn crop was all that could be expected under the prevalent weather conditions. At the close of the month the early planted corn, about forty per cent of the whole area, had reached the roasting ear stage, or a little beyond, giving promise of reaching maturity within twenty days, under favorable conditions. The balance of the crop was in various stages of growth, indicating need of very good ripening weather for a full month or more to place the bulk of it beyond danger of harm or frost. The outlook for the crop as a whole was at that time unsatisfactory. The late potato crop made fair growth in dry and sandy soil, but there were reports of damage by rot in many localities. The crop of early and fall apples gave good returns, especially in the northern half of the state; but winter apples were unpromising. Pasturage made a heavy growth, giving assurance of abundant fall feed for stock.

September was cooler than usual, the mean temperature being 3.4° below normal. Frosts occurred at numerous stations on the 16th, 17th, 18th, 24th and 27th, but little damage resulted to corn and other crops, except in limited areas on low ground. The main detriment caused by the cold and frosty period was the delay in bringing belated corn to full maturity. The period of most unfavorable weather and heaviest rainfall was from the 4th to the 10th. In the last half of the month there were about twelve days of ideal weather for maturing crops, harvesting, threshing and plowing. During this time corn made very good progress, and at the close of the month fully eighty per cent of the crop was well matured, the balance requiring two weeks of frostless weather and generally favorable conditions to make it safe. There was but little expectation of bringing all of the belated portion of the crop to maturity, as some of it was green and soft at the close of September. A considerable amount of the early corn was cut and put into shocks after the first appearance of frost. Fall pasturage was never better, and seldom as good at this time of year. Fair progress was made in harvesting the minor crops, and a good deal of second crop hay was secured. Fall plowing was well advanced, much more than the usual acreage having been done with the soil in excellent condition. The potato harvest showed a very light yield, and much damaged by rotting. The fall apple crop was fair, but winter apples were inferior in size and quality. On the whole September was a fairly satisfactory month, though below normal in temperature and sunshine. The adverse features of the month were the natural sequence of the preceeding abnormal spring and summer.

October was an ideal autumn month. The mean temperature was slightly above and the rainfall below the normal, and the percentage of sunshine was higher than usual. The bulk of the rainfall came in the first seven days, and generally with but little disturbance of the elements. No trace of snow was reported during the month. The first general killing frost occurred on the 18th, at which time there was practically very little of value exposed to damage by freezing temperature. The greater portion of the late planted corn was fairly well matured before the middle of the month. Reports were received of very many fields planted as late as June 15th which were well ripened by October 10th. The amount of fall plowing in the state at large was much greater than in recent years. A limited acreage of fall wheat and rye was sown, and the conditions were favorable for germination and growth, insuring a good stand. The fall pasturage was never better, being very green and succulent at the close of October. The dry weather was favorable to harvesting potatoes, apples, and all the late maturing crops. The potato crop was generally light, with considerable damage by rot, though some localities report a fair yield. The yield of winter apples was much below the average. Forage crops and garden truck made excellent yields. As a whole October was a remarkably fine month, making an exceptional record in view of the adverse weather conditions of the preceding months.

November was unusually dry and seasonably warm, with less than the average amount of atmospheric disturbance. Conditions were favorable for farm operations, and excellent prog-

ress was made in cribbing the corn crop. The cobs contained more than the usual amount of moisture, but the dry weather and freezing temperature prevented damage by heating in the cribs. The small acreage of fall wheat and rye suffered no material injury from dry weather and freezing. The weather was highly favorable for stock feeding and pastures afforded good feed throughout the month. The supply of water for stock was ample for the winter.

On the whole the crop season of 1903 was materially better than the preceding season, the quality of the output of the soil being much superior. The forage crops have been exceptionally heavy, and the fall months were favorable for securing the full benefit of the abundant yield of pasturage and fodder. There is much cause for congratulation and thankfulness that, under such unusual conditions, the yield of all staple crops has been sufficient to afford a liberal reward for the labor of the tillers of the soil of this most fertile state.

ERRATA IN 1902 ANNUAL.

CHARLES CITY.—Monthly mean temperature for June recorded 56.8° on page 19, should have been 64.0°. Mean annual temperature recorded 46.6° on pages 15 and 19, should have been 46.4°.

DE SOTO.—Monthly mean temperature for December recorded 22.2° on page 19, should have been 22.5°. Mean annual temperature recorded 22 2° on pages 15 and 19, should have been 22.5°.

GALVA.—Monthly mean temperature for December recorded 15.8° on page 19, should have been omitted.

GUTHRIE CENTER.—Monthly mean temperature for July recorded 73.0° on page 19, should have been 72.4°. Mean annual temperature recorded 48.9° on pages 15 and 19, should have been 46.8°.

MT. AYR.—Monthly mean temperature for December recorded 19.4° on page 19, should have been 21.1°. Mean annual temperature recorded 48.7° on pages 15 and 19, should have been 48.8°.

MT. VERNON.—Monthly mean temperature for July recorded 74.0° on page 10, should have been 73.9°.

SHELDON.—Monthly mean temperature for November recorded 36.8° on page 19, should have been 37.°0. Mean annual temperature recorded 45.4° on pages 15 and 19, should have been 45.5°.

GILMAN.—Monthly precipitation for February recorded .87 inches, on page 21, should have been .89 inches. Annual precipitation recorded 42.00 inches on pages 15 and 21, should have been 42.02 inches.

LACONA.—Annual precipitation recorded 54.17 inches on pages 15 and 21, should have been 53.97 inches.

LE CLAIRE.—Annual precipitation recorded 46.86 inches on pages 15 and 21, should have been 45.86 inches.

RED OAK.—Monthly precip'tation for December recorded 2.32 inches on page 21, should have been 2 52 inches. Annual precipitation recorded 47.36 inches on pages 15 and 21, should have been 47.56 inches

SAC CITY.—Monthly precipitation for October recorded 1.56 inches on page 21, should have been 1.16 inches. Annual precipitation recorded 42 77 inches on pages 15 and 21, should have been 42.37 inches.

J. R. SAGE,
DIRECTOF.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. JANUARY 1904 No. 1.

WEATHER AND CROPS—JANUARY, 1904.

The month was colder than usual, with some excess of precipitation. The mean temperature for the State, 14 degrees, was 4.2 degrees below normal, and the average precipitation, 1.18 inches, was 0.21 of an inch above normal. During the first and second decades the temperature was seasonable, and the general weather conditions were very favorable for feeding stock and the usual farm operations of the winter season. The last decade brought wide-spread storms of snow, rain, sleet and ice, followed by extremely low temperature which continued through the balance of the month. The heavy coating of ice damaged fruit trees, vines, timber, telegraph and telephone wires and poles; also caused much suffering to farm animals, and great inconvenience to stock feeders. It was one of the worst storms of sleet and ice ever experienced in this State. The extent of damage to fruit cannot as yet be determined. Fall grain and the grasses were undoubtedly somewhat damaged by ice and extreme cold, but the covering of snow beneath the ice afforded some measure of protection.

EDITORIAL NOTES.

Farmers are being warned to test their seed oats very carefully before seeding this season. The average oats crop in this State last season was much below the standard in weight, and reports of numerous experiments indicate that the grain is generally very deficient in germinating power. Careful tests should be made at once; and no seed should be sown that is below the standard in weight and fertility.

The Cincinnati *Price Current* recently compiled from reports of the U. S. Department of Agriculture a table showing the production of corn in the United States, by states, for the past seven years. This table shows Iowa in the lead in corn production, with a margin of about 2,000,000 bushels better than the next best corn state, which is Illinois. Returns for the past ten years show a larger excess credited to Iowa.

In Great Britain, 1902 was the wettest twelve months for more than half a century. In London rain fell on 205 days, against an average of 166 days for previous years.

The United States now stands at the head of the list of exporting nations. For the calendar year 1903 the exports of domestic products from this country amounted to $1,457,565,783, exceeding the output from the United Kingdom by about $32,000,000. This foremost rank as an exporting nation has been attained within the last six years, and the products of agriculture have been the means whereby it has been achieved.

Efforts are being made to develop sugar beet production in Woodbury county the coming season. A local company will pay $4.50 per ton for the beets at the factory. The soil and climate of that section are well adapted to the industry.

The palace of agriculture at the St. Louis world's fair is double the size of the agricultural building at the Chicago exposition in 1893 It covers an area of eighteen acres, and it will be none too large for the display of farm products of this country.

A Maine paper mill is making from Illinois cornstalks a quality of paper that sells as high as eight cents a pound. That s heme seems likely to conserve the timber that is being consumed so rapidly in the pulp mills.

SEASONAL FORECASTS FOR A YEAR.

In his annual report for 1903, the Chief of the Weather Bureau, Prof. Willis L. Moore, briefly discusses the difficulties involved in the problem of seasonal forecasts for a year. We copy the following extract from this excellent report: It is a very difficult piece of science that is involved in the attempt to place the forecasts of the seasons for a year in advance upon a reliable basis, because it will be necessary to take account of several interrelated processes in nature, which depend upon the circulation of the atmosphere of the sun and of the earth. The science of meteorology is not to be confined to the atmosphere of the earth; because the changes in the action of the atmosphere of the sun precede the variations in the earth's air, which finally culminate in a certain type of season. Thus, wet and dry seasons, warm and cold summers and winters, and all the other climatic differences first depend upon the persistence of special high and low areas of pressure in one locality or another; these go back to the circulation of the great currents in the atmosphere, which seem to surge back and forth from one side of the earth to the other, or from the oceans to the continents; finally, these currents are probably due to the solar radiation, which itself changes with the output of energy from the interior of the sun. Thus, meteorology is really a very closely allied but difficult branch of solar physics, and it ought to be studied with the aid of a fully equipped observatory devoted especially to such researches. On the sun we count up the number of hydrogen flames or prominences seen on the edge of the disc from day to day, and, from a discussion of the thirty years' record in hand, they are known to vary strongly from year to year. Similarly, the faculæ and spots have their fluctuations in synchronous cycles, and these have been studied for

many years. Furthermore, the sun emits energy in the form of radiant light and invisible heat, and by means of suitable spectrum observations the variable amount of this light, and especially the invisible heat, can be registered from day to day and from year to year. The result of these records is to indicate that the sun is in fact a great, variable star, and that terrestrial weather changes in close synchronism with it. There is yet another register of the energy emitted by the sun to be found in the variations of the earth's electrical and magnetic fields, which is perhaps the most sensitive of all, and certainly the most accessible to our measures. The newly discovered action of ions in the atmospheres of the sun and the earth, respectively, which are now believed to be the basis of the electrical and magnetic manifestations, is affording much information upon this obscure subject, and it is full of promise in practical investigations. Langley has announced that the invisible radiant heat energy, as measured in his bolographs, varies from season to season and from year to year. The passage of an eclipse shadow through the atmosphere changes the atmospheric magnetism and electricity in the same way that day and night modify them—by cutting out the sun's rays. In short, the entire field of cosmical processes forms a complex problem which especially concerns the meteorologist, and by him should be studied out for the benefit of mankind, whose life and happiness depend so largely upon the weather. The Weather Bureau is so far convinced of the importance of finding out the laws of this cosmical physics, by which alone the problem can be conclusively solved, that it has been thought proper to found a research observatory at Mount Weather, on the crest of the Blue Ridge Mountains, about six miles from Bluemont, Va., and equip it suitably for these investigations. Professor Bigelow has recently been placed in charge of supervising the plans for its construction and development upon the best modern principles. It is evident that such an institution, having its beginning in the early years of the twentieth century, will have an increased usefulness as the years go by, if it is organized according to the demands of the best science. It will require fine instruments and able students if it is to command the respect of the scientific world. * * * * *

Specifically, the plan in mind contemplates the development of an observatory as indicated in the following statement:

(1) An observatory building is in process of erection at Mount Weather, which is well adapted as a school of instruction and for making observations of the ordinary kind with the common meteorological instruments, barometers, thermometers, wind and rain gauges, nephoscopes, theodolites, and actinometers. The first floor is for administration, the second for living quarters, the third for laboratories, and the roof for observing.

(2) Plans are being prepared for a plant adapted to generate large quantities of hydrogen, for balloon ascensions, including a shop for the construction of balloons and kites. The ascensions will be limited to about four miles in height, our immediate purpose being to measure the temperatures and thermal gradients, which will e able us to construct daily isothermal charts on the two upper planes already described, so as to provide isotherms as well as isobars on the high levels. It is proposed to make a complete series of ascensions first at Mount Weather, and afterwards in different portions of the United States, in order to observe the temperature conditions in all classes of cyclones and anticyclones. We may attempt some high ascensions, up to ten or twelve miles from the ground, when our experience and other conditions warrant, but, since storm movements are practically limited to the strata within four miles of the ground, the first group of ascensions will be to moderate elevations.

(3) It seems important to install a high-grade bolometer for measuring the invisible solar radiation, which is thought by some students to be largely responsible for the actual temperature of the upper atmosphere. Also, a first-class spectro-heliograph is required for keeping a record of the solar prominences, faculæ, and spots prevailing at the time of making our weather forecasts. These two instruments are the essentials of an efficient solar physics observatory, and would require the services of an able student of physics to bring out the best results and discuss them efficiently in suitable reports.

THE MOON AND THE WEATHER.

Meteorologists in Russia have recently been annoyed by the systematic issue of long range weather forecasts by a civil engineer named Demtschinsky. The man has a periodical of his own for the promulgation of his theories, the most important of which is that the moon exercises a considerable influence upon temperature changes, air pressure and rainfall. His predictions appear in that publication and also in a number of newspapers. Though Demtschinsky may be honest in his beliefs, he does not appear to be averse to notoriety. He has allowed a rumor to go uncontradicted that there is a prospect of his being put in charge of the United States Weather Bureau at Washington! One effect of these predictions and stories is to puzzle volunteer observers for the established meteorological service and to paralyze their enthusiasm. In other ways, also, no doubt, the cause of science is hurt by Demtschinsky's utterances.

Professor Klossovsky, of the University of Odessa, has thus been impelled to undertake an elaborate review of the forecasts in question and the principles on which they are founded. He undermines the system itself at a number of points, and finally shows that only about 50 per cent of the predictions are verified. In other words, there is no more certainty of their fulfillment than about the result of tossing up a coin. Demtschinsky is virtually playing a game of "heads and tails." Of course, when the chances are even that he may be right or wrong, his assurances are valueless. Under the auspices of the American government the rate of verification is fully four out of five, or over 80 per cent. Professor Klossovsky has done valuable service in thus exposing the worthlessness of Demtschinsky's work. Not the least commendable feature of his review is a challenge with which it ends. The pseudo meteorologist is invited to consent to a plan whereby his system and his predictions shall be considered by a commission of experts. If he declines, his hesitation will be a significant confession of lack of confidence in his own divinations.

The truth is, Demtschinsky is far behind the times. In Europe and America the idea that the moon controls the weather has been suggested repeatedly during the last twenty or thirty years. The possibility has been investigated by numerous meteorologists of good reputation, and has been practically discarded. If the Russian engineer who has recently entertained the theory had read the books of Sprung, Van Bebber and Hann, he would have had his eyes open to his mistake. Several excuses for a short-lived faith in the hypothesis can be found, but it will not stand the test of application to all countries alike and for all periods of time. The matter has probably never been summed up more accurately than by Professor William C. Davis, of Harvard University. He says in his "Elementary Meteorology" that whatever slight excess of one weather element or another there may be at certain times of the lunation, it has no sufficient value for prediction. In his judgment, forecasts based upon the influence of the moon or planets "are no better than the forgotten predictions of astrology." Long range forecasts of practical value are likely to come before many years, but the moon does not promise any help in formulating them.

A discussion of this kind raises the question, What constitutes a trustworthy authority in science? Official position and university degrees count for something, but they are not vital. Neither does a fondness for studying natural phenomena—weather, disease, the movements of the stars or the habits of insects—make a man a true scientist. Education is important, careful and prolonged observation is needful, but the one great essential is the right method of testing theories which suggest themselves to fertile minds. The process calls for the exercise of a logical faculty possessed by comparatively few. No matter how distinguished the original discoverer of a new fact or the author of a new theory—be he Faraday, Pasteur, Schiaparelli or Ramsay—science demands independent corroboration before accepting the alleged revelation. It will approve no so-called law of nature that does not yield in the hands of others, properly trained, the same results as its earliest advocates announce. If the doctrine that the moon seriously influences the weather will not stand this test, it may be guesswork or superstition, but it is not science.—*New York Tribune*.

A FIVE-YEAR CENSUS PERIOD.

The decennial census, based as it is in the United States on constitutional requirement, is so firmly established that it will probably seem to many people at first glance like a great innovation to suggest that census statistics be collected, even in a limited way, every five years. Senator Hopkins' bill providing for an agricultural census every five years will therefore be apt to meet with much discussion. The proposal seems, nevertheless, an excellent one, and the work could probably be done under the newly created permanent census bureau with an expenditure small in comparison with that which such work has required in the past.

In some of the European countries, notably Germany and France, a complete enumeration of the population is had every five years. These countries feel, no doubt, greater need of accurate knowledge as to their growth, or possibly decline, in numbers, than we do in this country.

Though several of the European countries are much more accurate in their statistics of many social phenomena than we are, the United States holds a recognized position at the forefront for commercial and industrial statistics. An Englishman who recently published a book on American industry spoke, for example, of the great advantages Americans derive from their statistics "in competition with nations like our own (England), whose commercial statistics are half a century or more out of date." As our best farming lands fill up with settlers, and as closer figuring on our crops with reference to our position in the world's grain markets becomes necessary, the value of full agricultural statistics will increase.—*Chicago Record Herald*.

CLIMATOLOGY OF THE MONTH, JANUARY, 1904.

BAROMETER.—Mean temperature, 30.12 inches; highest observed, 30.66 inches, at Sioux City, on the 25th; lowest observed, 29.59 inches, at Davenport and Dubuque on the 7th and 22nd; range for state, 1.07 inches.

TEMPERATURE.—The monthly mean temperature for the State, as shown by records of 111 stations, was 14.0°, which is 4.2° below the normal. By sections the mean temperatures were as follows: Northern section, 10.1°; Central section, 14.1°; Southern section, 17.8°. The highest monthly mean was 21.6° at Red Oak; lowest monthly mean, 6.6° at Charles City. The highest temperature reported was 57°, at Red Oak, on the 19th; lowest temperature reported, 32° below, at Elkader and Fayette, on the 27th. The average monthly maximum was 45.4°; average monthly minimum, 23.2°. Greatest daily range, 49°, at Atlantic and Villisca; average of greatest daily ranges, 34.2°.

PRECIPITATION.—Average precipitation for the State, as shown by records of 122 stations, was 1.18 inches, which is 0.21 of an inch above the normal. The averages by sections were as follows: Northern section, 0.49 of an inch; Central section, 1.06 inches; Southern section, 2.00 inches. The largest amount reported was 3.68 inches, at Lacona; least amount reported, .02 of an inch, at Storm Lake. The greatest daily rainfall reported was 2.45 inches, at Belle Plaine, on the 20th. Average number of days on which .01 of an inch or more was reported, 6.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 50 miles per hour, from the southeast, at Sioux City, on the 18th. Average number of clear days, 12; partly cloudy, 8; cloudy, 11.

OBSERVERS' NOTES.

AFTON.—*N. W. Rowell*. The 25th and 29th, 18° below zero the coldest in ten years by one degree. Sleet that fell on 20th remained till after Feb. 1. Effect on fruit will be seen later.

ALLERTON.—*Rex Shriver*. Sleet on 20th damaged fruit and shade trees; remained over two weeks.

ALTA.—*David E. Hadden*. Intensely cold last decade of the month. Fine solar halo with brilliant parhelia and upper contact arch all forenoon of the 23rd.

AUDUBON.—*Geo. E. Kellogg*. Coldest day of the season was the 24th; temperature did not rise above 14° during the day.

BEDFORD.—*E. E. Healy*. Heavy sleet on the night of 20th did much damage to trees.

BELKNAP.—*A. W. Rankin*. Sleet storm on 20th caused much damage to trees and shrubbery.

BONAPARTE.—*B. R. Vale*. Cold at each extreme, but mostly a pleasant month. The rain on 20th did not freeze much.

BRITT.—*Geo. P. Hardwick*. Coldest January in eight years; about average snowfall.

CHARITON.—*C. C. Burr*. Sleet did great damage to trees and telegraph lines; some telephone plants destroyed.

CLARINDA.—*A. Van Sandt.* Sleet on 19th and 20th did some damage to trees.

CLINTON.—*Luke Roberts.* Mean temperature 3.8° below normal. Snowfall 7 inches, with 4 inches to commence on: Sleigh could be used every day in the month. There have been nine colder Januaries in the last 26 years. Nine days with temperature below zero.

CORYDON.—*Mrs. Clara Miller.* Ice formed on trees half to three-fourths inch thick, causing damage to fruit and shade trees.

GRAND MEADOW.—*F. L. Williams.* Last nine days of the month were bitter cold; roads good and stock doing well.

HOPEVILLE —*M. L. Ashley.* The sleet storm of the 20th was very bad, and difficult to estimate as to amount of precipitation.

HUMBOLDT.—*H. S. Wells.* Coldest January in ten years.

INDIANOLA.—*John L Silton.* Storm on 20th left a sheet of ice 1.3 inches, coating trees and vines with heavy layer, remaining firmly till end of month.

JEFFERSON.—*Isaac Young.* Grey circle tinged with crimson around the moon on night of 27th.

LEON.—*Millard F. Stookey.* Thunder and lightning on 20th; fruit and shade trees much damaged by sleet.

MT. AYR.—*A. F Beard.* Sleet on 20th caused much injury to trees, telephone wires and poles.

MT. VERNON —*Jos. W. Hubbard.* The ice on 20th caused much damage to trees and great peril to pedestrians.

RIDGWAY.—*Arthur Betts.* Coldest January on record here, but a pleasant month; 61 per cent of sunshine.

VILLISCA.—*C. E. Matteson.* A fair and pleasant month up to 23rd; hail, snow and sleet the last week injured the peach crop.

WAUKEE.—*E. J. Leonard.* Month favorable till 20th; sleet and ice with zero weather balance of month.

WILTON.—*J. M. Rider.* Very heavy sleet on 20th, covering trees and wires with ice and icicles, making a beautiful scene; sleet remained until end of month.

ERRATA IN DECEMBER REVIEW.

ATLANTIC.—Mean temperature recorded 11.2° on page 8, should have been 11.3°.

BELKNAP.—Maximum temperature recorded 50° on the 31st, page 7, should have been 55° on the 2nd.

BELLE PLAINE.—Mean maximum temperature recorded 25.4° on page 8, should have been 25.5°. Mean temperature recorded 16.4° on page 6, should have been 16.5°.

CHARITON.—Mean temperature recorded 22.4° on page 7, should have been 22.3°.

CHARLES CITY.—Maximum temperature reported on the 7th, page 6, should have been the 6th.

COLLEGE SPRINGS.—Mean temperature recorded 25.0° on page 7, should have been 25.6°. Mean maximum temperature recorded 35.2° on page 8, should have been 36.5°.

COLUMBUS JUNCTION.—Mean temperature recorded 21.5° on page 7, should have been 21.6°.

CORNING.—Mean temperature recorded 23.2° on page 7, should have been 23 4°. Mean minimum temperature recorded 11.7° on page 8, should have been 12.1°.

EARLHAM.—Mean temperature recorded 21.5° on page 7, should have been 21.2°.

FOREST CITY.—Mean temperature recorded 13.8° on page 6, should have been 13.9°. Mean maximum temperature recorded 24.2° on page 8, should have been 24 3°. Maximum temperature recorded on the 7th, page 6, should have been the 6th.

GALVA.—Mean temperature recorded 19.0° on page 6, should have been 19.1°. Mean minimum temperature recorded 7.9° on page 8, should have been 8.2°.

GRINNELL [Near].—Mean temperature recorded 19.6° on page 6, should have been 19.1°.

HANLONTOWN.—Total snowfall recorded 3.2 inches on page 6, should have been 3.5 inches.

IOWA CITY.—Maximum temperature recorded on the 7th, page 6, should have been the 6th. Maximum temperature recorded 30° on page 8, on the 29th, should be 20°.

IOWA FALLS.—Maximum temperature recorded on the 7th, page 6, should have been the 6th.

MONTICELLO.—Total snowfall recorded 8 5 inches on page 6, should have been 9.5 inches.

OLIN.—Total precipitation recorded .99 inch on pages 6 and 10, should have been 1 09 inches. Total snowfall recorded 4.5 inches on page 6, should have been 8 0 inches.

ONAWA.—Mean temperature recorded 26.4° on page 6, should have been 24.0°. Mean minimum temperature recorded 18 2° on page 9, should have been 13.3°.

OSKALOOSA.—Mean temperature recorded 20 2° on page 7, should have been 19.0°. Mean minimum temperature recorded 10.0° on page 9, should have been 9 5°. Daily precipitation recorded .18 inch on the 11th, page 10, should have been .20 inch. Total precipitation recorded .32 inch on pages 7 and 10, should have been .34 inch.

PRIMGHAR.—Mean temperature recorded 16.7° on page 6, should have been 17.0°. Mean maximum temperature recorded 29.1° on page 9, should have been 29.8°.

RIDGEWAY.—Mean temperature recorded 16.3° on page 6, should have been 16.2°.

WATERLOO.—Maximum temperature recerded on the 7th and 24th, page 6, should have been 6th and 23d.

WHITTEN.—Mean temperature recorded 17.4° on page 6, should have been 17.8°. Mean minimum temperature recorded 6.8° on page 9, should have been 5.7°. Minimum temperature recorded 19° on the 25th, page 9, should have been 19°.

U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. McDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. FEBRUARY 1904. No. 2.

NOTES AND COMMENTS.

Iowa leads the states in the production of eggs, the yearly product being 100,000,000 dozen. Ohio comes next with 91,000,000 dozen; Illinois is third with 86,000,000 dozen, and Missouri fourth, with 85,000,000 dozen. The value of the combined poultry and egg product would be nearly double that of the precious metals.

It has been suggested that the recent bulge in the price of wheat is likely to cause an increase in the acreage of spring wheat in Iowa and other parts of the northwest. Unquestionably the time is favorable for expansion in the production of that cereal in sections of this state best adapted to its growth, but it is wise to exercise due caution in this matter. The crop should be seeded early as possible and more than the usual amount of care should be taken this season in procuring seed. Spring wheat is an uncertain crop in this section, at the best.

The coming farmer in the corn belt will demand his silo as much as he will his barn. Recent experiments show that silage is a very superior ration for the fattening steer as well as being almost indispensable as a ration for the dairy cow. The fact is that corn put in the silo and fed is worth so much more and will go so much further than corn fed the old way that its use will become almost imperative—*J. S. Trigg.*

The moon and the weather
May change together;
But the change of the moon
Does not change the weather.
If we'd no moon at all,
And that may seem strange,
We still should have weather
That's subject to change.
From "Notes and Queries."

Milton T. Ashley, voluntary observer at Hopeville, Clarke county, writes as follows: "I have made several tests of home-grown seed corn, and find none fit for use. The best samples showed only 67 per cent germination. Some corn shipped into the county and advertised for seed I tested. Two samples showed one good and the other worse than bad. I fear that too many of our farmers will trust to old time methods of selection of seed and be bitterly disappointed. This trouble is probably not local, but quite general, and the farmers need good counsel as to where and how to procure good seed."

From many sources we hear similar complaints as to the germinating quality of seed corn. No time should be lost in making preparations for the planting season, which is close at hand.

In this latitude February 2d—Candlemas Day in the church calendar, and "ground hog day" in old folk lore—is usually about the middle of the period of severest winter weather. This is the basis of the old proverbs

"At Candlemas Day another winter is on its way."
"Candlemas Day! Candlemas Day!
Half our fuel, half our hay."

On an average we have about six weeks of winter temperature after the 2d of February. South of this state, however, the rule would not hold good.

The coldest region on earth inhabited by man is in northeast Siberia, above the Arctic Circle, where the temperature sometimes falls to 90° below zero. The hottest region is in the great Sahara Desert of Africa. The wettest spot on earth, according to Davis, is at Cherrapunji, at an elevation of 4,435 feet on the southern slope of the Himalaya Mountains, north of the Bay of Bengal, India. The average annual rainfall is 474 inches, of which over 400 inches fall in the five months from May 1st to October 1st.

IN MARCH.

To the north the sun returning
Clears the dimness from the blue,
Paints the white out of the landscape,
Gilds the willow boughs anew.

Wintry storms may still blow fiercely,
There are balmy hours between,
When the breezes dance and whisper,
"This will make the wheat fields green."

Longer days and shorter shadows,
Less of gloom and more of cheer,
There's a hint that's half a promise,
That the spring will soon be here.
—Lizzie Ferris, in the Inter-Ocean.

EVAPORATION BY WIND.

It is a well-known physical principle, in use in a number of ways, that evaporation takes place more rapidly from a moist surface when the air above that surface is in more or less rapid motion. This holds good when the moist surface is that of the cultivated field and the wind blows over it. Prof. T. Russell, Jr., obtained the following results from experiments designed to show relative rate of evaporation as affected by rate of wind motion. Compared with the evaporation from a water surface when covered by still air, the evaporation from the same surface when the wind showed different velocities was as follows: Wind 5 miles per hour, evaporation 2.2 times. Wind 10 miles per hour, evaporation 3.8 times. Wind 15 miles per hour, evaporation 4.9 times. Wind 20 miles per hour, evaporation 5.7 times. Wind 25 miles per hour, evaporation 6.1 times. Wind 30 miles per hour, evaporation 6.3 times. These experiments were made when the temperature of the air was 84 degrees F. and the humidity was 50 per cent.—*Murray's Price Current.*

TEST THE SEED CORN.

Seed corn should never be planted until it has been tested to determine what per cent will germinate. While this is always advisable, perhaps it is more necessary this year than common for the reason that corn was slow in drying out last fall and extremely cold weather came unusally early.

Examination of a good many samples of corn in different parts of the State, and of some lots of seed corn purchased in the west, leads the Ohio Experiment Station to believe that there will be considerable more trouble than usual this year in getting a satisfactory stand. The safe thing to do is to test the seed early and have plenty of time to look elsewhere for seed of greater vitality, if occasion demands.

The station has recently tested eight different lots of corn including five varieties. Three of these tests were made with the same variety of corn, the selected seed of which had been carried through the winter in different ways, viz: In a large crib of corn six feet wide; overhead in crib spread out in a thin layer on the floor; in a room where the temperature was from sixty to seventy-two degrees.

Of the crib corn (selected ears) only sixty kernels out of a hundred germinated; of a similar corn kept overhead in crib, eighty-one kernels germinated; of that subjected to artificial heat, ninety-five out of the hundred germinated. This for corn which seemed quite mature at husking time.

Of the other corn tested, choice ears sent to the station in the pink of condition (supposedly so until the kernels were examined) showed as low as eighty per cent germinated.

It is quite probable that the low temperature of the early winter, coming while kernels and cob yet contained much moisture, is responsible for this state of affairs.

A convenient way to test corn is between sheets of moist paper or cloth, placed in a box of suitable size. Several lots may be tested at once and examined much more easily and quickly than when planted in sand. Simply keep the paper moist and where the temperature does not fall below 55 degrees. It should all germinate in from four to eight days, depending upon the sort of corn weather furnished.

Handled in this way it is possible to examine it daily and note the progress of germination.

There are different degrees of vitality in corn that will germinate. Many of the weak, spindling stalks which produce a small nubbin, or nothing at all, spring from seed of barely enough vitality to get the plant above the ground. Seed that will grow fairly well when conditions are favorable at seeding time will rot if cold, damp weather happens to prevail.

If possible use only such seed as has large, bright looking germs. Wrinkled and dull-colored germs have likely been injured by freezing. Plumpness at the tip is an evidence of vitality. Thin, shrunken kernels having sharp pointed tips should be rejected, as well as those having an excess of soft, white starch at either crown or tip.

The Station hopes that its suggestions given last fall have been followed by the corn growers of the state and that all have supplied themselves with the best seed corn obtainable and have taken good care of it. Choice seed corn is worth much more than anyone thinks of asking for it. Poor seed should be classed with the luxuries (?) which no corn farmer can afford.—*Ohio Experiment Station; C. G. Williams, Agriculturist.*

SEASONABLE WEATHER PROVERBS.

The following lines and couplets are copied from "Weather Folk Lore," recently published by the U. S. Weather Bureau. Pick out the proverbs that suit you best. They are all good—when they are verified.

The month that comes in good will go out bad.
A favorable January brings us a good year.
January warm, the Lord have mercy!
If grass grows in January, it grows the worse for it all the year.
Always expect a thaw in January.
If there is no snow before January, there will be the more in March and April.
A warm January, a cold May.
There is always one fine week in February.

If February gives much snow,
A fine summer it doth foreshow.

February rain is only good to fill ditches.
Thunder in February or March, poor sugar (maple) year.
Winds in March and rains in April promise great blessings in May.
As it rains in March, so it rains in June.
A dry and cold March never begs its bread.
March flowers make no summer bowers.
March comes in like a lamb and goes out like a lion.
March comes in like a lion, goes out like a lamb.
March in January, January in March, I fear.
March damp and warm will do the farmer much harm.
When March has April weather, April will have March weather.
March winds and April showers bring forth May flowers.
A cold April the barn will fill.
Moist April, clear June.
'Till April's dead, change not a thread (of clothing),
Dry May brings nothing
May damp and cool fills the barns and wine vats.
A hot May brings a fat churchyard.
A dry May is followed by a wet June.
Wet May, dry June.
Calm weather in June sets corn in tune.
A late spring, a great blessing.
Better late spring and bear, than early blossom and blast.
A late spring never deceives.
If the spring is cold and wet, then the autumn will be cold and dry.
A dry spring, rainy summer.
Early thunder, early spring.
Who doffs his coat on a winter's day will gladly put it on in May.

WEATHER AND CROPS—FEBRUARY, 1904.

February was unseasonably cold and dry. The mean temperature for the State was 14.8°, which is 4.8° below the normal. There has been but one colder February within the past fifteen years, and that was in 1899, when the mean for the State was 12.2°. February, 1900, scored the same temperature record as the past month. The average precipitation was .41 of an inch, which is .63 of an inch below normal. There was less than the usual amount of wintry storms of sufficient force to interfere with farm operations, travel and transportation. The roads were generally in fine order, and conditions were favorable for feeding stock. The temperature at the close of the month was quite moderate and spring-like, and the first appearance of migratory birds and fowls was noted in many localities. The limited area of fall wheat and rye was generally without covering of snow during the period of lowest temperature, and these crops undoubtedly suffered some damage. The damage to fruit is as yet undetermined.

CLIMATOLOGY OF THE MONTH.

BAROMETER—Mean pressure, 30.21 inches; highest observed, 30.85 inches, at Sioux City, on the 10th; lowest observed, 29.37 inches, at Davenport, on the 6th; range for State, 1.48 inches.

TEMPERATURE—The monthly mean temperature for the State, as shown by records of 107 stations, was 14.8 degrees, which is 4.8° below normal. By sections the mean temperatures were as follows: Northern section, 10.7°; central section, 15.0°; southern section, 18.8°. The highest monthly mean was 21.6° at Keokuk; lowest monthly mean, 7.2° at Estherville.

The highest temperature reported was 70°, at Keosauqua, on the 6th; lowest temperature reported, 26° at Fayette, on the 1st. The average monthly maximum was 51.3°; average monthly minimum, 14.4° below zero. Greatest daily range, 60.0° at Denison; average of greatest daily ranges, 41.0°.

PRECIPITATION—Average precipitation for the State, as shown by records of 118 stations, was 0.41 of an inch, which is 0.63 of an inch below normal. The averages by sections were as follows: Northern section, 0 63 inch; central section, 0 35 inch; southern section, 0.25 inch. The largest amount reported was 1.99 inches at Ridgeway; least amount reported, trace at Osceola and Thurman. The greatest daily rainfall reported was 0.84 of an inch at Ridgeway, on the 17th and 18th. Average number of days on which .01 of an inch or more was reported, 4.

WIND AND WEATHER—Prevailing direction of the wind, northwest; highest velocity reported, 61 miles per hour, from the northwest, at Sioux City, on the 2d. Average number of clear days, 10; partly cloudy, 9; cloudy, 10.

OBSERVERS' NOTES.

AFTON—*N. W. Rowell.* First robins appeared February 29th.

ALTA—*David E. Hadden.* Month cold and mostly cloudy; mean temperature, 5.2° below normal of past fourteen years.

AMANA—*C. Schadt.* Month cold, northwest wind prevailing. But little snow on ground and frost penetrated the ground, causing freezing in pipes several feet in depth. Ice formed on trees January 19th; did not melt until February 5th. Thunderstorm on 6th.

ATLANTIC—*J. W. Love.* A pleasant winter month and roads in good condition; lightning in southwest on morning of 29th, at 4 o'cloçk.

AUDUBON—*Geo. E. Kellogg.* On 29th observed wild geese flying northward.

BELKNAP—*A. W. Rankin.* Only half an inch of precipitation in February, and ground frozen two to four feet.

BONAPARTE—*B. R. Vale.* Uniformly solid month. Good roads, and conditions good for feeding stock. Thawing at close of month.

BRITT—No severe storms, and but little snow; roads fine and live stock wintering well.

CLINTON—*Luke Roberts.* Mean temperature 16.1°, or 5.9° below normal; rainfall, .95 of an inch, or 1.05 below normal. Wind, 5,000 miles; cloudiness, 60 per cent; first decade cold.

GRAND MEADOW—*F. L. Williams.* Mercury below zero fifteen days; dry and roads good most of month.

HANLONTOWN—*Miss G. M. Paschen.* Only a few drifts of snow remained at close of month.

HOPEVILLE—*M. L. Ashley.* Ducks flying northward on 29th; bluebirds here; but little of the frost thawed.

HUMBOLDT—*H. S. Wells.* No blizzards; month 2 degrees warmer than January.

IDA GROVE—*J. E. Conn.* Month very cold; the mean temperature, 13.7°.

LOGAN—*Mrs. M. B. Stern.* Month cold, with but little snow and no bad storms; fine winter weather.

OLIN—*Nathan Potter.* Good sleighing first half of the month.

RIDGEWAY—*Arthur Betts.* The month gave 170 hours of sunshine; rain on four dates; good month for the farmer; sleighing generally good. December, January and February gave thirty-five days below zero temperature, and twenty-five thawing days. January was the coldest month; mean for the winter, 13.5°.

TOLEDO—*H. P. Giger.* A curious thaw occurred on night of 22d-23d. The temperature at 7 P.M. of 22d was 29° and at 7 A.M. on 23d it was 25°. The maximum thermometer showed a rise of 11° and the minimum a fall of 15° during the night.

VILLISCA—*C. E. Matteson.* A dry and cold winter month; stock doing well; roads fine.

WASHTA—*H. L. Felter.* But little snow in patches at end of the month; zero or below on fourteen mornings; no bad storms.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. MARCH 1904. No. 3.

NOTES AND COMMENTS.

During the eighteen months ended June 30, 1903, the amount of rainfall at the government laboratory in Georgetown, British Guiana, was 98.90 inches. The record includes not only the measurements of rainfall, but also the contents of chlorine and of nitrogen in the form of ammonia and nitric acid. The amount of chlorine was 244 pounds, equal to 402 pounds of common salt per acre, and 4.67 pounds of combined nitrogen.

The severe cold has no terrors for insect life. It has been shown by experiment that insects may be artificially or naturally frozen—subjected, indeed, to very low temperatures—without killing or even injuring them. Eggs, larvæ and pupæ, the stages in which most insects pass the winter, are perfectly immune to cold. One of the commonest evidences of this hibernation is to be seen when firewood is carried into the house and placed near the warm stove. It takes only a short time to bring out a swarm of ants that were sleeping in beetle borings, their common retreat.—*St. Nicholas*.

Many reports of correspondents from Illinois, Iowa and the Northwest indicate that the amount of plowing done last fall was much more than usual. An article in *Orange Judd Farmer*, describing Brookmont Farm, of 7,000 acres, in western Iowa says: Fall plowing is preferred for corn and all the land that can be prepared in the fall is plowed then. Fall-plowed ground becomes sufficiently warm for planting corn a week to ten days earlier than spring-plowed land. This means two weeks earlier maturing in the fall, an important difference in seasons of early frost. It requires a smaller number of teams to raise corn when the land is plowed in the fall, because then the hardest work of preparing the ground is not crowded into a few weeks in the spring. In a wet spring it is difficult to plow a large acre for corn without having to plow some of the land when too wet. In the thirty-one years that corn has been raised on Brookmont Farm it has been found that corn on fall plowed land has suffered less from the drought than that on land plowed in the spring. The past year (1903) corn has been planted in Brookmont Farm as follows: On fall plowing, 1,300 acres; on spring plowing, 2,560; listed, 140 acres; total, 4 000 acres.—*Murray's Price Current*.

Earthquake shocks occurred at various places in New England on the morning of March 21st. Professor Henry Shaler Williams, recently elected head of the department of geology at Cornell University, in discussing the phenomenon, said: "The earthquake undoubtedly was caused by a slip of a stratum on another, deep in the earth. One of the two faces moved, causing the jarring, although the faces moved only a few inches the earth's surface was disturbed for hundreds of miles. The earthquake caused a readjustment of the two faces. The tension was relieved, and probably there is no immediate danger of a recurrence."

The Minneapolis *Journal* says: "It is not unusual for the 'old residenter' to rise on cold winter mornings and speak contemptuously of the lack of severity of modern winters. He declares that the weaklings of this day and age would not be able to withstand the ravages of ancient winters. Now is he come to judgment. Away back in 1822 the weather attracted the attention of the authorities at Fort Snelling Accurate (for that time) records were kept, and have been tabulated by the Pioneer Fuel Company of Minneapolis. The months of December, January and February were grouped as representative winter months and the average mean temperatures were made up. They were classed as 'mild,' 'warm' and 'cold.' Warm winters were those showing an average mean temperature of 18 degrees above or more. Mild winters show an average mean temperature of between 12 and 18 degrees above zero, while the cold winters were those whose average for the three months was 12 degrees or below. Of a group of eighty-one seasons, brought down to date, twenty-five winters were classed as cold, thirty as mild, and twenty-six as warm."

FEEDING VALUE OF SOFT CORN.

Under the auspices of the animal husbandry section of the Iowa Experiment Station at Ames, some very valuable experiments have been made to determine the feeding value of soft corn for beef production. The results, as set forth in Bulletin No. 75, just issued, show a practical agreement between the chemical tests and the experimental tests, as to the composition and value of soft corn compared with the fully matured product. The following conclusions are deducted from the experimental work just completed:

1. That soft corn grown on the college farm in 1902, and containing 36 per cent of moisture at the beginning of the test, pound for pound, on a water free, or dry matter basis, was fully equal in feeding value to mature corn grown in 1900, when used for fattening cattle.

2. That cattle fed on such soft corn made nearly as heavy gains and finished equally as well as those fed on mature corn grown in 1900.

3. That when soft corn, similar to that used in this test, could be purchased for 30 cents per bushel, the prevailing mar-

ket price, gains on fattening cattle could be made at a cost of 3.03 cents per pound less than when mature corn, costing 50 cents per bushel, the prevailing market price, was fed under similar conditions.

4. That a study of the Chicago live stock market conditions, from January 1, 1903, to July 31, 1903, shows conclusively that the comparatively low price of beef cattle was not caused by an oversupply of half finished cattle. On the contrary, there was a larger number of well finished cattle marketed during that period for 1903 than for the corresponding period of any of the past ten years.

5. That the chemical analyses would indicate that the nutritive value of the corn grown in 1902 compares favorably with mature corn grown in other years when water free substance or dry matter serves as a basis of comparison.

6. That the amount of moisture present was the main difference so far as composition is concerned. That the amount of moisture depends mainly on the maturity of the corn when stricken by frost.

CONTROLLING SOIL TEMPERATURE.

With the winter's leave-taking we at once become vitally interested in the rapid warming up of the soil, because all persons that are concerned in crop production know that the growth of vegetation is dependent upon air, moisture and a certain amount of warmth. Early in the spring there is but little apprehension about the two first mentioned, warmth being the factor of first consideration.

It is scarcely necessary to say that the removal of water from the land by drainage is one of the quickest and most effective means of warming it. Unless provision has previously been made for the removal of free water the task of seeding will be an uphill one. However, under average conditions when the soil dries out with reasonable rapidity much may be done by the farmer to hasten a rise of temperature in the surface soil.

In his work on "Soils" King says that the thorough preparation of the seed bed is justified in a large measure by the warming effect which judicious, thorough tillage has. The development of a mulch over the ground lessens the loss of water from the surface by evaporation, and if by this means we can save the loss into the air of a few pounds of water per square foot we have avoided the withdrawal of an enormous amount of heat, owing to the fact that evaporation is a cooling process. Thorough tillage, therefore, not only saves moisture, but at the same time it permits the seed bed to warm up so that plant foods are freely liberated. The same warmth that liberates food also hastens germination, thus getting the plant into a condition to take advantage of the food being prepared.

It is not so important early in the spring that the ground should be warmed deeply, but better only so far as to provide ample available plant food for the start, and room enough for the first roots, and this is what early tillage does; the loose, open soil conducts neither the cold water up to become still colder by evaporation, nor the absorbed sunshine down where it is not yet needed. In effect this method converts the whole field into a hotbed or cold frame, and commences irrigation by saving water at the start. It does even more, for while it develops early a little soluble plant food, it holds in abeyance these processes in the deeper soil, which, by starting too early, would cause a needless loss by developing nitrates which may be leached away before the crop has its roots ready to use them.

In view of the importance of free surface tillage early in the spring as a means of warming up the soil it is impossible to urge with two much zeal the practice of freely discing or harrowing just as soon as the soil will work without puddling. Too many are inclined to let their old corn fields lie until they are inverted with the plow, which process often means a matter of a month or six weeks from the time plowing is started until it is finished. All this time soil moisture is being evaporated at a rapid rate while the soil particles are not being raised to that temperature that brings about the most rapid germination after the crop is planted. Our advice is to start the harrows or discs just as soon as the land will work well, because when this is done time may be taken to plow properly, to cultivate thoroughly and to harrow well in the immediate preparation of the soil before planting. It is the duty of every corn grower to see to it that the first operation in the spring after tillage implements are taken from the sheds is to produce a mulch over the stubble, corn land or fall plowed fields.—*The Homestead*.

MARCH WEATHER AND CROPS.

The past winter was colder than usual, and the soil was very deeply frozen. March was a typical spring month in respect to temperature, though with less than the usual number and severity of wintry storms. There was a general prevalence of cloudiness, however, and the frost yielded very slowly, leaving the soil too wet for seeding operations, except in a few favored localities. Probably much less than the average percentage of March plowing and seeding was done in the State. The greater part of the precipitation came in the last decade of the month, which caused the principal hindrance to general field work. Farm stock wintered well, and there has been a great abundance of forage for cattle feeding.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.98 inches; highest observed, 30.58 inches, at Sioux City, on the 3d; lowest observed, 29.30 inches, at Sioux City, on the 24th; range for State, 1.28 inches.

TEMPERATURE.—The monthly mean temperature for the State, as shown by records of 116 stations, was 34.8 degrees, which is 2.4 degrees above normal. By sections the mean temperatures were as follows: Northern section, 32.4 degrees, which is 2.8 degrees above normal; central section, 34.9 degrees, which is 2.7 degrees above normal; southern section, 37.0 degrees, which is 1.1 degrees above normal. The highest monthly mean was 38.6, at Burlington, Guthrie Center, Glenwood, Keokuk, Osceola and Ottumwa; lowest monthly mean, 27.0 at Cresco. The highest temperature reported was 78.0 degrees at Ottumwa on the 23d; lowest temperature reported 3 degrees at Columbus Junction on the 3d. The average monthly maximum was 62.9 degrees; average monthly minimum, 4 6 degrees. Greatest daily range, 55.0 degrees at Sioux City; average of greatest daily ranges 36.8 degrees.

PRECIPITATION.—Average precipitation for the State as shown by records of 127 stations, was 2.18 inches, which is 0.35 of an inch above normal. The averages by sections were as follows: Northern section, 1.74 inches, which is 0.12 of an inch above normal; central section, 2.05 inches, which is 0.17 inch above normal; southern section, 2.74 inches, which is 0 77 inch above normal. The largest amount reported was 4.57 inches at Bedford; least amount reported, 0 50 inch, at Ida Grove and Sioux City. The greatest daily rainfall reported was 2.35 inches at Bedford on the 30th. Average number of days on which .01 of an inch or more was reported, 7.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 68 miles per hour, from the northwest, at Sioux City, on the 2d. Average number of clear days, 8; partly cloudy, 8; cloudy, 15.

OBSERVERS' NOTES.

AMANA—*Conrad Schadt.* No farm work done; hardly a vestige of growing vegetation; thunderstorm on 24th and 30th.

ATLANTIC—*J. W. Love.* Robins on the 1st; bluebirds and larks on 5th.

AUDUBON—*Geo. E. Kellogg.* Some wheat sown on 1st; heaviest snowfall of the winter on 13th.

BONAPARTE—*B. R. Vale.* Precipitation, 2.73 inches; muddy fields and bad roads; no farm work done; subsoil not very wet.

BRITT—*Geo. P. Hardwick.* First larks observed on 16th; robins, 18th; bluebirds, 29th; frogs croaking 31st; too cold for seeding; ground frozen deep.

CLINTON—*Luke Roberts.* Mean temperature normal, but was 7.6° colder than March, 1903; precipitation, 1.61 inches, or 2 inches above normal; 1.06 inches came in form of snow on 24th, with strong wind.

ELKADER—*Chas. Reinecke.* Ice went out of the Turkey river March 1st.

FOREST CITY—*J. A. Peters.* No seeding done in March; frost still in the ground.

GRAND MEADOW. *F. L. Williams.* Month very disagreeable and backward; no field work done; roads bad; stock doing well.

GRUNDY CENTER—*E. S. King.* Only five clear days; no farm work done; stock wintered well.

HANLONTOWN—*Miss G. M. Paschen.* Ducks seen on 6th; birds came first of the month.

HUMBOLDT—*H. S. Wells.* Rain, 1.19 inches; March came in warm and went out cold; roads bad last half of month.

JEFFERSON—*Isaac Young.* On 24th lightning struck residence of Thomas Lynch, of Cooper; badly damaged; no oats sown yet.

KOSAUQUA—*J. H. Landes.* Thunderstorm and wind on 24th caused considerable loss in south part of county.

LOGAN—*Mrs. M. B. Stern.* Weather very changeable, but no bad storms; rather dry winter and spring.

OLIN—*N. Potter.* First half of month fine, up to 13th; last half changeable, with mud; spring backward, and no farm work done.

PACIFIC JUNCTION—*H. H. McCartney.* On the 2d, at 2 P.M., temperature was 68°; at 7 P.M. it had fallen to 20°; strong wind from southeast changed to gale from northwest, almost in a moment. Fall in temperature of 62° between 2 P. M. on 2d to 7 A.M. on 3d.

RIDGEWAY—*Arthur Betts.* Only 149 hours of sunshine; big snowstorm on 13th and 14th, but an agreeable month; wild geese and robins came early in the month.

ROCK RAPIDS—*W. C. Wyckoff.* Seeding began on 29th on ridges and up near State line; stopped by rain on 30th.

WAUKEE—*E. J. Leonard.* An inch more snow fell in March than in February; since January 1st have had 17.5 inches of snow; coldest day of winter was January 25th; temperature ranged 8° to 18° below zero.

BELATED REPORTS.

COLLEGE SPRINGS—February. Mean temperature 20.7°; highest 49° on the 5th and 22d; lowest -2° on the 4th; greatest daily range 32°; prevailing direction, northwest. Number of clear days 18, partly cloudy 4, cloudy 7.

INDEPENDENCE—February. Mean temperature 9.8°; highest 50° on the 6th; lowest -20° on the first; total precipitation 40 inches; greatest in 24 hours .35 inch on the 17th. Total snowfall 4.0 inches; prevailing direction, northwest; number of rainy days 2.

KNOXVILLE—February. Mean temperature 18.1°; highest 56° on the 6th; lowest -10° on the first; greatest daily range 38°; total precipitation .45 inch; greatest in twenty-four hours .20 inch on the 27th; total snowfall 3.0 inches. Number of clear days 10, partly cloudy 8, cloudy 11, rainy 4. Prevailing direction, northwest.

SHELDON—February. Mean temperature 12.6°; highest 54° on the 5th; lowest -18° on the 8th; greatest daily range 39° total precipitation .31 inch; greatest in 24 hours .25 inch on the 17th; prevailing direction, south; total snowfall 3.1 inches. Number of clear days 16, partly cloudy 6, cloudy 7, rainy 3.

WINTERSET—February. Mean temperature 18.3°; highest 45° on the 23d; lowest -7 on the 11th; greatest daily range 33°; prevailing direction, east; number of clear days 8, partly cloudy 7, cloudy 14.

ERRATA.

GREENFIELD—August, 1903. Daily precipitation of .53 inch recorded on the 27th, page 11, should have been 2.56 inches.

OTTUMWA—December, 1903. Mean temperature recorded, 25.0° on page 7, should have been 24.5°.

ERRATA IN JANUARY REVIEW.

AFTON—Mean temperature recorded 18.4° on page 8, should have been 18.2°. Mean maximum temperature recorded 27 4° on page 9, should have been 27.1°. Highest temperature recorded on the 9th, page 8, should have been the 7th.

BRITT—Total snowfall recorded 3.6 inches on page 7, should have been 4.6 inches.

CORYDON—Mean minimum temperature recorded 5.3° on page 9, should have been 5 4°.

EARLHAM—Total precipitation recorded 1.31 inches on pages 8 and 11, should have been 1.37 inches.

GILMAN—Total precipitation recorded .85 inch on pages 7 and 11, should have been 1.03 inches. Daily precipitation on 10th and 11th recorded .01 inch on page 11, should have been .10 inch.

GRAND MEADOW—Mean maximum temperature recorded 19.0° on page 9, should have been 19.1°.

GREENFIELD—Highest temperature recorded on the 7th, page 8, should have been on the 8th.

HAMPTON—Mean temperature recorded 10.5° on page 7, should have been 10.8°.

KEOSAUQUA—Mean temperature recorded 15.0° on page 8, should have been 14.8°.

LARRABEE—Mean temperature recorded 12.2° on page 7, should have been 11.9°. Mean maximum temperature recorded 22.5° on page 9, should have been 21.9°.

OLIN—Maximum temperature recorded 41° on the 7th, on page 7, should have been 42° on the 19th.

PRIMGHAR—Mean temperature recorded 10 3° on page 7, should have been 10.4°. Mean maximum temperature recorded 19.2° on page 10, should have been 19.3°.

STUART—Mean temperature recorded 16.9° on page 7, should have been 17.0°. Mean maximum temperature recorded 25.7° on page 10, should have been 25.8°.

WAPELLO—Maximum temperature recorded 41° on the 7th, on page 8, should have been 47° on the 19th.

WATERLOO—Total snowfall recorded 6.0 inches on page 7, should have been 5.0 inches.

ERRATA IN FEBRUARY REVIEW.

BELKNAP—Mean minimum temperature recorded 11.7° on page 8, should have been 11.3°. Mean temperature recorded 19.2° on page 7, should have been 19.0°.

CLARINDA—Maximum temperature recorded on the 24th, page 7, should have been 23rd.

GRUNDY CENTER—Total precipitation recorded .48 inch on page 6, should have been .58 inch.

IDA GROVE—Maximum temperature recorded on the 5th, page 6, should have been on the 5th and 6th. Minimum temperature recorded -12 on the 8th, page 6, should have been -15 on the 19th.

IOWA FALLS—Mean temperature recorded 13.0° on page 6, should have been 10.7°. Mean maximum temperature recorded 25.2° on page 8 should have been 20.5°.

KEOSAUQUA—Minimum temperature recorded on the 1st, page 7, should have been 1st and 2d.

NORTHWOOD—Mean temperature recorded 11.0° on page 6, should have been 10.8°. Mean maximum temperature recorded 21.7° on page 9, should have been 21.3°.

PRIMGHAR—Minimum temperature recorded -13° on the 11th, page 6, should have been -17° on the 8th.

SIBLEY—Mean temperature recorded 8.2° on page 6, should have been 8.6°.

SIOUX CENTER—Total snowfall omitted on page 6, should have been 2.5 inches.

THURMAN—Mean temperature recorded 20.2° on page 7, should have been 20.0°. Mean minimum temperature recorded 10.8° on page 9, should have been 10.3°.

WEST BEND—Mean temperature recorded 10.7° on page 6, should have been 11.0°. Mean maximum temperature recorded 21.7° on page 9, should have been 22.3°.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. APRIL 1904. No. 4.

APRIL WEATHER AND CROPS.

This has been an abnormally cold month, the records of 115 stations indicating a monthly mean temperature of 44.1°, which is 5.2° below the normal. It was the coldest April for the State at large, of which we have records covering all districts. At Des Moines the coldest April in any previous year of record was in 1881. The temperature of the past month, however, was notably equable from first to last, the rise being moderate, and barely sufficient in the last week to start fruit buds and foliage. This retarded germination and possibly lessened danger of serious damage by sudden change from warm to excessively cold weather. The rainfall was 0.74 of an inch above normal, the larger part of which came about the 7th and 8th, and between the 22nd and 25th. There were some dry periods, and sufficient amount of sunshine to afford ample opportunity for seeding and preparing the ground for planting corn. Seeding of spring wheat, oats and barley begun generally from the 1st to the 4th, and that work was practically completed in the larger part of the State about the 20th to 23rd. Germination of seed was unusually slow, but at the close of April there were indications of a good stand, except on low, wet fields. Fruit buds appeared healthy and promising, but there were but a few blossoms visible prior to the first of May. The pastures and meadows were unusually late in starting, and there was but little grass for stock at the end of the month. On the whole, though the growth of vegetation was much belated, the month was more favorable for the farmer than the corresponding month in 1903.

NOTES AND COMMENTS.

Under the new drainage law, the citizens of Wright county propose to open several big ditches that will have an aggregate length of twenty-five miles, which will make tillable several thousand acres of land now under water.

Experiments with various feed stuffs, made in Oklahoma last winter, proved that the greatest gains were made by cattle fed on alfalfa hay and corn meal.

More than ever this year the country needs a bumper crop. It is the one thing necessary to put an end to all pessimism and bring prosperity greater than we have known before.—*Minneapolis Journal*.

Professor Carleton, cerealist of the U. S. Department of Agriculture, who has recently made a report on oat culture in Kansas, says that the farmers have shown an increasing disposition to disregard all spring sown grains, because of the danger to them from hot weather.

WIND—VELOCITY AND PRESSURE.

Haswell's Hand-Book for Engineers, a standard and reliable authority, gives the following as to velocity and force or pressure of wind per square foot of surface, in pounds.

Miles per Hour.	Feet per Minute.	Pounds Pressure per Square Foot.
10	880	.500
15	1320	1.125
20	1760	2.000
25	2200	3.125
30	2640	4.500
35	3080	6.125
40	3520	8.000
45	3960	10.125
50	4400	12.500
60	5280	18.000
80	7040	32.000
100	8800	50.000

DRAINAGE AND DROUGHTS.

An Omaha reader takes exception to our statement that the drainage of marshes and lakes in no perceptible degree diminishes the rainfall of the territory where located and that the cultivation of a semiarid region in no way increases the rainfall, and he presents some plausible arguments to show that our contention is wrong. Here are a few facts for our friends to consider: Lower California is an arid desert. Still it has the Pacific ocean on one side and the gulf on the other. Why should it be dry when such an enormous evaporation under a tropical sun is always in operation? The records show conclusively that n all the territory west of the one hundredth degree of west longitude the settlement of the country and the cultivation of the soil have in no manner increased the average rainfall. Take the Mississippi Valley, the territory which this statement is tended to cover, and where does the water come from which makes up the average of thirty to thirty-five inches per annum which the states of Minnesota, Iowa, Illinois and Missouri receive? Take the State of Iowa, to illustrate. To give this State one inch of rain would require the evaporation of the water of a lake twenty by twenty-seven and one-half miles in area and eight feet in depth, or a river a mile wide, eight

feet deep and 550 miles in length. The yearly rainfall of thirty-one inches in this State, would make a lake 110 miles long, fifty miles wide and twenty-six feet deep; and if all the water in all the rivers, creeks, lakes, ponds and sloughs in the State was vaporized and returned to the earth in the form of rain it would give less than one inch of rainfall. Now, whence comes the rainfall we get? From the Gulf of Mexico. The Mississippi Valley, if one could see it pictured out in relief, would be seen to be a vast trough reaching from northern Minnesota to the Gulf of Mexico, up which the moisture laden clouds are driven by the south winds, assuring a permanent and reliable rainfall and making the valley the garden spot of America. Had there been a range of mountains like the Rockies flung across the lower part of this valley, all that part of it which lay at the north would have been an arid desert. For the past two years all the northern part of this valley, better drained than it has ever been before—millions of acres of swamp lands reclaimed by drainage and put under cultivation, and lake beds converted into cornfields—has been deluged with such an excess of rainfall that all the drainage done was utterly insufficient to dispose of surplus water. It is now well settled that timber grows in any given territory because it rains there and that it does not rain because the timber grows. The facts justify a repetition of the phrase, "While drainage will dry up the earth it will not dry up the heavens," for the reasons above stated.—*J. S. Trigg's Farm Notes.*

OUR GOOD SOIL AND CLIMATE.

We who live in America and in the corn belt little realize how much we have to make us thankful. First there is the soil, which is richer than England has or Scotland, except in favored spots. Next there is the climate. Granted that our climate has in it violent extremes and is trying to live in if we do not fit it right, yet it means well and really blesses us. I never knew how much we have to make us glad until I shivered in England, France and Scotland for nearly two months of their summer.

It was a constant wonderment to me that things grew so well as they did with so little heat. Coming home, the maize standing rank and green, twice as high as the fences, looks mighty good to me. And this sets me thinking. Corn grows mostly from the sun. True, there must be soil and water in that soil, but sun power makes the golden grains and sunbeams coiled up within those grains are ready to give out again their stores of energy or warmth in winter time. That sun that pours down its fervent rays is not to be lightly spoken of. It comes to bless. It is our own fault if he overcomes us. To eat simply, drink properly, hot water at meal times and little at other times, to dress comfortably and to take exercise regularly out of doors will be to insure robust health during the hottest weather.

And those heated nights when the corn blades whisper to each other and the katydids cry warnings from out the thickness of the trees, they are a blessing, too. It is your own fault if you swelter in stuffy chambers. There is the Great Outdoors calling to you. Provide each of you a cot that you can take out beneath the trees, sleep there or under canvass, see if you do not find your sins forgiven in the morning and new store of li e and energy in you.

This is the glorious good land here and the sun shines!

Thank God for the heat that fills the cribs with gold!—*Joseph E. Wing, in Breeders Gazette.*

FARMING WITH ELECTRICITY.

In the application of electricity to every day work Germany has, perhaps, gone farther, than any other nation. Electrically heated and operated cooking and laundry apparatus is in common use there, but the most striking single development is the electrical farm.

Take for example, the Quendnau farm, which covers 450 acres and its dairy handles 1,000 gallons of milk daily. Every part of the farm is lighted by electricity, and is in telephonic communication with every other part. The dairy has an electrical churn; the barn contains electrically operated feed and carrot cutting machines, and even the grindstone is turned by a small belt from the shaft connected with the barn motor.

The water pumping apparatus is run by electricity, all the buildings are lighted by incandescent lamps and there is an electrical indicator at the doors of all the houses. The farm has also its own threshing and grist mill, the machinery of which is turned by a current from the miniature central station and finally there is a small sawmill, which gets its power from the same station. On the farm are all kinds of electrical agricultural machines.

The power of all these various operations—lighting, heating, telephones, churning, cutting, grinding, pumping, threshing and sawing—comes from a 50-horsepower stationary engine working two dynamos. From this station the power is distributed to all parts of the farm, and the switchboard is so plainly marked that the ordinary farm hand can regulate the supply to fit the need.—*London Answers.*

CLIMATOLOGY OF THE MONTH, APRIL, 1904.

BAROMETER.—Mean pressure, 30.05 inches; highest observed, 30.61 inches, at Des Moines and Dubuque, on the 3d; lowest observed, 29.13 inches, at Des Moines on the 8th; range for State, 1.48 inches.

TEMPERATURE.—The monthly mean temperature for the State, as shown by records of 115 stations, was 44.1°, which is 5.2° below normal. By sections the mean temperatures were as follows: Northern section 42 4°, which is 4.9° below normal; Central section 44.4°, which is 4 4° below normal; Southern section 45.5°, which is 6.7° below normal. The highest monthly mean was 47.8° at Ottumwa; lowest monthly mean, 40.2° at Sibley. The highest temperature reported was 86°, at Sigourney and Forest City on the 22d and 23d; lowest temperature reported 13°, at Primghar on the 11th. The average monthly maximum was 77.1°; average monthly minimum 20 9°. Greatest daily range, 48° at Forest City; average of greatest daily ranges 37.2°.

PRECIPITATION.—Average precipitation for the State, as shown by records of 126 stations, was 3 63 inches, which is 0.74 of an inch above normal. The averages by sections were as follows: Northern section 2.73 inches, which is .11 of an inch above normal; Central section 3 48 inches, which is .58 of an inch above normal; Southern section 4.68 inches, which is 1.57 inches above normal. The largest amount reported was 8.97 inches at St. Charles; least amount reported, 1.52 inches at Elkader. The greatest daily rainfall reported was 3.11 inches at Sigourney on the 25th. Average number of days on which .01 of an inch or more was reported, 7.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 56 miles per hour, from the northwest, at Sioux City, on the 11th. Average number of clear days, 15; partly cloudy, 6; cloudy, 9.

OBSERVERS' NOTES.

ALLERTON.—*Rex Shriver.* Latter part of April, warm enough to start grass and foliage.

ALTA.—*David E. Hadden.* April was unusually cool, and the season is fully two weeks late.

AMANA.—*Conrad Schadt.* Cold, unseasonable weather, with frequent frosts; field work much delayed.

ATLANTIC.—*J. W. Love.* Farm work much hindered by cold and wet weather.

BAXTER.—*W. S. Thorp.* At close of April, plowing for corn was two thirds completed; small grain was coming up and grass was short.

BONAPARTE.—*B. R. Vale.* Cold month; vegetation two weeks later than normal; rains not excessive, but cold and mixed with snow; much cloudy weather.

BRITT.—*Geo. P. Hardwick.* Frost in ground at end of month; Spring ten days late; no bloom yet.

CHARITON.—*C. C. Burr.* Continued wet and cold, with frequent frosts.

CLINTON.—*Luke Roberts.* Month abnormally cold; no cherry trees in bloom at close of the month. There were 13 mornings, from 2nd to 21st, when water froze. The mean temperature was 44 1°, being 7.9° below normal. This breaks all April records during the past 26 years. The rainfall was 3.40 inches, which is half an inch in excess of normal.

CORYDON.—*Mrs. Clara Miller.* Snow fell on the night of the 19th and was not quite all gone on evening of 21st.

FLORENCE.—*J. H. DuBois* Seeding was mostly done by the 23d, except the last week it was unusually cold for April.

FOREST CITY.—*J. A. Peters.* Seeding begun April 4th, much delayed by rains and cold weather; oats about all in by the 23d; last ten days fine for work.

GREENFIELD.—*J. G. Culver.*—On the 23d lightning struck a tree 20 feet south of J. C. Mason's house and broke nearly every window on the south side of the house; the glass was broken to bits and fell outward; 100 feet south a window was broken and another 150 feet northeast, in these cases the glass fell inside. No one hurt.

GRUNDY CENTER.—*E. S. King.* The daily mean was 5.5° colder than in April, 1903. Small grain seeding commenced on the 6th and finished about the 23d.

HANLONTOWN.—*Miss G. M. Paschen.* Some seeding done April 6th; then delayed by rain till the 14th. Some potatoes planted on the 19th. Early gardens were up by the 30th.

INWOOD.—*G. M. Larsen.* Heaviest snow of the season fell on night of the 19th, the amount being 3.5 inches. Last week of the month was fine.

MOUNT VERNON.—*Jos. W. Hubbard.* Temperature below normal; season late, but favorable at the close.

RIDGEWAY.—*Arthur Betts.* Coldest April on record; last ten days delightful; 262 hours of sunshine; anemones on 16th, and buttercups, 25th; 8 days totally devoid of clouds.

VINTON.—*T. F. McCune.* Season a little late; small grain up and doing well; may be light; leafing backward. Garden stuff up in most places.

WHITTEN.—*F. P. Butler.* Very cold until last few days; seeding all finished, and plowing for corn well along.

ERRATA.

INDEPENDENCE—February—Total precipitations recorded .40 of an inch, on page 5, in March Review under belated reports, should have been .45 of an inch.

MARSHALLTOWN—February—Total snowfall omitted on page 6, should have been 5.0 inches.

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. MAY 1904. No. 5.

IOWA CROP REPORT, JUNE 1, 1904.

ACREAGE OF STAPLE CROPS, AND AVERAGE CONDITION OF CROPS, FRUIT AND LIVE STOCK.

Reports received June 1st from county and township correspondents of the State Weather and Crop Service show the following results as to the number of acres and average condition of staple farm crops; also the condition of fruit and live stock.

CORN.—Total number of acres, 9,052,450;—an increase of about 7 per cent as compared with the average of the past six years, and 1,500,000 acres in excess of the area actually harvested in 1903. The average condition of corn about June 1st was 90 per cent, or about fifteen points above the estimated condition at corresponding date last year.

WHEAT.—The area of spring wheat sown this season appears to be only 775,040 acres, a decrease of about 377,000 acres as compared with the acreage in 1902. The winter wheat acreage is about 71,030 acres, Condition of spring wheat, 94 per cent; winter wheat, 85 per cent.

OATS.—Area seeded, 4,018,980 acres; a decrease of about 190,000 acres compared with the acreage of 1901, or about 5 per cent below the normal area. The condition is placed at 92 per cent.

BARLEY.—Area seeded, 493,370 acres; decrease since 1901, about 38,300 acres. Condition June 1st, 93 per cent.

RYE.—Area seeded, 99,590 acres; decrease since 1901, about 25,000 acres. Condition June 1st, 91 per cent.

FLAX —Area seeded, 51,370 acres; decrease since 1901, 23,130 acres. Condition of crops, 85 per cent.

POTATOES.—Area planted, 113,250 acres; condition 95 per cent. Acreage about normal.

MEADOWS.—Area 2,797,640 acres; an average of recent years. Condition 96 per cent. Condition of pastures 97 per cent.

CONDITION OF FRUIT.—Apples, 91; plums, 89; peaches, 48; grapes, 87; cherries, 83; strawberries, 94; raspberries, 88; blackberries, 77 per cent.

CONDITION OF LIVE STOCK.—Cattle, 94; swine, 93; sheep, 97; horses, 95; foals, 93; spring pig crop, 85 per cent.

CONDITION OF CROPS JUNE 1, 1903.—Corn, 75; wheat, 93; oats, 93; barley, 96; rye, 94; potatoes, 91; flax, 84; meadows, 109; pastures, 107; apples, 70; cherries and plums, 35 per cent.

MAY WEATHER AND CROPS.

Though the month of May was generally regarded as unseasonably cold, the records for the state show that the average daily temperature (59.6°) was about normal, the daily deficiency being only 0.8°. The average rainfall, 3.78 inches, was .35 of an inch below normal, the northern section receiving the larger average amount. In portions of the west central district, and in some of the southern counties, there were some heavy downpours, which caused much delay in planting, the great excess of moisture being due in large part to the saturated condition of the subsoil, resulting from abnormal rainfall in the preceding season. On the whole it was a favorable month, with sufficient warmth and moisture for grass and small grain, and general conditions favorable for farm work and the germination of the better qualities of seed. Except in quite limited areas, the corn crop was planted about as early as usual, and the soil was in very good condition. The month was especially favorable for the growth of grass in meadows and pastures, and for the small grain crops on well drained lands. The hay crop is well assured; oats and spring wheat stooled out fairly well; potatoes made a fine start; garden truck was well advanced at close of the month, and the fruits promised a better yield than has been produced in recent years.

NOTES AND COMMENTS.

In his farm notes J. S. Trigg says: "The predictions of any man thirty days ahead on the weather are absolutely valueless." And so say all men of sense who have given due thought to the subject.

The *Evening Wisconsin* says: "The grass crop never looked more promising in the northern states, and as that crop amounts to much more in value than the cotton crop thoughtful observers should not forget this prominent blessing."

The *Rockford Register* says: "The state can well afford to have Professor Holden make some more corn trips next September and tell the farmers how to save seed corn. There are enough of them having to replant their fields this spring so that they will listen to him."

In "Notes on Science," by Prof. John L. Tilton, published in the *Indianola Herald* of May 12, 1904, we find the following interesting paragraph: Those who were at the track meet last Saturday were treated to a miniature tornado. The whirlwind was first noticed on the tennis court, then west of the fence and trees it reformed and pas ed slowly across the ball park in a northwesterly direction beyond the grounds. There was a cloud of dust probably twenty feet in diameter whirling violently around in a direction opposite to the hands of a watch as one looks down; but through the center was a vertical clearer space with distinct boundaries in which the streaks of dust indicated an upward movement. This center reached upward into the air to perhaps twice the height of ladies' hall, where it looked as if it terminated in a point. It occupied perhaps ten minutes in traversing a distance of four hundred yards. It is to be regretted that no cameras were at hand to photograph it.

RELATION OF RAINFALL AND AGRICULTURE.

When the annual rainfall is under eighteen inches, agriculture can seldom be safely practiced without irrigation. Grazing then becomes the chief occupation, as is now the case over a large extent of our western plains, between the 98° meridian and the Rocky Mountains; and the people return in a measure to the roving life characteristic of the aboriginal inhabitants of semi-arid regions. When the rainfall is less than twelve inches a year, the region is reduced to a desert, and the water supply is too small to be of service in irrigation, unless in small areas, or on the banks of large rivers. On the other hand, the tropical regions where the rainfall rises above a hundred inches in a year are so luxuriantly overgrown as to make their occupation a difficult matter. The general rainfall of the eastern part of our country or of western Europe, with annual total varying from forty to eighty inches equably distributed through the year, is an amount under which human occupations are best developed.

The distribution of rainfall through the year is a matter of great moment. The northwestern part of the United States is favored in having the average value of the precipitation in successive months comparatively equable; droughts are exceptional, but when occurring are found in one season about as frequently as another. In Florida, the summers are wet and the winters are comparatively dry. In eastern Nebraska, there is a similar distribution of rainfall from dry winters to wet summers. In California, the reverse is true; the summers have a continuous drought, making the ground dry and dusty; the winters are cloudy and wet. These variations will be found to depend chiefly on the system of the general winds.

The irregularity in the monthly rainfall is an important matter, especially in regions where the annual supply is moderate. Even in the well-watered States east of the Mississippi, a deficiency in the summer rainfall sometimes causes droughts; for example, the southern Atlantic States had in September, 1888, 1.84 inches; while the same month of the preceding year had 9.47, or over five times as much; this variation appears to result chiefly from the variation in number, paths, and activity of cyclones in different years. On the margin of the western plains, where the total rainfall is hardly enough for agriculture, the departures from the normal monthly fall are of more serious import: a succession of rainy seasons tempts settlers further and further west, and when a series of dry years follows, the distress occasioned by the failure of crops becomes a calamity.

In India, where the year is divided into three seasons, the cold, the hot, and the wet seasons, the crops are preserved in the dry season by irrigating canals fed from rivers rising in the mountains, or in a smaller way by water pumped up from the rivers; if the waters in the rivers is insufficient, or if the rains arrive too late or are deficient, famine results, and the people of that great country die by the thousands. In more recent years, with the improvement of the irrigating canals, and with the better means of transportation of the plenty of one province to supply the need of another, the danger from this source is lessened.—*Davis' Meteorology*.

MIDWINTER IN WESTERN ONTARIO.

Mr. A. G. Seyfert, of Stratford, Ontario, writes to the U. S. Monthly Weather Review, under date of January 26, 1904, giving account of the rigors of the past winter in that portion of Canada. He says:

Not within the memory of the oldest inhabitant has western Ontario experienced such an unprecedentedly severe winter as this. Instead of the usual autumn rainfall, fine weather prevailed up to the middle of November, when it turned cold and commenced to snow, and has continued almost incessantly to the present time. Four feet of snow on the level and drifts in many places four times that depth result. Country roads are blockaded, and communication almost entirely cut off. Railroads are in but little better condition. The main lines are kept open, but many of the branches are cempletely snowed under and abandoned for the present. Every effort is being put forth in fighting the elements to keep the roads open, but never did such conditions prevail since railroads were first built in this province. The high winds, the intense cold, and the enormous quantity of snow are more than human agencies can overcome. The local papers are full of details of all sorts of accidents and fatalities attributable to the weather conditions. Roofs breaking down from the weight of the snow, people frozen to death within sight of their homes, freight trains loaded with live stock in snow drifts until the strongest animals only survived; is the tale that could be prolonged indefinitely.

During the two and a half months of this remorseless climate he mercury has been but once or twice above the freezing point, and for days many degrees below zero all day. One of the most serious features of this condition of affairs is the water famine with which most of the farmers have to contend. The

rainfall had been below the average when the winter set in, and since then none has fallen and the water supply of most of the farmers is exhausted, causing great inconvenience and in many cases much suffering.

February is usually the worst winter month in this latitude, and if this is the case this year untold privations will have to be endured before the end is in sight.

A QUICKENED GULF STREAM.

If the stories told by mariners about the heightened velocity of the Gulf Stream in the last few days be correct, an explanation of the phenomenon ought not to be hard to find. Surface currents in the ocean result from the action of the wind. The water which issues from the Gulf of Mexico and flows northeastwardly from the southern extrem ty of Florida comes originally from that portion of the Atlantic lying near the equator. The trade winds of one hemisphere, blowing from the northeast, and those of the other hemisphere, blowing from the sontheast, co-operate in forcing the upper layers of the sea into the belt of calms, where the water acquires a westward montion. By the intervention of the continent the current is split, and the direction which is then taken is materially altered, but the impetus imparted by Nature's great marine pumping engine is not lost. In all probability the freer discharge which has just been reported means that this piece of invisible mechanism has, temporarily at least, been working a little harder than usual.

The trade winds, like all other winds, result from differences in atmospheric pressure. Near the equator the barometer usually reads much lower than it does twenty or twenty-five degrees away. These high and low pressure systems oscillate northward and southward with the seasons, but their organization is maintained the year round. Variations in the amount of difference — in what the meteorologists call the "gradient" — are also observed, and it may be asssumed that one has recently occurred which has tended to increase the velocity of the winds. Such an effect might be produced in either one of two ways. There might have been a diminution of pressure near the equator, or there might have been an unusual banking up of the air along the tropics. Owing to the lack of observatories at sea, it will probably be impossible to say which of these two influences has operated. International barometric charts show, however, that over the continents and islands departures of this sort from average conditions are not at all uncommon.

A deficiency or an excess of atmospheric pressure in one part of the globe must be compensated for somehow elsewhere. The volume of the air remains the same. It is the distribution only that changes. In time it will doubtless be possible to correlate eccentricities observed simultaneously in widely separated regions. The discovery of one would thus serve to explain the other to some extent, and possibly come to have a prophetic value. Interpretation and forecasting would also be facilitated, perhaps, if a part of this strange behavior of the atmosphere could be connected with the changes in the amount of solar radiation, or with marked differences in the ease with which the sun's heat is able to penetrate the earth's gaseous envelope. Researches having that object in view are in progress in this country and in Europe. It is not yet possible to say what will be the result, but it is excusable to hope that the researches will prove fruitful.—*N. Y. Tribune.*

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.93 inches; highest observed, 30.26 inches at Dubuque, on the the 3d; lowest observed, 29.53 inches, at Davenport, on the 8th; range for state, .73 of an inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 114 stations, was 59.6 degrees, which is 0.8° below normal. By sections the mean temperatures were as follows: Northern section, 58.2°, which is 1.1° below normal; Central section, 59.9°, which is 0.3° below normal; Southern section, 60.6°, which is 1.4° below normal. The highest monthly mean was 62 4°, at Burlington, Onawa, Keokuk and R dgeway; lowest monthly mean, 56.4° at Sibley. The highest temperature reported was 93°, at Ridgeway, on the 22d; lowest temperature reported, 27°, at Charles City on the 15th. The average monthly maximum was 85.8°: average monthly minimum, 34.3°. Greatest daily range, 47°, at Monticello and Northwood; average of greatest daily ranges, 37.3°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 126 stations, was 3.78 inches, which is 2.35 of an inch below normal. The averages by sections were as follows: Northern section, 4.01 inches, which is .19 of an inch above normal; Central section, 3.41 inches, which is .68 of an inch below normal; Southern section, 3.92 inches, which is .43 of an inch below normal. The largest amount reported was 8.15 inches at Onawa; least amount reported, 1.50 inches at Clear Lake. The greatest daily rainfall reported was 3.33 inches at Florence, on the 24th and 25th. Average number of days on which .01 of an inch or more was reported, 8.

WIND AND WEATHER.—Prevailing direction of the wind, southeast; highest velocity reported, 41 miles per hour, from the south, at Sioux City, on the 4th. Average number of clear days, 13; partly cloudy, 10; cloudy, 8.

OBSERVERS' NOTES.

ALLERTON.—*Rex Shriver.* Corn was nearly all planted at close of month.

AUDUBON.—*Geo. E. Kellogg.* Nearly six inches less rainfall this month than in May, 1903.

BAXTER.—*W. T. Thorp.* Small grain looking fine; prospects good for fruits.

BONAPARTE.—*B. R. Vale.* Rain, 4.17. Corn planting was very tardy. Corn culture was hardly begun at end of month.

BRITT.—*Geo. P. Hardwick.* Corn was planted in favorable conditions from 9th to 24th; grain thin from poor seed; fruit prospects mostly poor.

CLINTON.—*Luke Roberts*. May mean temperature slightly above normal; rainfall about two inches below normal. A month of ideal weather for farm work; but one frost (on 15th) that was harmless; though late vegetation was in good condition, except where poor seed was planted.

DOWS.—*A. C. Fuller*. A severe wind squall and electrical storm occurred on the 24th, at 9 P. M., causing considerable damage in some localities.

FOREST CITY.—*J. A. Peters*. Though dry, the crops look fine at close of the month. Some corn replanted on account of wire worms.

HANLONTOWN.—*Miss G. M. Paschen*. Corn planting begun on 4th; on 5th the ground white with hail; planting finished about 21st. Oats in good condition but thinner than usual.

HOPEVILLE.—*M. T. Ashby*. Close of the month finds fields wet and clammy, with considerable plowing to do and much planting to be done.

HUMBOLDT.—*H. S. Wells*. More corn planted than last year, but not so much wheat.

IDA GROVE.—*J. E. Conn*. An exceptionally fine month; crop prospects good.

INWOOD.—*G. M. Larsen*. A fair month; promise of a large crop of grain and fruit.

LARRABEE.—*H. B. Strever*. Wind caused some damage to outbuildings at Meriden on afternoon of the 5th. Several barns were damaged.

OLIN.—*N. Potter*. May has been an ideal month for farm work. Conditions are normal.

PACIFIC JUNCTION —*H. H. McCantney*. Ground has been saturated to extent of retarding planting, but crops are starting well.

RIDGEWAY.—*Arthur Betts*. A perfect May; entirely frostless; 312 hours of sunshine; thirteen days calm; no gales nor windstorms.

WAUKEE.—*E. J. Leonard*. Rainfall 3.46, or less than one-third the amount in May, 1903; too cool and cloudy for normal growth of crops.

ERRATA IN MARCH REVIEW.

COLLEGE SPRINGS.—Maximum temperature recorded 66° on the 2d, page 8, should have been 70° on the 9th.

DENISON.—Total precipitation recorded 1.95 inches on pages 7 and 11, should have been .83 inch.

INDIANOLA.—Mean temperature recorded 36.0° on page 8, should have been 36.4°. Mean minimum temperature recorded 26.4° on page 9, should have been 27.0°. Minimum temperature recorded 12° on the 3d, page 8, should have been 3d and 26th.

EARLHAM.—Mean maximum temperature recorded 45.3° on page 9, should have been 45.2°.

GALVA.—Letter indicating number of days missing, page 7, omitted should have been [F].

KEOSAUQUA.—Mean temperature recorded 36.7° on page 8, should have been 36 8°.

ONAWA.—Maximum temperature recorded 63° on the 2d, page 7, should have been 66° on the 9th.

THURMAN.—Maximum temperature recorded 66° on the 2d, page 8, should have been 68° on the 9th. Total snowfall omitted, on page 8, should have been 3.0 inches

WASHINGTON.—Maximum temperature recorded 60° on the 23d, page 8, should have been 65° on the 21st.

WILTON JUNCTION.—Maximum temperature recorded 60°, on the 24th, page 7, should have been 61° on the 21st.

ERRATA IN APRIL REVIEW.

ALBIA.—Minimum temperature recorded on the 13th, page 7, should have been 14th.

COLLEGE SPRINGS.—Letter indicating number of days missing, page 7, omitted, should have been [D].

CORNING.—Total snowfall recorded 3.0 inches, page 7, should have been 2.0 inches.

HUMBOLT.—Minimum temperature recorded 20° on the 16th, page 6, should have been 18° on the 3d.

INWOOD.—Minimum temperature on page 6, omitted, should have been 22° on the 3d.

ZEARING.—Mean temperature recorded 43.3° on page 6, should have been 43.4°.

BELATED REPORTS.

KNOXVILLE.—April.—Mean temperature 46.2°; highest 76° on the 30th; lowest 23° on the 16th; greatest daily range 34°; total precipitation 5.54 inches; greatest in 24 hours 1.90 inches on the 25th; prevailing direction, northeast; number of clear days 13, partly cloudy 5, cloudy 12, rainy 7.

ROCK RAPIDS.—April.—Mean temperature 43.2°; mean maximum temperature 55.5°; mean minimum temperature 31.0°: highest 75° on the 30th; lowest 18° on the 17th; greatest daily range 41°; total precipitation 1.11 inches; greatest in 24 hours .55 inch on the 22d; number of clear days 19, partly cloudy 9, cloudy 2, rainy 3.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. JUNE 1904. No. 6.

IOWA CROP CONDITION, JULY, 1904.

Following is a summary of reports received from correspondents of the State Weather and Crop Service, estimating the condition of the staple farm crops July 1, 1904. The reports generally show that the stand of corn and oats is materially lighter than the average, owing to defective seed; and all crops are several days later than usual, as a result of the late advent of spring. The general condition, however, is several points better than at the corresponding date last year, as will be seen by the figures below:

CONDITION JULY 1, 1904: Corn, 90 per cent; spring wheat, 91; winter wheat, 87; oats, 91; barley, 93; rye, 94; flax, 89; meadows, 90; pastures, 94; potatoes, 101; apples, 85; plums, ? ; grapes, 89.

CONDITION LAST YEAR: Corn, 77 per cent; spring wheat, 88; oats, 87; barley, 89; rye, 98; flax, 85; meadows, 104; pastures, 107; potatoes, 96; apples, 70; plums, 49; grapes, 78.

JUNE WEATHER AND CROPS.

The month of June was cooler than usual, with less than the normal amount of rainfall, and a large percentage of cloudiness in portions of the state. The daily average temperature was 2.5 degrees below normal. The precipitation was quite unequally distributed; the northern section receiving an average of 4.53 inches, the central section 2.74, and the southern section 3.08 inches. The week ending June 6th brought excessive rains in all parts of the state, except portions of the east central district. The wet and cloudy weather of that week caused much delay in the cultivation of corn, and in large portions of the state the fields became weedy and the growth of corn was considerably retarded by cold nights and wet, cloudy weather. The second week was generally very favorable for field work and the growth of crops, the days being bright and warm with ideal conditions for cleaning out the corn fields. The week ending the 20th was also favorable, though the temperature was below normal. There was but little interruption of work, and fair progress was noted in the growth of all crops. From the 20th to the close of the month the average temperature was abnormally low, and there was more than usual cloudiness in the larger part of the state. Despite all drawbacks, however, the corn crop advanced steadily, and at the close of the month the fields were generally clean and the stand was but little below the average of the past fifteen years. The month as a whole was favorable especially for small grain, which headed out about the usual time, though short in straw, giving promise of a much better crop than was harvested in 1902 or 1903. The hay crop was well advanced and fairly good, especially in quality. Potatoes and garden vegetables were usually promising.

NOTES AND COMMENTS.

In a large part of Iowa the crop of cherries has been much larger than usual. The strawberry crop also has been very good, but not up to the standard in flavor. Plums, peaches and blackberries are much below the average in condition. Raspberries and gooseberries, quite fair crops

Under the new drainage law, petitions are being filed in the offices of various county auditors asking for the authorization of drainage ditches to be dug through lands subject to overflow and too wet for cultivation, to promote the public health and welfare of the people. A timely bulletin has been issued by the Iowa Experiment Station at Ames, entitled "Drainage Conditions in Iowa," which will serve as a valuable handbook for farmers, drainage engineers and students. A copy may be secured by addressing a note to Director C. F. Curtiss, Ames, Iowa.

About everything grown in the way of green forage has been tried for filling the silo, and the result of all the experiments is that no crop so well fills the bill, taking ease and economy of handling and value as ensilage, as our common field corn cut when the ears are well glazed. This makes the silo fit into the ordinary farm economy all through the corn belt.—*J. S. Trigg.*

The application of the dynamo to water power gives every waterfall, no matter where located, a money value. Wise men recognizing this fact are picking up all available water powers, for they will all be used in the near future.—*J. S. Trigg.*

FORECASTING THE WEATHER.

The American people like to be humbugged. Next to the gold brick and green goods artist, the long range weather forecaster is the biggest fake on the market. There is not a man living today who can give the slightest clue as to whether next July will be wet or dry, abnormally hot, or unusually cold, and whoever attempts to do so is simply playing on the credulity of the public. The average fakir's long range forecasts consist of a series of violent storms, tornadoes, hot waves, cold spells and hailstorms, which, if one-fourth of them arrived, would make all Iowa a howling wilderness in a short quarter of an hour. Even the milder tempered gentry have the happy faculty of

making such an indefinite forecast that it can not be applied to any locality or any date. There is not a farmer in Iowa who would not be absolutely ruined if he planned his work for one season in accordance with the predictions of these false prophets. He would have to contend with frosts up to the first of June and beginning again in August, floods during the entire season, weather that would scorch vegetation like a blast from a furnace and a sharp cold spell every third day.

To be sure these forecasts hit it once in a while. One who is guessing all the time can not fail occasionally to hit it. His guess is worse than useless if he does not succeed at least every other time and a great many of them do not do this good. Neither of the long range prophets will explain to the scientific world the basis upon which he makes his forecasts, and this refusal of itself would justify the charge of fraud and chicanery if there were no other thing against them.

The officials of the United States Weather Bureau, on the other hand, take the public into their confidence. They openly admit that there is much about the science of forecasting that they do not know and may never learn. They do not claim absolute accuracy for their forecasts but over 80 per cent of them are verified. Predictions are usually made for only thirty-six hours in advance and any one conversant with the facts knows that at present that is as far ahead as our knowledge will warrant any one in predicting. The day may come when scientists may be able to tell something about the coming seasons by reference to the peculiar action of sun spots, but this problem is just being taken up and several years must elapse before anything of moment can be announced. The most these scientists hope to do is to foretell whether a season will be unusually hot, or abnormally cold, whether the rains will be abundant, or drouth prevail. Detailed forecasts for each day, months in advance, will probably never be attempted, as that feature is at present believed to be quite infeasible. In the meantime don't be running after false gods—*Afton, Iowa, Star-Enterprise.*

CULTURE OF FORESTS.

The Pennsylvania Railroad company is engaged in planting locust trees with a view of supplying crossties in the future. Last fall 50,000 trees were planted at Conewago, Pennsylvania, and now as many more are being planted. Next fall, it is said, the company will plant 200,000, and in the following spring 650,000. The forest will cover three square miles, and, it is estimated, will furnish 5,000,000 ties within twenty-five years. This is an excellent work, and is evidence of a wise and farsighted policy. Tree planting is neglected by individuals because forest trees are of slow growth and the benefit or profit is too remote to tempt one to set out forests. But in the case of such a corporation as the Pennsylvania Railroad company the case is different. Such a corporation is supposed to be immortal, and the management, if it is prudent, is always looking to the future. Iron and steel have been tested as substitutes for wooden crossties, but without success. Wood is manifestly the best material for this use, and there is scarcely any use which has caused a more general and deplorable devastation of the forests of the United States as the demand of the railroads. The time is rapidly approaching when the natural supply must fail or become too expensive. Some of the western railroad companies have for some years back been planting trees along their right of way. On the fertile lands of the prairies trees make rapid growth, and, while a sufficient supply can not be produced this way, enough can be grown to make it worth while.

The Pennsylvania company is going about the work in the right way. Large areas of rough land, suitable for the purposes of a forest, can be obtained at a slight cost, and a forest once grown will continue, under proper management, to yield ties and perpetuate itself indefinitely. Careful trimming from the time the young trees begin to grow will train them into proper shape, and thus a single tree will yield more ties than those which have had no pruning. The Pennsylvania company has also selected the very best tree for the purpose. The locust is one of the most rapid-growing of the hardwood trees, and one locust tie will probably outlast a half dozen of oak or chestnut. In fact the locust is regarded as the most durable of all our native woods, and a railroad track laid upon locust ties would be almost as permanent as if the ties were of iron.—*Baltimore Sun.*

CLIMATIC FACTORS IN RAILROAD ENGINEERING.

A thesis on the above subject has been prepared by R. M. Brown as a part of his course in general climatology at Harvard University and has been published in the Journal of Geography for April, 1903. The struggle of railroads against climatic conditions has been recorded so fully during the past century as to become exceedingly instructive, and the influence of the various climatic factors is presented one by one in Mr. Brown's memoir.

As to heavy precipitation he notes that the rainy seasons are often followed by droughts, and this alternation destroys all woodwork either by shrinkage and splintering or by the growth of fungi. Railroad ties decay when there is a good supply of moisture and when the temperature is between 32 degrees and 150 degrees. Data on these points are given for India, South Africa, Central Africa and Central America.

The diseases that are considered peculiar to climate, such as cholera, malarial fevers and yellow fever, offer difficulties that must be overcome. The experiences of numerous large railroad undertakings are mentioned. The droughts that occur in some locations require the building of huge tanks, while in other cases one must go a long distance to obtain pure water. Outdoor work can not well be done in the rainy weather and laborers accustomed to hot dry weather lose many days in the rainy season.

The floods and damages by heavy rains are matters of great importance and "are registered on the books of the construction companies with unceasing regularity. * * * The history of every road that traverses the belt of heavy precipitation is a story of continual struggle against floods." In regions of heavy rainfall land slips are frequent and a long list of these is given by the author

The ballast on the roadbed appropriate to the long, dry season is not appropriate to the heavy rain season. In general, the ballast produces dust haze sufficient to obscure the approaching train; the dust also penetrates the machinery, causing hot axles and other damage. In America and England, under most conditions, stone ballast is the more expensive, but in India the climate reverses this rule.

In regions of moderate precipitation, whether of rain or snow, the length and weight of the freight trains is determined by the weather; thus, on the Pennsylvania railroad west of Pittsburg, the load assigned to an engine is 1750 tons in good weather and 1225 in bad weather. On the Union Pacific road the snow offers great obstacles; about 2 per cent of the entire expense of the road is credited to the removal of snow and repairs of snow sheds. The Iquique railroad of Chili reports increased cost of working during fogs which produce slippery rails.

In regions of light precipitation, or drought, railroad ties decompose; the danger of fire is increased, and burning bridges cause wrecks of trains. In the Arabian deserts the railroad operators suffer comparatively little from disease. On the Transcaspian road the lack of good water brought about

ence. On the Iquique road it is necessary to convey water tanks and in some cases distilled water was carried forty miles mules.

In regions of high altitude the rarefaction of the air causes ich trouble to the operators, but on the other hand the absence germs prevents the decay of organic matter. In the report work on the railroad up the Jungfrau, Doctor Kronecker ted that mountain sickness sets in at altitudes varying with ferent persons, but that it a tacks all persons as soon as they dulge in the least muscular effort above 10,000 feet. Persons good health can stand being passively transported up to 12,- feet without inconvenience; a prolonged sojourn may, how- er, be disastrous. On the Callao, Lima and Oroya railroad any thousands of laborers lost their lives. "So difficult was to work in the rarefied air at high altitudes that riveters did t average a week's work each and many returned on the next ain." On the other hand, in building the Sierra Leone rail- ad the number of deaths and invalids was wonderfully low, t the climate had an enervating effect and there were frequent sences on leave. In the upper portions of the railroads, such the Jungfrau, snow avalanches are a serious obstacle, but ay be avoided by burrowing under or by underground tunnels. any railroads are abandoned during the snow season. Not nly in Switzerland but also in the Rocky Mountain region snow metimes overpowers all human efforts.

In regions of severe winter cold another class of obstacles is iet with, namely, the formation of ice. Although deep and rozen rivers and lakes may be traversed by railroads, yet when ne breakup comes in springtime there is a period when such ransportation must cease and when boats are also impossible. The experiences of the Transsiberian road and the Canadian Pacific are given with some detail. The average number of days during which work is possible on account of the snow and ice and the frozen ground is very limited. At Lake Baikal the soil s unworkable from October to April; at Vladivostock, the num- ber of days when the temperature is below freezing is 150, and, n general, on the Transsiberian railroad the total number of working days in a year is about 100. A general tabulation of he number of working days in each month of the year, for vari- ous portions of the United States, would perhaps elucidate many of the problems relating to the labor question.—*Monthly Weather Review, April, 1903.*

CLIMATOLOGY OF THE MONTH OF JUNE, 1904.

BAROMETER—Mean pressure, 29.96 inches; highest observed, 30 26 inches, at Des Moines and Dubuque on the 26th and 27th; lowest observed. 29.44 inches, at Sioux City on the 3d; range for state, 0.82 inch.

TEMPERATURE—The monthly mean temperature for the state, as shown by records of 114 stations, was 67.1°, which is 2.5° below normal. By sections the mean temperatures were as follows: Northern section, 65.7°, which is 2.6° below normal; central section, 67.5°, which is 2.0° below normal; southern section, 68.2°, which is 3.1° below normal. The highest monthly mean was 70.6° at Monticello; lowest monthly mean, 63.7° at Sibley. The highest temperature reported was 94° at Clinton, Larrabee, Ridgway and Ruthven on the 23d and 24th; lowest temperature reported, 35° at Charles City on the 2d. The average monthly maximum was 88.1°; average monthly minimum, 45.9°. Greatest daily range, 45 at Pocahontas; average of greatest daily ranges, 33.4.

PRECIPITATION—Average precipitation for the state, as shown by records of 126 stations, was 3.45 inches, which is 1.05 inches below normal. The averages by sections were as follows: Northern section, 4 53 inches, which is .15 inch below normal; central section, 2.74 inches, which is 1.56 inches below normal; southern section, 3.08 inches, which is 1.23 inches below normal. The largest amount reported was 8.35 inches at Humboldt; least amount reported, .44 inch, at Gilman. The greatest daily rainfall reported was 3.67 inches at Charles City on the 19th. Average number of days on which .01 of an inch or more was reported, 7.

WIND AND WEATHER—Prevailing direction of the wind, southeast; highest velocity reported, 58 miles per hour, from the northwest, at Sioux City, on the 28th. Average number of clear days, 13; partly cloudy, 10; cloudy, 7.

OBSERVERS' NOTES.

ALLERTON—*Rex. Shriver.* An ideal month for all crops; fruit generally good.

ALTA—*David E. Hadden.* June cool, with rainfall about 2 inches below normal of preceding 14 years.

AMANA—*Conrad Schadt.* Month was cool and dry, favorable for small grain, but not so good for corn and grass.

ATLANTIC—*J. W. Love.* Did not have one clear day in June, and nights were cool; severe storm and some hail on the 20th, but not much damage resulted. Crops are doing well.

BONAPARTE—*B. R. Vale.* Rain 4.41 inches, against 2.30 in June, 1903. Up to date we have 1.48 inches in excess of last year, but crops are much better. Month too cool for corn.

BRITT—*Geo. P. Hardwick.* But three clear days in June; corn acreage large, but stand thin. Oats short and thin; meadows and pastures below average; potatoes good.

CARROLL—*Moses Simon.* Lightning struck and burned dwelling of M. Yegge on night of 28th, causing $1,000 damage. No one hurt.

CHARITON—*C. C. Burr.* No floods or severe storms in June; nights abnormally cool.

CLARION—*J. H. DuBois.* Clover in blossom June 11th, strawberries ripe 13th; new potatoes on 18th; oats heading 20th.

FOREST CITY—*J. A. Peters.* Corn varies from four to twenty-four inches high; too cool and cloudy for corn; hay crop good.

GRAND MEADOW—*F. L. Williams.* June dry and cool; all crops except corn look well; potatoes extra good.

GREENFIELD—*J. D. Culver.* Rainfall much less than usual but was well distributed, and none of the crops suffered.

GRINNELL—*A. O. Price.* Rainfall in June 1.22 inches. The least amount in a long period.

GRUNDY CENTER—*E. S King.* All crops were ten days late June 1st, but were up to date on 30th; corn knee high on average and three-fourths laid by; grass short.

HANLONTOWN—*Miss G. M. Pashen.* Corn crop not making good progress; small grain looks well; early potatoes, peas and beens fit for use.

HUMBOLDT—*H. S. Wells.* Rainfall for June 8.35 inches; corn plowing hindered, but the crop is all right where it has been worked; hay crop made.

IDA GROVE—*J. E. Conn.* A fine growing month; small grain looks well; hay crop heavy; good rains, but no bad storms.

INWOOD—*G. M Larsen.* Fair conditions the entire month; nights rather too cool for corn; prospect good for large crop of grain.

JEFFERSON—*Isaac Young.* Hail did some damage on the 19th near Churdan; some windmills damaged; lightning killed some cattle in south part of county.

MONTICELLO—*C. E. Heisey.* June was very dry; only .90 of an inch of rain; showers went around us; grass brown, early potatoes short; corn better than ever before.

MOUNT VERNON—*Rev. J. W. Hubbard.* Temperature and rainfall below normal; hay crop light; small grains promise well; frui's abundant.

OLIN—*Nathan Potter.* Rain only 1.42 inches; cold June weather; a fine month for cultivating corn; all crops normal.

ONAWA—*C. G. Perkins.* Hailstorm on 29th did considerable damage.

OSAGE—*G. D. Pattengill.* On the 18th, from 1:30 to 2:30 P. M , the rainfall was 2.90 inches.

OSKALOOSA—*Jos. Boyd.* June was cool and free from severe storms.

POCAHONTAS—*F. E. Hronek.* On night of 28th a hailstorm caused much damage in a strip 3 to 5 miles wide and 8 to 10 long. Damage to corn 10 to 40 per cent.

RIDGEWAY—*Arthur Betts.* A very pretty June; 315 hours of sunshine; terperature normal; vegetation has made rapid growth and is of good color; 16 days calm.

WAUKEE—*E. J. Leonard.* June remarkably free from severe storms; small fruit abundant; crops doing well.

ERRATA IN MAY REVIEW.

CRESCO—Minimum temperature recorded on the 15th, page 7, should have been 10th and 15th.

DENISON—Maximum temperature recorded on the 22d, page 8, should have been 22d and 24th.

NEW HAMPTON—Mean temperature recorded 56.9 on page 7, should have been 57.0. Mean maximum temperature recorded 69 8 on page 10, should have been 69.9. Number of days missing omitted on page 7, should have been (c).

OSCEOLA—Mean temperature recorded 60.0 on page 8, should have been 59.9. Mean minimum temperature recorded 48.6 on page 10, should have been 48.5.

ROCKWELL CITY—Total precipitation recorded 3.65 inches on pages 8 and 11, should have been 3.70 inches.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve
Algona	Dr. F. T. Seeley

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. JULY 1904. No. 7.

IOWA CROP REPORT, AUGUST 1, 1904.

Tabulated reports received from correspondents of the Iowa Weather and Crop Service show the following estimates of the condition of the staple crops on August 1, 1904:

Spring wheat, 75 per cent; corn, 88 per cent; oats, 89 per cent; flax, 94 per cent; pastures, 96 per cent; potatoes, 101 per cent; apples, 73 per cent; grapes, 86 per cent.

At corresponding date last year the estimates were as follows: Spring wheat, 82 per cent; corn, 73; oats, 77; flax, 84; pastures, 104; potatoes, 80; apples, 65; grapes, 80.

Compared with the estimates of condition on July 1, 1904, spring wheat shows a decline of 16 points, on account of the serious attack of rust and blight during the latter part of July. The estimates are two points lower on corn and oats as compared with the July rating. As a matter of fact, however, the general outlook of the corn crop is better than it was about the first of July, though it is still relatively about eight to ten days later than usual.

Secretary Greene, of the Iowa Horticultural Society, gives the following report of the fruit crop for August 1, 1904:

Summer apples, 62 per cent; fall apples, 64; winter apples, 54; peaches, 10; American plums, 60; domestic plums, 38; Japan plums, 45; grapes, 82 per cent. The best crop of apples is grown this year in the eastern part of the State.

JULY WEATHER AND CROPS.

This has been the coldest July since 1891, when the mean temperature for the state was 68.6°. The mean for this month, 70.6°, was 3.6° below the normal. The warmest period was the second decade. The average rainfall for the state, 4.41 inches, was .18 of an inch above normal. The northern section received an average of 3.77 inches; central section, 4.47; southern section 5.00 inches. Rain in measurable quantity fell at one or more stations in the state every day during the month. And yet the average number of clear days was 16, partly cloudy, 9, and cloudy, 6. Generally there was sufficient sunshine to promote plant growth. The days were warm, and nights unusually cool. The heaviest storm of the month, in respect to amount of rainfall, occurred on the night of the 19th; but the excessive downpour was limited to a few counties. On the whole the month was favorable for crops and field work. Corn was laid by from the 4th to the 15th,—about a week later than usual. During the showery period in the early half of the month spring wheat and oats were attacked by rust. The wheat crop was damaged seriously, but oats were not very badly injured. The latter half of the month was favorable for harvest operations and most of the small grain was in shock or stack before August 1st. Haying progressed quite favorably and though the yield was lighter than the average the quality was superior, and most of it was secured in good order. Corn made notably fine progress, despite the cool weather, and at the close of the month that crop was much more advanced than was deemed possible earlier in the season. Potatoes, garden truck, apples, small fruit and all minor crops made normal advancement.

WHEN CORN IS TASS'LING OUT.

There is music in the breezes
As they rustle thru the corn,
There is grandeur in the sunrise
As it dries the dew each morn;
There is gladness 'mongst the people
And the farmers fairly shout—
There is always joy in Iowa
When the corn is tass'ling out!

There is singing in the hayfield
And along the dusty roads,
Where the farm boys drive the wagons
With their fresh and fragrant loads;
The housewives sing so gaily
As their tasks they go about—
There is heaps of joy in Iowa
When the corn is tass'ling out!

Over yonder in the stack yard
Rise the swelling yellow cones,
And the stackers toil and listen
For the dinner bell's sweet tones,
While they laugh and greet each other
With a lusty, ringing shout—
There's a pile of joy in Iowa
When the corn is tass'ling out!

And the waving, nodding tassels
Tell a story, short, but true,
Of the happy times a-coming,
Of the debts a-coming due;
How we'll meet 'em and pay 'em.
Every one without a doubt—
There's prosperity in Iowa
When the corn is tass'ling out.

—J. F. Dalton, in Manson Democrat.

AS TO SEED CORN.

Throughout the corn belt there was last spring a vigorous effort made by some of the agricultural experiment stations to instruct the growers of corn in regard to their seed corn, its selection, planting, etc. While much good was thus no doubt accomplished, the right time to do this sort of work is in the fall of the year, at the time when the seed corn should be gathered from the field. Once knowing what to select for seed, the winter care of it is really a simple matter, bearing in mind the fact that to insure a perfect germination of seed corn it should be picked before frost and kept where it will not freeze until planted, for it is frost which is the principal destroyer of the vitality of seed corn.—*Trigg's Farm Notes.*

NOTES.

In Iowa corn is grown principally for the grain. In Franklin county, Missouri, the cob is more valuable in the market than the shelled corn grown thereon. The variety produced in that region is known as the cob-pipe corn, and the factories in that section manufacture cob-pipes for shipment to all parts of the world. In Iowa dry cobs are used for kindling fires, for which purpose they are sold in towns for about a dollar per load. So corncobs end in smoke, whether sold at the pipe factory or for fuel.

Our American maize is growing upon the world. Its merits as a wholesome food are just beginning to be understood. In every way corn, employing the word in the sense peculiar to America, is a staff of life. Where its use is most abundant the finest type of men and women is raised and domestic animals are unsurpassed in vigor. Corn is nutritious, compact in bulk, easily transported, and one of the least perishable of foodstuffs. It contains in itself the elements that will sustain life for an indefinite period. In this age of rapid commercial communication there should be no famine as long as such a large surplus of corn is available. Corn is cheap, in fact, too cheap. It is worth relatively more than it sells for. The price is not likely to go too high, for its production in this country, great as is the yield, could easily be doubled. From every point of view corn is one of the greatest of nature's gifts to man, though as yet imperfectly appreciated.—*St. Louis Globe-Democrat.*

THE MISCHIEF OF WRONG THEORIES.

During the past century there has been such steady progress in all branches of science that the more intelligent portion of the community has abandoned those notions with regard to astrology, alchemy, spontaneous generation, witchcraft, and other philosophies that were formerly accepted by the most learned. The diffusion of education has raised the children of the present generation above the level of the philosophers of a former generation. And yet we have seen it demonstrated again and again that the popular majority does not fully appreciate the extent of our present knowledge of the laws of the weather, and is still liable to resort to unscientific methods in hope of accomplishing that to which science has not yet attained.

We have seen communities in America and Australia carried away with the idea that cannonading can produce rain, or in Europe that the ringing of church bells or the offering of prayers can avert droughts and floods. In southern Europe the agriculturists are but just recovering from the strange belief that hail can be prevented by shooting rings of smoke toward the clouds. During the past ten years a wealthy engineer of Russia has devoted his fortune to the conversion of the people to his idea that the moon controls the weather, and so seriously does his advocacy of this error affect the uneducated agricultural community that the director of the weather service at Odessa (Klossovsky) has gone to the trouble of publishing an elaborate statement of the errors in fact and theory committed by this engineer. He shows very clearly that Demtchinsky's method of predicting the weather by lunar periods amounts to nothing more than predicting an average condition, an average which very rarely occurs, whereas the departures from it are very frequent. The verifications of these predictions are like the combinations in an ordinary game of chance, where there is an equal number of heads and tails, or hits and misses.

As the collection of meteorological statistics depends so largely upon the voluntary work of thousands of upaid observers, it is to be feared that the good work we are doing in America may be seriously interrupted if erroneous views are allowed to have an influence in this country as profound as they seem to have in southern Russia.

We can not repeat too often and too clearly the general proposition that meteorology is to be advanced only by studying in details the effects on the atmosphere of insolation, radiation, the diurnal rotation and annual revolution of the earth, and the presence of continents and oceans.—*Monthly Weather Review.*

THE PLANETARY WEATHER PROPHETS.

The prophets who profess to believe that variations in temperature and precipitation are due to movements of the planets have come to grief out in California. According to the most recent issue of "The United States Monthly Weather Review," they promised the farmers an abundance of rain last winter, but their hopes were not realized in the southern part of the State. There is no reason to imagine that the authors of these fallacious assurances are particularly dejected over the result, but the failure of the prediction is influencing public opinion in a wholesome manner. Remarking upon the disappointment, The San Diego *Times* says: "We are thrown again upon the Weather Bureau, with added experiences in discounting old-time signs as interpreted by that wonderful array of weather-wise men who annually find their way into print to demonstrate what they can not predict about the weather."

The methods of the planetary forecasters—those of them who are honest, at least—are defective in several ways. They seldom sit down a year after their predictions have been issued and make a rigid comparison between the promise and the actual facts. Such a proceeding would be instructive in the extreme, though highly discouraging. They also neglect to formulate any system of mechanism whereby the planets can do the work imputed to them. They usually exhibit a singular ignorance of well established and fundamental laws. One of these men, for instance, mentions in a letter to the Weather Bureau the usual prevalence of easterly winds in Southern California last winter, and thinks that they were the result of some magical celestial influence. There is a much more simple way to account for them. Observation at government stations shows that there was an unusually high atmospheric pressure in the centre of the continent for several months, beginning with November, and a deficiency along the Pacific Coast. Now, the air always flows from a high area toward a low one, and the velocity is proportional to the "gradient." The latter having been steeper than is common, the movement should have been more vigorous than ordinary. The abnormal prevalence of easterly winds and the deficiency in precipitation in the vicinity of San Diego and Los Angeles, therefore, were closely related

o the severity of the winter in the eastern half of the country, which was due primarily to differences in pressure between the heart of the continent and the Atlantic Coast.

One of the most important advances made in meteorology in the last few years is the revelation that simultaneous changes occur in pressure in widely separated regions. In a recent number of "Nature" W. J. S. Lockyer gave striking illustrations of the barometric seesaw. Going back through an interval of over thirty years, he showed that when the pressure was sensibly higher than the average in India it would almost invariably be below the mean in South America. Between the areas which exhibit opposite conditions the boundaries are not yet well defined, nor is the duration of an abnormal state of things always the same. The interval apparently varies from one year to four. There does not appear to be a regular periodicity from which conclusions regarding the future can safely be drawn. Nevertheless, there is a significance in the single fact that the opening of a new chapter of history in one locality is often attended by a corresponding change in another, remote from the first. The phenomenon needs more study before it can be turned to account practically, but it seems to point to a thoroughly rational system of long range forecasting. It will not enable the expert to predict what will happen on a particular day, but it may possibly assist him to reach a fairly accurate conclusion of the general character of a period several months in length.

Caution must be exercised in attempting to explain sustained departures from the average of many years over a large area. Compensating excesses or deficiencies in other parts of the globe are perfectly intelligible because there is only just so much atmosphere. Accumulations here mean scarcity there. It is conceivable, of course, that exceptional obscurity in one locality, say, from an abundance of volcanic dust, might thus destroy the balance by cutting off some of the sun's heat in one locality. There is a stronger probability, however, that fluctuations in the output of solar energy will some day be logically connected with the observed effect. Any one who is familiar with the extent and violence of the disturbances which occur on the sun will find such a suggestion more credible than the notion that diminutive bodies, whose surfaces undergo no apparent change, have any appreciable influence.—*N. Y. Tribune*.

CLIMATOLOGY OF THE MONTH.

BAROMRTER.—Mean pressure, 29 98 inches; highest observed, 30.32 inches, at Dubuque, on the 2d; lowest observed, 29.69 inches, at Davenport on the 11th; range for state, 0.63 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 119 stations, was 70.6°, which is 3.6° below normal. By sections the mean temperatures were as follows: Northern section 69.1°, which is 3.9° below normal; Central section 71.0°, which is 3.1° below normal; Southern section 71.70°, which is 3.9° below normal. The highest monthly mean was 74.0° at Keokuk; lowest monthly mean, 66.5° at Cresco. The highest temperature reported was 100°, at Marshalltown on the 17th; lowest temperature reported, 38°, at Fayette on the 2d. The average monthly maximum was 93.1°; average monthly minimum, 46.8°. Greatest daily range, 43°, at Logan; average greatest daily ranges 33.4°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 117 stations, was 4.41 inches, which is 0.16 of an inch above normal. The averages by sections were as follows: Northern section, 3.77 inches, which is 0.41 below normal; Central section, 4.47 inches, which is 0.38 above normal; Southern section, 5.00 inches, which is 0.54 above normal. The largest amount reported was 11.97 inches at Thurman; least amount reported, 1.28, at Plover. The greatest daily rainfall reported was 7.73 inches at De Soto on the 19th. Average number of days on which .01 of an inch or more was reported, 10.

WIND AND WEATHER.—Prevailing direction of the wind, southwest; highest velocity reported, 42 miles per hour, from the northwest, at Sioux City on the 3d. Average number of clear days, 16; partly cloudy, 9; cloudy, 6.

OBSERVERS' NOTES.

ALTA.—*David E. Hadden.* July mean temperature was 3° below normal, and rainfall about 1.50 inches less than average of preceding fourteen years.

AMANA.—*C. Schadt.* Nights were cool, and weather very favorable for ripening grain and harvesting, with sunshine and rain enough to promote growth of corn.

ATLANTIC.—*J. W. Love.* Corn has made rapid growth, though nights were cool.

BONAPARTE.—*B. R. Vale.* Rain, 4.43 inches, but latter half of month was dry; good harvest weather after the 10th.

BRITT.—*Geo. P. Hardwick.* Wind and hail on 14th and 17th lodged grain and blew off apples. Wheat barley and potatoes good.

CHARITON.—*C. C. Burr.* No severe storms; temperature did not rise above 90 in July.

CLINTON.—*Luke Roberts.* A fine month for all crops, out of door work and personal comfort. Rain, 3.18, barely enough for crops; corn, potatoes and fruit doing well; grain and hay mostly secured.

COLUMBUS JUNCTION.—*J. B. Johnston.* On the 30th a severe electric storm caused damage to buildings and live stock.

FOREST CITY.—*J. A. Peters.* Harvesting oats began about 23d; early corn in tassel on 25th; oats about one-third in shock at close of month.

GRAND MEADOW.—*F. L. Williams.* Month was generally favorable for crop growth; barley crop heavy; oats and wheat rusted; pastures extra good; hay light; corn late.

GRINNELL.—*A. O. Price.* Perfect harvest month and all matured crops secured in fine condition.

HANLONTOWN.—*Miss G. M. Paschen.* Haying began the 6th; harvest of oats, 28th; heavy storm night of 29th damaged small grain and corn; some damage by hail.

IDA GROVE.—*J. E. Conn.* Corn doing well; haying nearly done; fruit crop good.

INWOOD.—*G. M. Larson.* The month was very favorable for farm work; abundant crop of good hay put up; corn looking well.

LOGAN.—*M. B. Stern.* Month changeable, cool and warm, but crops have grown finely.

OLIN.—*Nathan Potter* Good month for farm work, which was well advanced at its close.

POCAHONTAS.—*F. E. Hronek.* Excellent weather for haying and harvesting; corn tasseling and silking at close of month.

RIDGEWAY.—*Arthur Betts.* Coolest July on record here; 341 hours of sunshine; just enough rain, and crops are promising; hard windstorm on the 18th, with some damage to orchards, etc.

WAUKEE.—*E. J. Leonard.* Storm on 19th was severest in years; more rain fell in ten hours (6.80) than fell in May and June.

BELATED REPORTS.

FAYETTE.—May. Mean temperature 57.0°; mean maximum 70.0°; mean minimum 44.1°; maximum temperature 87° on the 20th and 22d; minimum 30° on the 10th; greatest daily range 39°; total precipitation 4.99 inches; greatest in 24 hours 1.16 inches on the 25th; number of rainy days, 7.

FAYETTE.—June. Mean temperature 65.3°; mean maximum 77.8°; mean minimum 52.8°; maximum temperature 88° on the 23d; minimum temperature 40° on the 9th; total precipitation 2.02 inches; greatest in 24 hours .83 inches on the 23d; number of rainy days 8.

VILLISCA.—June. Mean temperature 66.6°; mean maximum 79.0°; mean minimum 54.1°; maximum temperature 88° on the 21st; minimum temperature 43° on the 30th; greatest daily range 35°; total precipitation 2.73 inches; greatest in 24 hours .57 inches on the 20th; number of rainy days 11; clear 10; partly cloudy 16; cloudy 4; prevailing direction of wind, southwest.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. AUGUST 1904. No. 8.

AUGUST WEATHER AND CROPS.

The average temperature of August, 1904, was exactly the ame as August, 1903, 1902 and 1891. The mean was 2.7° be- ow the August normal. In the northern section it was 67.3°; entral section, 69.2°; southern section, 70.7°. The month was mostly clear and warm by day, though unseasonably cool it night. The average rainfall was normal for the state, but in ts distribution the larger amount was received in the south and eastern districts, where it was most needed. The bulk of the rainfall came about the 17th to 21st and the 29th. There were, on the average, 17 clear days, 8 partly cloudy, and 6 cloudy, affording an ample amount of fair weather for harvesting, stacking, threshing, cutting wild hay, millet, etc., and fall plowing. In all these farm operations very good progress was made. The pastures were revived and made green as in June by the copious showers in the latter half of the month. The corn crop made fair advancement during the month, though in view of its belated condition its progress was not as rapid as seemed desirable. The most advanced portion of the crop was well filled and dented at the close of the month. Reports at that time indicated that about one-third of the crop, with favorable conditions, would be mature by September 20th, while the balance required abundant warmth and sunshine until October 1st to be safe from harm by killing frost. The crop was unusually rank, green, and heavily eared. The minor crops were in good condition. Potatoes made heavy yield, and early apples were especially good and abundant. The yield of tomatoes and green corn for canning has been better than usual. Garden truck, cucumbers for pickling and melons yielded abundantly.

THE WEATHER SERVICE.

The *American Cultivator*, one of the ablest agricultural journals in America, says:

"The weather-reporting service, particularly in New England and the Middle States, has been excellent this summer, and has proved decidedly of use during the hay harvest. Year by year the department workers and their correspondents are adding to their efficiency as the result of experience.

"The time has come, arrived long ago, in fact, when farmers can rely quite safely upon the reports given out. A farmer who is naturally a good judge of local weather signs, and who has learned how to study the government weather reports including the weather conditions in other parts of the country, has a decided advantage in planning his farm work.

"Local signs by themselves are not very reliable, and do not usually indicate the weather long in advance. But the government weather men are often able to predict fairly well several days in advance, owing to the reports of weather in other sections, and its known rate of advance and length of duration. Those who still doubt the usefulness of these reports should compare them for awhile with the judgments of those who depend wholly upon observation of the sky and similar means. For long-time predictions the station reports will no doubt show the better average of correctness.

"The careful observer will soon learn to strike a balance between the reports and local indications, and will get the full usefulness of each. The study of weather signs, and also the charts and reports, should be an item in the public school course of every town."

SELECTED NOTES.

All the gold in America—the greatest hoard of yellow metal ever gathered in any country—could not buy one year's harvest of our corn and wheat. To buy one season's wheat crop would take all the gold mined in this country in six years. In the past seven years all the gold mines of the world have only produced enough to buy one year's yield of our six cereals. The cereal, cotton and hay crops, more than one hundred and fifty million tons, could not be bought with all the money in the country, as our stock of money—gold, silver and paper—has not yet reached the stupendous total of two and three quarter billion dollars.—*Wall Street Journal*.

It has been ascertained that not less that 4,000,000 acres of land in the state of Iowa, much of it under cultivation, would be greatly benefited by drainage, while Minnesota has probably as much more. These wet lands are the best lands when the water is got rid of. This needed drainage is now well under way in both states. Huge ditchers operated by steam and gasoline engines are at work making main waterways sometimes twenty miles in length, while smaller machines are putting in laterals and feeders. Later tile drains on the farms tributary to these ditches will relieve these choice lands from the plague of standing water and make possible the production of the finest of crops.—*J. S. Trigg*.

Of course not all of the carbonic acid in the air is secured, nor indeed all of that which enters the cellular air pass ges of the green parts of the plant, and hence it follows that very much larger volumes of air than have been stated must be brought into close contact with the growing clover in order to meet its needs. This air, however, can not come into intimate relations with the green chlorophyll-bearing cells of the clover in the field without of necessity permitting the evaporation of large quantities of water from the plants; and this brings us to realize how imperative is the demand for water by rapidly growing crops. The writer has found, for example, by direct measurement that the air passing three feet above a clover field, and at a moderate rate,

even as early as May 30th, in Wisconsin, when the air temperature is only 52.48 F., may have its relative humidity increased from 44 to 48 per cent by the moisture taken from the field; and this means that 3,510 pounds of water are required to make even the observed change of humidity in a volume of 152,600,000 cubic feet of air, which is the amount required to carry to the clover crop its carbon, supposing all the carbon which the air contained to be utilized.—*Prof H. F. King*.

GREAT VALLEYS FOR GREAT NATIONS.

The following article from the columns of the *New Orleans Picayune* contains matter of interest, especially for geographic students:

The Mississippi Valley is the most extensive and the most fertile and productive agricultural region on the globe. It is in the north temperate zone, and, therefore, it possesses climates best suited for the residence of people of the white race, and consequently, is the most favorable to the development of the highest civilization. Covering an area of nearly two million square miles, it embraces conditions capable of sustaining a dense population, and there is no question that it is destined to become the seat of power of the greatest nation that has ever inhabited the earth.

All great nationalities grow up in valleys, because it is only in such situations that food products and the other material requisite for the maintenance and employment of a large population can be found. The Valley of the Nile was the seat of a great Egyptian power. The Valley of the Euphrates was the heart of the Babylonian Empire. The great nations of India and China grew up in the wide valleys along their mighty rivers. In modern times when ocean transportation is so available food products and other raw material can be carried to the countries that do not possess them, but it may be laid down as a rule that the greatest nations grow up in locations where their populations can be most cheaply fed and most advantageously employed.

It has been frequently suggested that the Valley of the Amazon, in South America, is to be at some time in the future the seat of one of the world's greatest national powers. It contains two million square miles, while the Amazon itself is the greatest river on our globe, with numerous navigable tributaries. All such prophecies are vain, because the mouth of the mighty river lies immediately under the equator, and the whole of the valley's area is in the torrid zone.

United States Consul Louis H. Ayme, in a report to the Department of Commerce, at Washington, gives an account of a recent journey of exploration made by him to Manaos at the mouth of the Rio Negro, a large tributary that comes into the main river from the north. He reports that the Amazon river may be divided into three parts: "The lower Amazon, extending as far as Manaos, where the Rio Negro flows into it, a distance of about 900 miles; the upper Amazon, from Manaos to Iquitos, near the Peruvian boundary, a distance of perhaps 1,800 miles, and the Peruvian Amazon region, with navigable rivers for a distance of 1,600 miles and more. This amazing river system, which empties into the Atlantic, through a series of mouths 180 miles wide, more than twice as much water as the Mississippi carries in flood, and which stains the ocean for a distance of 600 miles, lies in a broad, flat valley elevated but a few inches above flood level, with an inclination of only about 1 foot in 5 miles. This valley almost always flooded, is covered with vast forests, in which at sparse intervals are found occasional hard-wood trees of some value. This depression, at least 30 miles wide, has a swift, very deep river running through it, with a breadth of from 2 to 6 miles. The thick forest growing up out of the water forms the so-called "banks." Here and there are patches of slightly elevated ground on which Indian huts are erected. To make this huge river and to sustain the growth of the vast matted forest, rain—much rain—is needed, and it is a fact that more rain falls in this region than in any other of like extent in the world. As one sails or steams up the great river there are seen occasional patches of green, level vegetation, for all the world like wondrously fertile meadows, and it is not difficult to imagine great flocks of cattle feeding on them, until the sight of a capybara or tapir, more than knee deep in the green ooze, informs one of the real consistency of that tempting and solid-looking meadow; it is little better than a swamp.

In these extraordinary forests there are found some of the most beautiful and valuable woods in the world, as well as fruits, nuts, oils, balsams and gums, but—and this but is unsurmountable—they are found as rarely as diamonds in the gravel or gold nuggets in the streams. There is a false impression existing that rubber trees, ebony, rosewood, and all the rest are found in great groves or clusters, like our pine or oak forests. The fact is that these trees are solitary. When two of them are only a quarter of a mile apart (and remember that the quarter-mile is not open space, but thick-matted, almost impenetrable swamp forest) they are considered close together; if they are a mile apart they are not considered to be very far distant from each other. Nor does this huge forest produce any great quantity of food for human beings. The staple articles of food for the dweller on the Amazon is dried pirarucu, a huge, fat river fish, and "farinha," the starch of the manioc root.

In all that vast region which lies under a tropical sun the only towns are Para, at the mouth of the Amazon, and Manaos, 900 miles up the river at the confluence of the Rio Negro, and in every other direction there are no settlements, and only a few scattered tribes of natives, who move about from tree to tree of the dense forest when they can no longer remain upon the flooded lands.

If the Valley of the Amazon were in a temperate zone, it would be sought and settled by the whites, who would control its river floods by levees, cut down its forests, cultivate its lands, and build towns and cities. But under a tropical sun and in a climate which is deadly to all people of the white race, the Valley of the Amazon is as hopeless of such a future as are the valleys of the Congo and the Niger.

The only parts of South America that are fit for the habitation and development of the white races are the countries in the lofty mountain region of the Pacific coast, and Argentina, the southern part of Brazil, Paraguay and Uruguay. South America is not likely to ever give rise to any great dominating power, because the requisite physical and climatic conditions are lacking. Only a small portion comparatively of South America lies in a temperate zone, and, therefore, North America will continue to dominate the hemisphere.

WHEAT RUST.

In an article on "Wheat Rust," Prof. W. M. Hays, who is one of the greatest authorities on wheat cultivation, discusses the subject very exhaustively.

Professor Hays says that the rusts of cereal grains are caused by a class of minute parasite plants, which do not produce flowers or seeds, but their means of reproduction are by spores. There are several species of these pestilerous plants, the life histories of which are not fully worked out; but it is certain that their spores live over winter and germinate on the surface of the leaves of wheat and other members of the grass family.

The only outward evidence of the presence of these plants is their heads or seed-like spores. The bodies of the plants are mere slender branching threads, growing through the tissues of the leaves and stems of plants. Sometimes they grow throughout the plant without forming spores. Their thread-like branches extend out under the plant's skin, there developing some little round spores so numerous, that as they g ow and

well, they push up the underskin of the plant and burst it pen. The patches on leaf or stem being evidence of the presnce of yellow or black masses of spores.

These rust parasites use the food that belongs to the kernel f the wheat in producing both the spores and the thread-like odies of the rust plants. It may be that the parasite has other ajurious effects on the growing grain than the mere absorption f its food, but of this little is known. The amount of spores howing is evidently not always the index to the amount of ajury done.

But when there are large amounts of rust spores there is ertain to be considerable damage. This subtle disease is always resent and all our fields are exposed to it, as all towns are onstantly exposed to the germ of consumption. In favorable easons the rust diseases do not spread rapidly and each wheat lant has none or so little that its vitality is not sapped; just as nen do not succumb to consumption in the high altitudes and lry atmospheres of some southern states. In moist warm seasons, on the other hand, the rust multiplies rapidly and the arge, soft wheat plants are compelled to support such a burden of these internal foes that their vigor is seriously impaired, just as the human family when placed in damp, unhealthful conditions is much more liable to succumb to germs of tuberculosis.

As a man or a cow will thrive under favorable conditions with a small amount of tubercular germs in the system, so a wheat plant will fatten up its berries if burdened with only a few of the thread-like bodies of its parasite. But if the conditions are unfavorable the man or the cow grows poor; and with bad conditions the wheat can not fatten up its berries; or, if the rust develops early in the life of the host plant, it sets but few berries and we have but few shrunken kernels.

Little is known, it seems, as to whether one species of rust under certain climatic conditions is worse than another, but appearance of spores before harvest is generally heralded as an unusually bad omen, and whether the presence of dark-colored spores is more significant of injury than yellow spores is not well understood. It is true, however, that the dark spores usually appear later in the season on the stubble of the grain and live over the winter. In a year of cool weather at the ripening season the effect of rust is often over-estimated as proven at threshing time.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 30.03 inches; highest observed, 30 34 inches, at Dubuque and Des Moines, on the 23d and 26th; lowest observed, 29.60 inches, at Davenport, on the 19th; range for state, 0.74 inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 115 stations, was 69.1°, which is 2.7° below normal. By sections the mean temperatures were as follows: Northern section, 67 3°, which is 3.2° below normal; central section, 69.2°, which is 2.4° below normal; southern section, 70.7°, which is 2.9° below normal. The highest monthly mean was 73.3° at College Springs; lowest monthly mean, 65.0° at New Hampton and Sibley. The highest temperature reported was 97°, at Mt. Ayr and Waukee, on the 13th; lowest temperature reported 35°, at Earlham, on the 8th. The average monthly maximum was 91.4°; average monthly minimum, 44.0°. Greatest daily range, 45° at Rock Rapids; average of greatest daily ranges, 35.1.

PRECIPITATION.—Average precipitation for the state, as shown by records of 126 stations, was 3.43 inches, which just equals the normal. The averages by sections were as follows: Northern section, 2.89 inches, which is 0.16 inch below normal; central section, 3.24 inches, which is 0.29 inch below normal; southern section, 4.15 inches, which is 0.45 inch above normal. The largest amount reported was 6.75 inches at Fort Dodge; least amount reported, 0.66 inch, at Sibley. The greatest daily rainfall reported was 4.00 inches at Fort Dodge on the 29th. Average number of days on which .01 of an inch or more was reported, 7.

WIND AND WEATHER.—Prevailing direction of wind, southwest; highest velocity reported, 42 miles per hour, from the south, at Sioux City, on the 3d. Average number of clear days, 17; partly cloudy, 8; cloudy, 6.

OBSERVERS' NOTES.

ALTA.—*David E. Hadden.* The rainfall for August was .88 inch above the 14 years' normal; temperature about normal.

ALLERTON.—*Rex Shriver.* Favorable month for all kinds of work; fall pastures starting well; apple crop good.

AMANA.—*C. Schadt.* First and second decades very dry and favorable for threshing; corn made good progress.

AMES.—*Thos. S Hunt.* Corn backward at close of August, needing 3 or 4 weeks without frost.

ATLANTIC.—*J. W. Love.* A peculiar month; only one thunderstorm in August; light, harmless frost on morning of 8th.

BONAPARTE.—*B. R. Vale.* Rain 4.40 inches, well distributed; temperature below normal; pastures good.

BRITT.—*Geo. P. Hardwick.* Generally fair, with no severe storms; cool nights, with two light frosts on low lands (8th and 22d); wheat rusted badly; oats yielding 28 to 30 bushels, of good quality; barley about same; corn uneven.

CHARITON.—*C. C. Burr.* A month of bright, pleasant days and cool nights; corn needing 30 days after close of August.

CLINTON.—*Luke Roberts.* Mean temperature of August 2.4° below normal; rainfall 2.34 inches in excess of normal; crops made good growth; lightning did some damage in this county.

FOREST CITY.—*J. A. Peters.* Light frost in low places on 8th; no damage; not over 25 per cent of corn in full roasting ears at close of month.

GREENFIELD.—*J. G. Culver.* Two brilliant meteors on evening of 10th, between 9:30 and 11.

GRINNELL.—*A. O. Price.* Weather fine for stacking and threshing; clear days prevailed.

HAMPTON.—*E. C. Grenelle.* Frost observed in several places on morning of 8th and 22d; no damage.

HANLONTOWN.—*Miss G. M. Paschen.* Threshing from shock begun on the 11th. Oats good quality and average 40 bushels per acre.

HOPEVILLE.—*M. T Ashley.* Month closed with corn late; will require a full month of warm weather to mature the crop.

IDA GROVE.—*J. E. Conn.* Exceptionally fine weather; warm days and cool nights; corn doing well and pastures good.

INDIANOLA.—*John L. Tillon.* On 17th lightning struck a barn six miles west of town, set it on fire and killed a boy.

INWOOD.—*G. M. Larsen.* August generally fair; nights were cool; oats and barley make good yield; wheat damaged by rust and poor; large fruit crop; lightning has done much damage.

KEOSAUQUA.—*J. H. Landes.* Remarkably cool nights have been most marked features of the month.

LARRABEE.—*H. B. Strever.* On the 17th lightning struck barn of Jas. Main, a few miles northeast of Cherokee. Martin Main was killed instantly.

OLIN.—*N. Potter.* Rain sufficient for fall pasture and for fall plowing; corn has done well, but is ten days late.

RIDGEWAY.—*Arthur Betts.* Warmest August since 1901, with 354 hours of sunshine; rainfall light, more than half falling on 9th; a pretty fog-bow observed on the 20th; mirages on the 2d and 6th; crops will compare favorably with 1898.

ZEARING.—*H. E. Burkhart.* Four miles northwest of town about 15 acres of corn killed by frost, on the 8th; shock threshing all done by 31st.

ERRATA IN JULY REVIEW.

EARLHAM.—Total precipitation recorded 6.23 inches on pages 7 and 11, should have been 6.33 inches.

ESTHERVILLE.—Maximum temperature recorded on the 17th, page 7, should have been on the 16th.

FLORENCE.—Total precipitation recorded 4.54 inches on pages 7 and 11, should have been 4.00 inches. Amounts on 13th and 19th, should have been .03 inch, instead of .30 inch.

HARLAN.—Mean temperature recorded 71.4° on page 8, should have been 71.0°.

MT. AYR.—Mean maximum temperature recorded 84.3° on page 10, should have been 84.1°.

SIGOURNEY.—Minimum temperature recorded 51° on the 1st, page 7, should have been 46° on the 2d.

WAUKEE.—Minimum temperature recorded 52° on the 1st and 2d, page 8, should have been 1, 2, 23d.

ATLANTIC.—Mean temperature recorded 70.6° on page 7, should have been 70.5°. Mean maximum temperature recorded 83.6° on page 9, should have been 83.3°.

GALVA.—Mean maximum temperature recorded 82.0° on page 9, should have been 82.4°. Mean temperature recorded 69.8° on page 8, should have been 70.0°.

IDA GROVE.—Mean temperature recorded 72.4° on page 8, should have been 72.2°. Mean maximum temperature recorded 83.9° on page 9, should have been 83.6°.

MARSHALLTOWN.—Mean maximum temperature recorded 84.4° on page 10, should have been 84.3°.

MASON CITY.—Mean minimum temperature recorded 60.2° on page 10, should have been 60.3°. Mean temperature recorded 70.3° on page 7, should have been 70.4°.

CRESCO.—Maximum temperature recorded on the 17th, page 7, should have been 17th and 18th.

BELATED REPORTS.

MONTEZUMA, July.—Total precipitation, 5.13 inches; greatest in 24 hours, 3.10 inches on the 19th; number of rainy days, 6.

VILLISCA, July.—Mean temperature, 70.6°; mean maximum, 82.4°; mean minimum, 58.9°; 59.8°; maximum temperature, 92° on the 16th, 17th and 18th; greatest daily range, 34; total precipitation, 7.70 inches; greatest in 24 hours, 3.05 inches on the 19th; number of rainy days, 8; clear, 17; partly cloudy, 12; cloudy, 2; prevailing wind from the southwest.

NORTHWOOD, July.—Mean temperature, 69.3°; mean maximum, 80.5°; mean minimum, 58.1°; maximum temperature, 91° on the 17th; minimum, 47° on the 2d; greatest daily range, 35; total precipitation, 5.00 inches; greatest in 24 hours, 1.00 on the 6th and on the 17th; number of rainy days, 11; clear, 16; partly cloudy, 9; cloudy, 6; prevailing direction of wind from the northwest.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. SEPTEMBER, 1904. No. 9.

SEPTEMBER WEATHER AND CROPS.

The average temperature of September was about normal for the state, the southern and central sections showing an excess, and the northern section a small deficiency. The coldest period was from about the 11th to the 22d. The average rainfall for the state was 2.78 inches, which amount is about 0.52 of an inch below the normal for September. In its distribution there was much inequality, ranging from less than a tenth of an inch at one station in the northwest to over eight inches in the southeast district. The southeast and northeast districts received the heaviest rainfall. The week ending September 12th was normal in temperature and sunshine, with very light rainfall, and generally favorable conditions for ripening the belated corn crop, a considerable portion of which was well dented with husks and blades putting on the brown shade of autumn. The week ending the 19th brought several days of good ripening weather, but much anxiety for the safety of the immature portion of the corn crop was caused by the occurrence of light to heavy frosts on the mornings of the 12th, 14th and 15th, the cold wave extending to all districts in the state. A few stations also reported frost on the 21st. The lowest temperature recorded was 30° at four stations. The observed effects proved that the frosts were not "killing," and that the damage to the corn crop was limited to late planted fields in the bottom lands of the central valleys of the state. Broadly stated, the actual damage by frost affected less than one-fourth of the area planted, and the shrinkage of the frosted portion of the crop was probably less than 20 per cent. This would indicate possible loss of 5 per cent of the crop for the state, as the direct result of frost. The cold weather of that period, however, retarded the development of the crop, and made it desirable to extend the ripening weather beyond the 1st of October. During the month good progress was made in the usual farm operations, such as plowing, seeding fall wheat and rye, harvesting potatoes, apples and millet, and threshing small grain. The yield of potatoes and fall apples has been very satisfactory. The grape crop is heavy, and there has been a good yield of plums. The growth of all kinds of garden truck has been unusually heavy. The pastures have been much better than usual for September. At the close of the month it was estimated that ninety per cent of the corn crop was practically safe, giving promise of more than the average output of merchantable corn.

A VALUABLE SERVICE.

That the government climate and crop service as conducted under the auspices of the weather bureau of the United States Department of Agriculture is playing an important part in the economic conditions of the farmer is forcibly called to mind in the review of the annual Iowa report for the year 1903 as it has been issued by the director of the Iowa bureau at Des Moines. It is interesting to note that during the year there were issued 10,000 copies of the 1902 report, 32,000 monthly reviews, 70,000 weekly climate and crop bulletins, not to mention an appendix of 185 pages in connection with the annual report. This shows the magnitude of the service in one state from the standpoint of printed matter distributed.

Fortunately, in Iowa, the state and the federal goverments have been enabled to unite their forces, thus insuring better results to the farmer by virtue of this consolidated service. It is interesting to note that at the end of the fiscal year ending June 30, 1904, there were 50,000 rural patrons of telephones in Iowa who were daily receiving the benefit of the climate and crop service. In addition to these there were 7,000 farmers getting the reports from the bureau through the mails direct, not to mention the tens of thousands who had the information placed before them through the agency of the daily press.

The Iowa service has six regularly equipped stations in different portions of the state, from which accurate information regarding climatic changes is always available. In addition to this there are 132 correspondents in various portions of Iowa who are in close touch with local conditions and report weekly their observations to the main office at Des Moines, from which the officials of the service are enabled to summarize the important details in making up their weekly crop reports.

Every year farmers are learning the value of this service. With the advent of the telephone and the rural mail their value to the man in the country is to be rapidly enhanced until the time is here when no progressive farmer will be without daily, and, if necessary, hourly information relative to possible climatic changes.—*Chicago Drovers Journal.*

NOTES AND COMENTS.

According to a recent report of the U. S. consul at Halifax, the province of Nova Scotia has been scorched by one of the worst droughts in its history, the most disastrous effects being suffered in the eastern portion. It will cause much privation, and possible hunger.

Macaroni wheat escaped rust in the Dacotas, and this fact is likely to enlarge the area of that grain in future years. If good bread may be made of the flour, its rust-resisting quality will insure its commercial value.

In a flash of lightning the air is simply heated momentarily to the point of incandescence along the path of the discharge. This is the accepted scientific theory as to the nature of the electric spark or flash.

The moon affects the tides and is an aid to courting but, she has not a thing to do with the weaning of babies and calves or the planting of potatoes.—*J. S. Trigg.*

If the fertilization of the soil is the main thing sought, try mammoth clover, plowing the whole thing under the second year. It is the cheapest method of renovating a wornout field there is to be found.—*J. S. Trigg.*

The brief summer season of the north country is a miracle worker. Out of the long winter paralysis, the snow banks, the chill and dilatory spring, with May frosts and snowstorms, the grip of the cold is broken at last, and heat, moisture, electricity and seventeen hours of sunshine get in their work. Grain, fruit and flower then go on a wild sixty mile an hour race, and the garden of Eden replaces the arctic winter waste. Such wheat, such oats, such flax, such potatoes and garden truck, and life on the farm one mad rush to save and gather the abundance before the geese start south and the praties freeze in the ground! Three months of heaven to offset nine months of purgatory! The Finn, the Russian and the Norseman take kindly to these conditions.—*J. S Trigg.*

WEATHER AND CROPS IN UNION COUNTY.

The close of this year of crop reports finds us with clear skies and warm air. This has been a whole season of anxiety as to the outcome of our crops. Today finds our corn crop ripening except the belated plantings, and even this is turning color in husk and blade, and with present indications is likely in this part of the state to make corn. Taking it altogether we have an average crop for ten years. Hay not so good as last year, but oats equally as good. Potatoes much better, and, corn very much better; and during all the year pastures have been fine. The rainfall last year, from May to September, inclusive, was 37.43 inches, while this year it was only 19.01 inches; and yet for the farmer this has been as wet a season as last. This is from the fact that we had frequent rains, and some quite heavy. We have had no great downpour at any one time. In May last year we had 11.90 inches while this year we had 4.20. In August, 1903, we had 12 34; this year, 4.66 inches. This excess for 1903 is from two great rains, one in May and one in August. The average temperature has been lower this year than last. With the promise of high prices for farm products (except meats) the farmers are quite as well off as they have been in the best seasons.

N. W. Rowell,
Vol. Observer.

Alton, Iowa, October 1, 1904.

CROP SEASONS AT RIDGEWAY.

Observer Arthur Betts, of Ridgeway, Winneshiek county, has tabulated meteorological data for the crop season—April 1st, to October 1st, for seven years. The figures below show the mean temperature in degrees, precipitation in inches, and total hours of sunshine for the six months period in the years named:

YEAR.	Mean Temperature.	Precipitation.	Sunshine.
1898	67.7	13.59	1,557
1899	66.8	19.70	1,561
1900	69 4	23 43	1,715
1901	69 8	20.47	1,704
1902	66.0	30.86	1,378
1003	66.4	25 04	1,436
1904	67.1	18.45	1,584
Average	67.6	21.65	1,562

FAKE FORECASTS.

In ordinary mercantile business it is quite a common experience for the manufacturer of a good article that is rapidly growing in popular favor to find counterfeits or infringements on his patent springing up like mushrooms, and sometimes offering very serious and illegitimate rivalry. The Weather Bureau has gone through a very similar experience. In 1870 there were, we believe, no long-range forecasters known to the country, except the ordinary farmers' almanacs, and we doubt whether any but the most credulous placed any faith in them. I have often told of the confession of one of these almanac weather makers, who with a twinkle in his eye said that after the proper astronomical part of the almanac was completed, and when he was in the spirit for writing up the weather, he would sit down and make it up for a year ahead, or so long as he felt in the mood. He fully understood that some people can be gulled sometimes, but we all know that we can not fool all the people all the time. So far as we recall the names of those who have distinguished themselves for making popular weather predictions based on principles that are contrary to all our knowledge of meteorology, the list runs somewhat as follows: Venor, 1875–1890; Hicks, 1890 to date; Dunne, 1892 to date; Foster, 1885 to date; Elmer, 1903 to date; Snavely, 1902–1904.

While these have been active in the United States, the rest of the world has also had its varied experiences. In England, Mr. Hugh Clements and his great expounder, Hon. William Digby, have vexed the printer with an imposing volume and the public with daily predictions in the local newspapers. These authors speak as confidently about the moon as Rev. Mr. Hicks does about Vulcan, Jupiter and the other planets, real and imaginary. Italy and Austria have gone through a sad experience with vortex-ring cannons for driving away hail. Russia has enjoyed the gratuitous services of Demtschinsky and his predictions based upon the moon.

In general, it would seem that weather predic ion and long-range forecasts are so greatly desired that everyone is willing to give a man a fair show. The wonder is that the indefinite utterances of these oracles can be accepted as forecasts, or that their flat failure when they do not become definite should not have consigned them to oblivion. Recall, for instance, the sad work of Falb, who in 1895 predicted terrible earthquakes and storms, possibly indicating the approaching end of the world, thereby frightening the whole of Spanish America, so that no work could be done for weeks and the whole community was thrown into a hopeless state of panic. Recall the prediction made about 1880 of an awful storm that would scourge the Gulf and South Atlantic States. Many of the intelligent inhabitants and nine tenths of the less intelligent were frightened by the prediction, and allowed it to entirely alter their ordinary lives and business.

Who was it that in 1901 started a newspaper paragraph, purporting to come from some responsible person, predicting a hurricane for the coast of New Jersey on a certain date? So great was the anxiety that it was necessary for the Secretary of Agriculture to issue a counteracting telegram showing that the original was certainly a fake. A community even of the most intelligent, cool-headed people is likely to be carried off its feet by enthusiasm for some hero, or by a mania for some financial scheme, or to be stampeded by fright. Emotions are contagious, and it is necessary for a community to protect itself against injurious popular movements, just as it would protect itself against injurious contagious diseases. Freedom of individual action is the ideal on which we have built up our republic; but when that freedom of action threatens the existence of the republic it must be restrained, moderately, if you will, and wisely, but still sufficiently to protect the public from danger. We would not for a moment countenance the publication of numerous nautical almanacs differing considerably in the pre-

liction of exact positions of the sun, moon, and stars, because we know that only one of these can be right, and that the others would certainly lead to errors in navigation that would endanger the l ves of thousands of persons. The community does not allow either druggists or physicians to operate without first giving satisfactory evidence that they are competent to handle the drugs that they deal in. Every state has its laws relative to the licensing of steam engineers, since a steam engine in incompetent hands would be a menace to the lives of many.

Wherever the life and property of the citizens are at stake, the government of the people, by the people, and for the people, must necessarily look after their interests, and the time must soon c me when a general law will forbid the publication of weather predictions and storm warnings, especially those of a sensational character, by any others than properly licensed persons.—*U. S. Monthly Weather Review.*

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 30.04 inches; highest observed, 30.55 inches at Dubuque on the 21st; lowest observed, 29.71 inches at Sioux City on the 28th; range for state, 0.84 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by the records of 114 stations, was 64.0°, which is 0.4° above normal. By sections the mean temperature was as follows: Northern section, 61.8°, which is 0.5° below normal; central section, 64.3°, which is 1.1° above normal; southern section, 65.6°, which is 0.2° above normal. The highest monthly mean was 68.6° at Belknap; lowest monthly mean, 59.0° at Sibley. The highest temperature reported was 94° at Wilton Junction on the 11th; lowest temperature reported, 30° at Atlantic, Earlham, Hanlontown and Rock Rapids on the 14th, 15th and 21st. The average monthly maximum was 88.9°; average monthly minimum, 34.7°. Greatest daily range, 54° at Estherville; average of greatest daily range, 36.5°.

PRECIPITATION.—Average precipitation for the state, as shown by the records of 122 stations, was 2.78 inches, which is 0.52 of an inch below normal. The averages by sections were as follows: Northern section, 2.67 inches, which is .74 inch below normal; central section, 2.13 inches, which is 1.13 inches below normal; southern section, 3.53 inches, which is 0 28 inch above normal. The largest amount reported was 8.33 inches at Keokuk; least amount reported, .09 of an inch at Ida Grove. The greatest daily rainfall reported was 3.01 inches at Keokuk on the 18th and 19th. Average number of days on which .01 of an inch or more was reported, 7.

WIND AND WEATHER.—Prevailing direction of the wind, south and southwest; highest velocity reported, 39 miles per hour from the northwest at Sioux City on the 1st. Average number of clear days, 13; partly cloudy, 8; cloudy 9.

OBSERVERS' NOTES.

AFTON.—*N. W. Rowell.* A month of great anxiety to all; we have alternated between hope and fear as sunshine and shadows came and went. But a kind Providence has so tempered the winds that no blighting frost has fallen. Our corn crop is secure and our pastures green, with ripe fruit upon tree and vine. Let us give thanks.

ALTA.—*David E. Hadden.* The mean temperature for September was about 1° below the normal; no killing frost occurred during the month.

AMANA.—*C Schadt.* Weather favorable for maturing corn; no real killing frost; only about 5 per cent lost by late planting from effect of frost on the 15th on low ground; grapes, plums and apples abundant.

AMES.—*Thos. S. Hunt.* Corn is now well out of danger.

ATLANTIC.—*J. W. Lov*. A moderately warm September; first ice formed on 14th; corn is nearly all safe.

BONAPARTE.—*B. R. Vale.* Rain 6.73 inches; too wet for farm work or the good of the corn; subsoil full of water; pasture good.

BRITT.—*Geo. P. Hardwick* Frost damaged corn on low lands and slightly on high lands; injured about 35 per cent. Thunder and windstorm on the 28th damaged corn and light buildings.

CHARITON.—*C. C. Burr.* Month passed without a killing frost; on 15th frost did some harm to corn on low land; some corn yet needs ten days to ripen; pastures better than average.

CLINTON. *Luke Roberts.* Mean temperature 2° above normal; rainfall .55 of an inch below normal; per cent of cloudiness, 50; frost affected corn only in places and but slightly; crop as good as in 1903, possibly better.

DECORAH.—*F. H. Baker.* There was a light frost on 15th.

EARLHAM.—*Geo. Phillips.* Month closed with no damage by frost; corn now safe except very late planted.

CLARION.—*J. H. DuBois.* Frost on 15th killed leaves of tender vines; apple, plum and potato crop very large.

FOREST CITY.—*J. A. Peters.* No killing frost in September; frost on the 15th damaged corn only on low land and creek bottoms; ground in good condition for plowing.

GRAND MEADOW.—*F. L. Williams.* There being no killing frost was favorable to corn; corn cutting well advanced, and fall work well along.

GREENFIELD.—*J. G. Culver.* No frost sufficient to injure vegetation except in few places on lowest bottoms; very little damage to corn.

GRINNELL.—*A. O. Price.* No serious damage by frost; large amount of corn cut; plowing well advanced.

GRUNDY CENTER.—*E. S. King.* A variable month; corn practically safe; potatoes yield 200 to 300 bushels per acre.

HOPEVILLE.—*M. L. Ashley.* Eighty per cent of corn safe at close of month; late fields need 10 to 15 days of good weather.

INWOOD.—*G. M. Larsen.* Month favorable for corn, and crop will be heavy; pastures good.

KEOSAUQUA.—*J. H. Landes*. Five rainstorms, each attended with fierce electric disturbance, causing loss of stock and buildings in different parts of the county.

LARRABEE —*H. B. Strever*. Corn touched by frost on low lands on 21st; bulk of crop safe at end of month.

LOGAN.—*Mrs. M. B. Stern*. Frost on 15th killed very tender precipitation, but did not do much injury to corn.

MT. VERNON.—*J. W. Hubbard*. Season closes favorably; small grains and root crops good; corn crop large, with an unusual per centage of soft ears.

OLIN.—*Nathan Potter*. A fine month; frost damaged corn on low land; apple and po ato crops large.

RIDGEWAY.—*Arthur Betts*. Warmest September since 1898; sunshine 262 hours; on night of 5th nine fires were kindled by lightning in sight of this station. Hail on 17th, and hailstones averaged size of plums.

WAUKEE.—*E. J. Leonard*. Month free from heavy storms; some corn frosted on low lands, but bulk of crop is now safe.

WAVERLY.—*H. S. Hoover*. Upland corn untouched by frost; last ten days worked wonders in ripening corn.

WHITTEN.—*Frank P. Butler*. Frost did but little damage and corn is now practically safe.

BELATED REPORT.

BELKNAP—*August*. Mean temperature 71.8°; highest 91° on the 13th; lowest 50° on the 9th; greatest daily range 26°; total precipitation 4.25 inches; greatest in 24 hours 1.80 inches; number of clear days 25, partly cloudy 2, cloudy 4, rainy 5; prevailing direction, south.

ERRATA IN AUGUST REVIEW.

MASSENA.—Minimum temperature recorded 43° on the 8th, page 7, should have been 40° on the 26th. Total precipitation recorded 4.23 inches on page 7, should have been 4.03 inches.

WILTON JUNCTION.—Maximum temperature recorded on the 12th, page 8, should have been on the 12th and 13th.

LOGAN.—Maximum temperature recorded on the 14th and 15th, page 8, should have been on the 14th.

OSAGE.—Maximum and minimum temperature on the 1st, page 10, omitted, should have been 75 and 54 respectively. Maximum temperature recorded 89° on the 12th, page 7, should have been 90° on the 24th.

LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. McDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. OCTOBER, 1904. No. 10.

OCTOBER WEATHER AND CROPS.

October was warmer and drier than usual, the daily mean temperature being about 1° above normal, and the average rainfall for the state 0.73 of an inch below normal. The northern section received the largest amount, the average being about 0.29 of an inch above the October normal. The first frost of the month occurred on the morning of the 6th, and was heavy enough to kill vines and most of the cornstalks remaining green in the northern half of the state. In the southern half that frost was light, causing no damage. The first general killing frost covering the state occurred on the morning of the 23d, all crops being safe at that time. The bulk of the rainfall came in the first and second decades—mainly between the 5th and 20th, the balance of the month being dry and favorable for farm work, for drying out the corn crop and harvesting the minor crops. No better weather could be desired for preparing corn for cribbing than was prevalent from the 20th to 31st. Good progress was made in harvesting the corn during the last week, though the heavier ears contained considerable moisture. But the weather was cool by night, though moderate and clear by day. The heavy potato crop was harvested in good condition, the quality of the product being unusually good. Pastures were very good throughout the month. Good progress has been made in fall plowing. The small acreage in fall wheat and rye showed an excellent growth and good stand. On the whole October was a very mild and favorable month, crowning a fairly productive crop season.

NOTES AND COMMENTS.

October brought an abundant supply of health-giving ozone, with the delightful glow and warmth of the temperate zone. There is nothing in the torrid zone that equals the Indian summer of this latitude.

What will be the character of the coming winter? That question is frequently propounded to observers of the Weather Bareau, and it's easily answered. It will be an open winter—sure! It will be open on all sides and above, for free entrance of all the winds that blow; for boreal blasts, blizzards, snow flurries from the north and west, and for some balmy breezes from Gulfland. It will be an old-fashioned winter; that is to say, it will be quite like some of the fashions of winter that prevailed in the pioneer years between the 40's and 70's. Whether severe or mild its prototypes may be noted in the old-time records. There will be some sudden changes, intermittent temperatures, and a goodly number of bright, cold, crisp and health-giving days. All in all, it will be good winter for indoor social enjoyment, for hearing lectures, attending institutes and meetings for mental and moral improvement. It will be a good winter for taking account of stock and preparing for next season's business. This is fully as specific as any of the long-range prognostications.

At the recent session of the International Geographic Congress, held in Washington, D. C., Commander Robert E. Peary, U. S. N., served as president and made the opening address. Referring to the rapid progress made in recent years, he said; "Wireless telegraphy is an accomplished fact today, not an experiment, and the atmosphere of the globe in a short time will throb incessantly with countless messages." He referred to the isthmian canal as the grandest project, the greatest engineering, financial, and diplomatic problem of the age, and added; "A fearless master hand has at a stroke cut the Gordian tangle that has hitherto defied the ablest statesmen and financiers of the world, and the nations today accept without question the Panama canal as a fact."

With deep regret announcement is made of the death of Isaac Young of Jefferson, Greene county, one of the faithful voluntary observers and crop reporters of the climate and crop service of Iowa. His death occurred on the evening of September 21st, after a brief illness. In all things he was faithful until the end.

By joint action of the boards of supervisors of Monona and Harrison counties a great drainage ditch is to be dug, at an estimated cost of $258,000, which will reclaim 86,000 acres of land that is now too wet for cultivation. It is likely to be a very profitable enterprise, from a sanitary as well as a financial point of view. Within a few years the rich land thus brought into cultivation will grow the heaviest crops produced in those counties. The soil is practically inexhaustible. The reclaimed tract may produce four to five million bushels of corn per year.

Will Chamberlain, in his "Wayside Notes," says: As a weather prophet, Bob White is a profound fizzle. He does not belong to the Hicks school, because he makes no claims to weather prognostications. His "More Wet" is his personal clarion, and has no relations to storms in any sense of the word, The quail is very neat and trim little gent of the by-ways.

It is the surplus water in the soil that injures crops, and this is removed by tile drainage. No moisure is drained from the soil by tiling that would be helpful to plant growth.

United States Consul Winslow says that Belgium has eleven large mills that grind American corn exclusively, and that the product of these mills is used for bread making. One large bakery turns out 10,000 loaves of bread weekly made of a mixture of 25 per cent corn flour and 75 per cent rye or wheat. Over 800 bakeries in Berlin are selling bread made of this same mixture. Commenting on this statement an exchange says: "The short wheat crop and the probable advance in the price of bread will afford the corn grower an unusual good opportunity this year to start a propaganda in the United States for the more general use of corn as food. If it has been possible to lead Europeans into using corn it ought to be even less difficult to do the same thing in this country. A more general use of corn would not only largely benefit the western states, which are the chief producers of this cereal, but would be a blessing to poor people the country over who find their slender incomes hardly equal to the feeding of large families on such an expensive luxury as white bread.

The molasses, gluten and sugar feeds and the multitude of other balanced and mixed feeds which have developed of very late years are constantly growing in importance and in the appreciation in which they are held in the trade. At the same time, millfeeds are as highly esteemed as ever they were, and it cannot justly be said that they have suffered at all in the estimation of the public by the increasing use of the multitude of special feeds which have come to the front. This is explainable by two reasons; one that millfeeds are quite largely used as a basis for various mixed foods, and the other that the practice of feeding stock in a special and careful way has made immense strides in the last five years. Once bossy got grass in season and hay out of season, and if she succeeded in annexing a bran mash on the side or a dessert of cut up pumpkins or whole turnips she regarded herself as a lucky if not pampered animal. Nowadays, all this is changed. The farmer has his sharp eye glued on the analyses and tests of the agricultural colleges and state boards of agriculture, and the consequence is that the bill of fare which the progressive farmer serves up to his stock and poultry rivals the menu of the average country hotel for length and variety. All this is pleasant for the live stock and profitable for the farmer, and, at the same time, gives wide scope to the feed business, which daily assumes greater and greater importance. Nor is the end of this movement by any means in sight, for it is based upon the purely business principle of securing the best possible results from a given investment.—*Flouer and Feed.*

UNRELIABLE WEATHER PROPHETS.

The following article clipped from the editorial columns of the *Homestead* is scientifically sound, and worthy of a careful reading:

Nothing could be of greater practical value to the farmer than a reliable prognostication of the weather for a year or even for a single season. Such a prediction would be a controlling factor in the decision of many important questions regarding crops and farm management. If the characfer of the weather as to temperature, humidity, sunshine, wind and rainfall could be foretold with accuracy, the farmer could well afford to invest a generous sum each year in the forecasts.

Many intelligent and generally well-informed persons will tell you that certain men whom they can name have solved this problem; that their predictions from year to year have been marvelously verified by the results, and that their publications are worthy of attention and study.

When the prognostications of these long-range weather forecasters are examined they are almost invariably characterized by two features, either of which would condemn them as being worthy the credence of educated people. One of these is their pretended dependence on astronomical or astrological conditions; the other is their general character, varying enough as to either time or locality to be valueless and unsusceptible of being tested.

Astrology has no standing as a science. It makes its appeal to the ignorant and superstitious. Astronomy is one of the genuine sciences and its conclusions are everywhere received with respect; but any astronomer of standing will tell you that there is no body of astronomical knowledge on which long-range weather predictions, or weather forecasts of any character, can be based. There is a supposed connection between the variations in the size and character of sun-spots and atmospheric and magnetic conditions on the earth; but the problem has not yet been worked out; and any writer who leads his readers to infer that it has been even partially solved is either uninformed or mendacious.

The professional long-range weather prophet makes his forecasts so indefinite and general that he can and actually does claim any storm of any character at any place within several days of his assigned dates as being a substantial fulfillment of the prediction. The futility of such logic is seen when it is remembered that some kind of an atmospheric disturbance is occurring in some part of the United States almost every day in the year. Like our "equinoctial storms" of fall and spring, give the weather prophet's storm a leeway of three or four days each way, six or eight days in all, and it will be pretty sure to come along, according to programme.

In its very nature, the weather depends on an infinite variety of causes, conditions and combinations between them. It is not susceptible of reliable long-range prediction. The weather forecasts now published by the government are mainly reliable because they are made in accordance with known scientific principles. They are based on observed phenomena, calculated on actual movements of storm centers. They are not always verified by results in every part of the territory they cover; but they are infinitely more valuable than any long-range forecasts made. It is safe to give the long-range weather prophet a wide berth.

THE WEATHER AND THE ALMANACS.

The way to determine the value of long-range weather forecasts is to compare them with the records, noting misses as well as hits. They ought to score about 50 per cent of verification by the law of chance, even if the storm dates were drawn from a lottery wheel. From an almanac published by one of the planetary weather prophets the following extracts have been clipped covering the period from October 20 to November 7, 1904:

OCTOBER—"Fourth storm period. This period runs from the 20th to 25th, central on the 22d. The disturbing factors at this time are the Vulcan equinox, the Mercury disturbance, the opposition of Jupiter, with moon on the celestial equator and full. Things to be expected. It is probable that some of the most marked disturbances of the month will occur at this time. Low barometer and rapid change to warmer may be expected in all western sections as early as the 21st. Rain with probable thunderstorms will quickly follow, and during the 22d, 23d and 24th, a series of storms will pass over the country from west to east. Mercury will begin his work of thick cloudiness, mist and sleet northward at this time. Earthquake disturbances will be felt in many parts of the globe not far from the 24th."

"Fifth storm period.—This period is central on October 27th and 28th. Some energetic storms, especially on and about the

lakes and North Atlantic will appear at this time. Rain will turn to sleet and snow northward," etc.

NOVEMBER—"First storm period. This period covers the first six days of the month, having its center on the 3d. In most western extremes the weather will turn quite warm. From about the 3d to the 6th these conditions will develop into cloudiness and rain and pass eastwardly across the country. The culmination of the period will fall on and touching the 5th, about which day rain, with possible thunder, will turn to colder and snow in the north and be followed by rising barometer, high westerly winds and much colder."

Now it is scarcely necessary to refer to the weather maps, covering the period from October 20th to November 8th, to be assured that these almanac forecasts were not verified in Iowa. During that period there has been a steady prevalence of most delightful Indian summer weather over the greater part of the western half of the United States, and most of the time throughout the northern states. The almanac maker did not correctly decipher the wireless messages sent by Jupiter and the other planets. Storms were sweeping over some other portions of the earth, and even over portions of this continent, not only on the specified storm days of the almanac, but also on all the days in October, and all other days in the year. So of course all long-range forecasts may be verified by allowance of a liberal range of time and locality. But—*cui bono*.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 30.06 inches; highest observed, 30.54 inches at Dubuque on the 6th; lowest observed, 29.46 inches at Davenport and Dubuque on the 21st; range for state, 1.08 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 111 stations, was 53.1°, which is 1.0° above normal. By sections the mean temperatures were as follows: Northern section, 51.1°, which is 0.4° above normal; central section, 53.0° which is 1.6° above normal; southern section, 55.2°, which is 0.7° above normal. The highest monthly mean was 58.4° at Belknap; lowest monthly mean, 49.2° at Estherville. The highest temperature reported was 96° at Waukee on the 4th; lowest temperature reported, 16° at Earlham on the 27th. The average monthly maximum was 81.9°; average monthly minimum, 23 2°. Greatest daily range, 51° at Waukee; average of greatest daily range, 36.9°.

PRECIPITATION.—Average precipitation for the state as shown by records of 120 stations, was 1.67 inches, which is 0.73 of an inch below normal. The averages by sections were as follows: Northern section, 2.50 inches, which is .29 inch above normal; central section, 1.60 inches, which is .78 inch below normal; southern section, 0.90 inch, which is 1.73 inches below normal. The largest amount reported was 4 43 inches at Sioux Center; least amount reported, .14 inch at Bonaparte and Corydon. The greatest daily rainfall reported was 3.00 inches at Olin on the 9th. Average number of days on which .01 of an inch or more was reported, 6.

WIND AND WEATHER.—Prevailing direction of the wind, southeast, south, and northwest; highest velocity reported, 52 miles per hour from the northwest at Sioux City on the 21st. Average number of clear days, 15; partly cloudy, 8; cloudy, 8.

OBSERVERS' NOTES.

ALTA.—*David E. Hadden.* October rainfall occurred during the middle decade; last decade was ideal weather; frost on the 6th was only heavy in low places; first general killing frost came on night of 22d.

AMANA.—*C. Schadt.* Weather very favorable for ripening and drying corn, and a considerable part of the crop is harvested; despite apparently unfavorable season nearly all crops have been abundant; fall sown fields look green and healthy; first killing frost October 23d.

ATLANTIC.—*J. W. Love.* A very fine month for farm work; farmers husking corn and report heavy yield of good quality. Ducks made southward flight on 2d and wild geese the 4th.

BAXTER.—*W. L. Thorp.* Corn matured without damage by frost.

BONAPARTE.—*B. R. Vale.* A royal month for farm work and maturing the corn crop; rainfall 0 14 inch—the lowest record in years.

BRITT.—*Geo. P. Hardwick.* First killing frost here on October 6th, with but few mornings of frost temperature; corn husking begun the 25th, though much was unfit to crib.

CHARITON.—*C. C. Burr.* Month favorable for farm operations, and work is well advanced; some corn being cribbed.

CLINTON.—*Luke Roberts.* A very fine month with 20 clear days and no killing frost until 23d; rainfall only 0.59 inch—the least October rainfall in the last 26 years, except in 1897 when it was only 0.37 of an inch.

FOREST CITY.—*J. A. Peters.* Very little corn cribbed; not dry enough; first killing frost here October 6th.

GARDEN GROVE.—*F. L. Williams.* Very favorable month for ripening corn; but little in crib yet; pastures fine as in June; plowing well along.

GRINNELL.—*A. O. Price.* First killing frost October 23d; weather fine; corn dry enough to crib.

GRUNDY CENTER.—*E. S. King.* A remarkable month; best kind of weather for corn and harvesting potatoes; some begun to crib corn on the 19th.

HANLONTOWN.—*Miss G. M. Paschen.* Corn husking begun last week in October. About one third soft, one third sound, and balance rotten.

HUMBOLDT.—*H. S. Wells.* Corn all right and turning out good; pastures still good.

IDA GROVE.—*J. E. Conn.* An exceptionally warm and dry October; corn husking begun on the 20th.

INWOOD.—*G. M. Larsen.* A fine month. Good yield and quality of corn; considerable clover threshing.

LARRABEE—*H B. Strever.* Frost killed corn on 6th, but flowers were in bloom till 23d.

LEON—*M. F. Stookey.* Freezing temperature forming ice on night of 21st–22d. Not much frost on account of wind.

LOGAN—*Mrs. M. B. Stern.* A remarkable month for mildness; killing frost came later than usual.

OLIN—*Nathan Potter.* An ideal month for fall work; corn-picking began with better crops than usual.

RIDGEWAY—*Arthur Betts.* Coolest October since 1898; 212 hours sunshine; first killing frost on 6th; very heavy thunder on 10th, struck in several places.

SHELDON—*A. W. Beach.* First killing frost on 6th; corn all safe; husking generally begun on 24th.

STOCKPORT—*C. L. Beswick.* Least rainfall for any month since these records begun, over three years ago.

WAUKEE—*E. J. Leonard.* Fine month for maturing corn; no frost sufficient to kill tomato vines till 23d, and frost every night after that except one.

WHITTEN—*Frank P. Butler.* Morning of 23d ice formed; it was the first killing frost; the one the 6th was light.

ZEARING—*H. E. Burkhart.* Frost of the 6th did no damage; corn being cribbed last of month, and yield reported to average 50 bushels per acre.

BELATED REPORTS.

SIGOURNEY—*August*. Mean temperature 70.8°; highest 95° on the 13th; lowest 46° on the 8th; greatest daily range 36°; total precipitation 3 62 inches; greatest in 24 hours 1.47 inches; prevailing direction, northwest. Number of clear days 18, partly cloudy 9, cloudy 4, rainy 8.

SIGOURNEY—*September*. Mean temperature 65.6°; highest 94° on the 10th; lowest 36° on the 15th; greatest daily range 33°; total percipitation 2.99 inches; greatest in 24 hours .69 inch; prevailing direction, southwest. Number of clear days 5, partly cloudy 17, cloudy 8, rainy 10.

ROCKWELL CITY—*September*. Mean temperature 62.2°; highest 90° on the 28th; lowest 38° on the 14th, 15th, 19th; greatest daily range 42°; total precipitation 1.75 inches; greatest in 24 hours .55 inch. Number of clear days 14, partly cloudy 10, cloudy 6, rainy 4.

WAPELLO—*September*. Mean temperature 67.6° highest 89° on the 17th; lowest 40° on the 15th; greatest daily range 31°; total precipitation 4.24 inches; greatest in 24 hours 1 51 inches; prevailing direction, southeast. Number of clear days 16, partly cloudy 11, cloudy 3, rainy 6.

AFTON—*September*. Mean temperature 65.2°; highest 86° on the 1st, 10th, 28th; lowest 35° on the 15th; greatest daily range 34°; total precipitation 2.80 inches; greatest in 24 hours 1.08 inches; prevailing direction, southwest. Number of clear days 15, partly cloudy 9, cloudy 6, rainy 7.

MAQUOKETA—*September*. Mean temperature 62.0; highest 90° on the 10th; lowest 30 on the 15th; greatest daily range 44°; total precipitation 3 99 inches; greatest in 24 hours 1 52 inches; prevailing direction, northwest. Number of clear days 11, partly cloudy 5, cloudy 14, rainy.

ERRATA IN SEPTEMBER REVIEW.

CHARITON.—Maximum temperature recorded on the 28th, page 7, should have been 10th and 28th.

CRESCO—Mean temperature recorded 60.4° on page 7, should have been 60.8°.

CLARINDA.—Maximum temperature recorded on the 29th, page 7, should have been the 28th.

ESTHERVILLE.—Maximum temperature recorded on the 18th, page 7, should have been the 17th.

SIOUX CENTER.—Mean temperature recorded 61.2° on page 7, should have been 61.0°. Mean Maximum temperature recorded 74.5° on page 10, should have been 74.1°

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve
Algona	Dr. F. T. Seeley
Allerton	Rex Shriver
Alta	D. E. Hadden
Alta (near)	W. J. Minard
Amana	Conrad Schadt
Ames	Exp. Station
Atlantic	J. W. Love
Audubon	Geo. E. Kellogg
Baxter	W. T. Thorp
Bedford	E. E. Healy
Belknap	A. W. Rankin
Belle Plaine	S. P. Vandike
Bonaparte	Hon. B. R. Vale
Boone	Carl Fritz Henning
Britt	G. P. Hardwick
Buckingham (Traer P. O.)	Dr. W. A. Daniel
Burlington	I. S Shontz
Carroll	Moses Simon
Cedar Rapids	Electric Light and Power Co.
Chariton	C. C. Burr
Charles City	*Clarence J. Root
Clarinda	A. S. Van Sandt
Clear Lake	E. C. Schrader
Clinton	Luke Roberts
College Springs	A. M. Finley
Columbus Junction	J. B. Johnston
Corning	Jerome Smith
Corydon	Miss May Miller
Cresco	L. G. Krumm
Cumberland	Agent C., B. & Q. R'y
Davenport	*J. M. Sherier
Delaware	Wm. Ball
Decorah	F. H. Baker
Denison	Prof. W. C. Van Ness
Des Moines	*Geo. M. Chappel
De Soto	R. D. Minard
Dows	A. C. Fuller
Dubuque	*Orin Parker
Earlham, R. F. D.	Geo. Phillips
Elkader	Chas. Reinecke
Estherville	Earle W. Peterson
Fayette	R. Z. Latimer
Florence (Clarion P. O.)	H. Du Bois
Forest City	J. A. Peters
Fort Dodge	Tobin College
Ft. Madison	Miss L. A. McCready
Galva	C. E. B. Roberts
Gilman	Jas. L. Wylie
Glenwood	J. P. Jackson

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. NOVEMBER, 1904. No. 11.

IOWA CROPS—FINAL REPORT, 1904.

TOTAL YIELD FOR THE STATE—VALUE OF SOIL PRODUCTS AT FARM PRICES DECEMBER 1ST.

Despite somewhat adverse conditions at the outset, and belated growth of the cereal crops, the final report for the season of 1904 makes a satisfactory exhibit of the agricultural resources of the state. The warmth and dryness of the autumn made partial amends for low temperature and slow progress during the summer.

CORN.—The area planted this season was 9,052,450 acres. The loss of acreage from various causes was relatively small compared with recent seasons, and it is probable that practically about nine million acres were harvested. The average yield for the state appears to have been about 36 bushels per acre. The total yield is 323,853,330 bushels, which is 93,342,000 above the yield last year and the largest crop produced since 1900. During the past fifteen years there have been two larger crops; viz.: 345,000,000 bushels in 1900, and 335,000,000 bushels in 1901. This year's output is 62,000,000 bushels above the fifteen year average.

The average price per bushel, at the farms December 1st, was about thirty-five cents; total value of the crops, $113,348,665.

WHEAT.—This crop was badly damaged by rust and blight. The area of winter wheat was about 71,030 acres, and the average yield 14.3 bushels per acre; total yield, 1,017,000 bushels. The acreage of spring wheat was 775,040 acres; yield 9.1 bushels per acre; total output for the state, 7,080,430 bushels. Farm prices, winter wheat 92 cents; spring wheat, 86 cents. Total value of wheat crop, $7,024,809.

OATS.—Area seeded, 4,018,980 acres; yield per acre 29.4 bushels; total bushels, 118,435,570. The farm value, 26 cents; total value December 1, $30,793,284.

RYE.—Area seeded, 99,590 acres; yield per acre, 15 bushels; total yield, 1,517,090 bushels. Value, at 54 cents per bushel, $819,228.

BARLEY.—Area seeded, 493,370 acres; yield per acre, 25 bushels; total yield, 12,317,710 bushels. Value, at 34 cents per bushel, $4,188,021.

FLAX. Area, 51,370 acres; yield, 11 bushels per acre; total yield, 591,140 bushels. Value, at $1.15 per bushel, $679,811.

POTATOES.—Yield per acre, 125 bushels; total output, 14,255,680 bushels. Value, at 28 cents per bushel, $3,991,590.

HAY (TAME).—Area harvested, 2,797,640 acres; total yield, 4,499,090 tons. Value, at $5.62 per ton, $25,284,885.

HAY (WILD).—Total amount cut, 1,091,590 tons. Value, at $4.50 per ton, $4,912,155.

PASTURAGE AND GRAZING.—The value of pasturage and grazing, harvested by live stock, in pastures and in grain fields, cornfields and meadows after harvest, is placed at $90,000,000, or about $400 per farm of 160 acres. This is believed to be a very low estimate, for reasons set forth in a separate article.

TABULATED CROP SUMMARY.

CROPS.	Total Products.	Farm value December 1st.
Corn	323,853,330 bushels	$113,348,665
Wheat	8,097,430 bushels	7,023,809
Oats	118,435,570 bushels	30,793,284
Rye	1,517,090 bushels	819,228
Barley	12,317,710 bushels	4,188,021
Flax	591,140 bushels	679,811
Potatoes	14,255,680 bushels	3,991,590
Hay (tame)	4,499,090 tons	25,284,885
Hay (wild)	1,091,590 tons	4,912,155
Pasturage and grazing (cornfields, etc.)		90,000,000
Buckwheat (estimated)		250,000
Sweet potatoes		850,000
Sorghum and broom corn		260,000
Timothy seed		950,000
Clover and millet seed		175,000
Flax seed		679,810
Fruits and garden truck		7,500,000
Total soil products		$291,207,258

In this estimate no account is made of the profits derived from the consumption of the staple crops in the dairy and live stock industry.

The average farm value of milch cows is $28, and of horses, $92 per head.

NOVEMBER WEATHER AND CROPS.

The month was unusually warm and the driest November on record for the state. The mean temperature, as shown by records of 110 stations, was 41.0 degrees, which is 6.3 degrees above normal. The average in 1902 was .2 of a degree higher and 2.9 degrees higher in 1899. The average precipitation for the state at 119 stations was .15 of an inch, which is 1.25 inches below normal. Nine stations reported no rain in measurable amount. Practically all the precipitation fell on the 9th and 10th, and the average number of clear days was twenty. The conditions were ideal for husking corn and drying out the surplus moisture. At the close of the month the bulk of the crop was harvested. Conditions were also favorable for fall plowing and general farm work of the late autumn period. The pasturage was better than usual, though the fields were brown. Winter wheat and rye suffered some damage for want of moisture.

FINAL CROP REPORT, 1904.

TOTAL YIELD AND AVERAGE PER ACRE—BY COUNTIES.

VALUE OF PASTURAGE AND GRAZING.

In net value the grass crop is easily foremost among the soil products of this state. Conservative figures show that the hay crop, both cultivated and wild, was worth on December 1st, $30,197,040, at the low prices current at the farms on that date. But pasturage and grazing can not be measured by the ton or bushel, and the value must be estimated by taking into account the value of the farm animals and the output of the dairy industry. Here is one statement of the problem to be solved: If the grass crop when made into hay is worth $30,000,000, cut from less than 4,000,000 acres, what is the relative value of over 8,000,000 acres in pastures harvested by stock seven months in the year, plus the immense amount of grazing obtained from about 16,000,000 acres of grain fields, corn fields, meadows, etc., after harvest and through a portion of the winter season? It is not an exaggerated statement to say that pasturage and grazing count three fold the value of the hay crop in the production of live stock and in the dairy. According to the United States census the value of live stock and dairy products disposed of in Iowa in 1899 was approximately $150,000,000. Unquestionably two thirds of that amount must be credited to pasturage and grazing. That would signify a total value of about $100,000,000, or a little over $430 per farm.

MRS. MILLICENT B. STERN.

This office has been saddened by receipt of a note announcing the death of Mrs. Millicent B. Stern, who passed away at her home in Logan, November 12, 1904, in the 84th year of her age. She was the wife of Jacob T. Stern, who served as volunteer weather observer from 1860 till his decease in 1892. For the period of about twelve years the station has been kept with rare fidelity by Mrs. Stern, whose record bore evidence of the possession of a bright intellect until the final summons came. The records of the Logan station are of inestimable value to the people of that place and the state at large.

THE MUSKRAT AS A LONG-RANGE WEATHER PROPHET.

A valued correspondent inclosed the following clipping from a Minnesota paper, requesting the opinion of the editor of this publication as to the reliability of the muskrat as a true prophet of the character of the coming winter. The writer said: "I know from personal experience that the muskrat builds larger houses some years than others, but I had attributed it to the abundance or lack of material."

Following is the clipping referred to:

BEMIDJI, Minn., Dec. 2.—The muskrat as a weather prophet never misses. The little animals have about completed their winter building now and their houses are flimsy affairs, a sure sign of an open winter. The Indians and old settlers have more confidence in the little furry creatures than in human weather prognosticators. They say muskrats can tell months ahead what the weather will be and in Northern Minnesota they have shown their foresight by building thin walls to their winter homes.

REPLY.

DEAR SIR,—I am in receipt of your letter of the 3d inst., and the clipping relative to the muskrat as a long-range weather prophet. Responding to your request, I venture the opinion that the muskrat is quite like his biped brother of the human species—he works under stress of necessity. If his house is thinner than usual just now, it is due to the fact that October and November were phenomenally mild; the muskrat was out enjoying the sunshine. Possibly he had heard some of the talk that the climate is changing and the winters are growing milder since the old pioneer days. He concluded that the good time had come—sure, and what's the use building thick houses any more? From this point of view we may regard thin muskrat houses as signs of mild autumns, and not as sure indications that the coming winters will be of the same sort. When zero pinches the musky rodent may wish he had thatched up betimes in better shape. Really, now, I don't believe the animal, however strong his instinct may be, knows any more about the coming winter than the almanac-maker, or other long-range weather fakir.

Very respectfully,
J. R. SAGE.

WEATHER BUREAU STATION AT CHARLES CITY, IOWA.

A new Weather Bureau station was opened at Charles City, Floyd county, Iowa, on November 1, 1904. The longitude of Charles City is 92° 38′ W., latitude 43° 04′ N. and elevation 1015 feet above mean sea level. The city is situated in the valley of the Cedar River, and is partially surrounded by hills ranging in height from 50 to 68 feet above street level. The station is located one block from the river. It is furnished with a full instrumental equipment, the wind instruments and electrical sunshine recorder being mounted on a 50 foot steel tower, in the base of which the thermometer shelter is suspended. The rain gauges have a ground exposure in the yard. Two observations will be taken daily and the usual records kept.

CLARENCE J. ROOT,
Assistant Observer, Weather Bureau.

CONCERNING WEATHER FORECASTS.

Benjamin Franklin was a pioneer in meteorology, as well as in the correlated science of electricity. His kite experiment, demonstrating the identity of lightning with artificial electric sparks, gave him world-wide fame; but no less important from a scientific point of view, and of greater practical value, was his discovery of the rotary circulation of winds in the general storms of the Atlantic coast, and a progressive movement in a northeasterly direction. By inquiries addressed to numerous correspondents and travelers in the colonies he reached the conclusion that the northeast storms of that region began at extreme southwest points about a day earlier than at Boston. From a careful study of the mass of facts thus laboriously collected he formulated his tentative philosophy of storms.

Franklin's contemporaries, and the people generally, were not deeply impressed by this new theory. There was nothing spectacular about it, appealing to the popular imagination like his famous kite-flying experiment performed amid thunder and lightning. He was a century in advance of his age. And the bulk of the people were biased by the teachings of the oldtime astrologers that the moon is the dominant force, with the planets as adjuncts, in the production of storms and weather changes. But Franklin was unique among the philosophers of the eighteenth century. Though a great reader of books and current literature, in scientific studies he consulted chiefly the book of nature. His methods were characterized by simplicity and directness. He was richly endowed with the genius of common-sense. He gave little heed to the occult doctrines and mysticisms of ancient philosophy. To him the vaporings of the oldtime astrologers were of less value than the soughing of the east wind, which was a portent of a coming storm from the westward.

In the field of meteorology Franklin was essentially an explorer, setting up landmarks for guidance of future investigators. Following his line of research, in the first half of the nineteenth century a number of able scientists brought some measure of order out of chaos, and were able to discern regular lawful sequence in the apparently erratic sweep of wind currents and storm-eddies. With the rapid advance of settlements to the westward, and construction of railways and telegraph lines, conditions were made favorable for collecting and making a scientific analysis of climatic data. This was done by scores of observers and scientists under the auspices of the Franklin Institute of Philadelphia, and the Smithsonian Institution, aided in some measure by the government. Upon the foundation thus prepared the structure of the National Weather Bureau was begun in 1870. From a small beginning, with an initial expenditure of $20,000, this branch of the public service has been enlarged in its scope until it has become of vital importance to all interests and all classes of people. The annual appropriation for its support is about a million and two hundred thousand dollars, and this great Bureau has won the admiration of the civilized world. Its field of observation now embraces the continent from the Arctic circle to the northern coast of South America. And today marine interests, inland commerce and agriculture share about equally the benefits of the service.

It is a Bureau of applied science, with ample provision for original research. It is both progressive and conservative—proving all things and holding fast that which is good. It has been founded upon well-attested scientific principles. All the discoveries and generalizations in meteorology made by the most eminent scientists of America and Europe have been utilized and reduced to practical form in the work of the forecast division. Inventive skill has been called into requisition to construct instruments for recording automatically the most minute changes in atmospheric pressure, temperature, humidity, precipitation, wind velocity and direction, sunshine, etc. These complex and almost infallible instruments have been installed at about 200 regular stations within the territory covered by this service, in charge of thoroughly trained observers who have become experts in this line. Simultaneous observations are collected by telegraph twice daily, and oftener when needed; and by this means the forecast officials are enabled to note the actual weather conditions in all parts of the continent. On prepared maps lines are drawn showing areas of low and high pressure, noting differences of temperature and direction of wind at the various stations. Storm centers are thus located, and the graphic pictures show the area of disturbance, energy and direction of movement. Upon this basis of actual conditions, thus graphically presented to the eye of the official in charge the forecast is made as to the weather changes that are likely to occur in the different parts of the country within the coming twenty-four, thirty-six or forty-eight hours.

In the methods of forcasting there is nothing even remotely akin to occult science or the practice of astrology. No storm forecast is issued until a storm actually appears, or is in the initial stage of development. When the weather map reveals the outlines of a storm at the far west or northwest the problem to be solved by the forecaster relates to its probable future course, its velocity of translation, its increase or decrease in extent and force, and the disturbance of elements likely to be caused during its progress across the continent. This is something of a complex problem, requiring in its solution a very thorough study and the application of well established principles of meteorological science. Due consideration must be given to the results of experience and observation of weather processes in previous storms, but that does not insure perfect accuracy of the forecast. There are different types of storms, and those belonging to a certain type of form and combination of lows and highs on the map frequently display very eccentric behavior in their transcontinental movement. Nature's great law of diversity holds true in the weather to a remarkable degree. No exact duplicate of any general storm has been issued. And this extreme variability of movement, under quite similar conditions at the outset, has prevented an overproduction of perfectly successful weather forecasters. It is indeed marvelous that in this country, with its widely variant storm-types, they have achieved from 80 to 90 per cent of accuracy in their work.

Well now, having made so good a record at short range, why not extend the period a full week or month? This is a question often propounded. The answer of experience is that those who venture further usually fare worse. Just beyond what is shown on the daily weather chart is an illimitable realm of uncertainty, wherein those who enter must walk by faith not by sight. Forecasters take large risks if they attempt to hit storm centers offhand, or by random shots; to hit even at short range they must take very deliberate aim with the weather map as a rest.

Unquestionably there is a general desire for an extension of the range of forecasts, to cover the near future, and if possible the coming season. If some explorer in meteorology and astronomy should discover a fundamental law, whereby he could accurately calculate the time of arrival, the force and pathway of all storms for weeks and months in advance, and could warn the people of future floods or drouths in defined localities, he would at once take rank as the greatest scientist in the world. And then if he would reveal the secret of his discovery for the benefit of future generations, he would be honored as the greatest of philanthropists as well as the wisest of mankind. But alas, up-to-date this great man has not arrived, and as yet we have not even a postal card notification of the date of his coming.

In ancient times astrologers worked a profitable "graft" to satisfy the public demand for knowledge of the future, representing that all human events, and even weather changes, were due to the influence of the moon and planetary bodies, and that they alone knew how to read the celestial cipher. Isaiah, the great Hebrew prophet, referred to that guild in rather uncomplimentary terms, as "Stargazers, astrologers, and monthly prognosticators." Since the middle ages this practice has fallen into disrepute, but we have some "modern instances" indicating a survival of the superstitious beliefs which formed the basis of old-time astrology. Our modern stargazers and monthly prognosticators refer in mysterious phrase to the moon, Mercury, Venus, Saturn and even the hypothetical Vulcan, as the powers of the air which brings storms and all weather changes and earthquakes. These men peddle their long-range forecasts in almanacs and other publications, profiting by practice on human credulity and ignorance of natural laws. Their alleged predictions are usually very indefinite as to the exact date of arrival of storms, and their line of travel when they arrive; and by skillful ambiguity of language they may claim a verification if a storm crosses the continent anywhere between Hudson's Bay and the Gulf of Mexico, at any time within an alleged storm period of three to five days.

Some of the ablest scientists of this country and Europe have devoted much time and labor to the study of this problem. They have consulted weather records of all countries, taking note of the dates of heavy storms, making comparison with the position of the moon and planets, to determine if there in any discoverable connection between the movement of those minor bodies and the sweep of storm-eddies in earth's atmosphere. The consensus of opinion has been that there is no foundation of fact or philosophy for that system of long-range forecasts. So thus far there has been an entire failure to establish a scientific and practical basis for any kind of trustworthy predictions as to the occurrence of storms, floods or drouths in specified localities and at certain dates in future months or seasons. Though such foreknowledge is very desirable, yet at the pre-

sent stage of human progress it is beyond possibility of realization. In this field of scientific research the wisest students have been most deeply sensible of the limitations of human knowledge; but charlatans and pretenders claim to hold a key to mysteries in earth and the heavens that are hidden to the balance of mankind. Quackery in meteorology as well as in medicine is indicated by the extravagant pretensions of its practictioners.

Modern astrologers, following closely the lines of their ancient prototypes, give the sun a minor or passive role, while the moon and planets form an all-star aggregation in the ever-shifting scenes of earth's drama. To each planet is assigned some specialty act on the stage, each producing a different type of weather; and when two or three act in conjunction the complex results are startling. In the program as presented by a long-range almanac the leading role in developing regular storm periods is given to "Vulcan", though that hypothetical planet modestly keeps out of sight. The almanac says: "The Vulcan period is the foundation and frame work around which all storm disturbances grow."

According to this almanac the planet Mercury is in control of the sprinkling apparatus, causing mist and drizzles in summer, and damaging sleet in winter. Just how Mercury produces such an effect on the earth is one of the curious things in occult science. The almanac says: "Mercury moves and operates at such distance from the sun as to admit of much vapor and humidity. At the same time its nearness to the sun causes perpetual evaporation and steam and vapor in its atmosphere and skies, and this is in some as yet indefinable way communicated to our own and other planets in our system. * * * This peculiar infection infused into the sun by the Mercury perturbation, we hold, may reasonably take on such forms as to be thrown out by the solar energy, being reconverted into something like its original elements in our own globe and atmosphere. Hence our thick prolonged cloudiness, our mist and drizzling rains and sleet storms during the Mercury disturbances.

This abstruse statement translated into plain English signifies that the planet Mercury when it gets into a "disturbance," throws water into the face of the sun, and that body retaliates by turning his hose on the whole planetary family! That relieves great Jupiter Pluvius from some measure of blame for excessive humidity.

Another extract from the almanac will throw more light on this problem. It says: "The disturbances of each and all the planets are communicated to all the rest of the planets, not directly, but through the perturbations caused by the planetary equinoxes to the sun. * * * When the plane of each planet's equator cuts the sun, this force is violently antagonized, the center of energy is put out of balance in the great solar orb, and perturbing waves react upon all bodies in our system, resulting in the phenomena which we witness in our earth and skies and which we denominate as meteorological."

There we have the gist of the system,—straight! The planents are dynamos revolving swiftly in space, each projecting from its equator tremendous electric force. When that equinoctial stream of planetary thunder and lightning strikes the sun squarely in the face it makes old Sol hot, and of course he strikes back! Who wouldn't? It's no very pleasant thing to be cut in the face by that sort of electric buzzsaw! This theory accounts not only for terrestrial storms and extreme heat, but also for the great spots that appear occasionally on the sun's face. The noxious planetary equinoxes cause all that disfigurement. Science is a great thing when it aids us in solving such problems as that! In reading over this almanac's dramatic story of how the planets are continually "perturbing" the sun, and how the sun hurls it back at all creation, one is reminded of a lot of boys poking sticks into a mammoth hornet's nest, and the stinging "reactionary disturbance" issuing from that previously passive body!

Really, it is difficult to treat such ludicrous matter with becoming dignity and seriousness. The chapter of the almanac descriptive of "Each planet's peculiar phenomena" is absolutely irresistible as a mirth-provoker to any reader who possesses a sense of the ridiculous and some elementary knowledge of meteorology and astronomy. One is impressed by the evident earnestness of the author, and yet it seems that he must be too intelligent to believe in his absurdly fantastic theories. They are no more believable than the myths and legends of the ancients. It is inconceivable that a learned astronomer and meteorologist actually believes that the sun is passive except when it is "perturbed" by some planet's equinox; that mists and vapors are injected and infused into the sun by Mercury's perturbation, and then thrown out by solar energy to form mists and sleet on earth; and that during the so-called "Jupiter period" the carrying capacity of earth's atmosphere becomes disordered and weakened, so that it cannot transport and diffuse humidity, thereby causing consuming drouths in places and destructive cloudbursts in other localities. One who actually believes that kind of absurdity is beyond the reach of influence by evidence and argument. The bare statement of such propositions is a sufficient refutation.

Students in the primary class in meteorology learn that the ever-changing phenomena of the weather are all referable to the action of the sun upon the earth and its atmosphere, vapors and gases; that the constantly radiated energy of the sun supports heat, light and electric force in the solar system. The planets possess no form of independent energy whereby they may "perturb" the sun and increase its potency. Gravitation is only a name given to the statical relation of all matter in the universe, and it is a physical constant. There is absolutely no proof of any "perturbation" or increase in storm energy when the sun crosses the equator of the earth or any other planet. That is merely a hypothesis, supported by a priori assumptions and occasional coincidences. People often confound coincidence with consequence.

Planetary weather forecasts are too-far fetched to be practicable. The prophets in that line work at the wrong end of the problem. When there is more than the usual degree of heat or storminess, they peer into the nebular spaces to see what caused the disturbance on earth, and then allege that it was done by Jupiter, or was the malign work of Saturn, which in their philosophy causes epidemics and pestilential contagious diseases. Possibly also they may in time discover that it is due to Saturnian potency that we have rings and combines in human affairs; why not?

True science, in the last analysis, is plain common sense applied to the study of nature's problems. In erecting philosophical structures the foundation should rest on the earth. Begin with facts as the solid basis of theories. Reason from the known to discover the unknown. In forecasting a storm, observe the good old recipe of the cook book for cooking a hare—first catch your storm, and then predict its future course and time schedule. A storm in hand (i. e., on the map), is worth two in some nebular hypothesis! It's mighty easy forecasting storms if one is allowed a broad range as to the exact locality and a long range as to the date. Storms are coming and going all the time, somewhere; on all dates as well as the specified days of the almanac's storm period.

It is probably true that cyclones or storm eddies, are as much in evidence one day as another, considering the earth as a whole. So one may safely predict storms for every day in the year with the certainty that they will rage somewhere. It would keep the moon and planets mighty busy with their equinoxes to maintain the continual stream of atmospheric eddies flowing over the face of the earth. But really the moon and planets are not charged with that duty. In respect to light, heat and power of gravitation these bodies are infinitesimal as compared with the sun, which is the prime cause of weather phenomena on earth.

J. R. SAGE.

CLIMATOLOGY OF THE MONTH OF NOVEMBER, 1904.

BAROMETER.—Mean pressure, 30.10 inches; highest observed. 30.56 inches, at Sioux City, on the 11th; lowest observed, 29.49, inches, at Davenport, on the 28th; range for state, 1.07 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 110 stations, was 41.0°, which is 6.3° above normal. By sections the mean temperatures were as follows: Northern section, 39 3°, which is 7.0° above normal; Central section, 40.7°, which is 6.1° above normal; Southern section, 43.1°, which is 5.4° above normal. The highest monthly mean was 45.8°, at St. Charles; lowest monthly mean, 37.4° at Maquoketa. The highest temperature reported was 80°, at Ruthven and Waukee, on the 18th; lowest temperature reported, 4°, at Britt, on the 30th. The average monthly maximum was 71.1°; average monthly minimum, 9.6°. Greatest daily range, 56°, at Rock Rapids, average of greatest daily ranges, 37.8°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 119 stations, was 0.15 of an inch, which is 1.25 inches below normal. The averages by sections were as follows: Northern section, 0.17 of an inch, which is 1.19 inches below normal; Central section, 0.15 of an inch, which is 1.28 inches below normal; Southern section, 0.14 of an inch, which is 1.30 inches below normal. The largest amount reported was 0.50 of an inch, at Bonaparte and Glenwood; least amount reported, none, at Rockwell City. The greatest daily rainfall reported, was 0.50 of an inch, at Bonaparte and Glenwood, on the 9th and 10th respectively. Average number of days on which .01 of an inch or more was reported, 1.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 43 miles per hour, from the northwest, at Sioux City, on the 29th. Average number of clear days, 20; parly cloudy, 6; cloudy, 4.

OBSERVERS' NOTES.

ALLERTON.—*Rex Shriver.* Weather during the month has been unusually fine.

ALTA.—*David E. Hadden.* An ideal November. One of the finest on record here. The daily mean temperature of the month was 8° above the average of the preceding 14 years. There was only one storm of rain and snow during the month and the greatest number of clear days and the least number of cloudy days on record.

AMANA.—*Conrad Schadt.* Indian summer weather prevailed throughout the month. The nights were cool and often foggy and the days mild and hazy. The ground seems to be as dry as ever at this time of the year. The roads are as dry, hard and even as paved streets.

ATLANTIC.—*J. W. Love.* This has been the finest November of which I have any record. Pasturage good for this season of the year. Roads never were in better condition. Dandelions in bloom on the 29th.

AUDUBON.—*Geo. E. Kellogg.* First snow of season on the 10th.

BONAPARTE.—*Hon. B. R. Vale.* A pleasant and profitable month. Only .64 inch of rain since September 27th.

BRITT.—*Geo. P. Hardwick.* An ideal month. But one cloudy day.

CHARITON.—*C. C. Burr.* November was a month of sunshine; no storms. Farm work is well advanced. Water for stock is getting to be an object, surface water being exhausted; but a trace of rain during the entire month.

CLINTON.—*Luke Roberts.* The month was almost rainless and cloudless.

FOREST CITY.—*J. A. Peters.* The most delightful November for years—no snow. Most of corn cribbed and fall work on farm well finished.

GRUNDY CENTER.—*E. S. King.* A very remarkable month for lack of storms.

IOWA FALLS.—*J. B. Parmelee.* A twelve-year record does not show such fine weather for November.

LARRABEE.—*H. B. Strever.* November has been very mild and clear, enabling farmers to carry forward fall work at a good pace.

MOUNT VERNON.—*Rev. Jos. W. Hubbard.* Remarkable for clear skies, moderate temperature and small amount of rainfall.

OSKALOOSA.—*Jas. Boyd.* November was a very dry and pleasant month. The least precipitation I have recorded for the past 14 years.

RIDGEWAY.—*Arthur Betts.* Wild geese going south on 17th. There were 13 days without a cloud and 15 days of uninterrupted sunshine. Drouth conditions prevailed.

ROCK RAPIDS.—*W. C. Wyckoff.* Finest fall in 23 years.

SHELDON.—*A. W. Beach.* First snow on 9th. Ground not frozen to prevent plowing.

WASHTA.—*H. L. Felter.* Unusually fine weather all during the month. All clear days but one. Could plow up to the 30th.

WAUKEE.—*E. J. Leonard.* Weather remarkably fine all the month. One light rain and no snow. Only 3 cloudy days and 2 partly cloudy since October 21st, or 36 clear days out of 41.

WAVERLY.—*H. S. Hoover.* No snow until the 29th; then only a trace.

BELATED REPORTS.

NORTHWOOD—September—Total precipitation 1.40 inches; greatest in 24 hours .50 inch on the 1st; prevailing direction, northwest; number of clear days 10, partly cloudy 9, cloudy 12, rainy 5.

CLEAR LAKE—October—Mean temperature 51.6°; highest 76° on the 16th; lowest 26° on the 25th and 27th; greatest daily range 25°; total precipitation 2.65 inches; greatest in 24 hours 1.25 inches; prevailing direction southeast; number of clear days 8, partly cloudy 17, cloudy 6, rainy 4.

NORTHWOOD—October—Total precipitation 2.30 inches; greatest in 24 hours .80 inch; number of rainy days 4.

SPIRIT LAKE—October—Mean temperature 50.4°; highest 78° on the 16th; lowest 22° on the 24th; greatest daily range 40°; total precipitation 2.38 inches; greatest in 24 hours .97 inch; prevailing direction, south; number of clear days 10, partly cloudy 7, cloudy 14, rainy 4.

WHAT CHEER—October—Mean temperature 55.2°; highest 86° on the 4th; lowest 24° on the 29th; greatest daily range 49°; total precipitation .37 inch; greatest in 24 hours .22 inch; number of rainy days 2.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—O. A. OLSON, Forest City.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XV. DECEMBER, 1904. No. 12.

DECEMBER WEATHER AND CROPS.

December was nearly normal as to temperature and precipitation. The mean temperature for the state was half a degree above normal, and the precipitation 0.15 of an inch above the average. The first decade was dry and fair, with ideal conditions for finishing corn husking, and the usual farm operations of the early winter period. For about half the month the ground was well covered with snow, which afforded protection to winter grain and the grasses during the coldest weather. The bulk of the precipitation came in form of snow and sleet, and fell mostly on the 11th, 16th, 26th and 27th. But one severe storm visited the state, and that was the blizzard that swept over all sections from the 26th to the 28th. It was unusually severe, causing blockades of railways in many localities. Farm animals, not well sheltered, suffered severely, and newspaper reports indicate some loss of valuable stock As a whole December was a fairly good and pleasant winter month.

EDITORIAL NOTES.

In the production of a ton of apples the soil loses less than thirty cents' worth of nitrogen, potash and phosphoric acid. The bulk of the crop is the product of sunshine, air and water.

A ton of butter, worth about $500, robs the soil of less than one dollar's worth of crop growing material while a ton of wheat takes away $7 50 worth of fertility.

In the final crop report of the Illinois Board of Agriculture, that state is credited with 7,825,000 acres of corn. The average yield was 36 bushels per acre The total yield for that state was 281,700,000 bushels. The government statistician credited Illinois with 9,428,000 acres, and a total yield of over 344,000,000 bushels The state report of acerage planted was based on the returns of assessors, and is more likely to be correct than estimates of crop reporters on the basis of the census of 1899.

Again the astronomers note the appearance of a comet sweeping into the domain of old Sol's planetary system. And now if there should be anything unusual in the line of weather on our planet, the "star gazers and monthly prognosticators" may attribute it to the perturbing influence of this new celestial nomad. Who knows but it had a hand in getting up that blizzard which came with the expiring gasps of the old year?

In the annual report of the U. S. Department of Agriculture for 1904, Secretary Wilson makes a summary of the value of agricultural products as follows:

"After a laborious and careful estimate of the value of the products of the farm during 1904, made within the census scope, it is safe to place this amount at $4,900,000,000, after excluding the value of farm crops fed to live stock in order to avoid duplication of values. A similar estimate made for 1903 gives $4,480,000,000, and the census total for 1899 is $3,742,000,000. It is by no means to be admitted that these figures represent fully the value of the wealth produced on farms. Within the limits of ascertainable values, the farms of 1904 produced an aggregate wealth with a farm valuation that was 9.65 per cent above the product of 1903, and 31.28 per cent above the figures for the census year 1899. An occupation that has produced such an unthinkable value as one aggregating nearly $5,000,000,000 within a year may be better measured by some comparisons. All of the gold mines of the entire world have not produced since Columbus discovered America a greater value of gold than the farmers of this country have produced in wealth in two years; this year's product is over six times the amount of the capital stock of all national banks; it comes within three-fourths of a billion dollars of equaling the value of the manufactures of 1900, less the cost of materials used; it is twice the sum of our exports and imports for a year; it is three times the gross earnings from the operations of the railways; it is four times the value of all minerals produced in this country."

Mr. Carl Fritz Henning, volunary observer at Boone, Iowa, who is a recognized local authority on birds, contributed an interesting article to the *Boone Republican* relative to the wholesale destruction of English sparrows during the blizzard, December 27th and 28th. He attributed this unusual fatality among these hardy "tramps of our streets" to the fact that the blizzard was preceded by heavy mist and sleet, which covered the ground and trees with thick ice, rendering it impossible to obtain their usual supply of food.

CLIMATOLOGY OF THE MONTH OF DECEMBER, 1904.

BAROMETER.—Mean pressure, 30 07 inches; highest observed 30.52 inches, at Dubuque and Sioux City, on the 3d; lowest observed, 29 09 inches, at Dubuque on the 27th; range for state, 1.43 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 114 stations, was 23 4 degrees, which is 0.5° above normal. By sections the mean temperatures were as follows: Northern section 20.6° which is 0.5° above normal; central section 23.5°, which is 0.3° above normal; southern section 26.1° which is 0 4° above normal. The highest monthly mean was 29.9° at Keokuk; lowest monthly mean, 18.2°

at Forest City. The highest temperature reported was 67°, at Albia on the 22d; lowest temperature reported 19°, at Elkader on the 14th, The average monthly maximum was 55 5°; average monthly minimum, -8.8°. Greatest daily range, 57° at Maquoketa; average of greatest daily ranges 36.8.

PRECIPITATION.—Average precipitation for the state, as shown by records of 119 stations, as 1 44 inches, which is 0 15 of an inch above normal. The averages by sections were as follows: Northern section, 1.19 inches, which is 0.16 inch below normal; central section, 1.66 inches, which is 0.32 above normal; southern section, 1.48 inches, which is 0.32 inches above normal. The largest amount reported was 3.68 inches at Newton; least amount reported, .06 inch at Storm Lake. The greatest daily rainfall reported was 2 53 inches at Newton on the 27th. Average number of days on which .01 of an inch or more was reported, 5.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 57 miles per hour, from the northwest, at Sioux City on the 27th. Average number of clear days, 12; partly cloudy, 7; cloudy, 12.

OBSERVERS' NOTES.

AFTON.—*N. W. Rowell.* The blizzard commenced at 8 P.M. on 26th and continued to the 28th; the worst in my ten years' record.

ALLERTON.—*Rex Shriver.* The blizzard on the 27th blocked roads and paralyzed traffic.

ALTA.—*David E. Hadden.* Ideal weather most of the month; the blizzard on 27th raged all day, but was quickly followed by fine weather.

ATLANTIC.—*J. W. Love.* Month was very mild except during the heavy wind and snowstorm on 27th.

BONAPARTE.—*B. R. Vale.* Precipitation, 2.25 inches; a pleasant month with a bad storm on 27th; ground bare and without frost at close of month.

BRITT.—*Geo. P. Hardwick.* The summer of 1904 was cool; autumn warm and late, with insect life until close of December; very high wind, blizzard and drifting snow on 27th and 28th.

CHARITON.—*C. C. Burr.* On 26th had light sleet, some rain with thunder, followed by one of the worst blizzards on record.

CLARINDA.—*A. Van Sandt.* Storm of the 26th-28th was a hard one, with wind 35 to 40 miles, and snow drifts above fences.

CLINTON.—*Luke Roberts.* Temperature normal; precipitation 2.85 inches. Most of it coming on 26th and 27th.

CRESCO.—*L. G. Krumm.* The blizzard on 27th was the worst in recent years; the papers say it was the worst since 1873.

ELKADER.—*Chas. Reinecke.* Mean temperature for the year, 44.4°; total precipitation 25.36 inches; highest temperature 99° on July 17th; lowest, 32° below zero on January 27, 1904; total snowfall for the year, 44 inches.

ESTHERVILLE.—*Earl W. Peterson.* Beginning on the 26th at 3 P. M., we had the worst blizzard that has visited this place during the past twelve years; storm ceased during night of 27th.

GREENFIELD.—*J. G. Culver.* A blizzard, commencing 9 P. M. on the 26th and ending on the 28th, was the worst storm for years; roads and railway lines badly blocked by drifts.

HAMPTON.—*E. C. Grenelle.* Hard blizzard all day the 27th; worst since 1880.

HANLONTOWN.—*Miss G. M. Paschen.* The blizzard on the 27th was the most severe storm in this section since 1885. Drifts ten feet high where wind had full sweep, and objects were invisible four rods distant.

HOPEVILLE.—*M. L. Ashley.* Very severe storm on 27th and roads were blockaded.

HUMBOLDT.—*H. S. Wells.* Precipitation for year, 28.26 inches.

INDEPENDENCE.—*E. F. Wulfke.* On 27th the heaviest blizzard in 20 years visited this section; all roads blocked.

LARRABEE.—*H. B. Strever.* The month was mild and pleasant, except during the blizzard on 27th.

LOGAN.—*Glen H. Stern.* Fierce blizzard visited Logan on 27th; drifts in places 5 feet deep.

OLIN.—*N Potter.* Roads were blockaded two days by storm on 27th.

POCAHONTAS.—*F. E. Hronek.* The blizzard on 27th reminded us of old times; not enough snow to do much damage.

RIDGEWAY.—*Arthur Betts.* Warmest of eight Decembers, except in 1900. There were 148 hours of sunshine. The blizzard on 27th was the worst since December 11 and 12, 1899.

SHELDON.—*A. W. Beach.* A splendid month; only one bad storm, and that lasted but 24 hours.

STOCKPORT.—*C. L. Beswick.* A fine month, except on 26th and 27th, the latter being equal to any bad day on record here.

WATERLOO.—*M. L. Newton.* The storm on 27th was the worst in 20 years.

WAUKEE.—*E. J. Leonard.* The sensational feature of the month was the blizzard on the 27th; stock suffered much and roads drifted full in many places.

WAVERLY.—*H. S. Hoover.* A very heavy blizzard all day the 27th and snow drifted badly.

WHAT CHEER.—*R. S. Alexander.* Worst blizzard in years on 27th and 28th; terrific wind; roads blocked several days.

BELATED REPORTS.

LENOX—November—Mean temperature 42.2°; highest 68° on the 2d, 3d and 18th; lowest 11° on the 30th; greatest daily range 35°; total precipitation .11 inch; greatest in 24 hours .11 inch; total snowfall, trace; prevailing direction, south; number of clear days 27, partly cloudy 1, cloudy 2, rainy 1.

EARLHAM—November—Mean temperature 40.2°; highest 72° on the 3d and 17th; lowest 7° on the 30th; greatest daily range 45°; total precipitation .13 inch; greatest in 24 hours .13 inch; total snowfall, trace; prevailing direction, southwest; number of clear days 25, partly cloudy 3, cloudy 2, rainy 1.

GREENFIELD—November—Mean temperature 42.1°; highest 70° on the 3d and 19th; lowest 8° on the 30th; greatest daily range 35°; total precipitation .24 inch; greatest in 24 hours .24 inch; total snowfall .3 inch; prevailing direction, south; number of clear days 26, partly cloudy 3, cloudy 1, rainy 2.

OTTUMWA—November—Mean temperature 44.6°; highest 78° on the 19th; lowest 16° on the 30th; greatest daily range 37°; total precipitation .13 inch; greatest in 24 hours .13 inch; prevailing direction, northwest; number of clear days 21, partly cloudy 5, cloudy 4, rainy 1.

† Above normal. ‡ Received too late to be computed with means. *a*. One day missing; *b*. two days, etc. § Not supplied with self-registering instruments.

ERRATA IN OCTOBER REVIEW.

CLARINDA—Maximum temperature recorded on the 5th, page 7, should have been the 4th.

BELKNAP—Number of days missing marked as [H], pag. 7, should have been [G].

MARSHALLTOWN—Mean temperature recorded 51.6° on page 8, should have been 52.1°. Mean maximum temperature recorded 64.6° on page 10, should have been 65.6°.

CLEAR LAKE—Mean temperature recorded as 51.6° on page 8 of the November REVIEW, should have been 51.0°.

ERRATA IN NOVEMBER REVIEW.

CLEAR LAKE.—Mean minimum temperature recorded 30.2° on page 11, should have been 30.3°.

DELAWARE.—Minimum temperature recorded 37° on the 15th, page 11, should have been 35°.

INDEPENDENCE.—Minimum temperature recorded 28° on the 25th, page 11, should have been 22°. Mean minimum temperature recorded 27.4° on page 11, should have been 27.2°. Mean temperature recorded 39.2° on page 10, should have been 39.0°.

NEW HAMPTON.—Mean temperature recorded 40.7° on page 9, should have been 39.0°.

WAPELLO.—Maximum temperature recorded 43° on the 9th, page 12, should have been 45°. Mean maximum recorded 54.6° on page 12, should have been 54.7°.

DAILY MAXIMUM AND MINIMUM TEMPERATURES FOR DECEMBER, 1904.

Precipitation Chart December 1904.

APPENDIX.

ANNUAL SUMMARY, 1904.

CLIMATOLOGY OF THE YEAR 1904.

BAROMETER.—The mean pressure for the year was 30.04 inches. The highest observed pressure was 30.85 inches on February 10th, at Sioux City; lowest pressure, 29.09 inches on December 27th, at Dubuque. Range for the state 1.76 inches.

TEMPERATURE.—The mean temperature for the state was 43.4°, which is 3.3° below normal. The highest temperature reported was 100° on July 17th, at Marshalltown. The lowest temperature reported was 32° below zero on January 27th, at Elkader and Fayette. Range for the year 132°.

PRECIPITATION.—The average amount of rain and melted snow for the year, as shown by complete records of 96 stations, was 28.74 inches, which is 2.68 inches below the normal, and 6.92 inches below the average amount in 1903. The greatest amount recorded at any station for the year was 38.93 inches, at Keokuk. Least amount recorded 19.34 inches, at Vinton. The greatest monthly rainfall was 11.97 inches, at Thurman in July; least monthly amount, none, at Rockwell City, in November. The greatest amount in any 24 consecutive hours was 7.73 inches, at De Soto, July 19th. The average number of days on which .01 of an inch or more of rain fell was 75.

WIND AND WEATHER.—The prevailing direction of wind was northwest. Highest velocity reported, 68 miles an hour, in Sioux City, from the northwest on March 2d. Average daily movement, 216 miles. There were 164 clear days, 97 partly cloudy, and 105 cloudy days; as against 156 clear days, 100 partly cloudy, and 109 cloudy days in 1903.

CLIMATE AND CROP REVIEW—1904.

The year 1904 was cooler than usual, the mean temperature being 43.4° which is 3.3° below normal. The average precipitation was 28.74 inches, which is 2.68 below normal.

The winter was colder than usual. In January the average daily temperature was 14°, which is 4.2° below the state normal. The lowest temperature recorded was 32° below zero, on January 27th, at Elkader and Fayette. In February the mean temperature was 4.8° below normal, and the lowest was 26° below zero on the 1st. The soil was frozen to an unusual depth. March brought moderate temperature, but the prevalence of cloudiness prevented rapid thawing of the soil, and the ground was generally too wet for seeding operations.

April was abnormally cold, the records of 115 stations showing a daily deficiency of 5.2° in temperature. The average rainfall was 3.63 inches, which is an excess of .74 of an inch above the April average. There were some dry periods, however, with sufficient sunshine to afford ample opportunity for seeding and preparing the ground for planting corn. Seeding of spring wheat, oats and barley begun generally from the 1st to the 4th, and that work was practically completed in the larger part of the state about the 20th or 23d. Germination of seed was unusually slow, but at the close of April there were indications of a good stand, except on low, wet fields. Fruit buds appeared healthy and promising, but there were only a few blossoms visible prior to the 1st of May. The pastures and meadows were unusually late in starting, and there was but little grass for stock at the end of the month. On the whole, though the growth of vegetation was much belated, the month was more favorable than the corresponding month in 1903.

May was nearly normal, the daily mean temperature showing a deficiency of only 0.8°. The average rainfall, 3.78 inches, was .35 of an inch below the May normal. In portions of the west central district, and in some of the southern counties, there were some heavy downpours, which caused much delay in planting, the great excess of moisture being due in large part to the saturated condition of the subsoil, resulting from abnormal rainfall in the preceding season. On the whole it was a favorable month, with sufficient warmth and moisture for grass and small grain, and general conditions favorable for farm work and the germination of the better qualities of seed. Except in quite limited areas, the corn crop was planted about as early as usual, and the soil was in very good condition. The month was especially favorable for the growth of grass in meadows and pastures, and for the small grain crops on well drained lands. The hay crop was well assured; oats and spring wheat stooled out fairly well, potatoes made a fine start; garden truck was well advanced at close of the month, and the fruits promised a better yield than has been produced in recent years.

June was cooler than usual, with less than the normal amount of rainfall, and a large percentage of cloudiness in portions of the state. The daily average temperature was 2.5 degrees below normal. The precipitation was quite unequally distributed; the nothern section receiving an average of 4.53 inches, the central section 2.74, and the southern section 3.08 inches. The week ending June 6th brought excessive rains in all parts of the state, except portions of the east central district. The wet and cloudy weather of that week caused much delay in the cultivation of corn, and in large portions of the state the fields became weedy and the growth of corn was considerably retarded by cold nights and wet, cloudy weather. The second week was generally very favorable for field work and the growth of crops, the days being bright and warm with ideal conditions for cleaning out the corn fields. The week ending the 20th was also favorable, though the temperature was below normal. There was but little interruption of work, and fair progress was noted in the growth of all crops. From the 20th to the close of the month the temperature was abnormally low and there was more than usual cloudiness in the larger part of the state. Despite all drawbacks, however, the corn crop advanced steadily, and at the close of the month the fields were generally clean and the stand was but little below the average of the past fifteen years. The month as a whole was favorable especially to small grain, which headed out about the usual time, though short in straw. The hay crop was well advanced and fairly good, especially in quality. Potatoes and garden vegetables were usually promising.

July was unseasonably cool, the mean temperature being 3.6° below normal. The warmest period was the second decade. The average rainfall for the state, 4.41 inches, was .18 of an inch above normal. The northern section received an average of

3.77 inches; central section 4.47; southern section 5 00 inches. Rain in measurable quantity fell at one or more stations every day during the month. And yet the average number of clear days was 16, partly cloudy, 9, and cloudy, 6. Generally there was sufficient sunshine to promote plant growth. The days were warm, and nights unusually cool. The heaviest storm of the month, in respect to rainfall, occurred on the night of the 19th, but the excessive downpour was limited to a few counties. On the whole the month was favorable for crops and field work. Corn was laid by from the 4th to the 15th,—about a week later than usual. During the showery period in the early half of the month spring wheat and oats were attacked by rust. The wheat crop was damaged seriously, but oats were not very badly injured. The latter half of the month was favorable for harvest operations and most of the small grain was in shock or stack before August 1st. Haying progressed quite favorably and though the yield was lighter than the average the quality was superior, and most of it was secured in good order. Corn made notably fine progress, despite the cool weather, and at the close of the month that crop was much more advanced than was deemed possible earlier in the season. Potatoes, garden truck, apples, small fruit and all minor crops made normal advancement.

The average temperature of August, 1904, was exactly the same as August, 1903, 1902 and 1891. The mean temperature was 2.7° below the August normal. In the southern section it was 67.3°; central section, 69.2°; southern section, 70.7°. The month was mostly clear and warm by day, though unseasonably cool at night. The average rainfall was normal for the state, but in its distribution the larger amount was received in the south and eastern districts, where it was most needed. The bulk of the rainfall came about the 17th to 21st and the 29th. There were, on the average, 17 clear days, 8 partly cloudy, and 6 cloudy, affording an ample amount of fair weather for harvesting, stacking, threshing, cutting wild hay, millet, etc., and fall plowing. In all these farm operations very good progress was made. The pastures were revived and made green as in June by the copious showers in the latter half of the month. The corn crop made fair advancement during the month, though in view of its belated condition its progress was not as rapid as seemed desirable. The most advanced portion of the crop was well filled and dented at the close of the month. Reports at that time indicated that about one-third of the crop, with favorable conditions, would be mature by September 20th, while the balance required abundant warmth and sunshine until October 1st to be safe from harm by killing frost. The crop was unusually rank, green and heavily eared. The minor crops were in good condition. Potatoes made heavy yield, and early apples were especially good and abundant. The yield of tomatoes and green corn for canning has been better than usual. Garden truck, cucumbers for pickling and melons yielded abundantly.

The average temperature of September was about normal for the state, the southern and central sections showing an excess, and the northern section a small deficiency. The coldest period was from about the 11th to the 22d. The average rainfall for the state was 2.78 inches, which amount is about 0.52 of an inch below the normal for September. In its distribution there was much inequality, ranging from less than a tenth of an inch at one station in the northwest to over eight inches in the southeast district. The southeast and northeast districts received the heaviest rainfall. The week ending September 12th was normal in temperature and sunshine, with very light rainfall, and generally favorable conditions for ripening the belated corn crop, a considerable portion of which was well dented, with husks and blades putting on the brown shade of autumn. The week ending the 19th brought several days of good ripening weather, but much anxiety for the safety of the immature portion of the corn crop was caused by the occurrence of light to heavy frosts on the mornings of the 12th, 14th and 15th, the cold wave extending to all districts in the state. A few stations also reported frost on the 21st. The lowest temperature recorded was 30° at four stations. The observed effects proved that the frosts were not "killing," and that the damage to the corn crop was limited to late planted fields in the bottom lands of the central valleys of the state. Broadly stated, the actual damage by frost affected less than one-fourth of the area planted, and the shrinkage of the frosted portion of the crop was probably less than 20 per cent. This would indicate possible loss of 5 per cent of the crop for the state, as the direct result of frost. The cold weather of that period, however, retarded the development of the crop, and made it desirable to extend the ripening weather beyond the 1st of October. During the month good progress was made in the usual farm operations, such as plowing, seeding fall wheat and rye, harvesting potatoes, apples and millet, and threshing small grain. The yield of potatoes, and fall apples has been very satisfactory. The grape crop was heavy, and there has been a good yield of plums. The growth of all kinds of garden truck has been unusually heavy. The pastures have been much better than usual for September. At the close of the month it was estimated that ninety per cent of the corn crop was practically safe.

October was warmer and drier than usual, the daily mean temperature being about 1° above normal, and the average rainfall of the state was 0.73 of inch below normal. The northern section received the largest amount, the average being about 0.29 of an inch above the October normal. The first frost of the month occurred on the morning of the 6th, and was heavy enough to kill vines and most of the cornstalks remaining green in the northern half of the state. In the southern half the frost was light, causing no damage. The first general killing frost covering the state occurred on the morning of the 23d, all crops being safe at that time. The bulk of the rainfall came in the first and second decades—mainly between the 5th and 20th, the balance of the month being dry and favorable for farm work, for drying out the corn crops and harvesting the minor crops. No better weather could be desired for preparing corn for cribbing than was prevalent from the 20th to the 31st. Good progress was made in harvesting the corn during the last week though the heavier ears contained considerable moisture. But the weather was cool by night, though moderate and clear by day. The heavy potato crop was harvested in good condition, the quality of the product being unusually good. Pastures were very good throughout the month. Good progress was made in fall plowing. The small acreage in fall wheat and rye showed an excellent growth and good stand. On the whole, October was a very mild and favorable month, crowning a fairly productive crop season.

The month was unusually warm and the driest November on record for the state. The mean temperature, as shown by records of 110 stations, was 41.0°, which is 6.3° above normal. The average in 1902 was .2 of a degree higher and 2.9° higher in 1899. The average precipitation for the state at 119 stations was .15 of an inch, which is 1.25 inches below normal. Nine stations reported no rain in measurable amount. Practically all the precipitation fell on the 9th and 10th, and the average number of clear days was twenty. The conditions were ideal for husking corn and drying out the surplus moisture. At the close of the month the bulk of the crop was harvested. Conditions were also favorable for fall plowing and general farm work of the late autumn period. The pasturage was better than usual, though the fields were brown. Winter wheat and rye suffered some damage for want of moisture.

The first decade of December brought continued fine weather with favorable conditions for gathering the corn and cribbing

the entire crop. The season as a whole was favorable for the production of a fair output of the staple crops. Though germination and growth were belated, the warmth and dryness of the autumn brought ample compensation to the patient and faithful tillers of the soil.

ERRATA IN ANNUAL SUMMARY, 1903.

BAXTER.—Annual temperature on page 16, omitted, should have been 47.6°.

BEDFORD.—Annual temperature on page 16, omitted, should have been 48.8°.

BELLE PLAINE.—Dec.—Mean temperature recorded 16 4° on page 6, should have been 16.5°.

CHARITON.—Dec.—Mean temperature recorded 22.4° on pages 7 and 21, should have been 22.3°.

CHARLES CITY.—Feb.—Mean temperature recorded 18.8° on page 21, should have been 19.8°.

COLUMBUS JUNCTION.—Dec.— Mean temperature recorded 21.5° on pages 7 and 21, should have been 21.6°.

CORNING.—Dec.—Mean temperature recorded 23.2° on pages 7 and 21, should have been 23.4°.

DECORAH.—Annual mean temperature recorded 44 7° on page 21, should have been 44.9°.

EARLHAM.—May.—Mean temperature recorded 60.6 on page 21, should have been 60.0°.

Mean temperature for December, and annual mean temperature recorded 21.5° and 46.7°, respectively, on pages 7 and 21, should have been 21.2° and 46.6°.

FOREST CITY—Dec.—Mean temperature recorded 13.8° on pages 6 and 11, should have been 13.9°.

GALVA.—Dec.— Mean temperature recorded 19.° on pages 6 and 21, should have been 19.1°.

GRINNELL (near).—Dec.—Mean temperature recorded 19.6° on pages 6 and 21, should have been 19.1°.

GRUNDY CENTER.—Mean temperature for June and annual mean temperature recorded 60.6° and 47.3° on page 21, should have been 63.6° and 46.4°, respectively.

HAMPTON.—Sept.—Mean temperature recorded 61.05° on page 21, should have been 61.4°.

INDEPENDENCE.—March.—Mean temperature recorded 37.6° on page 21, should have been 37.4°.

MOUNT VERNON.—Annual mean temperature recorded 47.4° on page 21, should have been 47.5°.

ONAWA.—Dec —Mean temperature recorded 26.4° on pages 6 and 21, should have been 24.0°.

Annual mean temperature recorded 49.3° on page 21, should have been 49.1°.

OSKALOOSA.—Dec.—Mean temperature recorded 20.2° on pages 7 and 21, should have been 19 9°.

Annual temperature recorded 48.5° on page 21, should have been 48.4°.

OTTUMWA.—Nov.—Mean temperature on page 21, omitted, should have been 37.7°.

Dec.—Mean temperature recorded 25.0° on pages 7 and 21, should have been 24.5°.

PACIFIC JUNCTION.—Annual temperature recorded 49.5° on page 21, should have been 49.1°.

PRIMGHAR.—Dec.—Mean temperature recorded 16.7° on pages 6 and 21, should have been 17.0°.

RIDGEWAY.—Dec.—Mean temperature recorded 16.3 on page 6 and 21, should have been 16.2°.

KEOSAUQUA.—June.—Mean temperature recorded 65.0° on page 21, should have been 65.1°.

LE MARS.—Dec.—Mean temperature recorded 19.8° on page 6 and 18.8° on page 21, should have been 20.2°.

Annual temperature recorded 45.7° on page 21, should have been 45 6°.

Dec.—Minimum temperature on 3d, page 9, recorded -5 should have been 15°.

Dec.—Mean minimum temperature recorded 8.8° on page 9, should have been 9.5°.

LEON.—June.—Mean temperature recorded 64.2° on page 21, should have been 66.2°.

Annual temperature recorded 49 7° on page 21, should have been 49.9°

RUTHVEN.—Sept.—Mean temperature recorded 60.6° on page 21, should have been 60.0°.

VILLISCA.—March.—Mean temperature recorded 40.6° on page 22, should have been 40.2°

WATERLOO.—Annual temperature recorded 46.7° on page 22, should have been 46.6°.

WHITTEN.—Dec.—Mean temperature recorded 17.4° on pages 6 and 22, should have been 17.8°.

BELLE PLAINE.—March.—Total precipitation recorded 2.00 inches on page 23 should have been 2.10 inches.

Annual precipitation recorded 34.33 inches on pages 16 and 23, should have been 34.43 inches.

CLEAR LAKE.—Annual precipitation omited, page 23, should have been 36.18 inches.

GRINNELL (near)—Total precipitation for July recorded 3.97 inches on page 23, should have been 3.79 inches.

IDA GROVE.—July.—Total precipitation recorded 4.41 inches on page 23, should have been 4.31 inches.

LEON—Dec.—Total precipitation on page 23, omitted, should have been .60 inch.

Annual precipitation on pages 16 and 23, omitted, should have been 34.30 inches.

OLIN.—Dec.—Total precipitation recorded .99 inch on pages 6, 10 and 23, should have been 1.09 inches.

Annual precipitation recorded 35 53 inches on pages 17 and 23, should have been 35.63 inches.

OSKALOOSA.—Dec.—Total precipitation recorded .32 inches on pages 7, 10 and 23, should have been .34 inch.

Annual precipitation recorded 28.01 inches on pages 17 and 23, should have been 28.03 inches.

OTTUMWA.—Dec.—Total precipitation on pages 7 and 23, omitted, should have been .81 inch.

RUTHVEN.—Nov.—Total precipitation on page 24, omitted, should have been Trace.

SAC CITY.—Nov.—Total precipitation on page 24, recorded .16 inch, should have been .26 inch.

Annual precipitation recorded 36.24 inches on pages 17 and 24, should have been 36.34 inches.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—O. A. OLSON, Forest City.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XVI. JANUARY, 1905. No. 1.

JANUARY WEATHER AND CROPS.

The weather records for the state at large show but one colder January, and that was January, 1893, when the mean for the state was 9.3°. This year the mean was 11.2°, which is 7 0° below normal. Since the first day of the month there has been practically no temperature high enough to lessen the height of the massive snowdrifts, and the fields in all parts of the state have been well protected from damaging effects of the extreme cold. Winter grain and grasses have suffered no material damage as yet. Generally sleighing has been good in all parts of the state. This has been favorable for hauling produce to the markets, and usual farm work of the winter season. The snow has prevented grazing stock in the corn fields and winter pastures, but o 1 the whole the conditions have been favorable for the farmers.

ORIGIN OF COLD WAVES.

[New York Tribune.]

The cold waves which affect the United States generally enter this country from the northwest, appearing first in Montana and the Dakotas, but almost immediately being felt in Minnesota. They then push southward and eastward, their path following that of the last preceding barometric depression. When the low area travels along the Great Lakes eastward, the cold wave is not severely felt in the South. If the depression crosses Texas and Louisiana or moves up along the South Atlantic coast, the Gulf States suffer. The most intense cold, it should be added, is observed near the center and in the eastern half of an area of very high barometer which follows the low area or storm. All of this is an old story. Much less is known about the development of these visitors before they invade the United States.

Telegraphic reports from Edmonton, in British America, almost invaribly indicate the presence of extraordinary pressures and low temperatures about two days before the boundary is crossed, and Winnipeg, Manitoba, is affected almost simultaneously with North Dakota. Edmonton and Winnipeg are about fifteen hundred miles apart. What happens before Edmonton discovers a cold wave is a question that has been much discussed. Once it was thought that cold waves entered Canada from Hudson Bay. The impression has also prevailed th t they came down from regions north of the Arctic Circle. There can be no question, moreover, that Dawson, which is situated on the upper Yukon, occasionally has extremely cold as well as boisterous weather. *The Cœur d'Alene* (*Idaho*) *Sun* remarked a year or two ago that it had noticed that cold waves reached Havre, Mont., about three weeks after their appearance in the Klondike country (around Dawson).

Commenting on that statement, "The United States Weather Review" expressed the opinion that a cold wave might, and probably did very often, originate in the vicinity of Edmonton, independently of regions further north. It was suggested that the primary cause was radiation of the earth's heat through clear and nearly motionless air. That phenomenon would naturally occur near the centre of the continent. All oceans, including the polar sea, exercise a modifying influence on the cold experienced on adjacent coasts. The lowest temperatures are not recorded on the Artic Ocean, but in the interior. However, the editor of "The Weather Review," Professor Cleveland Abbe, wrote to Dr. Stupart, who is at the head of the Dominion service, and asked for an opinion regarding the statements of the Idaho paper.

In his reply, Dr. Stupart said that the matter needed further investigation and he was making a fresh study of the subject. Still, he had already discovered that some of the cold waves felt at Dawson never reach Edmonton and Winnipeg. It also happens now and then that Dawson and Edmonton are affected at the same time. The two places are so far apart that this fact would indicate that separate causes were occasionally at work. Again, other cold waves really did seem to travel from Dawson to Edmonton and Winnipeg, but the time required for the movement was only about five or six days, not three weeks. The third class of instances was numerous enough, Dr. Stupart thought, to warrant the expectation that a cold wave would be felt in Manitoba five days after it was reported from the Klondike. Considering its source, this verdict is not without value, but further study by meteorologists may lead to the conclusion that very few cold waves come to the United States from districts north of the Artic Circle, and that the majority develop in the neighborhood of Edmonton.

WHAT THE WEATHER BUREAU DOES.

[Marshalltown Times-Republican.]

When the weather bureau was created the results expected by the promoters of the bill were confined to warning the shipping interests of the seaboard and the Great Lakes of the approach of dangerous storms. The service has grown, however, as most good purposes grow, until its value and assistance touches and is appreciated by nearly all classes. It forecasts rain, snow and frost, and the information thus furnished is invaluable to crop raisers. The work of the bureau has become so closely allied with climate and agriculture that one can scarcely be considered apart from the other.

Statistics prove that one storm traversing our eastern coast in the absence of danger signals would leave not less than three million dollars' worth of wreckage. This is simply the money value of the property placed in a position of safety as a result of the

warnings furnished vessel owners and masters, but does not represent the value of property saved. A few years ago a severe storm from the west Indies swept up the Atlantic coast. Warnings of its approach were sent to every city along the Atlantic seaboard from Key West Fla., to Portland, Me., fully forty-eight hours before it reached the coast of Florida. After the passage of this storm it was estimated by the officials of the Savannah and Charlestown boards of trade that more than three million dollars' worth of property had been saved to those two cities alone, to say nothing of the loss of life which might have resulted, had the many vessels kept in harbor put to sea. This one forecast proved a saving to two cities alone of nearly as much money as is required to maintain the entire weather service for three years. The people of Georgia were given timely warning of the severe cold wave of Februrary, 1899, twenty-four to thirty-six hours before its arrival, and in and immediately around Atlanta fully a quarter of a million dollars' wo th of property was saved.

Sugar cane, the most important product of Louisiana, is peculiarly sensitive to low temperature, and is easily destroyed by frost. Whenever frost warnings are received from the weather bureau, all available labor is utilized in cutting the cane and placing it in a position of saf-ty. In this way heavy losses are averted by the planters annually. Some years ago it was estimated by the Governor of the state that nearly the entire crop would have been destroyed, but for the timely receipt of a frost warning issued by the weather bureau. Wisconsin tobacco raisers forewarned of frost saved their crop by huge bonfires a few years ago.

Hundreds of thousands of dollars are saved to the orange and truck growers of Florida and the raisin interests of California every year. The warnings are of untold value to the commerce on the Great Lakes, rivers and oceans, to say nothing of the overland transportation. The saving of perishable goods in transit benefits commerce, and these benefits revert directly to the producer. Any damage occurring to goods en route from the producer to the consumer is at the cost of the producer. In the early autumn and spring, timely warnings of frost are sent to the rural districts and disseminated as widely as conditions will permit, and the confidence of the people in these warnings is evidenced by the fact that hundreds of dollars are spent by individual owners in the various methods of protecting their plants or fruits against frost.

THE COLOR OF CORN.

Several days ago a prominent Chicago grain merchant remarked that the "prejudice relative to the color of corn is even more marked than that of the white against the black people of our country, and that while there was some cause for drawing the color line between the races, the question as applied to corn is purely one of sentiment."

The above statement started a discussion upon this ever-fruitful topic. It is a well-known fact that in the Southern States white corn is grown almost exclusively; the Southern farmers will not accept anything but white corn for feeding purposes, and their good wives must have the white corn meal for their old-fashioned "pones" and "butter-cakes." In the Northern and Eastern States, farmers, grain dealers and the queen of the kitchen insist on the yellow grain and the cornmeal made therefrom, claiming that it is stronger and more nutritious than the white varieties, but in the great corn belt of the West, where the bulk of the corn crop is produced, the farmer seeks to plant the varieties that will net him the largest returns from his investment.

At the Illinois experiment station, Iowa College of Agriculture, and other government institutions, the subject of corn breeding by selection and chemical analysis has been taught for the last ten years, the idea being to improve the varieties best adapted to the soil upon which they are to be grown. Some types of corn are bred to yield a high percentage of oil, some for high starch and low oil content, and others for high protein and low starch, etc. In this work of breeding, prolificacy and early-maturing qualities are an important consideration and the results are decidedly in favor of the white varieties.

The feeding value of corn is determined by its chemical analysis, and color does not have anything to do with it. If the farmer is feeding corn or cornmeal for meat or milk production, he wants in his grain all the protein he can get. White corn is equally as valuable for feeding purposes as yellow unless proven otherwise by chemical analysis.

The western farmer who feeds to his own livestock nearly 80 per cent of the corn produced on his farm, long ago ceased to regard the color question as an important factor. He is growing more white corn every year, because in several of the white varieties he has types that yield a larger number of bushels per acre than the yellow varieties, and, at the same time, produce more fodder. It is not a great while since that the farmer could sell his white corn at a premium, because the bulk of the crop of the country was yellow, and the demand from starch factories and hominy mills was for white corn, but today this condition is reversed and there is a scarcity of yellow corn. The demand for this yellow grain can not be supplied, and as a result, it is sold at a premium over white. This premium, however, does not justify the corn grower in switching back to the yellow, because the increased yield of the white varieties more than offsets any premium he might be able to obtain.

It is the belief of well posted farmers and grain dealers that it is only a question of time before the entire country is on a white corn basis. This will, undoubtedly, be the condition in the corn belt of the future unless the yellow varieties are bred up and otherwise improved to such an extent that they will yield just as many bushels per acre as the most prolific of the white varieties.

Some feeders contend that yellow corn is stronger than white; it would be equally as logical to claim that a yellow shelled egg contains more nutriment than that of the white shell. Our agricultural experiment stations, which have given this subject careful study, never make any distinction as regards color. These experts have had every opportunity to test this matter thoroughly, and thus far no experiment has ever been conducted, either in feeding livestock or by chemical analysis, to prove that yellow corn is more nutritious than white, or vice versa. It is wholly a question of chemical analysis, and the time may come when corn will be sold on this basis. It is false economy for eastern feed dealers and farmers to pay a premium for yellow corn on the theory that it is more valuable as a feed, just because it is yellow.—*Roy B. Simpson in Flour & Feed.*

EARLY YEARS AT RIDGEWAY, IOWA.

BY ARTHUR BETTS, VOLUNTEER OBSERVER.

1866—We had a snowy winter; huge drifts covered the fences. July was very arm. June and August rather cool. Crops good. Very mild October, with beautiful Indian summer. Nice corn crop. Very late fall.

1867—Another snowy winter, and much drifting. All crops good. Very late fall. October uncommonly warm, and much Indian summer. The summer season was warm.

1868—July was excessively warm. A good corn year. Delightful summer. All crops did well. Much drouth in July and August. 104° in July. October 2d first snow of the season, and earliest I ever saw in Iowa; nice Indian summer later. Warm March. Terrific thunderstorms from the north August 8th.

1869—Summer quite cool and wet. Crops generally good. In July a spot on the sun could be seen by the naked eye when near the horizon. October was uncommonly cold and unpleasant; so was November.

1870—October and November very mild; Indian summer long and delightful. Summer was warm, so was September, frost held off well. Crops fair to good.

1871—Spring opened very early. A warm March—mean about 40°—wonderfully mild and pleasant. Lilacs blossomed unusually early. Vegetation too forward, for in April and early May came damaging frosts in many localities. Lovely Indian summer in October. Very cold November.

1872—A good year. A fine summer. Plenty of everything. Seeding in April. March cold and wintry. The coming winter a hard one, and it commenced early.

1873—Awful snows in January and February. Terrible blockades. Winter very cold. Late spring. June uncommonly warm, and the summer was fine. Crops of all kinds bountiful.

1874—July and August warmer than usual. Coggie's Comet during those months a splendid sight, the tail at one time covering a large portion of the northern heavens. A good harvest of all crops. Indian summer from October 7th to the 28th, and the sky, atmosphere, and sun were gorgeous. October was wonderfully mild, with severe thundershower the 25th. First frost on the 28th of October—latest I ever saw—and it froze the ground. November came in warm; a thundergust on the 8th, and the wind tore up great oak trees. The spring of 1874 was very late. Mercury reached 102° in July. Ridgeway burned in May (27th).

1875—Very backward spring. January and February very cold. Good harvest of small grain. Known as the cold summer. Hard frost on the lowlands August 8th, and it made a good deal of soft corn, shortening the crop greatly. It was a splendid strawberry season. Lots of catching weather in harvest and stacking.

1876—This centennial year opened with a heavy all-day rain on New Years Day, and after it came an ice age, and many trees broke under the weight of ice. Lots of chinch bugs in the summer made havoc with wheat, and we had a general wheat failure—the first ever known here. Corn was a splendid crop. Seeding in April. The winter was not very cold, but a long one. The summer was delightful.

1877—February and December were spring months—unseasonably mild weather. Wheat sowed in February froze to death in March, for March was a cold winter month, making a late spring. Had an excellent wheat crop, and other crops bountiful. September very warm, like a June. November cold and snowy, and we husked corn in the snow. Farmers plowing all the month of December. Venus at greatest brilliancy could be seen in the daytime at all hours, it was so bright, and moonless evenings it cast starlight on the wall through the window. February mean about 33°, March about 24°, December about 38°.

1878—January very open and mild and no snow (mean about 30°). February a spring month, with a maximum temperature of 62° and a mean of about 34°. March was a record breaker—it was so warm, like an ordinary April, and April like May. It was like missing a winter, but there was lots of mud and flowers instead of snow. No damaging spring frosts, though vegetation started so very early. Seeding all done in February and March. Wheat was laid out for an immense crop. July 11 mercury 108° in the shade, and 140° in the sun, cooked the wheat which was in the dough, and made a terrible wheat failure. Lots of fields not harvested, and the grain looked like screenings. It sold for twenty-five cents per bushel. The hot summer made good corn. The year ending November 1878, is known as the year without a winter. Very late fall.

1879—Much snow in December, and it drifted terribly. Wheat no longer a staple—the country had been wheated to death. Very little wheat sowed. Crops were good. October a warm Indian summer month. Spring reasonably early. The winter months were very cold.

1880—Crops good. January had great mountains of snow, piled up in December, 1879. Summer was fine. Much snow. Wet May. Spring floods and washouts. June freshets. November a winter month.

1881—Summer warm. Good crops. Hay was an exceptionally good crop, and clover was beautiful. Mercury was 100° in August. Both September and October were very wet. January was very cold. December almost a spring month.

1882—January a good winter month. February was very mild. Early in May I started for Webster, South Dakota, where I spent fifteen years.

CLIMATOLOGY OF THE MONTH OF JANUARY, 1905.

BAROMETER.—Mean pressure, 30.33 inches; highest observed, 31.09 inches, at Sioux City, on the 25th; lowest observed, 29.12 inches, at Keokuk, on the 1st. The range for the state 1.97 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 118 stations, was 11.2°, which is 7.0° below normal. By sections the mean temperatures were as follows: Northern section 7.7°, which is 9.7° below normal; central section 11.2°, which is 7.3° below normal; southern section 14.6°, which is 8.2° below normal. The highest monthly mean was 19.6°, at Keokuk; lowest monthly mean, 4.2°, at Fayette. The highest temperature reported was 56°, at Keokuk, on the 1st; lowest temperature reported was 30°, at Inwood, on the 25th. The average monthly maximum was 43.8°; average monthly minimum, 18.9°. Greatest daily range, 48° at Audubon; average of greatest daily ranges, 35.4°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 125 stations, was .91 of an inch, which is .06 of an inch below normal. The averages by sections were as follows: Northern section, .70 inch, which is .11 inch below normal; central section, 1.07 inches, which is .04 inch above normal; southern section, .97 inch, which is .09 inch below normal. The largest amount reported was 1.82 inches at Lacona; least amount reported, .12 inch, at Storm Lake. The greatest daily rainfall reported was .90 inch, at Lacona, Ridgeway, Northwood, on the 11th and 12th respectively. Average number of days on which .01 of an inch or more was reported, 6.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 38 miles per hour, from the Northwest, at Sioux City, on the 5th. Average number of clear days, 13; partly cloudy, 8; cloudy, 10.

OBSERVERS' NOTES.

ALTA—*David E. Hadden*. January, 1905, was very cold, the mean temperature being lowest in 15 years, with one exception, January, 1893, which was about half a degree colder. Ground well covered with snow.

ATLANTIC—*J. W. Love*. An ideal winter month; snow enough for good roads; brilliant sun dogs on 24th.

BONAPARTE—*B. R. Vale*. A pleasant and seasonable month; nine days temperature was below zero, the lowest being 11° below on 14th and 25th; frequent light snows.

BRITT—*Geo. P. Hardwick*. Second and fourth weeks were very cold; 7° lower than average of last nine Januaries.

CLINTON—*Luke Roberts*. The mean temperature of the month was 14.7°, being the same as in January 1904, and 3.5° below the normal for past 27 years. The warmest day was the 1st, with a mean of 41.2°; and the coldest day was the 24th, with a mean of 4.5° below zero. There was a stout wind of 26 miles an hour, and blizzard conditions. Precipitation of the month only .79 of an inch of water, coming mainly in form of snow.

GRAND MEADOW—*F. L. Williams*. Month extremely cold; 19 days at zero or below; the 24th was an extremely bad day.

GREENE—*J. L. Cole*. Ice in Shell Rock river 24 inches thick; no thaw in January.

INWOOD—*G. M. Larsen*. Coldest month of the winter; more snow than for many years.

OLIN—*N. Potter*. A real winter month with no general thaw; no loss of stock reported.

PACIFIC JUNCTION—*H. H. McCartney*. Brilliant parhelia near sunset on 24th; snowfall same as in January, 1902, but much colder.

RIDGEWAY—*Arthur Betts*. Coldest January in 7 years, but a very agreeable month; 200 hours of sunshine; no bad storms; sleighing all the month; thawing temperature on 3 days.

SHELDON—*A. W. Beach*. Best sleighing in years; some sunshine every day but 2; splendid winter weather.

WAUKEE—*E. J. Leonard*.—First day of January was above freezing all day; almost steady cold since; 13 days reached zero or lower.

BELATED REPORTS.

FAYETTE—September—Mean temperature 61.2°; highest 89° on the 28th; lowest 32° on the 12th; greatest daily range 43°; total precipitation 6.08 inches; greatest in 24 hours 2.33 inches; prevailing direction, southwest. Number of rainy days, 9.

FAYETTE—October—Mean temperature 50.2°; highest 78° on the 9th; lowest 17° on the 27th; greatest daily range 40°; total precipitation 2.03 inches; greatest in 24 hours 1.04 inches; prevailing direction, northwest; number of rainy days, 6.

FAYETTE—November—Mean temperature 35.9°; highest 70° on the 1st and 2d; lowest 7° on the 30th; greatest daily range 41°; total precipitation, trace; greatest in 24 hours, trace; prevailing direction, southwest; total snowfall, trace; number of rainy days, none.

FAYETTE—December—Mean temperature 18.5°; highest 45° on the 8th and 22d; lowest 20° below zero on the 14th; greatest daily range 37°; total precipitation 2.30 inches; greatest in 24 hours .95 inch; total snowfall 19.5 inches; prevailing direction, northwest; number of rainy days, 6.

ERRATA IN ANNUAL SUMMARY, 1904.

Mean temperature, under climatology of year, 1904, on page 11, recorded as 43.4°, should have been 46.3°. Departure from normal, recorded as 3.3° below normal, should have been 0.4° below normal.

Under Climate and Crop Review, 1904, mean temperature recorded as 43.4°, should have been 46.3°. Departure from normal, recorded 3.3° below normal, should have been 0.4° below normal.

Annual mean temperature recorded as 43.4° on page 16, should have been 46.3°.

ERRATA IN DECEMBER REVIEW.

COLLEGE SPRINGS.—Number of days missing, recorded [a] page 5, should have been [b].

KNOXVILLE.—Mean temperature recorded 26.2° on page 5, should have been 26 7°. Mean maximum temperature recorded 34 8° on page 8, should have been 35.9°.

NEW HAMPTON.—Precipitation on 2d, 3d, 18th and 26th, page 9, recorded as .00, should have been trace.

THURMAN.—Total snowfall not recorded on page 5, should have been 4 5 inches.

TOLEDO.—Total precipitation on page 6, not recorded, should have been 1.58 inches. Greatest amount in 24 hours should have been .80 inch, on page 6. Total snowfall on page 6, not recorded, should have been 20.5 inches.

ZEARING.—Total snowfall recorded 17.3 inches on page 6, should have been 21.8 inches.

DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—O. A. OLSON, Forest City.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XVI. FEBRUARY, 1905. No. 2.

FEBRUARY WEATHER AND CROPS.

The month was abnormally cold, the mean temperature for for the state being 12.8°, which is 6.8° below the normal, making it the coldest February since 1890. The first half was a continued period of intense cold weather with more than usual snowfall and strong drifting winds. This rendered ordinary farm work, and especially the care of stock, quite difficult. There was enough snow, however, to serve as a protection to winter grain and grasses. The latter half was milder and at the close of the month the snow had mostly disappeared in the larger part of the state. The frost did not penetrate the ground deeply, and there was but little remaining in the soil on March 1st in the southern districts.

NOTES AND COMMENTS.

Carl Fritz Henning, voluntary observer at Boone, writes that prairie chickens and quails have had a hard time to procure sufficient food to sustain life during the severe winter weather on account of the heavy snowfall. Farmers report finding these birds frozen to death at old strawstacks and in the high grass along prairie streams.

Irrigation is as useful in New York state farming as it is in many places where it is supposed to be more applicable to the conditions, says the *New York World*. The new census bulletin just issued states that artificial provision against drought is used in Maine, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Florida, Alabama and Mississippi. Exceptionally high yields of fruit are reported as made possible by its use.

Although the United States comprised only 5 per cent of the world's population, it produced in 1900, 22 per cent of the world's wheat, 30 per cent of its gold, 32 per cent of its coal, 33 per cent of its silver, 34 per cent of its manufactures, 35 per cent of its iron, 36 per cent of its cattle, 38 per cent of its steel, 50 per cent of its petroleum, 54 per cent of its copper, 75 per cent of its cotton and 84 per cent of its corn—*Exchange.*

The *Australasian Pastoralists' Review* of January 16, says: Rain is badly wanted in many parts of the commonwealth. The past month has been one of bush fires almost everywhere, and a good downpour would not alone remove the heavy anxiety off the shoulders of our stock owners and agriculturists but bring up a fine spring of good feed on the burnt-out country. Good thunderstorms have occurred in parts of Queensland and the country around Tambo, Blackall, Aramac, Longreach and south to the border is reported as looking splendid. Since the bounteous rain which fell over a large part of New South Wales in the middle of December very little has fallen in that state and the coastal district is experiencing a very serious drought indeed. Victoria has been very dry, and only scattered storms are reported. South Australia is also experiencing a dry time. The heat has been terrific almost everywhere and has discounted very largely all the good done by any showers we have had. Almost up to the last report we have received, heavy rains and severe weather have been experienced over a large portion of New Zealand.

On January 1, 1905, Iowa was credited with live stock in numbers and values as follows: Horses, 1,144,456, valued at $85,250,746; mules 44,096, value, $3,529,755; milch cows, 1,335,832, value, $37,269,713; other cattle, 3,467,507, value, $67,348,010; sheep, 698,316, value, $2,652,483; swine, 7,290,625, value, $48,920,094; total, $244,970,801. These figures do not include calves, colts and other young animals under six months old.

Arthur Betts, voluntary observer at Ridgeway, Iowa, considers the past winter very mild and agreeable in comparison with some of the winters he experienced a few years ago, while serving as observer in Webster, Day county, South Dakota. He forwarded a sheet from his record for the month of January, 1887, to sustain his statement, and the figures indicate that it was a "terrible month" in that section. The lowest temperature recorded was 44° below zero, on the 6th. The mean for the month was —12.6°, and the mean of the minimum was —23.6°. On every day but one the temperature fell below zero, and on fifteen days the maximum was below zero. The total snowfall was 17 inches, and there were blinding blizzards on eleven days. On the warmest day of the month the mean was 12°. It was a month to be remembered.

The first number of the *Weekly Crop Bulletin* of the Iowa section, series of 1905, will be issued Tuesday, April 11th.

LONG RANGE FORECASTS.

[From the New York Tribune.]

A comprehensive and judicious review of the most notable attempts to foresee meteorological conditions for weeks or months at a time has just been issued by the United States Weather Bureau. Its author, Professor E. B. Garriott, is a veteran in the government service, and is admirably qualified for the task of writing such a treatise. His essay is probably the safest

guide at present available in reaching conclusions on this subject.

What seems to be the most promising line of work just now is the effort to predict seasonal charecteristics from the behavior of certain semi-permanent tracts of high barometer that have long been familiar features of international charts. These have a curious way of shifting about, and such changes are attended with perceptible local effects on the paths of moving low and high pressure areas and upon temperature and rainfall. For instance, if the western extremity of the one which in summer usually overlies the Atlantic Ocean should extend into the southeastern part of the United States, particularly warm, and perhaps dry, weather would prevail in the northern part of the country. In winter one of these great high areas forms over the continent of Asia. Should the westernmost end cover northern Europe, some of the storms that cross the ocean from America would be deflected toward the Mediterranean, and the progress of others would be checked in such a way as to react on the United States; whereas, if the permanent high pressure covered only the southern part of Europe, the Atlantic storms would travel toward Scotland and Scandinavia. Again, it seems probable that a slight displacement of the high pressure area over the Indian Ocean might simultaneously cause abnormal rains over the upper Nile and drouth in Australia.

Partly because it may afford a premonition of such variations from the average distribution of air over the earth, but for other reasons also, there is an increasing demand for study of the sun. Marked fluctuations in the amount of heat thrown off by the body have been noticed, and it is in the highest degree essential that any connection which may exist between them and meteorological eccentricities shall be detected. Professor Garriott finds much testimony to justify a belief that sunspots are in some sense symptomatic of disturbances in terrestrial conditions; and, while the case is not yet complete enough to warrant forecasting on that basis, the wisdom of further inquiry by competent experts is apparent.

The government has given careful consideration to a number of suggestions and theories which have been supposed to have a bearing on the weather of the United States. One was the supposition that the Japan current dominated the rainfall of California, and that indications of drouth or precipitation might be obtained by watching the changes in the strength and course of the current along the Aleutian Islands. For this hypothesis the Weather Bureau has not been able to find a rational foundation. The time honored notion that the moon is a potent agent was also considered, and Professor Garriott presents a fine array of quotations from modern authorities regarding it. A rigid comparison of lunar phases with weather changes leads Buchan and other prominent meteorologists to declare that the moon has no discernible influence at all, while Von Bebber concedes that there may possibly be a trifling modification of air pressure, but not one which can be utilized practically. Again, there is a recognizable tendency toward a six or seven day period. Sometimes rain will fall on the same day of the week for several successive weeks. Here is a fact which has been turned to account by one group of amateur weather prophets who contribute to the newspapers, though they sometimes mask their plan under a pretense of faith in lunar control. According to Professor Garriott, however, the periodicity is not regular and continuous enough to be of value to official forecasters.

The Weather Bureau has given much attention to the so-called "planetary" meteorology, and finds it to be sadly vulnerable. One of its devotees makes everything hinge on the movements of Vulcan, a body to which he assigns an orbit inside that of Mercury, but whose existence no astronomer has been able to demonstrate. Another prophet who talks learnedly about the crises which attend the equinoxes of the planets proves to be unable to compute accurately the time when such astronomical phenomena occur. Moreover, there seems to be no reason to believe that even if the dates were properly calculated anything unusual would be observed on them. After all, the real test of this sort of prediction is the extent to which verification is possible. Those who indulge in it are usually so vague in their warnings that it is impossible to tell in advance where the trouble of which they give notice is to be expected. Hence, it is hard to discover whether they are right or wrong. A man who has won some notoriety in the West for such work was persuaded last year to accept the 90th meridan of longitude as representing the locality for which his forecasts were meant. It then proved that his guesses concerning the temperature were incorrect more frequently than they were correct. Professor Willis L. Moore, the present head of the Weather Bureau, in an introduction to Professor Garriott's pamphlet, says of these irresponsible utterances: "They may properly be classed with quack medicine. They are both harmful in the extreme."

FARM GRASSES OF THE UNITED STATES.

It is astonishing that so little in the way of popular treatises on grasses in the way of books have been published in the United States. Of the earlier works the books of Flint, Killebrew, Beal and shaw are valuable. Some of these books are, however, out of date. The Beal book is an excellent and authoritive work. The United States department of agriculture has, of course, published many valuable bulletins which have been of great service to the farmers of this country. Prof. Spillman, agrostologist of the United States department of agriculture is the author of a book on farm grasses of the United States. The book is divided into fifteen chapters, treating the following topics: The grass crop, meadows and pastures, the seed, timothy, blue grasses, millits, two prominent southern grasses, red top and orchard grass, brome grasses, grasses of minor importance, grasses for special conditions, lawns and lawn making. The chapter on lawns and lawn making was prepared by C. R. Ball. The chapter on seeds by Edgar Brown. A grass crop being so important, deserves much more consideration by the average farmer than is usually given it. One is, therefore astonished that so little attention has been given it by our experimental stations. Few of our northern and eastern stations have published anything on the subject. Prof. Spillman thinks it is safe to say that in the United States 120,000,000 acres are devoted to pasture purposes and 59,000,000 acres to hay. The value of the hay crop for 1899 is estimated at $484,256,846. The only crop exceeding this was maize. Prof. Spillman says:

"It is impossible to estimate the value of the feed obtained from the 120,000,000 acres of improved pasture land, but when we add the value of this and the pasture value of the remaining 82 per cent of the total area of the country classed as unimproved land, nearly all of which is grazed, it is probable that the grass crop surpasses in value any other crop. But since hay is too bulky and usually too cheap to bear long distance shipment, comparatively a small portion of it finds its way to the markets. It is fortunate that at least one important crop must, from its very nature, be largely consumed on the land where it is produced. Otherwise we should long ago have reduced the fertility of practically all the farm lands in this country to so low a point as to have rendered farming unprofitable, just as has been done in all the older parts of the country where live stock farming has been neglected. It is a notable fact that in those portions of the country which have enjoyed the most permanent prosperity the grasses and live stock have always occupied an important place. In the New England states, which have felt keenly the competition of the fertile lands of the central west, agriculture has been

able to maintain itself only by devoting the major portion of the improved land to grasses."

Prof. Spillman gives an interesting map on the percentage of improved land devoted to hay and forage.—*Prof. L. H. Pammell in Register and Leader.*

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 30.28 inches; highest observed, 30.85 inches, at Sioux City, on the 2d; lowest observed, 29.66 inches, at Charles City and Davenport, on the 8th; range for state, 1.19 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 115 stations, was 12.8°, which is 6.8° below normal. By sections the mean temperatures were as follows: Northern section 10.6°, which is 5.9° below normal; central section 12.7°, which is 7.6° below normal; southern section 15.1°, which is 6.4° below normal. The highest monthly mean was 18.0° at Keokuk; lowest monthly mean, 8.1° at Forest City. The highest temperature reported was 69° at Glenwood and Onawa on the 28th; lowest temperature reported, 41° below zero at Galva and Ida Grove on the 2d. The average monthly maximum was 57.2°; average monthly minimum—30.6°. Greatest daily range 57° at Sibley; average of greatest daily ranges, 40.0°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 125 stations, was 1.57 inches, which is 0.53 of an inch above normal. The averages by sections were as follows: Northern section, 1.35 inches, which is .46 of an inch above normal; central section, 1.68 inches, which is 0.62 of an inch above normal; southern section, 1 67 inches, which is 0.53 of an inch above normal. The largest amount reported was 2.97 inches at Belle Plaine; least amount reported, 0.44 of an inch, at Sioux City. The greatest daily rainfall reported was 1.10 inches at Ottumwa, on the 24th. Average number of days on which .01 of an inch or more was reported, 7.

WIND AND WEATHER.—Prevailing direction of the wind northwest; highest velocity reported, 49 miles per hour, from the northwest, at Sioux City, on the 14th. Average number of clear days, 14; partly cloudy, 7; cloudy, 7.

PHENOLOGICAL OBSERVATIONS. 1904.

By direction of the Chief of the Weather Bureau, blank forms were seut to a number of voluntary observers in the winter of 1904, with request that they would note thereon the progress of the season as indicated by the earliest appearance of foliage and flowers, the movement of migratory birds and the various stages of growth of cereals, staple farm crops, fruits, etc. At the close of the year reports were received from nine observers whose names and addresses are as follows: Arthur Betts, Ridgeway, Winneshiek county; Fred McCullough, Hartwick, Poweshiek county; M. F. Boyd, Madrid, Boone county, N. W. Rowell, Afton, Union county; H. L. Felter, Washta, Cherokee county; E. S. King, Grundy Center, Grundy county; N. M. Leonard, Waukee, Dallas county; John H. Ver Steeg, Pella, Marion county; Rex Shriver, Allerton, Wayne county.

The averages of the dates recorded at the several stations as to the foliage of forest and shade trees are shown in the following tables:

Kind of Trees.	First Leaves.	Woods Green.	Leaves Coloring.	Leaves Falling.	Woods Bare.
Soft Maple	May 2	May 10	Sept. 25	Sept. 25	Nov. 5.
Ash	May 6	May 12	Sept. 30	Sept. 30	Nov. 1.
Oak	May 5	May 20	Sept. 20	Sept. 25	Nov. 4.

FRUIT TREES AND VINES.

Kind.	Leaves Start.	First Bloom.	Harvest Begun.	Character of Yield.
Apple	May 1	May 6	Aug. 1	Good to fair.
Peach	May 1	May 5	Sept. 15	Small.
Plum	May 3	May 5	Aug. 20	Poor.
Cherry	May 2	May 7	June 22	Fair.
Strawberry	April 20	May 9	June 20	Good.
Blackberry	April 30	June 4	July 30	Fair.
Raspberry	April 30	June 1	July 3	Good.
Grape	May 10.	May 15.	Sept. 1.	Fair.

CEREALS AND OTHER FIELD CROPS.

Kind of Crop.	Preparation of Soil.		Planting.		Harvesting.		Character of Crop.
	Begins.	Ended.	Begins.	Ended.	Begins.	Ended.	
Corn	April 15	May 30	May 5	June 3	Oct. 15	Nov. 30	Fair in yield and quality.
Spring wheat	April 1	April 15	April 5	April 18	July 25	Aug. 10	Poor—blights and rust.
Oats	April 1	April 20	April 10	April 22	July 15	Aug. 5	Variable—yield and quality.
Barley	April 1	April 18	April 8	April 20	July 20	Aug. 2	Fair.
Hay crop	.....	.....	.....	.....	July 1	Aug. 10	Excellent in quality.
Potatoes	April 2	April 30	April 10	May 20	July 20	Oct. 15	Heavy yield—good.

NOTES.

Corn tassels and silk were quite general in the central section about July 15th to 20th. Roasting ears were noted as early as August 12th and earliest corn was dented about August 20th.

Feeding early corn began August 20th on account of scarcity of old corn in farmers cribs.

First croaking of frogs noted March 28th. Wild geese were observed flying northward April 2d and ducks as early as March 1st.

M. F. Boyd, near Madrid noted first appearance of robins March 24th, bluebirds April 3d, brown thrush April 17th, swallows April 28th and first butterfly April 17th.

The honey crop was excellent in quality.

The peach comes into bloom about the time when apple blossoms appear. The foliage and bloom of the pear also come about the same time. These are minor crops in Iowa.

OBSERVER'S NOTES.

AFTON—*N. W. Rowell.* Latter half of month lifted mean temperature toward normal. Notes of robins heard at close of month.

ALLERTON—*Rex Shriver.* At end of month snow was almost gone, and roads were drying up.

ALTA—*David E. Hadden.* First half of February was intensely cold, latter half pleasant, and closing days were quite springlike; snow thawed rapidly and none remained at end of month.

AMANA—*C. Schadt.* Mercury fell to -32° on 13th; snow fell to depth of 15.7 inches and drifted badly; but little left at close of month.

BOONE—*Carl Fritz Henning.* First robbin heard on 25th; geese flying northward on 26th.

BONAPARTE—*B. R. Vale.* First half incessantly cold, the lowest in many years; last week warm, and roads were muddy.

BRITT—*Geo. P. Hardwick.* First half very cold; snow drifted badly; much ground bare at end of month

CLINTON—*Luke Roberts.* The mean temperature of February was 14.6° which is 7° below normal. There has been one colder February and that was in 1885, with a mean of 8.3°. The coldest day was the 13th, with a mean of 13.7° below zero. The minimum for that day was 27° below zero. This was the coldest registered since February 9, 1899, on which day it was 28° below zero. The total snowfall during the month was 18 inches, giving some good sleighing. The aggregate precipitation was 2.44 inches. Total for the winter 5.98 inches, which is 0.41 of an inch above the normal for past 26 years.

ELKADER—*Chas. Reinecke.* Total snowfall for winter months, 46 inches. Lowest temperature, 30° below zero on February 15th.

FORREST CITY—*J. A. Peters.* Coldest weather of record on the 13th, temperature 31° below zero. Snow drifted badly; the railway traffic was abandoned 3 days; coldest February of record here.

POCAHONTAS—*F. E. Hronek.* First half of February coldest since 1888; muskrat prophet failed again.

RIDGEWAY—*Arthur Betts.* First two weeks quite cold; latter half mild; 210 hours of sunshine, nine days without a cloud.

WAUKEE—*E. J. Leonard.* First half very cold, with a maximum of only 23°, and minimum below zero on twelve days. Latter half much warmer and birds appeared on 27th.

BELATED REPORTS.

SPIRIT LAKE (*c*).—November. Mean temperature 39.8°; highest 74° on the 4th; greatest daily range 46°; total precipitation .10 of an inch; greatest in 24 hours .10 of an inch; total snow fall 1.0 inch. Number of rainy days, 1.

OSCEOLA.—December. Mean temperature 24.4°; highest 65° on the 23d; lowest -6° on the 28th; greatest daily range 55°; total precipitation 1.50 inches; greatest in 24 hours .60 of an inch; total snowfall 15.0 inches; prevailing direction, southwest. Number of rainy days, 4.

OSCEOLA.—January. Mean temperature 12.2°; highest 56° on the 11th; lowest—17° on the 25th; greatest daily range 63°; prevailing direction, northwest.

ERROR IN DECEMBER REVIEW.

ALGONA.—Total precipitation recorded 1.27 inches on pages 5 and 9, should have been 1.37 inches. Precipitation on 3d, blank, should have been .10 of an inch. Total snowfall recorded 11.0 inches on page 5, should have been 12.0 inches.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—O. A. OLSON, Forest City.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

Afton ..... Hon. N. W. Rowell
Albia ..... E. R. Reeve
Algona ..... Dr. F. T. Seeley
Allerton ..... Rex Shriver
Alta ..... D. E. Hadden
Alta (near) ..... W. J. Minard
Amana ..... Conrad Schadt
Ames ..... Exp. Station
Atlantic ..... J. W. Love
Audubon ..... Geo. E. Kellogg
Baxter ..... W. T. Thorp
Bedford ..... E. E. Healy
Belknap ..... A. W. Rankin
Belle Plaine ..... S. P. Vandike
Bonaparte ..... Hon. B. R. Vale
Boone ..... Carl Fritz Henning
Britt ..... G. P. Hardwick
Buckingham (Traer P. O.) ..... Dr. W. A. Daniel
Burlington ..... I. S. Shontz
Carroll ..... Moses Simon
Cedar Rapids ..... Electric Light and Power Co.
Chariton ..... C. C. Burr
Charles City ..... *Clarence J. Root
Clarinda ..... A. S. Van Sandt
Clear Lake ..... E. C. Schrader
Clinton ..... Luke Roberts
College Springs ..... A. M. Finley
Columbus Junction ..... J. B. Johnston
Corning ..... Jerome Smith
Corydon ..... Miss May Miller
Cresco ..... L. G. Krumm
Creston ..... Rev. Wm. L. Gaston
Cumberland ..... Agent C., B. & Q. R'y
Davenport ..... *J. M. Sherier
Delaware ..... Wm. Ball
Decorah ..... F. H. Baker
Denison ..... Prof. W. C. Van Ness
Des Moines ..... *Geo. M. Chappel
De Soto ..... R. D. Minard
Dows ..... A. C. Fuller
Dubuque ..... *Orin Parker
Earlham, R. F. D. ..... Geo. Phillips
Elkader ..... Chas. Reinecke
Elliott ..... Henry Barnes
Estherville ..... Earle W. Peterson
Fayette ..... R. Z. Latimer
Florence (Clarion P. O.) ..... H. Du Bois
Forest City ..... J. A. Peters
Fort Dodge ..... Tobin College
Ft. Madison ..... Miss L. A. McCready
Galva ..... C. E. B. Roberts
Gilman ..... Jas. L. Wylie
Glenwood ..... J. P. Jackson
Grand Meadow (Postville P.O.) ..... F. L. Williams
Greene ..... J. L. Cole
Greenfield ..... J. G. Culver
Grinnell ..... Prof. J. S. Buck
Grinnell (near) ..... A. O. Price
Grundy Center ..... Ed King
Guthrie Center ..... D. G. Beardsley
Hampton ..... E. C. Grenelle
Hanlontown ..... Miss G. M. Paschen
Harlan ..... C. A. Reynolds
Hopeville ..... M. T. Ashley
Humboldt ..... H. S. Wells
Ida Grove ..... J. E. Conn
Independence ..... E. F. Wulfke
Indianola ..... Prof. J. L. Tilton
Inwood ..... Geo. M. Larsen
Iowa City ..... Prof. A. A. Veblen
Iowa Falls ..... J. B. Parmelee
Keokuk ..... *Fred Z. Gosewisch
Keosauqua ..... Prof. J. A. Landes
Knoxville ..... Casey & Bellville
Lacona ..... Agent C., B. & Q. R'y
Lansing ..... J. Ackerman
Larrabee ..... H. B. Strever
Lenox ..... J. L. Hurley
Le Mars ..... Dr. T. E. Cole
Leon ..... Millard F. Stookey
Little Sioux ..... G. H. Gibson
Logan ..... Glenn H. Stern
Maquoketa ..... Frank W. Keeney
Marshalltown ..... Mrs. Elizabeth Jones
Mason City ..... J. S. Mills
Massena ..... Fred. T Knott
Montezuma ..... C. J. Griffin
Monticello ..... A. Matthiessen
Mount Vernon ..... Rev. J. W. Hubbard
Mt. Ayr ..... A. F. Beard
Mt. Pleasant ..... Prof. J. W. Edwards
New Hampton ..... A. F. Kemman
Newton ..... Hon. J. P. Beatty
Northwood ..... Dr. E. R. Young
Odebolt ..... E. Starner
Ogden ..... C. L. Zollinger
Olin ..... Hon. Nathan Potter
Omaha, Neb ..... *L. A. Welsh
Onawa ..... C. G. Perkins
Osage ..... G. D. Pattingill
Oskaloosa ..... Jos. Boyd
Ottumwa ..... Dr. W. B. La Force
Pacific Junction ..... Agent C., B. & Q. R'y
Perry ..... J. A. Harvey
Plover ..... J. S. Smith
Pocahontas ..... F. E. Hronek
Red Oak ..... G. W. Holt
Ridgeway ..... Arthur Betts
Rock Rapids ..... W. C. Wyckoff
Rockwell City ..... C. M. Randall
Ruthven ..... F. M. Fitzgerald
Sac City ..... Frank Stouffer
St. Charles ..... C. W. Minard
Sheldon ..... Dr. A. W. Beach
Sibley ..... H. G. Doolittle
Sidney ..... A. P. Speers
Sigourney ..... J. T. Parker
Sioux Center ..... Jacob de Ruyter
Sioux City ..... *U. G. Purssell
Spirit Lake ..... W. C. Drummond
Stockport ..... C. L. Beswick

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XVI. MARCH, 1905. No. 3.

MARCH WEATHER AND CROPS

March 1905 was phenomenally warm, breaking all previous records of high average temperature for the state at large. The mean for the month was 41.5°, which is 9.1° above the normal. The spring like conditions were continuous, with the exception of about six days in the second decade. The frost disappeared and the surface dried off with unusual rapidity. Conditions were favorable for much preparatory work the first half of the month, and during the last ten days the bulk of the spring wheat area was seeded, with soil in fine tilth. Considerable oats and barley were also sown during the closing days of the month. A good start was made in plowing for corn, the most of it being in fields recently in meadow or pasture. The reports show some reduction in the acreage of spring wheat. Winter wheat, rye and clover came through the winter in fine condition. There were no indications of injury to fruit buds. The season opened fully a week earlier than the average, and over two weeks in advance of 1904.

BEFORE AND AFTER TAKING.

About the 1st of March the *Cedar Rapids Republican* published in condensed form the prognosis of March weather, issued by a noted long range weather profit as follows:

The irrepressible prophet who made a bad blunder with his predictions for February, is out again with dire predictions for March. According to his lurid dreams there will be one storm close upon another all through the month. He says that the probable result of conditions obtaining on the 3d, 4th and 5th will be a low barometer, warmer weather and southerly winds, culminating in rain, sleet and snowstorm within forty-eight hours of the 5th. Destructive sleet storms will be characteristic of this and the storm period immediately following. He does not anticipate a cold wave.

The second storm period will be from the 7th to the 12th with a low barometer and furious storms of rain, turning to sleet and later to blizzards. Equinoctial tempests are slated to do many and varied stunts.

The third storm period will be from the 15th to the 17th, with reactionary storms, and more decided rain and snowstorms.

The fourth period will be from the 19th to the 24th, at which time the moon will be full, and will be characterized by electrical displays, snow and sleet, winding up progressively with a great cold wave.

The fifth period will be from the 27th to the 29th with snow and rainstorms passing eastwardly.

These conditions are slated to bring high water and local floods of great danger in many localities.

On April 1st the same paper contained the following editorial paragraph relating to the local weather conditions during the past month:

The month of March, which ended at midnight, will go down in the records of the weather bureau as a remarkable month. It has been a great deal more like April than like March. Meantime just for the benefit of common sense it might be well to remember that the Rev. —— prophesied that March, 1905, would be a month characterized by severe atmospheric disturbances, sleet storms and blizzards.

The editor of the *Republican* should take note of the fact that the long range prophet does not make forecasts for any specified locality or date. His range is broad as to latitude and longitude, as well as time. Give him scope and he can verify everything. The March sleet storms and blizzards may have occurred in Siberia, Finland, Labrador or the Klondike. Wait till the returns are in from all the back districts. The astrologist gave warning that Mercury would pull off a sleet storm during its period of "perturbation"; but he couldn't tell exactly where the sleet would strike the earth. It's difficult to hit a small spot on a revolving target. Give the almanac-maker a square deal.

Of course such prophecies are worthless; but how much exact science can you expect to buy for 25 cents?

NOTES AND COMMENTS.

According to the *Modern Miller* the condition of winter wheat is quite favorable, except in a few localities.

A co-operative meteorological station has been established in Creston, Union county, in charge of Rev. W. L. Gaston, who is much interested in the service and well qualified to render accurate reports. The elevation of Creston is 1,312 feet above sea level, at the C., B. & Q. R'y track. We hope to maintain a permanent station at that important point.

Secretary Wilson is reported to have said in a recent interview: "The development of the beet sugar industry in this country has been so rapid and attended with such striking success, that it is only a matter of time when the millions of dollars we are now paying for imported sugar will be spent among our own people for American beet sugar."

The fluctuations in the snowfall of the past eight years seem to have affected particular regions with a certain uniformity,

according to figures compiled by the Street Railway *Journal*. New England had less snow in the season of 1904-5 than in the previous year and also less than the average for the six years ending June 30, 1903. The middle states had more snow in 1904-5 than the average for the six years ending 1903 and more than in 1903-4 with the exception of central and western New York, where the fall in 1903-4 was phenomenal. In the middle west, again, the fall was less than the average for the six years ending 1903 and less than the fall in 1903-4. Owing to the steady cold weather the past winter the snow in cities was beaten down until it became solid as a rock and was with difficulty removed.

The provinces of Andalusia, Valencia and Arragon, Spain, are suffering from a serious drought, causing almost total suspension of field work, with much suffering among the poorest classes.

If the season should be dry the value of loose, dry mulch will be appreciated. This method of keeping moisture in the ground is slowly becoming understood. The Department of Agriculture gives the following explanation of its advantages:

"As the moisture from the surface evaporates it is replaced by moisture drawn from greater depths by capillary attraction, just as oil is drawn through the wick of a lamp to replace that which is consumed by the flame. The rapidity with which moisture will evaporate from the ground depends upon the condition of the capillary tubes, or pores, that connect the surface with the deeper soil. Any dry blanket that can be placed between the atmosphere and the damp soil will check this evaporation. The most practical protection is a covering of finely pulverized dry soil two or three inches deep. By thoroughly loosening the surface layer the soil particles are disarranged so that the capillary tubes are not continuous. In this condition the surface soil becomes quite dry, and remains so without absorbing moisture from below, thus acting as a mulch and retaining the moisture within reach of the plant roots. It is necessary that this soil mulch be fine, for if it is composed of clods, air circulates between them and causes evaporation to take place from the soil below the surface. A rain, however, will wet the surface, causing the soil to run together and crust, thus restoring capillarity. This makes another cultivation necessary in order to renew the blanket of fine, loose soil."

THE VERNAL EQUINOX.

[Chicago Chronicle, March 21.]

As announced by the United States branch hydrographic office in this city, the sun will cross the equator and the vernal equinox will occur today at forty-nine minutes and thirty-six seconds past noon.

When we speak of the sun crossing the equator we are using, of course, impressionist language. The sun, it is true, is moving through the universe at an incredible speed around a more glorious sun, perhaps Alcyone, and is at the same time revolving on its axis once in twenty-five days, but with reference to the solar system it is stationary and all the vicissitudes of our little world result from its own tantrums and not from any movement of the sun.

The vernal and autumnal equinoxes and the summer and winter solstices result from the inclination of the earth's axis to the plane of its orbit at an angle of twenty-three and one-half degrees and always practically in the same direction. This causes the equator to cut the plane of the earth's orbit at the same angle. Consequently the sun can not be vertical over the equator except when and where the equator and the plane of the earth's orbit coincide. This happens on March 21st and September 23d.

As long ago as the time of Hipparchus it was discovered that the vernal equinox occurred a few minutes earlier every year and the acceleration of time is now ascertained to be twenty minutes and twenty-three seconds. The inference is that the inclination of the earth's axis to the plane of its orbit is changing slightly from year to year. Indeed, it is established that the earth is wabbling. It can not be said that it is exactly dancing a jig, but we know that its poles describe a circle once in 26,000 years. The consequence is that the vernal equinox will occur at a different hour and minute and second of the day every year for the next 26,000 years and then return to the hour, minute and second at which it will occur today. At present the north pole points to the north star, and poets have made great use of that fact in their business, but the truth is it is only a temporary arrangement

This wabbling or nodding propensity of our earth is credited with being the cause of the glacial epoch. Many thousands of years ago, the theory is, the north pole leaned away from the sun in the winter and toward the sun in the summer much more than at present. The result was that both the cold of winter and the heat of summer were intensified, and this produced immense glaciers in the winter and terrific thaws and floods in the summer.

The vernal equinox has always been celebrated by human beings as a time of great rejoicing, but not always according to knowledge. The church has appropriated it and called it Easter, but having glued it to a shifting calendar Easter and the vernal equinox have now drifted far apart. Some years ago the equinox was celebrated in an amusing dramatical performance in every ship on the ocean. Apparently the more we know about the equinox astronomically the less notice it attracts.

This day should by rights be New Year's day. The equinox is a world wide phenomenon. The day and the night this day are of equal length all over the globe and that never occurs except at the equinoxes. The autumnal equinox is a sad and dreary season and the vernal equinox is the time of birds and flowers and reviving nature.

Everything animate takes a fresh start today and this ought to be the beginning of a new year.

MARCH WEATHER.

Extracts from Weather Crop Bulletin of United States Weather Bureau for March, 1905.

WASHINGTON, D. C., April 1, 1905.

As a whole, March, 1905, was very mild throughout nearly the entire country, the temperature averaging above the normal everywhere, except in extreme northeastern New England and over a limited area in the southern Plateau, where a very slight deficiency is shown. Throughout the northern Rocky Mountain districts, the central valleys, Lake region, and Southern States the temperature excess was marked, the departures from normal ranging from 3° to 12° per day, being greatest in the Missouri and Red River of the North valleys. The first half of the month was decidedly cold in New England and the Middle Atlantic States and over a large part of the Lake region, but over these districts the latter part of the month was very mild. The temperature was above the normal throughout the rest of the country during nearly the whole of the month.

From Texas northward to the central Missouri valley and throughout the southern Rocky Mountain region and California the precipitation during March exceeded the average. There was also more than the average in the northern portion of the upper Lake region, and in portions of the Middle Atlantic States, upper Ohio Valley and portions of the South Atlantic and East Gulf States. In the lower Ohio and central Mississippi valleys, the interior of the central and east Gulf States, and in

the Carolinas, Virginia, and New England the precipitation was below the average, marked deficiencies occurring in the western portion of the Carolinas, Tennessee, and over the northern portion of the east Gulf States. The rainfall in Arizona and southern California was unusually heavy, from 2 to 3 inches more than the monthly average being reported from that region.

Nearly the entire country has experienced exceptionally favorable conditions for farming operations during the month of March. The temperatures were mild throughout the month, with the exception of the Lake region, Middle Atlantic States, and New England, where it was cold during the first half, but mild and favorable during the second half. Portions of the Gulf States suffered from too much rain, and farm work has been considerably delayed in the central and western portions. Throughout the central valleys and generally on the Pacific coast farm work is unusually well advanced, and, while slow progress was made in the Middle Atlantic States and New England during the forepart of the month, operations were active during the latter part.

Winter wheat is very promising, practically all reports indicating that this crop has come through the winter in unusually fine condition in the principal winter wheat states. The outlook on the Pacific coast is also promising, except in portions of southeastern Washington, where considerable was winter-killed.

Good progress was made with seeding of spring wheat and oats, the seeding of oats being nearly completed in Illinois and Missouri, and in the more southerly states the early sown is coming up to good stands. Spring wheat seeding is unusually well advanced over the southern portion of the spring wheat region, and was in progress at the close of the month in the extreme north portion.

Throughout the central valleys the soil was in fine condition for plowing during most of the month and this work is well advanced. Some corn has been planted as far north as Kansas, Missouri, Tennessee and North Carolina, while farther south a considerable part of the crop has been planted and some is up.

Reports indicate that peach buds have been extensively killed in the central valleys and central Gulf States, but in the Atlantic coast districts peaches have been but little injured so far. The reports respecting other fruits are generally encouraging.

CLIMATOLOGY OF THE MONTH OF MARCH, 1905.

BAROMETER.—Mean pressure, 30.03 inches; highest observed, 30.57 inches, at Dubuque, on the 12th; lowest observed, 29.39 inches, at Charles City and Des Moines on the 27th; range for state, 1.18 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 122 stations, was 41.5 degrees, which is 9.1° above normal.

By sections the mean temperatures were as follows; Northern section 38.3°, which is 8.7° above normal; central section 41.3°, which is 9.1° above normal; southern section 44.9°, which is 9.0° above normal. The highest monthly mean was 47.2° at College Springs and Sidney; lowest monthly mean, 35.9° at Cresco. The highest temperature reported was 84° at Onawa on the 27th; lowest temperature reported 1°, at Fayette, Grand Meadow, Osage and Ridgeway on the 11th. The average monthly maximum was 75.6°; average monthly minimum, 8.6°. Greatest daily range, 52° at Monticello; average of greatest daily ranges, 38.2°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 132 stations, was 2.04 inches, which is .20 of an inch above normal. The averages by sections were as follows: Northern section, 1.97 inches, which is .31 of an inch above normal; central section, 2.23 inches, which is .35 of an inch above normal; southern section, 1.93 inches, which is .04 of an inch below normal. The largest amount reported was 3.70 inches at Inwood; least amount reported, .39 of an inch, at Glenwood. The greatest daily rainfall reported was 3.00 inches at Inwood on the 18th. Average number of days on which .01 of an inch or more was reported, 8.

WIND AND WEATHER.—Prevailing direction of the wind, south; highest velocity reported, 52 miles per hour, from the south, at Sioux City, on the 27th. Average number of clear days, 8; partly cloudy, 8; cloudy, 15.

OBSERVERS' NOTES.

AFTON. *N. W. Rowell.* Season is fully 30 days in advance of last year; nothing like it in years.

ALLERTON. *Rex Shriver.* Pastures and meadows starting nicely; month very mild.

ALTA. *David E. Hadden.* About all precipitation of month fell in the middle decade; balance of month, spring like.

AMANA. *C. Schadt.* Season about three weeks early; seeding wheat and oats well advanced.

ATLANTIC. *J. W. Love.* A very good month for farmers, and well improved; grass growing nicely.

BAXTER. *W. T. Thorp.* Seeding begun on 27th; ground very dry.

BONAPARTE. *B. R. Vale.* Rain 2.03 inches; all fell the last half of month; some sod plowing and very little oats sown last week of the month.

BOONE. *Carl Fritz Henning.* Ice went out of Des Moines river March 2d; seeding spring wheat and oats begun the last week.

BRITT. *Geo. P. Hardwick.* Latter half of March was like April weather with advanced growth of grass and soft maple in bloom. English sparrows devoured buds of apple, plum and cherry trees which will lessen crop.

CHARITON. *C C. Burr.* More than average amount of farm work was done in March; soil in good tilth.

CLINTON. *Luke Roberts.* March temperature 6.5° above normal; rainfall slightly in excess of normal; frost out of ground by the 20th and much plowing was done.

CRESCO. *L. G. Krumm.* Seeding began on the 29th—two weeks earlier than last year.

ELKADER. *Chas. Reinecke.* Ice went out of the Turkey river March 4th.

ELLIOTT. *Henry Barnes.* On 3d, farmers began plowing sod; on 10th, they were seeding wheat; more farm work done in March than in preceding years.

FOREST CITY. *J. A. Peters.* Wheat seeding began on 26th; some oats sown in last week. Robins heard on 20th; frogs on 27th.

POSTVILLE. *F. L. Williams.* Month was warm; snow went off gradually; grass well started; plowing began on 28th; first seeding on 31st.

GRUNDY CENTER. *E. S. King.* Warm month; 8-foot snowdrifts entirely gone on 31st; sod plowing began on 20th; oats seeding on 29th.

HANLONTOWN. *Miss G. M. Paschen.* Wheat seeding on 28th; oats seeding on 31st; pussy willows and lilac bushes in bud; blue grass quite green.

IDA GROVE. *J E. Conn.* An exceptionally fine March; a great deal of plowing and some seeding done.

INDIANOLA. *J. L. Tilton.* Last of the heavy drifts disappeared on 26th.

LITTLE SIOUX. *Geo. H. Gibson.* Wheat sowing began on 6th.

MASSENA. *F. T. Knott.* Wheat seeding was nearly all done the last ten days, and some oats were sown.

POCAHONTAS. *F. E. Hronek* Old proverb failed; March came and went out like a lamb; seeding begun, and ground in fine condition.

RIDGEWAY. *Arthur Betts.* One of the warmest of Marches; 156 hours of sunshine; spring work began on 27th; snow on 13th and 14th.

SHELDON. *A. W. Beach.* Seeding commenced on the 20th, and wheat, about 75 per cent sown on 31st; soil condition good.

WAUKEE. *E. J. Leonard.* Month unusually fair; seeding done earliest in years.

ERRATA.

STORM LAKE—November, 1903. Total precipitation recorded .52 inch on pages 8 and 12, should have been .61 inch.

Total snowfall recorded 0.1 inch on page 8, should have been 1.0 inch.

STORM LAKE—December, 1903. Total precipitation recorded Trace on pages 4, 6 and 10, should have been 1.3 inch.

Total snowfall recorded 0.1 inch on page 6, should have been 1.3 inches.

STORM LAKE—January, 1904. Total precipitation recorded .02 inch on pages 7 and 11, should have been .41 inch.

Total snowfall recorded 0.4 inch on page 7, should have been 4.1 inches.

STORM LAKE—February, 1904. Total precipitation recorded .08 inch on pages 6 and 11, should have been .86 inch.

Total snowfall recorded 0.9 inch on page 6, should have been 8.6 inches.

STORM LAKE—March, 1904. Total precipitation recorded 1.54 inches on pages 7 and 12, should have been 1.63 inches.

Total snowfall recorded 0.1 inch on page 7, should have been 1.0 inch.

STORM LAKE—November, 1904. Total precipitation recorded 03 inch on pages 9 and 13, should have been .30 inch.

Total snowfall recorded 0.3 inch on page 9, should have been 3.0 inches.

STORM LAKE—December, 1904. Total precipitation recorded .06 inch on pages 5 and 9, should have been .80 inch.

Total snowfall recorded .8 inch on page 5, should have been 8.0 inches.

STORM LAKE—January, 1905. Total precipitation recorded .12 inch on pages 5, 7 and 12, should have been 1.48 inches.

Total snowfall recorded 1.5 inches on page 7, should have been 14.8 inches.

BELATED REPORT.

AMES—February. Mean temperature, 13.5°; highest, 61°, on the 28th; lowest, -31°, on the 13th; greatest daily range, 36°. Total precipitation, .67 inch; greatest in 24 hours, .27 inch; prevailing direction, north and southwest; total snowfall, 11.0 inches. Number of clear days, 17; partly cloudy, 6; cloudy, 5; rainy, 4.

COLLEGE SPRINGS—February. Mean temperature, 14 1°; highest, 62°, on the 28th; lowest, -30°, on the 14th; greatest daily range, 32°. Total precipitation, 1 58 inches; greatest in 24 hours, .35 inch, on the 6th; prevailing direction, northwest; total snowfall, 13.8 inches. Number of clear days, 13; partly cloudy, 7; cloudy, 8; rainy, 8.

KNOXVILLE—March. Mean temper ture, 43.9°; highest, 79°, on the 27th; lowest, -10°, on the 11th; greatest daily range 44°. Total precipitation, 1.40 inches; greatest in 24 hours, .75 inch, on the 23d; total snowfall, 1.0 inch; prevailing direction, northeast. Number of clear days, 8; partly cloudy, 9; cloudy, 14; rainy, 6.

KNOXVILLE—February. Mean temperature, 16.6°; highest, 69°, on the 20th; lowest, -26°, on the 13th; greatest daily range, 33°. Total precipitation, .40 inch; greatest in 24 hours, .20 inch, on the 27th; total snowfall, 2.0 inches; prevailing direction, southwest, northwest. Number of clear days, 15; partly cloudy, 4; cloudy, 9; rainy, 3.

ERRATA IN JANUARY REVIEW.

FAYETIE—Number of days missing recorded [f] should have been [g], on page 7.

ROCKWELL CITY—Mean temperature recorded, 10.4°, on page 8, should have been 10.2°.

WATERLOO—Total precipitation recorded .87 inch, on page 8, should have been .74 inch.

Total snowfall recorded 10.0 inches, on page 8, should have been 8.0 inches.

COLUMBUS JUNCTION—Total snowfall recorded 11.2 inches, on page 7, should have been 10.2 inches.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. McDONALD, Bayard.
Tenth District—O. A. OLSON, Forest City.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XVI. APRIL, 1905. No. 4.

APRIL WEATHER AND CROPS.

April was characterized by unusually variable temperature, the maximum for the state being 90° at Clarinda on the 9th, and the minimum 10° at Inwood and Sibley, on the 14th. The mean for the state was 47.5°, which is 1.8° below the April average. Severe frosts occurred in every week of the month, causing much apprehension for the safety of fruit buds; but they were generally not far enough advanced to suffer damage, except the earliest varieties in the southern section, which were injured slightly. The rainfall was below normal in the northern section, and somewhat above normal in the central and southern sections. In portions of the southern section excessive moisture retarded plowing for corn and general field work in the latter half of the month.

In the larger part of the state conditions were favorable for early seeding of wheat, oats and barley, and these crops were mostly sown before April 15th. Germination was retarded by cool weather. There was little hindrance to field work, except in localities where the rainfall was heaviest, and clay subsoil retained the moisture. At the close of April the season was still somewhat earlier than the average of recent years in respect to the growth of grasses and foilage, and much more than the usual amount of plowing and harrowing had been done preparatory to planting corn. Reports have been received of the beginning of corn planting during the last three days of the month. The soil was never in better tilth for planting than it was on May 1st, though the cool weather served to delay that work.

NOTES AND COMMENTS.

In New York May day was ushered in with snow and hail at various places, and the temperature was near the freezing point.

March was relatively much warmer than April. The temperature was 9.1° above normal in the former, and 1.8° below normal in the latter month. So irregularity is the regular thing in the weather, sometimes.

Consul-General Williams, of Singapore, states that the Philippines contain 400,000,000 acres of valuable woods, there being 450 varieties. Mr. Williams declares that in ten years we will be able to get all the gutta-percha and rubber we can use from the Philippines.

Given a wheat crop of 748,000,000 bushels, an amount equal to that gathered in 1901, and 200,000,000 bushels larger than that of 1904, it would seem possible that a good share of this country's export trade in wheat and flour would be regained. It seems reasonable, in fact, to expect that with present crop prospects the United States will contribute largely to the world's breadstuffs supply in 1905-06; if not in the form of wheat, then in the form of flour, which allows of the American miller getting a profit from the wheat, which some years ago went abroad largely in the form of grain.—*Bradstreet's.*

The next fifty years will mark a return to canal building and river and harbor improvement as a necessary means of conserving the national wealth. The appropriation of $100,000,000 in New York to enlarge the Erie Canal betokens the public interest in securing adequate facilities of water transportation. The appropriation of $375,000 by Pennsylvania for the improvement of the Delaware river to hasten the completion of the work of the general government in deepening the channel is an intelligent and encouraging indication of the trend of popular opinion. Our great rivers are great natural opportunities. They offer a willing service. It is stupidity not to avail ourselves of the offer.—*Philadelphia Record.*

A WEATHER WAGER.

A Los Angeles, California, dispatch dated May 3, 1905, says:

Charles Hatfield, a "rainmaker," who has been working since December 15th last to produce eighteen inches of rain for southern California by May 1st, on the pledge of a number of merchants to pay him $1,000 if he succeeded, has completed his demonstration and been paid a large proportion of the sum promised.

Those merchants of Los Angeles are extremely "easy." They wagered $1,000 against nothing, and the fakir who put up no stake won their pile. It is to be hoped that those liberal merchants will use some of that eighteen inches of rainfall in getting their heads soaked. Their craniums certainly need tightning up a little.

SUN SPOTS AND EARTHQUAKES.

[New York Tribune.]

A French astronomer, Abbe Moureux, believes that such terrestrial phenomena as earthquakes and volcanic eruptions are caused by those solar disturbances of which the sun spot is a manifestation. He is supposed to attribute the severe shock

which involved the loss of fifteen thousand lives in India a few weeks ago and minor tremblings elsewhere since the close of January to the exceptional solar activity which has been observed during the past three months. Indeed, so convinced was he that trouble was impending that he published predictions as long ago as February 9th.

If this theory should be well founded it should be possible to find corroboration by comparing records for thirty or forty years. At the maximum stages of three or four eleven-year sun spot cycles there should be a greater number of shocks and eruptions than usual, and at the minimum stages less than the average. A reasonably close correspondence of that sort should be discovered before much faith is placed in the supposed relationship. A few coincidences such as may have been noted since the opening of 1905 hardly count for much. They might be accidental and without real significance.

After a prima facie case had been established by statistics it would still be necessary to indicate the method by which solar influence was exerted. Perhaps the most plausible guess would be that magnetism or electricity was the agent; but to demonstrate conclusively how that force operated would be difficult. A temporary derangement of telegraphic service by the generation of earth currents, a curious trembling of obser atory magnets which are lightly poised and a display of the aurora borealis are common accompaniments of great solar outbreaks, but none of them involve the exercise of anything but an infinitesimal amount of mechanical force. It taxes the imagination severely to suggest a magnetic explanation of the displacement of millions of tons of solid material. Although the notion that lunar attraction might distort the earth's crust at the times when it raises the highest ocean tides is now pretty well discredited, it certainly had more to recommend it than a belief that there is any connection between the disturbances of which sun spots are symptoms and the shaking of thousands of cubic miles of rock.

One is not tied down to magnetism in the search for the intermediate mechanism, to be sure, and if anybody can propose a better hypothesis he can anticipate a respectful hearing. Until it is found, and until Abbe Moreaux is able to reinforce his interesting conjectures with at least a quarter of a century of history, he will find few followers.

STORY OF AN OLD TIME TORNADO.

The following article describing the tornado which destroyed the town of Camanche, Iowa, and caused desolation in its track for scores of miles across this state, on June 3, 1860, has been copied from the files of the Clinton Herald of June 9, 1860:

The storm, which occurred on Sunday, June 3d, will be remembered as long as there is a settler left of that date, as the great tornado. A strip of ground varying in width from twenty rods to a mile and extending from Cedar Rapids to Lake Michigan, leaving not a fence, nor tree, nor dwelling house, nor scarcely a living thing as withstanding its fury was the scene.

The storm had passed by Clinton, although far to the east the skies were black and threatening. The air was soft and balmy and the stars were beginning to shine, when a horseman dashed into the Main street and without scarcely drawing rein, cried: "Camanche is destroyed by a tornado and half the inhabitants are buried in the ruins; send down all your doctors and materials to dress the wounded." Immediately every vehicle in Clinton and Lyons was put in use and all available cars in the railroad yards were filled with supplies for the stricken people.

It was with great difficulty that the doctors could pick their way through the scattered debris, the crie of the wounded, the lamentations of those who were bereaved adding horror to the scene. All night the work continued, the dead, twenty-six in number, being tenderly laid at one side and special care being given to the wounded of whom there were more than 150.

There were in the beginning two storms starting west of the Cedar River and about twelve miles apart. Proceeding in separate and well defined courses until they reached the Wapsipincion river they united twenty-three miles west of the Mississippi and advanced with great rapidity. To those who watched its on-coming it was at first in appearance a threatening cloud which gradually assumed the form of a writhing serpent accompained by a roar greater than of a mighty Niagara. Beginning just west of the Cedar River the work of destruction spread over the farm house and field and through the towns of Lisbon, Onion Grove, Louden, Wheatland, Rogers Settlement, Mt. Vernon and De Witt, the latter place being not three miles from the center of the storm.

Albany, Illinois, had at that time about seven hundred inhabitants and although the loss of life was smaller than at Camanche, nearly every home was wrecked.

Instances of the storm which lasted but two or three minutes in one section, are replete with gruesome details, for during that period a village of nearly twelve hundred inhabitants was destroyed. All that remained of the contents of many houses could be put into one room twelve feet square, the rest of the furniture, clothes and bedding must have been blown into the river. A plank two inches thick effectually closed the door of Waldorf's new hotel by being driven through the door and the floor of the building in a slanting direction and sticking out, one end through the door, the other through the floor.

The first story of a building was blown out and the second story set down upon the foundation almost uninjured. Horses and cows were carried through the air at a height of twenty feet and for a distance of 200 rods.

A raft was passing down the river with twenty six persons upon it. But three of those survived and they found themselves upon the Illinois shore, not knowing how they reached there, whether through the air or the water. Near Bertram, Linn county, a man was seen carried in the vortex of the storm and afterwards a mutilated body was found three miles and a half from Bertram.

NOTES ON THE CORN CROP AT RIDGEWAY, IOWA.

BY ARTHUR BETTS, CROP REPORTER.

Average	July 17	July 29	September 13	October 4

* 20 per cent needed another week.

CLIMATOLOGY OF THE MONTH OF APRIL, 1905.

BAROMETER.—Mean pressure, 29.95 inches; highest observed, 30.47 inches, at Sioux City and Dubuque, on the 16th and 23d; lowest observed, 29.47 inches, at Keokuk on the 20th; range for state, 1 00 inch.

TEMPERATURE.—The monthly mean temperature of the state as shown by records of 123 stations, was 47.5°, which is 1.8° below normal. By sections the mean temperatures were as follows: Northern section, 45.3°, which is 2.0° below normal; central section, 47.5°, which is 1.3° below normal; southern section, 49.6°, which is 2.6° below normal. The highest monthly mean was 52.6° at Keokuk; lowest monthly mean, 42.9° at Sibley. The highest temperature reported was 90°, at Clarinda on the 9th; lowest temperature reported, 10°, at Inwood and Sibley on the 14th. The average monthly maximum was 79.3°; average monthly minimum, 19.5°. Greatest daily range, 58°, at Iowa City; average of greatest daily ranges, 40.7°.

PRECIPITATION.—Average precipitation for the state, as nown by records of 135 stations, was 3.03 inches, which is 0.14 f an inch above normal. The averages by sections were as ollows: Northern section, 2.09 inches, which is 0.53 of an ch below normal; central section, 3.07 inches, which is 0.17 f an inch above normal; southern section, 3.94 inches, which is .83 of an inch above normal. The largest amount reported was .49 inches at Leon; least amount reported, 0.63 of an inch, at ibley. The greatest daily rainfall reported was 3.25 inches at ttumwa on the 20th. Average number of days on which .01 f an inch or more was reported, 8.

WIND AND WEATHER.—Prevailing direction of the wind, orthwest; highest velocity reported, 54 miles per hour, from the orth, at Sioux City, on the 3d. Average number of clear ays, 12; partly cloudy, 8; cloudy, 10.

OBSERVERS' NOTES.

AMANA—*C. Schadt.* Weather was favorable for farm work, and the season about two weeks early; at close of month plums and cherries were in full bloom.

BONAPARTE—*B. R. Vale.* A cool wet and backward month; no preparation for corn planting except plowing sod; grass started nicely in March. Rainfall, 4.60 inches.

BRITT—*Geo. P. Hardwick.* Vegetation started early but was checked by cool weather; grain was put in in fine condition; pastures good at end of month.

CHARITON—*C. C. Burr.* Season is ten days earlier than average; fruit trees covered with bloom; plums and strawberries badly injured by frost.

CLINTON—*Luke Roberts.* April temperature was normal and rainfall .75 of an inch in excess; low temperature on the 5th, 6th, 7th, 15th, 16th and 17th checked growth of vegetation; month lost some of the advantages it had at outset, but the season is not discouraging.

CRESCO—*L. G. Krumm.* Considerable snow fell on night of 3d; also on afternoon of 13th. Early sown oats made thin stand.

CRESTON—*W. L. Gaston* Robins were with us from the first of month; box elder trees showed leaves on 5th; hail did some damage to fruit trees and gardens.

ELLIOTT—*Henry Barnes.* April 30th, apples cherries and plums in bloom; recent rains started growth of grass and grain.

FLORENCE—*J. H. DuBois.* Some corn planted April 28th and 29th; good stand wheat and oats.

FOREST CITY—*J. A. Peters.* Heavy frost and ice on 29th; small grain and grass looking good.

GRAND MEADOW—*F L. Williams.* Montn favorable for farm work and much ground ready for planting at end of month; pastures good.

HANLONTOWN—*Miss G. M. Paschen.* Early sown oats up the 20th; grass made rapid growth last few days of month.

HUMBOLDT—*H. S. Wells.* About the usual acreage of corn will be planted as last year; a little more wheat sown than recently.

IDA GROVE—*Dr. J. E. Conn.* An unusually cool April, but small grain and pastures made good progress.

INWOOD—*G. M. Larson.* All seeding done and plowing for corn commenced; too cool for growth of crops.

LITTLE SIOUX—*Geo. H. Gibson.* Fruit suffered but little from freezing on the 14th; moisture sufficient, but warmer weather is needed for grain and grass.

MONTICELLO—*A Mattheisen.* Grass and grain coming finely; farmers are two weeks ahead in work compared with last year.

NORTHWOOD.—*C. H. Dwelle.* Some early sown grain has been reseeded; rain needed.

OLIN.—*N. Potter.* All fruit safe from frost; pastures more than an average.

RIDGEWAY—*Arthur Betts.* A nice month; 264 hours sunshine, or 65 per cent; crops are looking fine; soil did not freeze over 8 inches in depth last winter.

SHELDON—*A. W. Beach.* Farm work well advanced; early gardens damaged by freezing on morning of 30th.

WAUKEE—*E. J. Leonard.* Month generally backward; frost hindered growth of small grain; fall wheat is looking well.

ERRATA IN FEBRUARY REVIEW.

HANLONTOWN.—Total snowfall recorded 7.5 inches on page 7, should have been 17.5 inches.

HARLAN.—Mean temperature recorded 12.6° on page 8, should have been 12.4°.

BELATED REPORTS.

NORTHWOOD.—March; mean temperature 37.0°; highest 65° on the 27th, 28th and 31st; lowest, 1° on the 11th; greatest daily range, 35°; total precipitation, 2.35 inches; greatest in twenty-four hours, .70 of an inch; total snowfall, 8.5 inches; prevailing direction, southeast; number of clear days, 4; partly cloudy, 10; cloudy, 17; rainy, 6.

CEDAR RAPIDS.—February; daily precipitation on 14th, page 11, recorded blank, should have been .22 of an inch; total precipitation recorded, 1.10 inches on pages 8 and 11 should have been 1.32 inches; total snowfall recorded 18.8 inches on page 8, should have been 21.5 inches; number of rainy days recorded, 7 on page 8, should have been 9.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. McDONALD, Bayard.
Tenth District—O. A. OLSON, Forest City.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XVI. MAY, 1905. No. 5.

IOWA CROP REPORT, JUNE 1, 1905.

Following is a summary of the June 1st reports, received from county and township correspondents of the Iowa Weather and Crop Service.

CORN.—The reports show an increase in the acreage in more than half the counties, and a slight decrease in some of the others wherein a portion of the acreage prepared for corn was too wet to plant prior to June 1st. The average increase for the State is about three per cent. The number of acres by counties can not be given until after the completion of the State census, now in process of tabulation.

The average condition of the corn crop was estimated about ninety per cent, or about the same as last year on corresponding date. A considerable portion of the crop, however, was scarcely visible above ground on June 1st.

The other staple farm crops are rated as follows, in condition:

Winter wheat, 102 per cent; spring wheat, 99; oats, 95; barley, 96; rye, 98; flax, 94; potatoes, 97; meadews, 100; pastures, 97.

CONDITION OF FRUIT.—Apples, 80 per cent, plums, 70, peaches, 35; cherries, 65; grapes, 90; strawberries, 103; raspberries, 96; blackberries, 94.

CONDITION OF LIVE STOCK.—Cattle, 100 per cent; sheep, 99; hogs, 99; spring pigs, 90; horses, 99; foals, 95.

Condition of crops June 1, 1904.—Corn, 90 per cent; winter wheat, 85; spring wheat, 94; oats, 92; barley, 93; rye, 91; flax, 85; potatoes, 95; meadows, 96; pastures, 97.

The area of spring wheat sown this year has been reduced probably 10 per cent below the area harvested last year. The oats acreage about the same as last year. Barley acreage has been reduced 7 to 10 per cent.

MAY WEATHER AND CROPS.

May was below normal in temperature and above the average in precipitation. The mean temperature for the state was 58.3° which is 2.1° below the May average. The northern section showed a deficiency of 3.3°; the central section, 1.6° and the southern section, 1.6°. Light frosts were noted in all districts on several mornings, but the damage to vegetation was quite small and mainly confined to low lands in the northern section. The average precipitation for the state, as shown by records of one hundred and thirty-two stations, was 5.95 inches which is 1.82 inches above normal. The greatest excess was 3.68 inches above normal in the northern section. There was more than the normal amount of cloudiness in all districts. During the first week in May the temperature was slightly above normal, and the rainfall generally light. This was favorable for preparing corn ground with soil in fine tilth, and a good beginning was made in planting that most important cereal. The second week brought excessively wet and cold weather, with numerous severe windstorms, which delayed planting and other field work, though the pastures, meadows and small grain received benefit from the moisture. The third week was also cool and cloudy, but the rainfall was not generally excessive.

Field work was resumed on driest ground about the 17th, and considerable progress was made in planting corn, and on the warmest land germination was fairly good. The latter part of the month afforded about the usual alternation of heat and cold, with some more than the average amount of coolness and moisture. The conditions were not generally favorable for germination of corn and much more than the usual amount of replanting was done. In numerous localities, where sufficient care was not taken in selecting and testing seed, the farmers replanted their entire acreage of corn. At the close of the month a fair start had been made in cleaning out the cornfields, and reports indicated a more promising condition of the corn crop than had been deemed possible at an earlier date. Wheat, oats, barley, rye and flax made good growth, with promise of fair yield. The pastures and meadows were extra good. The apple crop appeared to be very good, cherries and plums light. Strawberries were extra fine, ripening earlier than usual.

NOTES AND COMMENTS.

In the beginning this old earth was thickly sown with interrogation points. And some of these are continually cropping out to perplex mankind, somewhat like weeds and fungi. Happily we are not compelled to solve offhand all the complex problems relating to the mysteries of life and the universe. One by one, men are finding out some things heretofore inexplicable; but each step in advance opens out a new field of inquiry, and brings new zest to activity.

Some men are continually stating and restating great problems, while wiser men are intent on solving those questions that most deeply concern human welfare day by day, here and now. The best solvent to apply to all problems is plain common sense.

On a farm near Hawarden, Sioux county, during the first week in May, lightning struck a barbwire fence and gave a fatal shock to a boy named Bert Liston, who was standing near the fence. This is a warning as to the danger of constructing wire fences without protection by ground wires.

And another warning comes from the Belle Fourche district in South Dakota, where a stroke of lightning caused the death

of one hundred horses in a herd of one hundred and three, that were in contact with a wire fence. In thunderstorms keep away from live wires.

Fifty years ago Livingstone carved his name on a tree standing in view of the marvels of the Victoria Falls, in what was then "Darkest Africa." After Livingstone came Stanley and it was only thirty years ago that this great explorer explored the boundaries of Lake Victoria Nyanza, and it is less than twenty years ago when he made his last and in many respects most memorable trip through the then unknown regions of Central Africa, yet we have before us now a two-page advertisement of a fast railway train running through the very region explored by Livingstone and Stanley. A train de luxe leaves Cape Town every Wednesday for Kimberly, Mafeking and Bulawayo, connecting with parlor car service and sleeping accommodations to Gwelo, Salisbury and Victoria Falls. These trains are lighted by electricity and provided with dining and buffet accommodations. The Cape to Cairo Railroad indeed reaches nearly every important point, which only a few years ago we were reading about in the wonderful narratives of Livingstone's and Stanley's explorations. Nothing could illustrate more vividly the rapidity with which modern civilization is moving and the speed with which Darkest Africa is being opened, not only to the commerce but to the tourists of the world. Not only have the Victoria Falls thus been brought within the easy reach of travelers, but this stupendous wonder of the world, like Niagara, is about to be utilized to provide power to conduct electric energy for use in transportation and industry.—*Wall Street Journal*.

ALMOST IDEAL.

(Selected)

I know a spot where a brook spreads out and forms a limpid pool;
The elms and alders shade the place and keep it nice and cool.
A mossy bank slopes down on which one may rest all day long,
And many a bird is there to cheer the angler with its song.

A flattened rock on which to put your creel is near at hand;
In short, accommodations there may fitly be termed "grand."
There's everything about the spot the fisherman could wish,
And the only drawback seems to be the total lack of fish.

WEATHER BUREAU SAVING.

[The Prairie Farmer.]

In connection with what Chief Willis L. Moore of the United States Weather Bureau says in another column on the matter of "long range forecasts", it is timely that something should be said relative to the actual value that weather forecasts are to the farmer. Obviously, it is impossible to secure definite information as to the amounts annually saved through the agency of the weather bureau, but as the farmer becomes so situated that he can take advantage of its forecasts he is enabled to increase its benefit to himself and curtail losses that would otherwise occur. However, some interesting information on this point is published in the June issue of the Century magazine on the authority of Gilbert H. Grosvenor, who says:

"Some time ago a skeptical insurance company determined to investigate the amount of property saved in one year by the warnings of the weather bureau. It was a company of conservative men whose estimate would be under rather than above the truth, but it found that on an average the people of the United States saved every year $30,000,000 because of their weather service. As the people contribute $1,500,000 every year to its support, this means that they get annually a dividend of 2,000 per cent on the investment. An investment in which the original capital is paid back twenty times over in twelve months is extraordinarily profitable and well worth investigation.

Men are willing as a rule to invest money when they are able to secure a nominal return. If it be a fact that the investment of the cost of the government weather service pays a dividend of 2,000 per cent, it is certainly worthy of support. Thus the attacks that are occasionally made upon the service are illy advised, indeed, and worthy of little consideration.

Our readers are familiar with the bulletins that are issued in every State each Monday night for the week preceding. While these largely cover the conditions of the crops and the climate for that week, they are none the less valuable to every progressive farmer anxious to keep in touch with conditions in neighboring counties and States.

CHIEF MOORE ON LONG RANGE WEATHER FORECASTS.

(From the Prairie Farmer.)

From time to time our attention has been called to the claims of the long range weather forecaster, and his attacks upon the United States government service. While we have only words of commendation for the weather bureau, *The Prairie Farmer* has no sympathy for the weather fakir who seems to be content to work the public for what money there is in the business. Some time since we received a letter from a certain "long range forecaster" who desired to sell his "forecasts" to this publication. Ordinarily his communication would have been consigned immediately to the waste paper basket without further thought, but having seen the service offered to us in a number of our "country dailies" and observing a direct attack in this circular upon the Weather Bureau of the United States Bureau of Agriculture at Washington, we were prompted to forward the communication to chief Willis L. Moore of the Weather Bureau. We received from him the following reply, which we take the liberty of reproducing:

"I have just received your letter inclosing the pamphlet of a certain long range weather forecaster, and his personal letter to 'The Editor,' in which he asks for editoral comment that will advertise the forecasts that he has to sell. He calls attention to his oft-repeated warnings to the public that unusually destructive tornadoes, and other radical weather changes, would occur in April and May, *notwithstanding the fact that these are the most quiet months of the year*. He thinks that the fact that these warnings were verified is worthy of editoral comment by you. In answer, permit me to say that his statements are not founded upon fact, for April and May are the two months in which tornadoes always occur. Any one who uses long range predictions can make just as good a guess of tornadoes for April and May as the long range forecaster. It is ridiculous for any one to claim that a prediction of 'April and May will be the dangerous storm months this year, expect tornadoes and other dangerous storms' bears any definite relation to any definite storm occurring at any definite time at any definite place. Any faker can gain fame with the ignorant by predicting tornadoes for April any May, and at times he may include the latter part of March and all of June, because tornadoes occur every year during those months. I know of no April, May or June in which tornadoes have not occurred.

"The Weather Bureau is able to foresee from the morning map, when conditions are favorable over a large area, such, for instance, as that of a state, for the development of tornadoes, and very often it has predicted them and they have occurred inside of the area defined; but several years ago I prohibited the forecasting of tornadoes, for the reason that they only touch an infinitesimal part of the region over which the conditions were

favorable for their development, and it was not considered advisable to alarm millions of people, in hundreds of towns in order that a few persons in one city, or in two or three adjacent towns, might take the necessary precautions. We have contented ourselves with saying to the public that, whenever, in the spring or early summer months, the forecast contains the statement that there is a likelihood of severe thunderstorms, there is a possibility that some of them may develop into tornadic whirls.

"I believe it to be the function of an institution supported at public expense to do its best to expose deception, and those who would prey upon the credulity of the ignorant for the purpose of deriving personal profit. With this thought in mind, I have persistently attacked the long range forecasters, no one of whom, I believe, has any scientific principle back of his prediction. Some of them believe that, because of a few coincidences between the conjunction of certain planets and their forecasts, they have the ability to make predictions that have value; but the majority know that they are charlatans and that they are perpetrating fraud upon the public in selling their forecasts. I have adopted the policy of never mentioning the name of any of these long range forcasters in my opposition of them. This would be to their profit, as it would bring him into the limelight, enable him to talk back and attract attention to himself, which would only create curiosity in the public mind as to what predictions he was making, and so inure to his personal profit.

"I thank you for calling my attention to the matter. I am sure that *The Prairie Farmer* will never disseminate ignorance or untruth, but that in the future, as in the past, it will be found giving out correct information that will benefit its readers and educate and instruct them."

THE FUNNEL AND THE TORNADO.

[Kansas City Star.]

A feature of the tornado that enhances its terror is the mystery of its operation. There is something uncanny about the power of the funnel-shaped cloud that expends its force on a comparatively narrow swath and leaves the surrounding territory untouched. People instinctively inquire how such an enormous source of energy is developed and why it displays itself only in certain portions of the country.

Perhaps the simplest explanation of the tornado's formation can be based on the analogy of the escape of water from the opening of a funnel. The particles of water all tend to slide down the funnel's sides in straight lines to the mouth. But the opening is narrow, the particles jostle against one another, and in their effort to escape a swirling motion is set up. This is slow about the edges, but increases in rapidity toward the center in accordance with a well known law of physics. If the funnel is large the escaping water may attain an extreme velocity at the center. A familiar illustration is the miniature whirlpool produced when the plug is withdrawn from a washbowl.

The tornado is simply the washbowl inverted; that is, the suction is upward, not downward. There is a sudden rarefaction of air. A partial vacuum is created and air is sucked in from all sides to fill it. The particles crowd against each other in rushing toward the center, a vortex motion is produced and about the core of the storm the air is supposed to revolve frequently at the rate of four hundred or five hundred miles an hour.

The partial vacuum results from the contact of moist air masses of different temperatures. This occurs most frequently in the spring when the earth is heating rapidly, but when the upper atmosphere is still abnormally chilly. When such conditions exist a mass of warm, humid, light air may be isolated and hemmed in between colder, heavier masses. Suddenly it may happen to be released and so may shoot upward, releasing its moisture in rain and being helped in its ascent by the latent heat liberated by the condensation of the vapor. The colder, heavier air rushes in from all sides and the tornado vortex is the outcome.

Experience has shown that for this result there must be usually a temperature of at least 70 degrees with great humidity at a time of year when there may be much colder atmospheric strata near the earth. California is not visited by tornadoes because the whole atmospheric mass there is subject to the ameliorating influences of the ocean climate, and no large bodies of air at sharply diverse temperatures come in contact with each other. Similarly, tornadoes do not occur north of the fiftieth parallel, because the necessary heat is lacking. But they develop in the central and eastern parts of the United States, in Southern Europe and Africa.

CLIMATOLOGY OF THE MONTH OF MAY 1904.

BAROMETER.—Mean pressure, 29.90 inches; highest observed, 30.28 inches, at Dubuque, on the 23d; lowest observed, 29.31 inches, at Des Moines, on the 3d; range for state, 0.97 of an inch.

TEMPERATURE.—The monthly mean temperature for the State, as shown by records of 123 stations, was 58.3°, which is 2.1° below normal. By sections the mean temperatures were as follows: Northern section, 56.0°, which is 3.3° below normal; central section, 58.6°, which is 1.6° below normal; southern section, 60.4°, which is 1.6° below normal. The highest monthly mean was 63.6°, at Keokuk; lowest monthly mean, 53.2°, at Sibley. The highest temperature reported was 88°, at Glenwood and Welton Junction on the 3d and 29th; lowest temperature reported, 28°, at Washta on the 26th. The average monthly maximum was 82.2°; average monthly minimum, 34.3°. Greatest daily range, 49°, at Carroll; average of greatest daily ranges, 36.9°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 132 stations, was 5.95 inches, which is 1.82 inches above normal. The averages by sections were as follows: Northern section, 7.60 inches, which is 3.68 inches above normal; central section, 5.88 inches, which is 1.79 inches above normal; southern section, 4.38 inches, which is .03 of an inch above normal. The largest amount reported was 10.83 inches at Hanlontown; least amount reported, 2.57 inches at Bonaparte. The greatest daily rainfall reported was 3.48 inches at Onawa on the 11th. Average number of days on which .01 of an inch or more was reported, 14.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 59 miles per hour, from the south, at Sioux City, on the 3d. Average number of clear days, 12; partly cloudy, 11; cloudy, 8.

* At those stations thermometers are read in the morning; the maximum temperature then observed appears in the maximum column for the preceding day, on which it nearly always occurs.

OBSERVERS' NOTES.

ALTA—*David E. Hadden.* May was cloudy, cool and wet; rainfall about double the normal amount; only exceeded once in last 16 years, and that was in May, 1892; temperature about 3° below normal.

ALTON—*W. S. Slagle.* Very hard wind on 10th; frost on 26th killed some garden truck on low ground.

AMANA—*Conrad Schadt.* Though May had 16 rainy days, the farmers found ample time to plant corn, which was mostly finished by close of month; fruits promising.

BONAPARTE—*B. R. Vale.* First half of month very wet, and month was unusually cold; no severe storms; precipitation 2.27 inches, while last year we had 4.17 inches.

BOONE—*Carl Fritz Henning.* On May 1st apple blossoms were observed. May 4th plums, apples, wild plums, violets and sweet williams were in bloom; corn planting started. May 10th to 12th many small birds were killed during hailstorm.

BRITT—*Geo. P. Hardwick.* Rain 8 10 inches, with exessive cloudiness; corn planting retarded. On night of 10th a small tornado passed through southeast part of county and destroyed a few buildings. Plum crop disappointing; apple prospects good.

CHARITON—*C. C. Burr.* Nights cool and sunshine below normal; prospects for a large corn crop not flattering; grasses and oats rank; fruit fairly good.

CLINTON—*Luke Roberts.* Mean temperature for May was 60.6°; rainfall, 5.95 inches; per cent of sushine only 50. The central portion of the month was cooler than the commencing or ending. There were 12 stormy days.

CRESCO—*W. L. Gaston.* About 1 P. M. on the 22d, a solar halo of unusual size and brilliancy was observed and created much comment.

ELLIOTT—*Henry Barnes.* By the 13th most of the corn had been planted; about 25 per cent has been replanted; grasses and small grain doing well.

FOREST CITY—*J. A. Peters.* Rain 7.89; low lands too wet to plant; hay crop promising.

GRUNDY CENTER—*E. S King.* Wet soil retarded planting, and but little corn plowing had been done at close of month; grass and small grain promising.

HANLONTOWN—*G. M. Paschen.* Severe thunder, wind and hailstorm on 11th did much damage to crops. First corn planted on 18th, and finished on 24th; acreage about same as last year; fruit promising where it was not cut short by hail.

HUMBOLDT—*H. S. Wells.* Corn coming good; small grain all right; stock doing well.

IOWA FALLS—*J. B. Parmalee.* Rainfall in May 7.73 inches, has been exceeded but once in thirteen years, and that was in 1896, when the amount was 7.76 inches.

LITTLE SIOUX—*Geo. H. Gibson.* Nearly 50 per cent of corn replanted on account of cold and excessive moisture; small grain and pastures good.

MASSENA—*Fred L. Knott.* Corn planting commenced on 5th, and replanting was done 20th to 25th.

MONTICELLO—*A. Matthiessen.* Corn slow in growth; hay and small grain extra fine.

NORTHWOOD—*Chas. H. Dwelle.* Storm on 11th damaged buildings and windmills; corn backward.

OLIN—*N. Potter.* Some early planted corn was replanted on account of wet and cool weather; the crop is ten days late; grasses and oats fine; heavy hail on 29th.

POCAHONTAS—*F. E. Hronek.* Excess of rain damaged crops on low ground; yet the grain looks fine.

RIDGEWAY—*A. Betts.* Coldest May on record here. No frost since April 21; sunshine 253 hours, or 55 per cent; 8 days were perfect; some severe thunderstorms but no gales.

STOCKPORT—*C. L. Beswick.* On 10th hail fell nearly 8 inches in circumference; corn planting mostly finished at close of May.

WAUKEE—*E. J. Leonard.* Corn made slow growth; small grain doing well; meadows, average crop; strawberries ripened earlier than usual.

BELATED REPORT.

LARRABEE.—April. Mean temperature 42.6; highest 80° on the 1st; lowest 10° on the 14 h; greatest daily range 41°; total precipitation 1.29 inches; greatest in 24 hours .43 inch; total snowfall 2.2 inches; prevailing direction, north and northeast. Number of clear days, 11; partly cloudy, 10; cloudy, 9; rainy, 7.

ERRATA IN MARCH REVIEW.

COLLEGE SPRINGS.—Maximum temperature recorded 79 on the 27th, page 6, should have been 80° on the 3d.

POCAHONTAS.—Total snowfall recorded 7.8 inches on page 7, should have been 4.5 inches.

ERROR IN APRIL REVIEW.

RIDGEWAY—Total snowfall recorded 2.8 inches on page 6, should have been 1.8 inches.

DAILY AND MONTHLY PRECIPITATION FOR MAY, 1905.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—O. A. OLSON, Forest City.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XVI. JUNE, 1905. No. 6.

IOWA CROP CONDITIONS, JULY 1, 1905.

Reports of crop correspondents showed the following averages of condition of staple crops, July 1, 1905: Winter wheat, 99; spring wheat, 94; corn 92; oats, 96; rye, 96; barley, 98; flax, 95; hay crop, 101; pastures, 105; potatoes, 98; apples, 65; grapes, 88; plums, 68 per cent.

On July, 1, 1904, spring wheat was rated 91; corn, 90; oats, 91; barley, 93; flax, 89; hay, 90; pastures, 94; potatoes, 101; apples, 85 per cent.

JUNE WEATHER AND CROPS.

June was about normal in temperature, the average for the state being 69.9°, which is .3° above normal. The average rainfall was 5.53 inches, or about 1.00 inch above the state normal. The distribution of rainfall was very unequal, ranging from 1.80 inches at Forest City, to 14.89 inches at Keosauqua. The greatest excess occurred in the southeast, and in a portion of the northwest districts. The central section received the lowest average. The first week was warm and generally dry, affording ideal conditions for the growth of crops and the cultivation of corn, potatoes, etc. A fair stand of corn was secured on well drained lands, and the fields were mainly well cultivated. Copious showers fell on the 9th and 10th, which were timely and beneficial in three-fourths of the state; but portions of the southeast district suffered much damage from excessive downpours, materially injuring crops in that region by flooding the bottoms and washing the cultivated slopes. The third week was normal in temperature and amount of sunshine, affording conditions favorable for growth and cleaning out the weedy fields. The last ten days of the month brought intermittent temperature, and closed with copious showers in all districts, and considerable excess in extensive areas in the northern section. At the close of the month the corn crop was materially better in stand and condition than at the corresponding date in three preceding years. Haying was begun, but the first cutting of clover suffered material damage by showery weather. The pastures were excellent, and the old meadows were improved by the rains. Small grain crops were not affected by rust, except in limited areas.

NOTES AND COMMENTS.

Numerous people express the belief that rain may be shaken out of the air by means of high explosives and a general bombardment of the sky. To sustain this notion they assert that there is generally a greater amount of rainfall on or closely following the Fourth of July, as a result of the wild, air-splitting celebration of that day. Records of past years do not sustain this view. In Iowa, for the period of fifteen consecutive years, the rainfall tables for the state show heavier rainfall on the 1st, 2d and 3d than on the 4th, 5th and 6th of July. June brings the heaviest rainfall, though at times the culmination of our rainy season is reached the first week in July. The idea of producing rainfall by jarring the air, or any other artificial means, may be termed a factless theory.

If everything went well with the farmer all the time—perfect weather conditions, no insect pests, no blight or rust, cheap and docile hired help, no summer hailstorms or untimely frosts, no floods or drouths—there would still be trouble, for so many would want to farm and so much would be produced that the business would not pay. So it is just as well to regard the calamities which beset the business as really essential to its best interests. It is only the disagreeable features, the slavery connected with dairying, which makes it the most profitable business on the farm.—*J. S. Trigg.*

In comparing the average annual temperatures of the past 16 years in Honolulu, it will be seen the lowest was 63.07 degrees and the highest 74.49 degrees. The maximum in the same period was 90 degrees and the minimum was 53 degrees. This is a remarkable exhibit of equability of temperature. Probably in no other place under the American flag will be found so little disparity between the extremes of heat and cold. The rainfall, except during the months of May, June, July, August and September, was somewhat erratic and wholly out of comparison with that of Southern California, whose temperature is not nearly so equable as Hawaii's. Last February there was heavier precipitation than in some whole years and not very far from the average annual fall of 20 years.—*Ex.*

WASHINGTON SPECIAL: Excluding the two reserves in Alaska, which cover nearly 5,000,000 acres, there are now in the United States fifty-one forest reserves, with a combined area of 57,833,974 acres. These reserves are divided among thirteen states and territories of the west. The people of the United States, as a whole, have little idea of the enormous magnitude of the interests affected by the government's forest reserve policy. Timber supply, important as this is, is a relatively small part of the whole purpose. The reclamation of millions of acres of arid land, a sustained or heightened fertility for other millions of acres of farm lands, and, finally, the safeguarding for the future of pasturage of millions of head of sheep and cattle are already certain results of that policy. It contemplates furnishing the present and thousand prospective settlers wood, water, tillable lands, and prosperous homes. Roundly stated, the purpose is to give these forests reserves their highest utility to all who use them now or will use them hereafter.

When you get up in the morning from your superheated couch
With a brain all hot and addled and a temper full of grouch,
When you wander to your office with a dull and fishy eye
'Neath a sun that's gayly blazing like a furnace in the sky,
Oh it's hot, but don't you mind it, though you're wilted and forlorn;
It's a little tough for mortals, but its mighty good for corn.
—*Council Bluffs Nonpareil.*

Mr. F. H. Newell, U. S. Hydrographer, says: "Not only are trees of great importance in maintaining favorable conditions for the perennial supply of water, but the forest has peculiar value in preventing erosion of the soil and the washing of silt into the reservoirs. The soil on many of the upland mountain parks is extremely light and easily moved by the beating of the rain. This is shown where cattle have traveled through the denuded areas. Each trail serves to collect the water from the occasional rains. A few sharp showers quickly cut out these trails into gulleys, and a few years suffice to convert them into miniature canyons and bad lands. About twenty years ago, when I first visited Colorado, there were to be found throughout the mountains little valleys with smooth fertile bottoms. On my last trip through this same country, I was dismayed by the appalling changes that had taken place. Each of these valleys was traversed by a deep-walled gulley, which in places widened out and left no room even for a wagon road. All the rich, light soil had been carried down the streams. This rapid erosion had been due to the cutting away of the timber and the burning of the brush and by over-grazing."

THE BLESSED RAIN.

The Rain came down on the brown
Rich furrows of mountain farms
And rivers with silver arms:
The cornblades rustled in merriment:
The cutworm made him a leafy tent;
The hemlock tassels were pearled.
Then, soft through fillets, of vapor spun,
The drops fell lazily, one by one,
A bluebird fluted to greet the sun;
A bow bent over the world.

The Rain came down on the town;
In floods, in torrents, in sheets
It swept the feverish streets.
A million lances of silver gray
It broke on steeples in stern array;
It veiled the cornice with wreaths of spray;
The big drops spattered the pane,
Then ceased. But gardens that late had been
So parched and thirsty, were fresh and green;
And all was wholesome and cool and clean;
For blest is ever the Rain.

—*By Arthur Guiterman.*

A SAD AND HEROIC DEATH.

By press dispatches we have received the details of the tragic ending of the life of Mr. Louis A. Hatten, formerly an assistant observer in the U. S. Weather Bureau office in Des Moines, who was drowned in the Arkansas river near Little Rock, Arkansas, on the evening of July 4th. Mr. Hatten served in this office from March 1903 to October 1903, during which period he won the high esteem of all who were associated with him in official and social relations. He was a competent observer, faithful in his work, and possessed of estimable qualities of character. The manner in which he came to his death gives the highest attestation of the noble spirit of the man. He was drowned while making a heroic attempt to save the life of a young friend with whom he was enjoying a holiday's outing on the river. Though failing in the effort to save the friend's life, he won for himself the imperishable crown of heroism. Mr. Hatten was born in Carrollton, Missouri, September 24, 1877, and was reared and educated at Carthage, Missouri. He was appointed assistant observer in the Weather Bureau in July 1902, and his first assignment to duty was at Evansville, Indiana, from which place he was transferred to Des Moines, in March 1903. He leaves a wife and a little son ten months old to grieve for his untimely taking off.

WEATHER MEDICINE.

The element of Superstition continues to be predominent in human nature, and the faker that can employ it successfully is always sure of an audience. The people still have faith in the imposter who claims to be able to foretell the weather a year in advance. The weather medicine man is only one in a legion of imposters, but he is the most exasperating one of the lot for reason of his lengthy staying powers. He keeps right on predicting cold weather for Winter and warm weather in Summer, with variable temperatures and occasional storms in the Spring and Fall, and a large section of the newspaper reading public accepts his fulminations as the conclusions of researches in what they fondly believe to be a new and mysterious science. The weather faker does not even have to exercise the virtue of keeping a close mouth in order to be esteemed wise; the more extensive his prognostications, so-called, the wider their range, the more profound is the awe in which he is held by the vast multitude of the unsophisticated. It is a pity that the gullible section of the public can not know the volunteer weather prophets for what they are—can not know what is the truth, that they know as little about the science of meteorology as do the medicine men of the Indian tribes about the healing art. It is a serious reflection, also, upon the press, that it should render space that could be made valuable, to such puerile and misleading vagaries as —— and —— and other such cheap mountebanks promulgate. Without the gullible newspaper through which to communicate with the gullible public, the weather medicine would soon give place in the public mind to a higher plane of thinking
—*Saturday Evening Post, Burlington, Iowa*

TRANSPORTATION ON THE GREAT LAKES.

The *Marine Review* states that never before in the history of the lakes had the shipyards been blessed with such a prodigality of orders; never before have all available berths been practically taken a year ahead. There are sixteen ships under order for 1906 delivery. This is in striking contrast with the condition of a year ago, when the ship building berths were practically vacant and no orders in sight. Indeed, the summer of 1904 was well advanced before the shipyards received a single order, but after that they came fast. But such a condition as now confronts the great lake shipbuilders is a new experience altogether. What with the orders for new ships, the lengthening of old ones and the inevitable repairs to the existing fleet, the shipbuilders of the great lakes can look forward to eighteen months of exceedingly active work. Since the beginning of the present year the great lakes' shipbuilders are working upon or have under order forty ships for the ore trade. These forty ships have a carrying capacity of 360,500 tons, or an average of a trifle over 9,000 tons each. Ten years ago the average carrying capacity of vesels under construction was only 3,000 tons. These forty ships for delivery during this year and next, carrying 360,500 tons on a single trip, will in an average season of twenty trips move 7,210,900 gross tons of ore. It was not until 1884 that the shipments of iron ore exceeded 1,000,000 tons per annum. These forty ships could therefore carry in a single season the combined movement of all the years from 1855 to 1870, and their capacity is in excess of even so recent a year as 1893, when 6,065,716 tons were moved. A ship has been pushed overboard on the great lakes every ten days during the past spring. The independent vesel owner as well as the ore owning steel companies have faith in the continued expansion of the iron business of the United States, for the greater part of the tonnage under order is for interests that must be called independent—that is to say, vessel owners without furnace or steel-making connections.

CLIMATOLOGY OF THE MONTH, JUNE, 1905.

BAROMETER.—Mean pressure, 29.91 inches, highest observed, 30.23 inches, at Dubuque, on the 27th; lowest observed, 29.49 inches, at Charles City, on the 5th; range for state, 0.74 of an inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 121 stations, was 69.9°, which is 0.3° above normal. By sections the mean temperatures were as follows: Northern section, 67.9°, which is 0.2° below normal; central section, 70.2°, which is 0.7° above normal; southern section, 71.7°, which is 0.5° above normal. The highest monthly mean was 74.5° at Red Oak; lowest monthly mean, 64.5° at Sibley. The highest temperature reported was 100° at Red Oak on the 9th; lowest temperature reported, 36°, at Washta on the 22d. The average monthly maximum was 92.1°; average monthly minimum, 45.7°. Greatest daily range, 48° at Washta; average of greatest daily ranges, 33.9°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 131 stations, was 5.53 inches, which is 1.00 inch above normal. The averages by sections were as follows: Northern section, 5.39 inches which is .71 of an inch above normal; central section, 4.78 inches, which is .22 of an inch above normal; southern section, 6.43 inches, which is 2.07 inches above normal. The largest amount reported was 14.89 inches at Keosauqua; least amount reported, 1.80 inches at Forest City. The greatest daily rainfall reported was 12.10 inches at Bonaparte on the 10th. Average number of days on which .01 of an inch or more was reported, 10.

WIND AND WEATHER.—Prevailing direction of the wind, south, southeast, southwest; highest velocity reported, 49 miles per hour, from the northwest, at Sioux City, on the 18th. Average number of clear days, 12; partly cloudy, 11; cloudy, 7.

OBSERVERS' NOTES.

ALTA—*David E. Hadden.* Temperature and rainfall in June were above normal; heaviest rainfall occurred during closing days of the month.

ALTON—*W. S. Slagle.* Altitude of this station is 1,308 feet. Light frost observed on 22d, causing no damage. Some rust on small grain.

AMANA—*Conrad Schadt.* Weather generally favorable for crops; no destructive storms during the month. Rye harvest begun on 30th.

BAXTER—*W. T. Thorp.* Fifty per cent of corn crop laid by at close of June. Hay crop, wheat and oats look good.

BONAPARTE—*B. R. Vale.* A normal June, except the phenomenal downpour of 12.10 inches of rain on the 10th, causing much damage to crops, soil and bridges.

BRITT—*Geo. P. Hardwick.* On the 18th a tornado passed from southwest to northeast, through center of county, causing loss of a few buildings in its track.

CHARITON—*C. C Burr.* Excessive moisture hindered cultivation of corn; early planted corn doing well

CLINTON—*Luke Roberts.* The mean temperature of June was 1.5° above normal; rainfall, 4.02 inches, was .41 of an inch below normal; conditions good for crops and a fine harvest is promised.

CRESTON—*W. L. Gaston.* Heavy rainfall interfered somewhat with corn plowing

ELLIOTT—*Henry Barnes.* A very growing month and crops are doing finely; heavy crop of clover and nearly all cut.

FOREST CITY—*J. A. Peters.* Height of corn June 30th about same as last year same date; rainfall 2.83 inches below normal.

GRAND MEADOW—*F. L. Williams.* Month wet; hay crop large; pastures extra; corn good but small; largest butter yield on record for this section.

GRINNELL—*A. O. Price.* Generally fair weather for field work and crops; small fruit abundant.

GRUNDY CENTER—*E. S. King.* Small grain uneven; corn best in years, fully knee high on 30th, hay and pastures good.

HANCOCK—*W. Armstrong.* All crops in fair condition at close of month; commenced to plow corn last time on the 26th.

HANLONTOWN—*Mrs. G. M. Paschen.* Corn made good progress in June; hay crop heavy and some hay made the last week of month; oats heading out and heavy; lightning did considerable damage to stock and buildings.

HUMBOLDT—*H. S Wells.* Rain 2.44 inches—not too much for all crops; showers the last week hindered hay making.

IDA GROVE—*Dr. J. E. Conn.* An unusually fine month for the crops; everything looking well, especially corn.

INDIANOLA—*Prof. John L. Tilton.* On June 1st, John Legget, of Lathrop, was killed by lightning; on the 19th a barn was burned by lightning two miles northeast; on 27th a chimney was struck.

INWOOD—*G. M. Larsen.* Greatest rain for many years fell on 28th; much hay spoiled and some other crops injured.

KEOSAUQUA—*J. H. Landes.* The rainfall, 11.23 inches, on night of 9th breaks the record for this place; much damage was done to crops on low lands by overflow, and on high lands by washing the soil; eighty-nine county bridges were taken out.

OLIN—*N. Potter* June was an ideal month for cultivating corn, which is a high average; oats and hay above average.

RIDGEWAY—*Arthur Betts.* Warmest June since 1901; 285 hours of sunshine, or 62 per cent; copious rainfall.

SHELDON—*A. W. Beach.* Conditions fine until 23d; since then too much rain for good progress of crops.

STOCKPORT—*C. L. Beswick.* On the 9th about 8 P. M. a gentle rain began and by morning the amount was 10.63 inches, —the heaviest ever recorded here.

WAUKEE—*E. J. Leonard.* Month favorable the first half, but very wet the latter part; all grain doing well.

WAVERLY—*H. S. Hoover.* A wet, cool month; too wet for making clover hay, and for corn and oats; apples not promising.

* At those stations thermometers are read in the morning; the maximum temperature then observed appears in the maximum column for the preceding day, on which it nearly always occurs.

TORRENTIAL RAINS, JUNE 9TH AND 10TH.

On the afternoon and night of June 9th and morning of the 10th, copious showers visited all districts, and in a considerable portion of the southeast and east-central districts the downpour can only be described by the term "torrential." The heaviest amounts reported at stations in the submerged section were as follows: Bonaparte, 12.10 inches; Keosauqua, 11.09; Stockport, 10 63 (three co-operative stations in Van Buren county); Mt. Pleasant, 7.20; Burlington, 6.10; Fort Madison, 6.40; Keokuk, 4.80; Charitòn, 4.22; Albia, 3.44; Iowa City, 4.87; Amana, 3.65; Davenport, 5.67; Wilton, 4.17; LeClaire, 4.41 inches. The larger part of this heavy precipitation fell in the twelve hours from 8:30 P. M. of the 9th to 8:30 A. M. of the 10th; and in Bonaparte the average downpour was about an inch an hour. This was phenomenal and record-breaking in that region. The result of such a shower may be imagined but can not be fully described in detail. Not many buildings were sufficiently well roofed to keep the occupants dry, and but few streams and water courses were adequate to carry off the surplus moisture. Those who were driven out into the wet say it came down in sheets and hi so hard it was difficult to stand though there was no wind. One of the Van Buren county reporters states that eighty-five county bridges were swept away. The aggregate damage to crops by erosion of soil on the slopes, and flooding the bottoms was altogether beyond estimation in all the area swept over by that unprecedented storm. Happily such storms are not usual visitations.

Hon. B. R. Vale, observer at Bonaparte, writes that the storm came up gradually on the evening of the 9th, with great electrical display in the southwest, the barometer being not extremely low, and rainfall began about 8:30. About 11 inches fell in 8 hours. There was a strong steady rain through the night, with no let up till 5:30 A. M. There was a dry subsoil, which took up a vast amount of the surplus. This helped to avert disaster. The *Keosauqua Republican* published over four columns concerning the storm and its effects, and boastfully added that "Van Buren county beat the record by pulling more water from the clouds in the same length of time than was ever done by any county in Iowa." One man lost his life during the night in trying to rescue his cattle from the floods.

DAILY AND MONTHLY PRECIPITATION FOR JUNE, 1905.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. McDONALD, Bayard.
Tenth District—O. A. OLSON, Forest City.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XVI. JULY, 1905. No. 7.

IOWA CROP CONDITIONS AUGUST 1, 1905.

The August 1st report of crop correspondents has been tabulated, showing following estimates of the condition of crops on the percentage basis: Corn, 94 per cent; spring wheat, 93; oats, 97; flax, 78 ; potatoes, 92; pastures, 103; apples, 40; grapes, 91.

Last year at corresponding date the estimates were: Corn, 88; spring wheat, 75; oats, 89, flax, 94; pastures, 96; potatoes, 101; apples, 73; grapes, 86.

JULY WEATHER AND CROPS.

The daily mean temperature of July for the state was 70.6°, which is 3.8° below normal. The rainfall was 2.91 inches, or 1.44 nches below the July average. The temperature was quite uniform, except as affected by altitude and latitude; but the rainfall was unequally distributed, ranging from 7.08 inches at Albia, Monroe county, to .69 of an inch at Washta, Cherokee county. The average of the northern section was 2.00 inches; central section, 3.19 inches; and the southern section, 3.45 inches.

The temperature of the month was exactly the same as in July 1904; but the rainfall this year was 1.50 inches less than last year, and conditions were more favorable this year for crop growth and harvest operations. During the first decade the weather was generally cool and showery, retarding the necessary work of finishing the cultivation of corn, and in many fields that crop was laid by in condition not up to the normal. The showery weather during the first half of July was somewhat unfavorable for securing the heavy crop of clover. But the latter half of the month was quite favorable for haying and harvesting oats, barley, rye and winter wheat. The hottest period of the month was during the second decade, from about the 13th to the 20th, during which time corn made very rapid progress. At the close of the month the average condition of corn was better than at the corresponding date in any year since 1900. Spring wheat ripened under favorable conditions, and the harvest was begun in the last week in July, with but little appearance of damage by rust. The oats crop was secured in good condition, and early threshing reports indicated a full normal yield. The hay crop secured in the latter half of July was generally in good condition, though somewhat overripe in the southern half of the state. As a whole July was a favorable month, with a minimum amount of damage from excess or deficiency of moisture or temperature. The crops already secured are better than was deemed possible in the spring months, and the growing crops give promise of an abundant yield.

TRAITS OF SUMMER STORMS.

[N. Y. Tribune, July 14.]

One of the most striking differences between such storms as have occurred in this vicinity within the last few days and those of winter is seen in the distribution of the attendant rainfall. At both seasons a wide area is likely to be affected at any one time, but the actual result is not the same. In cool weather the precipitation is usually almost uniform over the whole of the region favored, which may embrace several large states, and it is practically continuous for several hours. In warm weather it is concentrated over many widely separated spots. Sunshine often intervenes between these; and where there is a downpour at all it is generally swift, sudden and copious. That which visited New York City on Monday was almost without precedent in this respect for northern latitudes; but it illustrated the extremely local character of such meteorological episodes.

Summer and winter storms are dissimilar also in the changes in wind direction and temperature which accompany them. In cool weather the wind usually holds from the same quarter from the beginning to the end of the period of precipitation, and finally shifts to the northwest, where it stays for a day or two. Previous to that occurrence the air is mild if not really warm, but the mercury takes an abrupt drop when the sky clears. In July another programme is observed. Nine times out of ten the wind goes back after a shower to the same quarter as before which is generally the southeast. This may happen on several successive days while a given locality is under the influence of one particular barometric depression. The movement of a "low" in summer is almost invariably sluggish, and not until the centre of it has passed to the eastward does any lasting change come in the wind or temperature. A shower is often ushered in, to be sure, with a gust of greater or less violence from the west, but its duration is brief. The phenomenon is attributed by meteorologists to a convulsive descent of air from above in the middle of the storm; and though the volume of atmosphere which is thrust downward may be large enough to produce a cooling effect that last an hour or so, the benefit is shortlived. No permanent relief can be expected until the low area of barometer is followed by a high one and the wind comes steadily from the northwest.

Observations made with balloons and kites in thousands of instances show that with increasing elevation above the earth there is usually a slow fall in temperature. The average difference is about 1 degree Fahrenheit for every 300 or 325 feet. On occasions, however, notable departures from this standard are observed. Sometimes the diminution is not so rapid as might be expected, and when such a situation exists no particular consequences need be looked for. When, on the other hand, at an elevation of a few thousand feet a stratum of air is found which is much colder than the established formula demands trouble is almost sure to follow. At one point or another the hot air below will force its way upward, an exchange will take place on a greater or a smaller scale, and thundershowers, wind squalls, tornadoes or hailstorms will follow. A large brood of these local demonstrations is generated almost simultaneously, their intensity being governed mainly by the extent

to which the lower air is saturated with water vapor and by the temperature deficiency of the upper stratum.

The task of forecasting local disturbances is beset with peculiar difficulties. It is comparatively easy for the expert to recongnize on a weather map the conditions which are favorable to their development. These are likely to prevail over a wide area at one time, and warning of their existence ought always be given. It is practically impossible, however, to foresee precisely where any particular outbreak will begin. The most that can be done ordinarily is to say that there is a chance that such storms will form. After one does, its progress can be reported by telephone; but the responsibility of doing that has never been assumed by the national government, and probably never will be. Local forecasters who have studied the deflecting influence of hills upon the routes of summer storms might be enabled in time to perform useful service in announcing the probable path that would be taken by one which had come within the range of their observations; but the extremely short life of most disturbances would impair the value of even these indications.

CYCLONES ARE HARMLESS.

[Nature and Science in St. Nicholas.]

The ordinary land cyclone is usually quite harmless, and it is only by a mistaken use of the term that it has become associated with those terrifying storms peculiar to our country known as tornadoes. Cyclones have a bad reputation because they are commonly associated with other more harmful storms. Instead of being dangerous and destructive they are the chief source of rain in spring and autumn and supply the snow which adds so much to the pleasure of our northern winter. They cover a large extent of territory at one time, and on an average follow one another across the country from west to east at intervals of about three days.

A tornado often does great damage. It is known by its funnel-shaped cloud, which bounds and bounces along, now high in the air and again touching the ground. When it skims along the ground the havoc is greatest. Here the mightiest structures of man are crushed in an instant before the avalanches of wind let loose from every direction. The air seems to have an explosive force, buildings falling outward instead of inward, as one might think. In such a storm no place is safe, but the southwest corner of a cellar affords the best protection obtainable. If in the open lie flat on the ground. During a tornado, which lasts but a few minutes, the sky is covered by clouds of inky blackness, which here and there take on a livid greenish hue. The surface winds rush spirally upward into the funnel-shaped cloud, carrying with them many articles which are afterwards dropped some distance beyond. The danger zone is confined to a path less than a half mile in width and one hundred miles in length. These storms occur only on land.

The true hurricane is ocean-born. On the high seas of the tropics it marshals its forces of wind and wave, before which the stoutest ship is helpless and the fairest islands are laid waste. Even the sturdy mainland trembles under its awful castigation. These ocean storms last much longer than tornadoes, cover more territory and cause more damage. The hurricane which overwhelmed Galveston destroyed several thousand lives and millions of dollars' worth of property. The West India islands are frequently scourged by these awful visitations, and our own Atlantic coast sometimes feels the lash of these dreaded storms.

But the hurricane and the tornado are rare. The former seldom extends far inland, and usually occurs in the late summer or fall. Tornadoes are products of the south and west and are mostly confined to the spring and early summer months. The cyclone is a universal storm which travels over land and sea, in season and out of season, in spring or in fall, in summer or in winter. It is an old friend, but one much abused.

GROW A LITTLE ALFALFA.

[Cedar Rapids Republican.]

It is the boast of the arid west that it is the alfalfa country. But there is every reason for believing that Iowa can beat the world on alfalfa as well as on corn. The soil of the arid west has no natural advantages over the soil of Iowa. Even alfalfa likes a fairly good soil. But it wants depth. Some wise men assert that alfalfa roots go down 300 feet into the soil. There are westerners who claim to have found traces of them 150 feet below the top crust. But alfalfa wants depth. Where it strikes a hard pan alfalfa will not grow. Nor will it grow in rocks.

But Iowa has millions of acres that will grow alfalfa, undoubtedly. The way to find out is to try it. Alfalfa is said to add the balanced ration to the Iowa feed lot. All corn is not good, not even for hogs. Alfalfa is a growth that has the necessary variant. Even hogs are said to eat the hay with avidity and some Nebraska men have made small fortunes selling gound up alfalfa hay for chicken feed. Some of it is due to a fad. Some of it is based on solid facts. But give alfalfa a trial. Show that even with those forage plants Iowa is up with the best.

Soil inocculation and all that sort of thing is said to be unnecessary. Professor Holden says it can be done without that troublesome work. He says for the Iowa farmer to take a couple of acres of oat land. Spread some manure on it, six or eight loads an acre, disc it twice and then plow and harrow until it is like a garden seed bed. Sow the alfalfa fairly deep, an inch down. With favorable weather, which includes some rains, the alfalfa will grow from six inches to a foot in height. Leave the growth on the soil. Next spring there will be three crops.

Why not try it? Why not try it in every county in the state?

And now!

CLIMATOLOGY OF THE MONTH OF JULY, 1905.

BAROMETER.—Mean pressure, 29.93 inches; highest observed, 30.24 inches, at Sioux City, on the 24th; lowest observed, 29.37 inches, at Charles City, on the 4th; range for state, 0.87 of an inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 117 stations, was 70.6 degrees, which is 3.8° below normal. By sections the mean temperatures were as follows: Northern section, 69.5°, which is 3.7° below normal; central section, 70.8°, which is 3.5° below normal; southern section, 71.4°, which is 4.3° below normal. The highest monthly mean was 73.4°, at Keokuk; lowest monthly mean, 67.4°, at Sibley. The highest temperature reported was 102°, at Waukee, on the 16th; lowest temperature reported, 40°, at Washta, on the 25th. The average monthly maximum was 95.3°; average monthly minimum, 49.0°. The greatest daily range, 41°, at Waukee; average of greatest daily ranges, 31.6°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 128 stations, was 2.91 inches, which is 1.44 inches below normal. The averages by sections were as follows: Northern section, 2.00 inches, which is 2.21 inches below normal; central section, 3.19 inches, which is 1.09 inches below normal; southern section, 3.54 inches, which is 1.08 inches below normal. The largest amount reported was 7.08 inches at Albia; least amount reported, 0.69 of an inch, at Washta. The greatest daily rainfall reported was 4.00 inches, at Grinnell, on the 19th. Average number of days on which .01 of an inch or more was reported, 9.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 39 miles per hour, from the northwest, at Sioux City, on the 4th. Average number of clear days, 14; partly cloudy, 10; cloudy, 7.

OBSERVERS' NOTES.

ALTA—*David E. Hadden.* Mean temperature of July was about 3.5° below normal; rainfall 3 inches less than the 15-year average.

ALTON—*W. S. Slagle.* Very good month for growth of crops; wheat and corn doing well; no rust damage yet.

AUDUBON—*Geo. E. Kellogg.* Hail on 24th destroyed crops in small area.

BONAPARTE—*B. R. Vale.* First half of July cloudy and wet; very hot 14th to 18th inclusive; cool the balance of month, farm work retarded.

BOONE—*Carl Fritz Henning.* Splendid month for grain, such as oats, wheat and corn; large crop of hay.

BRITT—*Geo. P. Hardwick.* Excessive cloudiness and fog in July; extremes of temperature; corn uneven and late; oats and hay crops above average; apple twig blight prevailing over the county.

CHARITON—*C. C. Burr.* Corn is developing rapidly; no severe storms in July, but hay was badly damaged by showers.

CLINTON—*Luke Roberts.* July was over 2° below normal; deficiency in rainfall 2.69 inches; and yet all growing crops were in fine condition at close of month.

CRESCO—*L. G. Krumm.* At Bonair on 17th hail did much damage; surface very dry at close of month.

CRESTON—*W. L. Gaston.* July was unusually cool; good hay weather during latter part of month.

ELLIOTT—*Henry Barnes.* Heavy crop of hay gathered in good order in July; yield of grain fairly good; corn fully up to the average; good yield of potatoes.

FLORENCE—*H. Du Bois.* Hay harvested in fine condition; oats yielding 30 to 35 bushels; corn up to average for July.

FOREST CITY—*J. A. Peters.* From 13th to 20th corn made rapid growth; hay was never gotten up in better condition; month closes quite dry.

GRAND MEADOW—*F. L. Williams.* Many wet days but no very heavy rains; harvesting well along at close of month.

GRINNELL—*A. O. Price.* "Catchy" weather for haying; small grain good and crops secured in fair condition.

HANLONTOWN—*Miss G. M. Paschen.* Corn was mostly eared by 23d; barley and early oats harvested by 20th; standing up good; fair crop of black and red raspberries; drought cut berry crop short somewhat.

HUMBOLDT—*H. S. Wells.* Rain 1.4 inches; corn about 20 per cent below average; potato crop short; tame hay harvested.

IDA GROVE—*J. E. Conn.* This has been a cool month, but no damage was done to crops, which are looking good.

INWOOD—*G. M. Larsen.* A fine month; corn in fine condition; with favorable weather it will be a "bumper" crop; abundance of good hay put up.

JEFFERSON—*Geo. W. Day.* Haying commenced on 13th; oats harvest on 17th; no damage by hailstorm on 13th.

KEOSAUQUA—*J. H. Landes.* First of July and last of June wet weather spoiled nearly all early clover hay; but last of July was fine for harvesting; grain in fine condition at close of month.

OLIN—*Nathan Potter.* First week was mostly bad for making clover hay; since that time it has been good weather for harvesting.

POCAHONTAS—*F. E. Hronek.* High temperature from 14th to 20th; harvesting about finished by close of month and crops good.

RIDGEWAY—*Arthur Betts.* Month cool and similar to July, 1904, but not so pleasant; 319 hours of sunshine, or 39 less than average; hot weather 14th to 19th.

SHELDON—*A. W. Beach.* Best harvest weather in years; hay all put up without a drop of rain; harvest was late and corn is a week behind.

STOCKPORT—*C. L. Beswick.* No clear days between June 26 and July 13, and rain every day between those dates except July 7th.

WAUKEE—*E. J. Leonard.* Rain in first week hindered haying and corn plowing; generally favorable during remainder of month; grain nearly all in shock at close of July.

WAVERLY—*H. S. Hoover.* Very cool except a few days, 13th to 20th; last 11 days gave us remarkable weather for haying and harvesting; oats crop about an average; corn improving.

WEST BEND—*Ph. Dorweiler.* Month was below average in temperature; harvest well under way; corn backward.

WHITTEN—*Dr. Frank P. Butler.* On July 4th wore an overcoat to make calls. Heavy electric storm on night of 18th; oats blown down and corn lodged.

ERRATA IN MAY REVIEW.

CLEAR LAKE.—On page 11, the precipitation of the 4th, 6th and 7th should have been .35 of an inch, .10 of an inch and .18 of an inch respectively.

CLEAR LAKE.—Total precipitation on page 6, omitted, should have been 7.53 inches.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. McDONALD, Bayard.
Tenth District—O. A. OLSON, Forest City.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XVI. AUGUST, 1905. No. 8.

AUGUST WEATHER AND CROPS.

The month of August was above normal in temperature and rainfall for the state at large. The mean temperature was 74.3°, which is 2.3° above the August normal for Iowa. And the average was 3.7° higher than the mean temperature of July, 1905, which is quite a departure from the normal in this state. From the first week to the close of the month the temperature was about or above the normal line, so there was practically no check to the growth of the immature crops. The rainfall was generally timely in its coming, and not greatly in excess of local needs in any part of the state; the distribution being unusually favorable.

The average number of clear days was 16, and there was a sufficient number of hours of sunshine to promote healthy growth of plants. At the close of the month the corn crop had reached the roasting ear and glazing stage, giving promise of reaching the line of safety from harm by frost by the 20th to 30th of September. All crops were much further advanced on September 1st, than on the corresponding date in 1904, or the two preceding years. Some damage resulted from severe local storms of rain, hail and wind, but the aggregate of loss from this cause was not much in excess of the usual amount of damage in other seasons. There are numerous reports of injury to corn by root worms, mostly in fields where corn has been grown two or more consecutive years.

Thrashing oats and wheat from the shock was continued through the month, and reports indicate that the grain suffered some detriment from exposure to frequent showers.

The conditions were generally favorable to pastures, and the second crop of clover was unusually heavy. There were some complaints of blight of the leaves of the late potato crop, but the early crop was heavy enough to compensate in part for this loss. Altogether the month of August was very favorable.

NOTES AND COMMENTS

By a press dispatch we are pained to learn of the death of Moses Simon, who for the past fifteen years has served as cooperative observer of the Weather Bureau at Carroll, Iowa. He passed away on September 1, 1905, after a period of illness from cancer. He was a good citizen, and a most efficient observer. The station at Carroll will be continued under supervision of Mrs. Simon.

The Mount of the Holy Cross in Colorado has been set aside by the government as a forest reserve. This fine park will include an area of 1,500,000 acres, much of which at one time was covered by heavy timber.

Some money will be required to move the crops of the West, but in Iowa most of the moving will be done by cattle, horses, swine, sheep and poultry. The home market in the feed lots is the best place to dispose of corn and other feed stuffs.

FOR want of timely stacking, the farmers of Iowa suffered heavy loss in the quality of oats and wheat thrashed from the shock. That is a very wasteful practice, which in some years has caused the loss of millions in the impairment or total destruction of small grain. Is stacking a lost art in Iowa? If so, the Agricultural College at Ames should send out a score of young experts to teach the farmers how to build stacks, and show them the cash value of careful work in that line. There's millions in it.

BETTER YIELDING GRASS LANDS.*

(By Prof. Chas. F. Curtiss, Dean of Agriculture, I. S. C.)

We have had and are having a great corn revival throughout Illinois and the entire corn belt and it is an excellent thing. It certainly means that we are going to produce very much better results. We are going to get more from the corn lands of this great West, but we need to have as well as a corn revival, a grass revival. We need to study the grass crop as well as the corn crop.

The two great products of the central west are corn and grass and the greater of these is grass. That is, the grass and the forage crops of our farms and our farming states are of greater value, taken the one year with another, on an average, than any other single crop that we produce.

As a rule, we give less consideration to the hay and grass lands—and especially is this true of our grazing lands—than to any other part of our farms. I believe they are the lands that are the most susceptible to improvement, and it is the crop in which we can increase the returns with the least expenditure of additional labor, and at the least cost.

□ We are confronted with new conditions in the agriculture of the central west today. We have seen these lands advance, within a decade or a little more, from $50 and $75 to $100 and $150 per acre, and it is my prediction that they have not yet reached the limit. At the same time, while these western lands have been advancing in value we have experienced a decline of 25 to 50 per cent in the lands further east, the lands of the Ohio and Miami valleys and eastward from that. There will sometime be a corresponding advance in the lands of some other sec-

*This article is an extract from a stenographic report of Professor Curtiss' address before the late Illinois Farmers' Institute. It has lately been revised by Professor Curtiss and was published in the Prairie Farmer of Chicago, August 10, 1905.

tions, if we do not give attention to the right methods of maintaining the productive capacity of our farming land.

We all know that as valuable as corn is, it is not a complete ration, and if we expect to produce the best results in growing animals, and in dairy stock, and in developing horses, and in maintaining the breeding qualities of our animals, we must have a variety of feed stuffs. We must have the constituents that go to build up the bone and muscle and properly develop the animal in the highest form and highest state of excellence. These things are absolutely essential; never so much so as today, in view of the high-priced land that we have, in view of the quicker returns we must get from these animals, and the higher excellence that we must produce in the finished product. That point is generally conceded by the most successful stock men. In the face of the fact that we have higher priced labor, higher priced feed products of all kinds, the problem presented is, how we may cheapen the production of these animals by the rations we use, or the methods we employ in growing and producing them on our farms, and produce the finished product at comparatively a lower cost and without sacrificing any of the excellence.

I believe that the grass crop affords today the surest and most practical means of accomplishing cheaper production. That is, I think if we would give to the improvement of our forage crops and our pasture lands the same attention that we have given to the improvement of our cultivated crops and our grain crops, that we would receive a larger increase, larger returns for less expenditure than any other improvement that we may have.

It is sometimes said that when land becomes worth a hundred dollars an acre or more, that it is worth too much to maintain in grass. I believe that statement and that theory are entirely fallacious.

You will find today in the rich agricultural land of Great Britain a larger area of grass, relatively, than you will find in Illinois or Iowa. You will find lands worth three or four hundred dollars per acre more largely devoted to the growing of grass crops than they are in this country. And I believe, if we are to maintain our farms in the highest state of productive capacity, and conduct them with the highest profits, we shall be obliged to devote a large part of our farming lands to grass production, and relatively less to corn production.

I believe that if we were today to reduce the cultivated lands devoted to the grain crops twenty-five per cent and apply better methods, and devote that reduction of grain crops to grass production, that we might maintain our present output of grain, and at the same time have this increased grass land, that could be applied to the production of live stock, with greater profit than any other part of the farm. And I think it goes without saying we all recognize that we could reduce the acreage of our cultivated grain crops one-fourth per cent without decreasing the yield, if, at the same time we could apply the best methods of more thorough cultivation and of rotation, and the improved methods of agriculture which are being introduced today.

Now, in view of the fact that the grain crops have all advanced in value, in view of the fact that everything a farmer buys to balance his corn crop is high priced, and will undoubtedly continue high in price, I believe that we have, right on our farms and in the products of our farms, the means of balancing the ration, with greater economy and with greater profit, and with greater advantage to the maintenance of the fertility of the farm, than through the purchase of any of the by-products from the factories or the mills. These products must continue to be high, and while of course we do not expect to quit producing them, because there is a certain output from our factories and our mills that must always be consumed on the farm, and they ought to be consumed here rather than go abroad, yet there is a limit to the price we can pay for them and utilize them with profit.

Instead of paying out a large amount of money for these products at high prices, we might better produce on the farm the feeding stuffs containing the nutrients and the elements of growth and muscle and bone making that we need in our animals. The safest, the surest and the best means of producing that will be through the grass crops rather than in the grain crops.

Now I think we could, in the first place, extend the grazing season from two to three months in the year, on nearly every farm throughout this state and other states similarly situated. In fact, we do not get good grazing more than five or six months in the year, seldom more than five months. Wherever we can grow blue grass, we can extend the grazing period to eight or nine months, without serious difficulty. Particularly is that true with regard to the production of horses and of beef cattle. It can not be so readily done with diary cattle for the reason we can not expose them so much, and have them out so many months in the year.

But by maintaining our lands in good condition, and providing for a good growth of grass throughout the summer months, and carrying a surplus into the autumn and over the winter, we can graze up till the first of January in nearly all parts of Illinois. From this latitude south there will be no difficulty. And then, by maintaining a surplus of grass on the pastures over winter, we can turn stock out by the first of April instead of the first of May. So we can add two months to the grazing period at the end of the season, and one month at the beginning of the season, by holding in reserve on our grass lands a surplus of feed, which can be drawn upon at any time.

In order to do this, however, it will be necessary to give attention to the grass lands, in the way of building them up; in the way of cultivating them. If we expect to grow a crop of grass, we must expect to feed that crop the same as we feed our live stock. And we must give the same attention to the cultivation and the maintenance of the grass lands in the best state of fertility that we give to other parts of the farm. Three-fourths of our grass lands are relatively neglected lands. The pasture lands, as a rule, are the poorest and most inferior parts of the farm.

It is not always the case, but as a rule, the pasture receives no consideration, until all other parts of the farm have been brought under improved methods. And if we were to give it the annual attention in the way of top dressing, in the way of harrowing and distributing fertilizer, in the way of renewing the grass seed, and in the way of drainage, keeping the soil sweet and light and in the best possible condition, I believe that we could practically double the output from our pasture lands.

One of the first essentials is to see that we have a good stand of grass. So many of our grass lands are simply set aside to grass, and they are grazed closely from the beginning to the end of the season. The soil bakes, and becomes what we call hide-bound at times. The grass dies, and then if it is exposed when it is bare during the winter and during the midsummer's severe drouth, it dries out and kills out, and very soon we will have not more than half or three-quarters of a stand of grass on many of our grazing lands. And whenever that condition occurs, nature provides for a covering, and the weeds come in there, and they take possession of the soil just as soon as there is an opportunity. Just as soon as there is a reduced condition or weakened vitality of the grass crop, the weeds will come on and take possession. So that over a large part of our grazing lands, we have not a stand of grass at all, in many cases not to exceed a half a stand.

The first thing should be to secure a stand, after providing drainage. Of course that should be the beginning of all agricultural operations. We should have our grass land drained, as well as our agricultural land, and if we do not we can not expect returns. Of course we may get an inferior, coarse, rough sort

of grass, but it will not be the grass and it will not be the production that we must have from our valuable land today. No man can afford to own valuable land today that is not drained.

That should be the beginning. Then we ought to go through our grass land and make sure of getting a stand, the very first thing we do. I do not mean that we ought to put a plow in and plow them up regardless of conditions or what we want to use them for. I want to say emphatically that the best grass land of the world, in all farming countries, is land that has been devoted to grass for centuries. And that will be so in this state. Of course it may be desirable, and will be desirable to rotate a good part of the farm, but if certain portions of the farm can be put into grass and left there permanently, it will be much better than to be continually plowing the pasture land. If our land is lacking a stand in grass, it will not be necessary to put a plow in and plow it up and reseed, to start over again. We can put the disk and harrow in there and give the surface of our pasture land a thorough cutting up; so complete a cutting up that it will look, perhaps, as though but little grass remained. But put on, in connection with that, clover and timothy seed, and alsike and we can at once get a stand of grass without in any way disturbing the sod which has been there so long, and which is of such great value in getting the land up to its highest state of production. It will surprise you to see how much this will improve the grass land.

We have recently made some experiments on the college farm at Ames with blue grass pasture land that was not by any means in a low condition. It had been pastured, but kept up in a good state of fertility, but by going on it in the spring, just as soon as the frost was out of the ground, and putting a disk on and cutting it up, and then sowing the grass seed at the rate of two or three pounds per acre, dependent upon the varieties—sometimes as much as five pounds per acre—and following that with the harrow, and then not pasturing too heavily for a time, we have been able to add as much as one hundred per cent to the productive capacity of the soil in the first season, and that advantage will accrue for several seasons to follow.

It is very easy to add fifty per cent to the grass crop in a single year, by this method. Instead of having grass land growing weeds we can have the entire area growing grass. There is never any trouble about weeds in the pastures, if you first have the soil in good condition, and have grass enough to make a good stand. We see weedy pastures all over this country, on the best farms as well as on the poorest, and in nine cases out of ten the sole trouble is that the methods of managing this grass land have been wrong, and the weeds stand is a protest against that farmer's methods. The weeds would not be there if the methods had been right, and if there had been an opportunity for the grass to take possession of the soil. If you give our grasses possession of the rich farming land of central Illinois or any part of the state, and maintain the soil in the right condition, there will be no trouble in keeping down the weeds.

These are some of the first things that need to be observed in the growing of grass. Then, when we get our lands in that condition, we need to keep them there. It is like what the old English gardener said to an American lady, about making a lawn. In traveling in England she was very much taken with the richness and the velvety, luxuriant growth of the English lawns, and she thought she would get a recipe for making that kind of a lawn and have some in her own dooryard, so she asked him if he would kindly tell her how he made a lawn, and got it in such nice condition. He said:

"Madam, it is very simple. I prepares the seed bed perfectly, and I sows the grass seed, and then I waters it and mows it, and waters it and mows it for four hundred years, and then you have a lawn."

Now, that is the way to make a pasture. We must get the soil right, get the grass seed in there, and keep it in there, and then feed the grass crop the same as the corn crop. We know we can not grow corn unless we get the soil up and keep it up in a high state of fertility. And the same is true of the grass crop. If we give the same attention to the improvement of our grass lands, we will get double the returns for the outlay and labor and expense that we would get in improving our tillable lands.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.94 inches; highest observed, 30.33 inches, at Dubuque, on August 26th; lowest observed, 29.65 inches, at Davenport, on August 14th; range for state, 0.68 of an inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 125 stations, was 74.3°, which is 2.3° above normal. By sections the mean temperatures were as follows: Northern section, 73.1°, which is 24° above normal; central section 74.4°, which is 2.8° above normal; southern section 75.4°, which is 1.8° above normal. The highest monthly mean was 78.0° at Waukee; lowest monthly mean, 70.6° at Fayette. The highest temperature reported was 104°, at Waukee, on the 11th; lowest temperature reported 44°, at Rock Rapids, on the 6th. The average monthly maximum was 95.5°; average monthly minimum, 52.9°. Greatest daily range, 46° at Rock Rapids; average of greatest daily ranges, 33.1°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 136 stations, was 4.05 inches, which is 0.50 of an inch above normal. The averages by sections were as follows: Northern section, 4.06 inches, which is 0.96 of an inch above normal; central section, 3.48 inches, which is 0.24 of an inch below normal; southern section, 4.61 inches, which is 0.71 of an inch above normal. The largest amount reported was 8.47 inches at Plover; least amount reported, 1.04 inches at Vinton. The greatest daily rainfall reported was 3.74 inches at Allerton, on the 14th. Average number of days on which .01 of an inch or more was reported, 9.

WIND AND WEATHER.—Prevailing direction of the wind, south; highest velocity reported, 48 miles per hour, from the northeast, at Sioux City, on the 20th. Average number of clear days, 16; partly cloudy, 9; cloudy, 6.

* At those stations thermometers are read in the morning; the maximum temperature then observed appears in the maximum column for the preceding day, on which it nearly always occurs.

OBSERVERS' NOTES.

ALLERTON—*Rex Shriver.* Good yield of small grain; corn considerably damaged by root worms.

ALTA—*David E. Hadden.* High wind on 14th damaged shade trees, out buildings and sheds on fair ground; another windstorm on the 16th and both storms leveled corn badly.

AMANA—*Conrad Schadt.* The days were generally hot and nights mainly cool with fog; ground too dry for plowing near close of the month; mean temperature was 32° higher than in July.

BAXTER—*W. T. Thorp.* Weather favorable for corn; too much rain for thrashing and oats were damaged by being left in shock.

BONAPARTE—*B. R. Vale.* Rain 7.93 inches; a wet month with normal temperature; vegetation vigorous; subsoil full of water.

BRITT—*Geo. P. Hardwick.* No serious storms, but damp and excess of cloudiness; grain left to thrash from shock badly damaged; corn has made rapid advancement, but will not produce a yield

CHARITON—*C. C. Burr.* Grain damaged in shock by rains; fields too soft for movement of thrashing engines.

CLINTON—*Luke Roberts.* Rain, 4.11 inches, or .97 of an inch above normal. Month exceptionally fine for crops and work in fields. Greatest amount of rainfall in any 24 consecutive hours, 1 06 inches on 13th and 14th. No windstorm heavy enough to prostrate corn or other crops. If the temperature remains above the frost line for three weeks beyond August the crop will beat the record.

CRESCO—*L. G. Krumm.* On the 7th corn was badly riddled by hail in a narrow strip half a mile wide.

CRESTON—*W. L. Gaston.* The electrical storm on the 13th was the severest known here for many years.

ELLIOTT—*Henry Barnes.* Corn was somewhat damaged by windstorms on 17th and 21st. Old corn nearly all sold, and there has been a free movement of small grain to market.

FOREST CITY—*J. A. Peters.* August was an exceptionally good month for corn and for threshing small grain. Corn needs three weeks in September to mature.

GRAND MEADOW—*F. L. Williams.* A wet harvest and much damp grain in shock or stack; oats extra heavy; corn practically safe and crop heavy; pastures excellent.

GRINNELL—*A. O Price.* Seldom better pastures or bigger aftermath in meadows; at end of month corn was glazing and promised a big yield.

HANLONTOWN—*Miss G. M Paschen.* Threshing from shock begun on 9th; oats fair yield; harvest apples were ripe the 17th; good crop of blackberries.

INWOOD—*G. M. Larsen.* A fine month; grain yield fair to good; corn in good condition, needing two weeks of good weather in September.

OLIN—*N. Potter.* August was all that could be desired for threshing and ripening corn.

PLOVER—*J. S Smith.* Corn damaged by wind on 23d fully 25 per cent in pathway of storm, about 18 miles wide.

RIDGEWAY—*Arthur Betts.* Warmest August since 1900; hard hail 7th and 8th and some damage done; sunshine 302 hours, or 70 per cent.

WAUKEE—*E. J. Leonard.* Month favorable for work; corn needs dry weather; threshing about half done.

BELATED REPORTS.

FAYETTE—June—Mean temperature, 67.2°; highest, 91° on the 4th; lowest, 42° on the 8th; greatest daily range, 36°; total precipitation, 5.15 inches; greatest in 24 hours, 1.10 inch; prevailing direction of wind, southeast; number of clear days, 10; partly cloudy, 13; cloudy, 7; rainy, 13.

FAYETTE—July—Mean temperature, 68.4°; highest, 93° on the 17th; lowest, 42° on the 25th; greatest daily range, 36°; total precipitation, 2.62 inches; greatest in 24 hours, .57 of an inch; prevailing direction of wind, northwest; number of clear days, 16; partly cloudy, 8; cloudy, 7; rainy, 11.

MASSENA—July—Mean temperature, 72 2°; highest, 100° on the 16th; lowest, 48° on the 9th; greatest daily range, 35°; total precipitation, 1.91 inches; greatest in 24 hours, .88 of an inch; prevailing direction of wind, north and south; number of clear days, 19; partly cloudy, 4; cloudy, 8; rainy, 8.

DENISON—July—Mean temperature, 69.2°; highest, 95° on the 17th; lowest, 45° on the 10th; greatest daily range 32°; total precipitation, 3.68 inches; greatest in 24 hours, 1.03 inches; prevailing direction of wind, south; number of clear days, 21; partly cloudy, 8; cloudy, 2; rainy, 10

ERRATA IN JUNE AND JULY REVIEW.

AMANA—Precipitation on page 11, for June 5th, recorded .16 of an inch, should read .06 of an inch.

MONTICELLO—Precipitation on page 11, for June 11th, recorded .78 of an inch, should read .18 of an inch.

CEDAR RAPIDS—Precipitation, page 6, recorded 2.77 inches in July, should read 2.78 inches departure from normal, recorded 1.10 inches should read 1.09 inches.

DAILY AND MONTHLY PRECIPITATION FOR AUGUST, 1905.

A DESTRUCTIVE HAILSTORM.

On the evening of August 21st one of the most damaging hailstorms ever witnessed in Poweshiek county struck the town of Montezuma, says the *Grinnell Herald* of August 22d.

The storm came from the northwest and cut a clean swath about three miles wide and several miles long, stripping trees of leaves and bark, cutting off cornstalks and ruining the crops, de troying fruit, breaking window lights and splitting shingles and weather boarding. The hail was accompanied by a high wind. At Ewart where but little hail fell the corn was blown to the northeast while at Montezuma the wind blew toward the southeast. The hailstones were very large ranging from the size of a walnut to the size of the fist. The *Republican* office at Montezuma presented a broadside to the storm and suffered greatly thereby, having all its north window lights demolished and being deluged with rain. The lights on the north side of churches, schoolhouses, masonic hall and court house as well as those of dwelling houses were smashed during the terrific bombardment. The high school building lost fifty-six lights, Garfield school twenty. All the lights on the north side of every church in town were broken and about three-fourths of the lights on the north side of residences. It is reported that corn crops in the path on the storm were completely destroyed. The hailstorm lasted about fifteen minutes and rain fell in torrents accompanied by high wind and blinding lighting which did a great deal of damage, setting fire to barns and killing stock.

LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—O. A. OLSON, Forest City.
Eleventh District—H. L. PIKE, Whiting.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XVI. SEPTEMBER, 1905. No. 9.

SEPTEMBER WEATHER AND CROPS.

September was about two degrees above normal in daily average temperature, with a small excess of the mean rainfall. The warmest and brightest period of the month was the last decade, and the coldest period was from the 1st to the 9th. The heaviest rainfall for the state occurred in the second decade, from about the 12th to the 18th. The distribution of rainfall was quite unequal, the heaviest downpours occurring in the southwestern half of the state, dividing by a diagonal line from Lyon to Lee county. In portions of the area of greatest precipitation the excess was somewhat detrimental to crops, and especially damaging to wheat and oats in the fields put up in shocks awaiting favorable conditions for thrashing. The heaviest losses of the season resulted from the prevalent method of thrashing from the shock instead of the stack or barn. As a result, much of the excellent crop of small grain produced this year has been badly discolored and reduced below the standard grades in the markets. During the stormy period, about the 17th to the 19th, severe windstorms swept over considerable areas in all districts, aggregating probably about one-third of the state. Corn was prostrated to an unusual extent, and much of it failed to regain its standing position on account of great weight of ears and stalks. The damage and consequent reduction in quality and amount of the output can not be estimated prior to the harvest, but it is certain that a material loss resulted from that cause. The extraordinary weather of the last twelve days was of inestimable value to the state, bringing to maturity the belated portion of the corn crop and affording ideal conditions for cutting fodder, thrashing grain, putting up the second crop of clover, aftermath and wild hay, fall plowing, etc. At the close of the month practically 98 per cent of corn was well matured, and most of that which was planted about the middle of June was made sound and merchantable. Altogether September was a month to be remembered for its abundant sunshine and generally beneficient conditions, serving as a fitting crown of a most bountiful season.

NOTES AND COMMENTS.

According to a bulletin issued by the Iowa Highway Commission, this state has in rounds numbers about 100,000 miles of country roads. Of this mileage about 25,000 miles should be classed as main traveled roads. When these main traveled highways are made solid and reliable at all times of the year, they will constitute such a network that no farmer will be far from a good road. The business of the State Commission is to devise and adopt plans and systems of highway construction and maintenance, and disseminate information to all officers whose duties are in anyway related to that line of public service.

About 800,000 acres of land in Iowa is dedicated to public use in the highways, exclusive of the large acreage in the streets of the cities and towns. The country roads, and many of the streets in towns, afford fertile breeding ground for all kinds of pestiferous weeds. One of the good roads problems awaiting solution is how to abate the weed nuisance and make roads pleasant to the eye as well as passable for travel.

In the building of culverts and bridges and the digging of ditches reference must always be had to the maximum amount of water which they may be called upon to handle. It is the extraordinary and not the average rainfall which wrecks these structures and determines the water carrying capacity of the ditch. We recall the case of the man who undertook to drain and reclaim a small lake bed. He carefully figured out the average rainfall and the area of the watershed tributary to the lake and made out that a ditch of a certain size would easily carry off all the water. He drained the lake bed and had it all in crops, when one day along in June came a cloudburst, a rainfall of ten inches inside of six hours, which covered his crops with six feet of water, his ditch not being one-half large enough to handle such a volume of water, so when it did finally dispose of the water the crops were all ruined.—*J. S. Trigg*.

The present season affords, in the west at least, a remarkable object lesson in the value of tile drainage for wet farms. Side by side may be seen cornfields, the one on well drained land, the other taking its chance with the soil undrained, the one burdened with a magnificent crop, the other yellow and spindly, promising no satisfactory return whatever. The difference in the value of these two crops just about represents the cost of tile draining the land. It is almost needless to say that no business is being so overworked in that territory as the tile factories.—*J. S. Trigg*.

There are few bureaus in the United States Department of Agriculture that are more worthy of commendation than the climate and crop service as it has been instituted in every state in the Union. Not only are these weekly reports of interest, but they may be made of great value to both the producer and the consumer. Either can regulate their sales and purchases in a considerable measure by conditions of weather and crops as regularly recorded by the various bureaus working in conjunction with the Department of Agriculture.—*Prairie Farmer*.

Dr. Sohn said recently: "The climatic conditions in Greenland above the Artic circle are ideal. Even at our best consumption resorts in this country the patient has good days and bad nights. He can not go out in the damp air, and ordinarily

he loses at night what he has gained during the day. The secret of the outdoor treatment for this disease is abundant sunlight and dry, cold, bracing atmosphere. In the Artic regions in summer there is a period of three months of never-ceasing sunlight every hour in the twenty-four. Think of the effect of a continuous sun-bath of fourteen weeks. I have made numerous bacteriological cultures in Greenland, and have never found a disease germ. Such germs can not exist in that climate, as their propagation depends upon a temperature almost as high as that of the human body."

Hon. John Cownie, who is one of the best agricultural writers in the state, wants the farmers to get their seed corn in before any heavy frosts come, not later than the middle of October. He wants the best ears selected. He wants the ears put in crates, or swung over a beam in order that they may be thoroughly dried. He wants the corn kept during the winter months where it will not be exposed to zero temperature, some place where it will have a very even temperature, where dampness can not reach it and where rats and mice do not enter and destroy. Presumably he prefers the attic over a farmer's kitchen. In the spring he wants only the best kernels of each ear taken and planted, none of the kernels that grow at the tip or the butt of the ear.

If all this advice is followed and the corn is planted early, Mr. Cownie will guarantee 100 per cent corn in every field in the state. Mr. Cownie's advice is so direct and it is so easily followed that it is to be hoped the farmers generally will make use of it.—*Cedar Rapids Republican.*

THE NINE-LIVED CORN.

[*"Frolic of the Types," Council Bluffs Nonpareil.*]

The corn was killed in early May,
The floods had washed it quite away.

And later on it died again
And rotted 'neath the constant rain.

Once more we tolled its final knell;
The seed had not been tested well.

Yet, later, it began to sprout,
Then died. The weeds had run it out.

And later yet, still thin and pale,
It perished in a storm of hail.

Then came a fierce and burning heat,
It died that week of "fired" feet.

And then the awful smut arrived
And not a single stalk survived.

And soon we watched it in dismay,
Dry up and shrivel quite away.

Then came the last and saddest death;
It wilted 'neath the frost king's breath.

Nine times it died; and yet that fall,
We built new cribs to hold it all.

Now tell me, is there any cat
With lives enough to equal that?

ANOTHER RAIN MEDICINE MAN.

A correspondent of the Kansas City Star, writing from Topeka, Kansas, August 11th, said: There was an echo of the days when Kansas indulged seriously in the business of rainmaking in the mail of the secretary of state today. It was a letter from a Missourian who asked for the privilege of "showing" Kansas how to make rain. The Missourian is Allen Dorman, "president of the Continental Rainmaking company," of Clinton, Missouri. In a letter to the secretary of state, Prof. Dorman declared that he could come to Kansas and produce rain at any time and asked for orders. In his statement to the Kansas official, Dorman says:

"Rainmaking is a science. Oxygen is a poor conductor and bears the mineral molecules in their detached form that bridles the cloud with their electricity when it is far off. The mineral molecules are not oxidized; some may be borne far away on their mission of good. The Mississippi valley has been helped a billion dollars. Clinton, Mo., has been helped. Science has done the work. I have a drought formula."

"Boom, boom, boom! hear the cannon boom. A rain will surely come. A much needed rain is coming if science can induce nature to turn loose her moisture. The cannon booms and throws chemicals above the ground current to form new raindrops and prepare the chemical blue of the sky for rain. Science is advancing with leaps and bounds, but to help nature and to cope with its extensive meteorological conditions a purse of $500 may be required. Boards of trade and cities are expected to arrange lodging, location, cannon, etc., to save time and expense. Please state size of cannon caliber for chemical packages."

Mr. Dorman then proceeds to tell the secretary of state that he is the inventor of countless things of benefit to mankind. In his list of patents are "break hens from setting," "tooth powder," "to break new shoes," "home-made lye," "pie pan plates," etc.

Kansas ceased depending on artificial means for rain fifteen years ago. The state has suffered to such an extent from excessive moisture this year that a rainmaker would receive a scant welcome here.

LIGHTNING RODS UP TO DATE.

[The Literary Digest.]

The matter of protection from lightning, in the light of the most recent statistics, observations and experiments, is taken up in the report of a committee appointed in 1904 by the Royal Institute of British Architects. The conclusion of this body, which included several well-known scientific men and engineers, tend to modify in important directions the report published by the Lightning Rod Conference of Great Britain in 1882, which laid down what have since been considered the standard rules on the subject. The gist of these was that buildings should be protected by copper-strip conductors well grounded at the bottom and sharply pointed near the top. While the observance of this method doubtless saved many buildings, there has been a general feeling that it did not go thoroughly enough into the matter, and the present investigation, which covers the years 1901–04, is the result. The conclusions are thus stated editorially in *The Electrical World and Engineer* (New York):

"As the result of the investigation, and of experimental researches conducted since the lightning-rod conference report of 1882, the whole theory of lightning protection has been modified. The old idea was to erect perpendicular conductors from good ground to the top of the building. If there are several high points on the building, erect a perpendicular to each. It was supposed that a vertical rod exercised a protecting range of influence for a radial distance equal to its own height. These notions are abandoned. It is now supposed that lightning flashes are of two distinct characters, or, as described in the report, there are A flashes and B flashes. The vertical conductor is all right for the A flash, but for the B flash it may be of no use. There is thus always the comforting reflection left open to the owner of a lightning-struck rodded building that he suffered from a B flash. In brief, an A flash is a direct or main discharge between cloud and ground, while a B flash is a side discharge between one cloud and ground precipitated as the immediate consequence of a main flash between two opposed clouds. The only complete protection against a B flash is to construct a bird cage of metal around the building and to

ground the bird cage. This is almost precisely the construction followed in a modern skyscraper or tall office building, except that occasionally the steel structure is not thoroughly grounded. It is noticed in the report that these tall steel structures appear to be immune. Those who work inside modern tall office buildings during thunderstorms ought to lay this consolation to their souls: that they are rendered as nearly immune to lightning as modern science can devise. A flashes and B flashes may jump about and envelop them, but persons who are well inside the metal bird cage may consider themselves safe."

The new report, departing from the old, no longer recommends to gild, platinize, or electroplate the points near the top of a rod, and it restores iron conductors to confidence, preferring them to copper (except on the score of permanence) because of larger inductance, which in the old days was held in horror. Finally, the new report advises that two rods should be provided on each tower or high part of a building, one on each side. The writer concludes:

"Horizontal conductors should interconnect all vertical rods at the roof-ridge level, and also at the ground level. This works in the direction of the bird cage theory. All large masses of metal, in or on the building, should be grounded as directly as possible. Gas pipes should be kept away from lightning conductors. Steel pipe grounds are recommended, terminating below in packed charcoal and kept moist by rain-flow above. There can be no doubt that the new report is a great improvement over the earlier one, and property owners all over the world owe thanks to the committee for its labors. All nations have taxes and lightning damages in common."

CLIMATOLOGY OF THE MONTH OF SEPTEMBER, 1905.

BAROMETER.—Mean pressure, 29.99 inches; highest observed, 30.35 inches, at Dubuque, on the 13th; lowest observed, 29.50 inches, at Charles City, on the 18th; range for state, 0.85 of an inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 124 stations, was 65.8°, which is 2° above normal. By sections the mean temperatures were as follows: Northern section, 64.2°, which is 1.9° above normal; central section, 65.8° degrees, which is 2.5° above normal; southern section, 67.3°, which is 1.5° above normal. The highest monthly mean was 69.2°, at Red Oak; lowest monthly mean, 62°, at Hanlontown. The highest temperature reported was 96°, at Mount Ayr and Ottumwa, on the 1st; lowest temperature reported, 36° at Washta, on the 4th. The average monthly maximum was 88.0°; average monthly minimum, 44.0°. Greatest daily range, 48°, at Massena; average of greatest daily ranges, 34.1°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 130 stations, was 3.81 inches, which is .50 of an inch above normal. The averages by sections were as follows: Northern section, 3.23 inches, which is .16 of an inch below normal; central section, 3.08 inches, which is .17 of an inch below normal; southern section, 5.11 inches, which is 1.81 inches above normal. The largest amount reported was 13.18 inches at Thurman; least amount reported, .50 of an inch, at Clear Lake. The greatest daily rainfall reported was 6.10 inches at Alta on the 18th. Average number of days on which .01 of an inch or more was reported, 8.

WIND AND WEATHER.—Prevailing direction of the wind, southeast; highest velocity reported, 50 miles per hour, from the southeast, at Sioux City, on the 15th. Average number of clear days, 14; partly cloudy, 8; cloudy, 8.

* At these stations thermometers are read in the morning; the maximum temperature then observed appears in the maximum column for the preceding day, on which it nearly always occurs.

OBSERVERS' NOTES.

ALTA—*David E. Hadden.* On the 18th 6.10 inches of water fell in the twenty-four hours ending 11 P. M. of the 18th. The month as a whole was ideal; no frosts; corn made rapid progress and at the close was out of danger.

AMANA—*C. Schadt.* Weather fine and agreeable during the month; no frost and corn had ample time to mature.

BONAPARTE—*B. R. Vale.* Early half showery and cloudy; latter half bright, warm and good for corn.

BRITT—*Geo. P Hardwick.* Month exceptionally fine, without frost. Half of corn crop is up to average. Pastures good; plowing advanced.

CHARITON—*C. C. Burr.* Corn crop varies from total failure on flat land to 70 bushels per acre on good rolling ground. From April 1st to October 1st had 32.09 inches of rainfall; pasture splendid and fall plowing made good progress.

CLINTON—*Luke Roberts.* A fine month for ripening corn, with no frost; temperature 2° above normal; rainfall 3.81 inches, over a half-inch above average; of this amount 3.04 inches fell on the first day.

CRESTON—*W. L. Gaston.* The heaviest rain of the season occurred this month, the total being 6.37 inches. No frost, and everything green or fully ripe.

ELLIOTT—*H. Barnes.* At close of month corn was mostly mature, and a full average yield; potatoes below average.

FLORENCE—*J. H. DuBois.* At close of month 98 per cent of corn was safe; largest amount of fall plowing done for years; potatoes about a half a crop.

FOREST CITY—*J. A. Peters.* A frostless September and 95 per cent of corn was safe at its close; temperature 2.5° above normal.

GRAND MEADOW—*F. L. Williams.* At 6:15 P. M. on the 18th a heavy windstorm blew down some buildings and trees; corn was badly lodged; no frost during month and corn ripe; pastures extra.

GRINNELL—*A. O. Price.* Month without frost and corn fully ripened; pastures of June freshness.

HANLONTOWN—*Miss G. M. Paschen.* Cutting corn begun on 15th; potato crop poor; good yield of apples; plum crop light.

HUMBOLDT—*H. S. Wells.* Some plowing and thrashing yet to be done, but this work is well along; much corn is being fed; no clover seed harvested.

IDA GROVE—*Dr. J. E. Conn.* An unusually warm September; corn all matured and a fine crop.

INDIANOLA—*John L. Tilton.* On the 14th a severe thunderstorm occurred at Indianola. Lightning struck the center poles of a tent on the fair grounds. The county fair was in progress and the tent was filled with people; four persons were killed and several severely injured by the shock. The storm was unusually severe over a wide area A livery barn in town was struck and set on fire, but the property was saved by strenuous work. The telephones were burned out and rendered useless. It was a sad calamity to the people of that town and county.

INWOOD—*Geo. M. Larsen.* A fine month and better than was expected for benefit of corn crop; no frost; corn badly lodged by wind.

IOWA FALLS—*J. B. Parmalee.* This is the fourth time September has escaped a killing frost in the last fourteen years.

JEFFERSON—*Geo. W. Day.* Corn crop all right; potatoes and apples half crops; grapes above average.

KEOSAUQUA—*J. H. Landes.* Fine fall weather; latter half of month warm, with plenty of sunshine, grand weather for drying out corn which is now out of danger.

MASSENA—*Fred L. Knott.* Heavy wind blew corn down, cutting average yield at least ten bushels per acre.

MONTICELLO—*A. Mattheisen.* Corn cutting progressed finely, and 90 per cent safe at close of month; small grain good in yield and quality.

NORTHWOOD—*Chas. H. Dwelle.* Small grain good; corn excellent and out of danger of frost.

OLIN—*N. Potter.* September was frostless and an ideal month; corn all fully matured; pasture fine, and second crop of hay more than average.

OSKALOOSA—*Jos. Boyd.* An ideal month for maturing a bountiful crop of corn, for which we should thank the Giver of all good.

RIDGEWAY—*Arthur Betts.* Warmest of all Septembers; 239 hours of sunshine, or 64 per cent; no soft corn this year.

SHELDON—*A. W. Beach.* An ideal month for ripening all late corn which is now safe; sunshine was noted every day but two.

WASHTA—*H. L. Felter.* A severe thunderstorm on morning of 18th, with hail and damaging wind.

WAUKEE—*E. J. Leonard.* Month generally fair; corn drying fast and good quality; thrashing nearly done; late potatoes poor.

WEST BEND—*Ph. Dorweiler.* Ideal weather and no trace of frost; corn crop is all right.

ERRATA FOR AUGUST REPORT.

OSAGE—Mean minimum temperature, page 9, 60.2, should read 60.7. Monthly mean temperature, page 6, 72.2, should read 72.5. Date of minimum temperature 11",25", should read 25", page 6.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.*
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—O. A. OLSON, Forest City.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XVI. OCTOBER, 1905. No. 10.

OCTOBER WEATHER AND CROPS.

The daily average temperature of October for the state was 49.2°, which is 3 3° below normal. The average at the Mississippi river stations was higher than in the interior and western districts. The average precipitation was 3.40 inches, or .98 of an inch in excess of the October normal. The greater part of the rainfail came in the second decade. The first decade was warm and generally clear and dry, affording almost ideal conditions for ripening the belated portion of the corn crop, and for securing the second crop of clover and harvesting potatoes, apples and vegetables in good condition. The first killing frost was reported about the 11th and 12th in all districts, and all crops were fully matured. The wet weather prevalent from the 12th to the 20th retarded the drying out of the corn, but the last decade was more favorable and a good beginning was made in cribbing the fine crop that had been produced. The pastures were green, affording ample forage for stock throughout the month. Good progress was made in fall plowing. An increased acreage of winter wheat was sown in September, and this crop was in excellent condition as to stand and height at the close of October. All minor crops, garden truck and fruit were harvested in due season. Except some damage to-flattened corn by the wet weather about the middle of the month, the conditions during October were all that could be desired.

GENERAL NOTES.

In the next monthly issue the final crop report for 1905 will be published. To supplement the reports of regular crop correspondents, we respectfully solicit notes, estimates, figures and criticisms from any of the readers of this publication who may be qualified to give an opinion relative to the yield and quality of corn and other staple farm crops. There is much variability in the yield of corn. What is the average number of bushels harvested in the territory within the range of your observation? What is the quality compared with previous years? Take as wide range of observation as possible. Don't judge the general average by the yield of a single farm, or a limited area in a township. The public want reliable figures. Help us get the facts.

The gold output for Alaska for the year is estimated at about twenty-one million dollars. That's a very handsome dividend upon the original cost of that region. But the labor expended, and the privations endured in the production of that gold, brought a meagre compensation as compared with the rewards of labor expended upon the fertile fields of Iowa. The hay crop of this state for this year is worth one and two-thirds the value of Alaska's gold output, and the labor cost of the hay product was not half as great. Why, the farmers of Iowa waste more than the value of Alaska's gold every year in their corn fields, and that's not half the amount they waste yearly by not applying the best methods of farming. There is vastly more net profit in good farming than in gold mining in any country.

Everyone has tried to describe our Indian summer, and none has succeeded. It is like painting the rainbow. Such days must be seen, must be felt. It is not the eye alone that drinks in the scene with delight; it is not the ear alone that catches, far from the maddening crowd, all manner of voices and songs and instruments in the grand chorus of nature; it is not the lungs alone that feast upon the pure crisp air that fairly intoxicates you; it is not the sense of smell alone that is delighted with an odor so slight, pungent, indescribable, yet strangely agreeable; it is all these, and much more. And getting away from the busy haunts of man, up among the islands of the grand river or walking or driving through a wooded vale, or a broad expanse of prairie, there are sermons in an Indian summer day more eloquent, more effective than any that have ever been put into words. He who loves nature returns to his labors physically, mentally and morally better because of a day in the open during Indian summer.—*Burlington Hawkeye.*

The soil of Emmet county will raise a large yield of corn as well as small grain if properly tilled. H. C. Hanson, south of Armstrong, has a field of corn which he considered about the best in the county, and in order to ascertain if his statements were true some neighbors and people from Ringsted went out and husked a load, measured the ground and the corn, and examined the whole field carefully. It was found the average yield of the whole field would be about 92 bushels to the acre. They did not find a hill missing, and very few hills had less than three stalks. This is an example and a lesson of what good farming and good seed corn will accomplish. — *Armstrong Journal.*

According to the *Marine Review*, thirty million tons of iron ore will be transported down the lakes this year. There has been a steady increase in the ore trade, and also a constant decrease in the cost of transportation. It is confidently expected that there will be a movement of forty-five million tons of ore within the coming decade. This signifies a vast deal for the prosperity of the Northwest.

The total eclipse of the sun in August, 1905, occurred in the period of the greatest sunspot activity, and this afforded a rare opportunity to solar scientists to solve some of the problem relating to the variations of the sun's energies.

A Moscow report says that famine is prevalent in 100 districts of twenty-three provinces of Russia, and that it affects 18,000,000 persons, who will have to be fed until next July.

PENALTY FOR COUNTERFEITING FORECASTS.

Any person who shall knowingly issue or publish any counterfeit weather forecasts or warnings of weather conditions, falsely representing such forecasts or warnings to have been issued or published by the Weather Bureau, or other branch of the Government service, or shall molest or interfere with any weather or storm flag or weather map or bulletin displayed or issued by the United States Weather Bureau, shall be deemed guilty of a misdemeanor, and, on conviction thereof, for each offense, be fined in a sum not exceeding five hundred dollars, or be imprisoned not to exceed ninety days, or be both fined and imprisoned, in the discretion of the court.—[See Act of Congress approved March 3, 1905.]

POPULARIZING METEOROLOGY.

[New York Tribune.]

The work of the Weather Bureau at Washington in making practical popular applications of its meteorological knowledge is greatly to be commended. In the realm of science there are, generally speaking, two classes of workers: those who make original researches and discoveries and those who make the knowledge thus acquired known and practically profitable to the world. Perhaps it would be better to say there are these two classes of work, because it sometimes happens that they are both done by the same men, and those who make original researches also make practical applications of them to human needs. That combination of activities marks, of course, the highest form of unity.

Our Weather Bureau makes many observations, experiments and what not with a view to increasing theoretical knowledge of the weather and climatic conditions and phenomena. But these are of little value to the people unless their results are applied in some practical manner. For years daily forecasts of the weather have been widely published, and these steadily increasing in accuracy, have become more and more valuable to the public; even those who affect lightly to scoff at "Old Prob." often trusting to them implicity and profitably. A further development of the same principle is now seen in the issuance of special warnings of weather changes to special districts in which special crops are likely to be affected. A warning twenty-four hours in advance of the coming of frost may mean all the difference between prosperity and ruin to some fruit growing region.

In promoting that sort of work Professor Moore is giving to the Weather Bureau perhaps its greatest popular value. The average farmer or other citizen may take comparatively little interest in learned talk of high pressure and low pressure and atmospheric strata and all the rest of it, but he appreciates as ready money in his pocket a bit of information that enables him to gather a crop just in time to save it from being destroyed by frost; and when he finds such practical results proceeding from the more abstruse investigations in which he has taken little or no interest and which he may have been inclined to regard as a squandering of money, he will realize that after all they are well worth while.

JUST A WINTER'S SLEEPING.

The flowers of summer are dead,
And the world waits her garments to shed,
For her handmaid, October, has come to disrobe her—
November will spread her white bed!

She will sleep, and her sleep will be deep,
And the dull hours will silently creep,
And glad dreams without number will sweeten her slumber,
For she ll dream of the spring in her sleep!

But so weary she is, and outworn
With the burden of toil she has borne,
That not once will she stir till the birds call to her,
And the strength of the winter is shorn.

Then she'll throw off the robe that has kept
Her so warm from the winds that have swept
'Round the couch where she lies—and the light in her eyes
Will be brighter because she has slept!

—*Cleveland Leader.*

GRASS AS A MEAT MAKER.

All through the corn belt men have placed too much dependence upon corn as a meat maker and not enough on grass and other crops. Meat made from grass—and by grass we mean clover, alfalfa and blue grass—is always cheaply produced, while meat made from corn has often to be sold for less than it cost. But few men understand the real value of a good pasture as a meat producer, and altogether too little attention is paid to keeping pasture lands up to a high state of productiveness, the most common sin being in connection with overstocking them and never giving the grass any kind of a show to grow. We know of men who would hardly be able to sleep nights if they had a pasture which carried a heavy and luxuriant growth of grass and would not rest until they had got enough stock into it to "keep it down," as they express it. Grass must have some sort of a chance to grow above ground if it is to have a good, strong and vigorous root system. Where grass is weakened by overpasturing the weeds are quick to take advantage of the fact and soon swarm all over the field to still further help kill out the grass. A blue grass pasture unfed from July 1 till winter will furnish one of the best and very cheapest winter rations for the colts and for cattle and sheep as well, provided the snow does not get too deep.—*J. S. Trigg.*

CLIMATOLOGY OF THE MONTH OF OCTOBER, 1905.

BAROMETER.—Mean pressure, 30.09 inches; highest observed, 30.68 inches, at Charles City and Dubuque, on the 28th; lowest observed, 29.66 inches, at Sioux City, on the 13th; range for state, 1.02 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 116 stations, was 49.2° degrees, which is 3.3° below normal. By sections the mean temperatures were as follows: Northern section, 46.9°, which is 4.0° below normal; central section, 49.5°, which is 2.3° below normal; southern section, 51.1° degrees, which is 3.6° below normal. The highest monthly mean was 54.8°, at Keokuk; lowest

monthly mean, 42.4°, at New Hampton. The highest temperature reported was 95°, at Inwood and Sheldon, on the 4th; lowest temperature reported, 16°, at Decorah, Elkader, Maquoketa and Inwood, on the 28th, 29th and 30th. The average monthly maximum was 84.7°; average monthly minimum, 20.4°. Greatest daily range, 53°, at Keosauqua; average of greatest daily ranges, 38.7°

PRECIPITATION.—Average precipitation for the state, as shown by records of 125 stations, was 3.40 inches, which is 0.98 of an inch above normal, The averages by sections were as follows: Northern section, 3.15 inches, which is .96 of an inch above normal; central section, 3.58 inches, which is 1.13 inches above normal; southern section, 3.46 inches, which is .85 of an inch above normal. The largest amount reported was 5.36 inches at Iowa City; least amount reported, 1,20 inches, at Sioux Center. The greatest daily rainfall reported was 3.14 inches at Clinton on the 16th and 17th. Average number of days on which .01 of an inch or more was reported, 8.

WIND AND WEATHER.—Prevailing direction of the wind, Northwest; highest velocity reported, 47 miles per hour, from the south, at Sioux City, on the 8th. Average number of clear days, 16; partly cloudy, 6; cloudy, 9.

Sioux City	9268	47	S	8

OBSERVERS' NOTES.

ALLERTON—*Rex Shriver*. About one-third of corn gathered and some fall plowing being done; pastures good.

ALTA—*David E. Hadden*. First killing frost on morning of the 10th; corn entirely safe; first snow on the 19th, but soon turned to rain; month as a whole pleasant.

ALTON—*W. S. Slage*. Corn picking in progress; much of it down and would be damaged by snow.

AMANA—*Conrad Schadt*. Fine weather, with balmy days during a great part of the month; rains moistened the grounds thoroughly, which had been very dry.

ATLANTIC—*J. W. Love*. First frost on 10th; first ice on 12th; severe thunderstorms 16th and 17th; wild fowls flying southward on 27th; snow on 29th.

BAXTER—*W. T. Thorp*. Corn matured naturally and husking is in progress.

BONAPARTE—*B. R. Vale*. A pleasant and profitable month; corn husking begun about the 20th; much fall plowing done; fall grain doing nicely.

BRITT.—*Geo. P. Hardwick*. Corn and other tender vegetation killed on 12th; about an average crop of corn; husking during the last week; pastures fair to near the end of month.

CHARITON—*C. C. Burr*. Many are cribbing corn, which is badly tangled and down; more than usual fall plowing done; grass and pastures never better.

CLINTON—*Luke Roberts*. October, 1905, was 1° colder than normal, and 5° above the coldest October during the last 27 years; 8° below the warmest October. Rainfall, 4.45 inches; was 2.12 in excess of normal.

CORNING—*Jerome Smith*. The frost on the 12th killed all tender vegetation.

CRESCO—*L. G. Krumm*. First heavy frost on the 11th; ice on shallow troughs.

ELLIOTT.—*Henry Barnes*. Corn was well matured but badly down; husking somewhat delayed by bad weather; potatoes a fair crop.

FLORENCE.—*J. H. DuBois*. Large amount of plowing done; corn picking begun on 23d; average yield 50 to 55 bushels per acre.

FOREST CITY.—*J. A. Peters*. Corn husking begun last week in October; first killing frost on 11th, and corn out of the way.

GRAND MEADOW.—*F. L. Williams*. Field work well along; pastures good, and plowing well advanced.

GRINNELL.—*A. O. Price*. Rainfall 4.68 inches, almost 4 inches in excess of October, 1904; stock water will be abundant; corn dry enough to husk the last of month.

HANCOCK.—*W. Armstrong*. Corn harvest begun about the 25th; crop not quite up to 1904.

HANLONTOWN.—*Mrs. G. M. Paschen*. Most all stack thrashing finished by 15th; potatoes most all dug by 20th when corn husking begun; corn best in quality and yield for past 4 years; fall work retarded by bad weather.

HUMBOLDT.—*H. S. Wells*. A good month for corn harvest, and a bountiful crop.

INWOOD.—*Geo. W. Larsen*. Warmest day in October, 94° on 4th; coldest, 16° on 30th. Frost nearly every morning after the 10th; corn husking in progress and the crop is extra good in yield and quality. First snow on 20th, wet and heavy.

JEFFERSON.—*Geo. W. Day*. Corn gathering begun on 17th; bushels per acre, 35 to 75; quality good.

KEOSAUQUA—*J. H. Landes*. Ice one-fourth inch thick on morning of 12th. This is phenomenal, the first frost of the season being a genuine freeze. A beautiful fall month and favorable for work.

LARRABEE—*H. B. Strever*. First killing frost on 12th; corn was generally well ripened.

LEON—*Millard F. Stookey*. First killing frost of season on 12th; first snow on 30th.

MONTICELLO—*A. Matthiesen*. Corn crop good in yield and quality; ground in fine condition for plowing.

OLIN—*Nathan Potter*. October was a good month, the first half being warm and dry, and latter half wet enough to moisten the ground for plowing.

POCAHONTAS—*F. E. Hronek*. Killing frost on 12th, the latest date for years; no damage to crops.

RIDGEWAY. *Arthur Betts*. First decade of the month delightful; we had in the month 212 hours of sunshine, or 62 per cent; first killing frost on 11th; first snow on 19th.

SHELDON.—*A. W. Beach*. First half of month warm and clear; latter half cool and disagreeable, with two snowstorms.

STOCKPORT.—*C. L. Beswick*. First killing frost October 12th; latest frost in spring, April 22d; giving 173 frostless days; 95 to 98 per cent of corn was well ripened.

WAUKEE.—*E. J. Leonard*. Except about ten days near the middle of month October was favorable; first frost on 12th, and snow on 30th; crops all matured without damage.

BELATED REPORT.

HANCOCK.—September, mean temperature 70.5°; highest 91° on the 25th; lowest 44° on the 4th; greatest daily range 45°; total precipitation 7.61 inches; greatest in 24 hours 2.71 inches on 16th; prevailing direction, south; number of clear days, 23; partly cloudy, 1; cloudy, 6; rainy, 10.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—O. A. OLSON, Forest City.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XVI. NOVEMBER, 1905. No. 11.

IOWA CROPS, 1905.

Final Report for the State. Total Yield; Value of Soil Products at Farm Prices, Dec. 1, 1905.

The crop season of 1905, as shown by tabulated reports from each county, was the best that has been reported in this state since 1900. Altogether the showing as to aggregate yield and prices of staple products is beyond estimates made during the early half of the season.

Corn. Reports indicate unusual variation in the yield of corn, the averages by counties ranging from 25 to 45 bushels per acre, as a result of notable local differences in condition of the soil in the critical stages of the season. The first report of the season showed an average increase in the acreage of corn planted as compared with last year, but adverse local conditions in May and June caused a loss of acreage which has been taken into account in the final estimate of the output. The census returns showed the total area of corn to have been 9,583,815 acres in 1904. The yield this year is based on a total of 9,285,150 acres, the average yield for the state being 37.2 bushels per acre. The total product appears to be 345,871,840 bushels, which is 816,800 bushels in excess of the output of any previous year; but the average per acre was higher in four previous seasons since 1890. The average value of the corn crop on Dec. 1 was about 35 cents per bushel — total for the state, $121,055,144.

Wheat. The yield and quality of winter wheat has been good this season, but the acreage was small. The total appears to be 1,253,020 bushels, an average of 20.2 bushels per acre, and quality good. The total of spring wheat was 5,155,760 bushels — an average of 14.4 bushels per acre. The total wheat output (6,108,780 bushels) is worth $4,614,321 — an average of 72 cents per bushel.

Oats. The yield of oats, 37.2 bushels per acre, is above the average but the product was somewhat impaired by wet weather while standing in shocks. The total appears to be 146, 439,240 bushels, which amount has been exceeded but once in the records of the state, and that was in 1895. The farm value of the crop Dec. 1 was 25 cents per bushel — total $36,609,810.

Rye. Total yield 1,283,500 bushels—an average of 18 bushels per acre. Value, $667,420, at 52 cents per bushel.

Barley. Average per acre, 27.5 bushels; total yield 15,566,770 bushels. Value 33 cents per bushel; total value $5,137,034.

Flax Seed. Amount produced, 173,710 bushels. Value $156,393, at 90 cents per bushel.

Potatoes. Bushels produced, 9,352,190—average per acre 84 bushels; value 50 cents per bushel; total $4,676,045.

Hay. (*Tame*) Area harvested 3,598,500 acres, total output 6,477,300 tons, or 1.8 tons per acre. Value of crop $35,625,150, at $5.50 per ton.

Hay (*Wild.*) Amount harvested 1,313,310 tons; an average 1.2 tons per acre. Value of crop $5,909,895 at $4.50 per ton.

Pasturage and Grazing. This item includes pastures, grazing in meadows and grain fields after harvest and in corn fields in fall and winter months, and can be estimated only by reckoning its value as a factor in the production of farm animals and animal products of all kinds. In my judgment the farms of this state should be credited with the full value of the soil output which is the real basis of our great animal industry, and I have tentatively placed the estimate at about $400 per farm, believing that is below rather than above the average. The total output is placed at $80,000,000.

TABULATED CROP SUMMARY.

Crops.	Total Products.	Farm Value Dec. 1.
Corn	345,871,840 bus.	$121,055,144
Wheat	6,408,780 bus.	4,614,321
Oats	146,439,240 bus.	36,609,810
Barley	15,566,770 bus.	5,137,034
Rye	1,283,500 bus.	667,420
Potatoes	9,352,190 bus.	4,677,045
Flax seed	173,770 bus.	156,393
Hay (tame)	6,477,300 tons	35,625,150
Hay (wild)	1,313,310 tons	5,909,895
Pasturage and Grazing (cornfields, etc.)	Estimated	80,000,000
Buckwheat		85,000
Sweet potatoes		135,000
Sorghum & broom corn		190,000
Timothy seed		1,200,000
Clover seed		195,000
Millet & alfalfa		520,000
Sweet corn		510,000
Fruit crops & gardens		5,000,000
Total soil products		$302,286,212

In the above estimate of the value of cereal products no account is made of the increment derived from the consumption of these staple crops on the farms.

NOVEMBER WEATHER AND CROPS.

The average temperature of November was 38.4° which is 3.2° above normal. The average precipitation, 2.84 inches, was 1.53 inches in excess of the normal. But there was a large excess of clear and partly cloudy weather, the average number of clear days being 16, and partly cloudy 7. Conditions were unusually favorable for gathering corn, and all kinds of field work usual to the season. The bulk of the corn crop has been secured in good condition. Pasturage has been very good up to the close of the month. The rainfall was ample for maintenance of soil moisture during the winter. The area of fall wheat has been materially increased, and the condition of that crop is excellent. The area of fall rye is about the average of recent years, and the stand is good. The large amount of fall plowing in evidence in all sections of the state gives an encouraging outlook for the crop season of 1906.

FINAL CROP REPORT, 1905.

THE STATE CENSUS.

The State Census compiled during the past year is the most complete and satisfactory report of the kind that has been issued in Iowa. In the line of statistics of agriculture it is comprehensive and reliable.

According to the returns of the assessors, serving as enumerators, the area in corn in Iowa last year was 9,542,956 acres, and the total yield of corn was 346,577,988 bushels. These figures reveal the fact that the report of the Iowa Weather and Crop Service last year was made on conservative lines, though many people expressed the belief that the aggregate was too high. Our figures were 9,052,450 acres in corn, and the yield, 323,853,330 bushels. In all reports made by this bureau since 1890 our estimates of yield and acreage have been below the totals shown by the State and National census returns. In fact we have been too conservative to serve any good purpose in the line of moderation.

INDIAN SUMMER.

The following paragraph, copied from the Century Dictionary, gives a very good definition of the term Indian Summer, which is applied to the mild weather occuring in the Mississippi Valley in the autumn:

"Indian Summer in the United States.—A period in autumn characterized by calm and absence of rain. This condition is especially well manifested in the upper Mississippi Valley, where it is in conspicuous contrast with the climatic phenomena which precede and follow it. West of the belt of States lying adjacent to the Mississippi, the rainfall is so small that the chief characteristic of the Indian Summer is not exceptional enough to excite attention, and from the Mississippi Valley eastward the autuma periods of calm and dryness become more and more irregular in their occurrence and are, on the whole, of shorter duration. Hence, in the eastern States any period of unusally quiet, dry and hazy weather, even if it lasts only a few days, may be designated as Indian Summer, provided it occurs at any time between the middle of September and the early part of December. The haze which fills the air at such times is simply the dust and smoke which are not blown away by the wind, but float near the earth's surface. The name is due to the fact that the phenomena of the Indian Summer are much more distinctly marked in the region chiefly occupied by the Indians at the time this term became current than they were in the more eastern regions to which the white population was chiefly limited prior to the beginning of the present century."

CLIMATOLOGY OF NOVEMBER, 1905.

BAROMETER.—Mean pressure, 30.05 inches; Highest observed, 30.65 inches, at Des Moines, on the 30th; lowest observed; 29.30 inches, at Charles City on the 28th; range for the state, 1.45 inches

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 123 stations, was 38.4 degrees, which is 3.2° above normal. By sections the mean temperatures were as follows: Northern section 36.7 degrees which is 4.1° above normal; Central section 38.3 degrees, which is, 3.3° above normal; Southern section 40.3 degrees, which is 2.3° above normal. The highest monthly mean was 42.8° at Red Oak; lowest monthly mean, 35.2 at Sibley. The highest temperature reported was 70° at Belle Plaine, Webster City, Burlington and Corning, on the 4, 12, 13 and 17; lowest temperature reported —12°, at Estherville on the 30th, The average monthly maximum was 63.2°; average monthly minimum, 0.6°. Greatest daily range, 54° at Massena; average of greatest daily ranges 34.3°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 131 stations, was 2.84 inches, which is 1.53 inches above normal. The averages by sections were as follows; Northern section, 3.16 inches, which is 1.91 inches above normal; Central section, 2.67 inches, which is 1.26 inches above normal; Southern section, 2.58 inches, which is 1.40 inches above normal. The largest amount reported was 5.30 inches at Plover, least amount reported, .90 inch at Mt. Vernon. The greatest daily rainfall reported was 2.70 inches at Ft. Madison on the 23d. Average number of days on which .01 of an inch or more was reported..

WIND AND WEATHER.—Prevailing direction of the wind, Northwest; highest velocity reported, 54 miles per hour from the Northwest, at Sioux City, on the 24th. Average number of clear days, 16; partly cloudy 7, cloudy, 7.

OBSERVERS' NOTES,

ALTA.—*David E. Hadden.* The mean temperature of November, 1905 was 4.2 degrees above the normal and the precipitation, 2.12 inches in excess of the average of the preceding 15 years and the amount was larger than that of any November during the same period. The month as a whole was pleasant and ideal for corn picking.

ALTON—*W. S. Slagel.* Snow storm on 28th. Ten per cent of the corn still in the fields; picking delayed on account of wet weather. Many hogs died from cholera.

AMANA—*Conrad Schadt.* The month was remarkable for its many fine Indian Summer days. There were but four days on which the mean temperature was below the freezing point and only one—the last—on which the maximum temperature was below that point. Farmers had good and ample time for corn husking and plowing.

AMES.—*G. E. Stayner.* Light snow on the 7th and 29th.

ATLANTIC.—*J. W. Love.* November has been very pleasant with plenty of pasture for stock till close of month. Quite a thunder storm for this time of the year on the 23d.

ANDUBON.—*Geo. E. Kellogg.* Ninety per cent of corn in crib and is of extra quality and above average amount. Thunderstorm on 23d.

BRITT—*Geo. P. Hardwick.* Splendid month for farm work, plowing until 28th: Pastures unusually good until end of

month. Corn nearly all gathered in good condition, except that the hard freezing of Oct. 28th Nov. 1st, killed the germ of much that grew late

CLEAR LAKE.—*Oscar Stevens.* Clear Lake froze over on the night of the 29th.

CLINTON.—*Dr. Luke Roberts.* Maximum temperature, 6 degrees below and minimum and mean 3 degrees above normal; rainfall 0.67 inch in excess of normal. Storm days 7 less, cloudy days less and clear days more than normal.

CRESTON.—*Rev. Wm. L. Gaston.* The greatest rainfall reported from this station since April last occurred this month.

FLORENCE.—*J. H. DuBois.* Plowing up to the 26th.

FOREST CITY—*J. A. Peters.* Rainfall 1.79 inches above normal. First taste of winter, Thanksgiving, Nov. 30th,

FORT MADISON.—*Miss L. A. McCready.* Thunder storm on 27th.

GRINNELL.—*A. O. Price.* Thunder storm. Stock water abundent.

HANLONTOWN.—*Miss G. M. Paschan.* Corn husking most all finished by 20th, yield from 30 to 40 bushels per acre with better quality than past 3 years. Some fall plowing and ditching done during the month.

LARRABEE.—*H. B. Streever.* Frost stopped the plowing on the 28th.

OLIN.—*Nathan Potter.* A fine month with no severe storms; fall work on the farm in better shape than for several years.

ONAWA.—*C. G. Perkins.* More rain this month than during any November since 1886. Thunder storms on 5th and 23d.

RIDGEWAY.—*Arthur Betts.* Wettest of all the Novembers of which I have a record.

SHELDON.—*A. W. Beach.* Except for excessive rains, a very good month and corn is about all husked.

SIGOURNEY.—*J. T. Parker.* First snow of season on 8th.

WAUKEE.—*E. J. Leonard.* Month generally favorable; ground not frozen to hinder plowing till the 29th.

BELATED REPORTS.

WEBSTER CITY.—Oct.—Mean temperature 48.4°; highest 82° on the 6th and 7th; lowest 17° on the 28th; greatest daily range 41°; total precipitation 2.42 inches; greatest in 24 hours .75 inch on the 9th; prevailing direction, northwest. Number of clear days 16, partly cloudy 0, cloudy 15, rainy 5.

VINTON.—Oct.—Mean temperature 51.2°; highest 82° on the 4th and 7th; lowest 20° on the 29th; greatest daily range 34; total precipitation 2.22 inches; greatest in 24 hours 1.26 inches on the 17th; prevailing direction, northwest. Number of rainy days 4.

KNOXVILLE.—Oct.—Mean temperature 52.2°; highest 83° on the 4th and 5th; lowest 23° on the 28th and 31st; greatest daily range 38°; total precipitation 4.41 inches; greatest in 24 hours 2.10 inches on the 17th; total snowfall, trace. Number of rainy days 8.

NEVADA.—Oct.—Total precipitation 3.15 inches; greatest in 24 hours .95 inches on the 10th; total snowfall, trace. Number of clear days 22, partly cloudy 1, cloudy 8, rainy 6.

ESTHERVILLE.—Oct.—Maximum 88° on the 4th 5th. and 6th; total precipitation 3.06 inches; greatest in 24 hours .80 inch on the 1st and 10th; prevailing direction, northwest. Number of clear days 15, partly cloudy 0, cloudy 16, rainy 9.

ERRATA IN OCTOBER REVIEW.

SIBLEY.—Mean temperature recorded 44.2° on page 6, should have been 45.0°.

STORM LAKE.—Mean temperature recorded 44.0° on page 6 should have been 46.5°. Mean minimum temperature recorded 31.4° on page 9, should have been 36.4°.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECASTER,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. PAUL O. KOTO, State Veterinarian.

DISTRICT DIRECTORS.

First District—R. S. JOHNSTON, Columbus Junction.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—C. F. CURTISS, Ames.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. McDONALD, Bayard.
Tenth District—O. A. OLSON, Forest City.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Metorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve
Algona	Dr. F. T. Seeley
Allerton	Rex Shriver
Alta	D. E. Hadden
Alta (near)	W. J. Minard
Alton	W. S. Slagle
Amana	Conrad Schadt
Ames	Exp. Station
Atlantic	J. W. Love
Audubon	Geo. E. Kellogg
Baxter	W. T. Thorp
Bedford	E. E. Healy
Belknap	A. W. Rankin
Belle Plaine	S. P Vandike
Bonaparte	Hon. B. R. Vale
Boone	Carl Fritz Henning
Britt	G. P. Hardwick
Buckingham (Traer P. O.)	Dr. W. A. Daniel
Burlington	I. S. Shontz
Carroll	Miss Helene Marchand
Cedar Rapids	Electric Light and Power Co.
Chariton	C. C. Burr
Charles City	*Merton L. Fuller
Clarinda	A. S. Van Sandt
Clear Lake	Oscar Stevens
Clinton	Luke Roberts
College Springs	A. M. Finley
Columbus Junction	J. B. Johnston
Corning	Jerome Smith
Corydon	Clara Miller
Creston	Rev. W. L. Gaston
Cumberland	Agent C., B. & Q. R'y
Davenport	*J. M. Sherier
Delaware	Wm. Ball
Decorah	F. H. Baker
Denison	Prof. W. C. Van Ness
Des Moines	*Geo. M. Chappel
De Soto	R. D. Minard
Dows	H. A. Flett
Dubuque	*James H. Spencer
Earlham, R. F. D.	Geo. Phillips
Elkader	Chas. Reinecke
Elliott	Henry Barnes
Estherville	Earle W. Peterson
Fayette	R. Z. Latimer
Florence (Clarion P. O.)	H. Du Bois
Forest City	J. A. Peters
Fort Dodge	Tobin College
Ft. Madison	Miss L. A. McCready
Galva	F. H. Schleiter
Gilman	Jas. L. Wylie
Glenwood	J. P. Jackson
Grand Meadow (Postville P.O.)	F. L. Williams
Greene	J. L. Cole
Greenfield	J. G. Culver
Grinnell	Prof. J. S. Buck
Grinnell (near)	A. O. Price
Grundy Center	Ed King
Guthrie Center	D. G. Beardsley
Hampton	E. C. Grenelle
Hancock	W. Armstrong
Hanlontown	Miss G. M. Paschen
Harlan	C. A. Reynolds
Hopeville	M. T. Ashley
Humboldt	H. S. Wells
Ida Grove	J. E. Conn
Independence	E. F. Wulfke
Indianola	Prof. J. L. Tilton
Inwood	F. D. Hansen
Iowa City	Prof. Karl E. Guthe
Iowa Falls	J. B. Parmelee
Jefferson	G. W. Day
Keokuk	*Fred Z. Gosewisch
Keosauqua	Prof. J. A. Landes
Knoxville	Casey & Bellville
Lacona	Agent C., B. & Q. R'y
Larrabee	H B. Strever
Lenox	J. L. Hurley
Le Mars	Dr. T. E. Cole
Leon	Millard F. Stookey
Little Sioux	G. H. Gibson
Logan	Glenn H. Stern
Maquoketa	Frank W. Keeney
Marshalltown	Mrs. Elizabeth Jones
Mason City	J. S. Mills
Massena	Fred. T Knott
Montezuma	C. J. Griffin
Monticello	A. Matthiessen
Mount Vernon	Rev. J. W. Hubbard
Mt. Ayr	A. F. Beard
Mt. Pleasant	Prof. J. W. Edwards
Nevada	R. S. Patrick
New Hampton	A. F. Kemman
Newton	Hon. J. P. Beatty
Northwood	Charles Dwelle
Odebolt	E. Starner
Ogden	C. L. Zollinger
Olin	Hon. Nathan Potter
Omaha, Neb	*L. A. Welsh
Onawa	C. G. Perkins
Osage	G. D. Pattingill
Oskaloosa	Jos. Boyd
Ottumwa	Dr. M. W. Pascoe
Pacific Junction	Agent C., B. & Q. R'y
Pella	T. W. Cox
Perry	J. A. Harvey
Plover	J. S. Smith
Pocahontas	F. E. Hronek
Red Oak	G. W. Holt
Ridgeway	Arthur Betts
Rock Rapids	W. C. Wyckoff
Rockwell City	C. M. Randall
Sac City	Frank Stouffer
St. Charles	C. W. Minard
Sheldon	Dr. A. W. Beach
Sibley	H. G. Doolittle
Sidney	A. P. Speers
Sigourney	J. T. Parker
Sioux Center	Jacob de Ruyter
Sioux City	*C. D. Reed
Spirit Lake	W. C. Drummond

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XVI. DECEMBER, 1905. No. 12.

DECEMBER WEATHER AND CROPS.

December, 1905, will take rank in the climatic records as one of the most agreeable winter months ever experienced in Iowa. The average temperature for the state, twenty-seven degrees, was four degrees above the normal. The average precipitation 0.52 of an inch, was 0.73 of an inch below normal.

The conditions were very favorable for completing the corn harvest, the care of live stock, and the usual farm work of the season. The fields afforded excellent grazing for stock in all parts of the state, with but little obstruction from stormy weather and snow.

No reports have been received of damage to winter wheat and rye by freezing. There were nineteen clear days, six cloudy and six partly cloudy, as the averages of reports received from all stations.

CLIMATOLOGY OF THE MONTH, DECEMBER 1905.

BAROMETER.—Mean pressure, 30.13 inches; highest observed, 30.59 inches, at Des Moines on the 4th; lowest observed, 29.35 inches, at Davenport on the 28th: range for state, 1.24 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 117 stations, was 27.0°, which is 4.0° above normal. By sections the mean temperatures were as follows: Northern section 25.2°, which is 5.0° above normal; Central section 26.9°, which is 3.8° above normal; Southern section 28.9°, which is 3.3° above normal. The highest monthly mean was 32.4°, at Red Oak; lowest monthly mean, 22.8° at Charles City. The highest temperature reported was 62°, at Jefferson on the 8th; lowest temperature reported -11°, at Monticello on the 23d and 24th. The average monthly maximum was 52.0°; average monthly minimum, -3.1°. Greatest daily range, 53° at De Soto; average of greatest daily ranges 36.0.

PRECIPITATION.—Average precipitation for the state, as shown by records of 125 stations, was 0.52 inch, which is 0.73 of an inch below normal. The averages by sections were as follows: Northern section, .40 inch, which is 0.65 inch below normal; Central section, 0.63 inch, which is 0.71 inch below normal; Southern section, 0.53 inch, which is 0.84 inch below normal. The largest amount reported was 1.69 inches at Ottumwa; least amount reported, Trace, at Estherville, and Rock Rapids. The greatest daily rainfall reported was 1.27 inches at Ottumwa on the 28th. Average number of days on which .01 of an inch or more was reported, 3.

WIND AND WEATHER.—Prevailing direction of the wind, Northwest; highest velocity reported, 37 miles per hour, from the Northwest, at Sioux City on the 8th. Average number of clear days, 19; partly cloudy, 6; cloudy, 6.

ERRATA IN NOVEMBER REVIEW.

CHARLES CITY—Greatest precipitation in 24 hours recorded .73 inch on page 7, should have been .74 inch.

SHELDON. Maximum temperature recorded 65° on the 16th, on page 7, should have been 66° on the 11th.

OBSERVER'S NOTES.

ALTON.—*W. S. Slagle.* All corn was picked by Dec. 15; hog cholera abated; bees were out on 26th.

AMANA.—*Conrad Schadt.* Indian summer extended far into December; weather mild until towards close of month.

ATLANTIC.—*J. W. Love.* Unseasonably warm winter month; pasturage yet for stock; no rain only 1 inch of snow.

BONAPARTE.—*B. R. Vale.* An open month; good roads; only reached zero once; subsoil dry.

BRITT.—*Geo. P. Hardwick.* Remarkably fine month; above average of recent years; corn harvest finished earlier than usual.

CHARITON.—*C. C. Burr.* No severe storms and more than usual number of fine days; stock in good condition.

CLINTON.—*Luke Roberts.* December warm, the mean temperature being 4.7° above normal. Rain fall 0.43 of an inch below normal; wind moderate; 4 inches of snow.

GRAND MEADOW.—*F. L. Williams.* December extremely favorable for all kinds of stock; good sleighing at end of month.

IOWA FALLS.—*J. B. Parmalee.* The finest December in ten years.

OLIM.—*N. Potter.* December has been remarkable for eveness: no severe storms, with good roads and healthfulness; one of the best in Iowa's history, or the winters experience in 60 years.

RIDGEWAY.—*Arthur Betts.* Month uncommonly fine; 190 hours of sunshine, or 19 more than ever before in December; For 1905 the mean temperature was 46.8°; precipitation 36.93; hours of sunshine 2823; snowfall 42.3 inches; clear days 159; cloudy days 56, prevailing wind south.

WAVERLY.—*H. S. Hoover.* Remarkable month for finishing up outdoor work; it was 4.4 degrees warmer than the preceding December.

DAILY MAXIMUM AND MINIMUM TEMPERATURES FOR DECEMBER, 1905.

ANNUAL SUMMARY, 1905.

CLIMATOLOGY OF THE YEAR 1905.

BAROMETER.—The mean pressure for the year was 30.04 inches. The highest observed pressure was 31.09 inches on January 25th ,at Sioux City; lowest pressure, 29.12 inches on January 1st at Keokuk. Range for the state 1.97 inches.

TEMPERATURE.—The mean temperature for the state was 47.3°, which is 0.4° below normal. The highest temperature reported was 104° on August 11th at Waukee. The lowest temperature reported was 41° below zero on Feb. 2nd, at Galva and Ida Grove. Range for the year 145°.

PRECIPITATION.—The average amount of rain and melted snow for the year, as shown by complete records of 107 stations, was 36.51 inches, which is 4.79 inches above the normal, and 7.77 inches above the average amount in 1904. The greatest amount recorded at any station for the year was 52.26 inches at Thurman. Least amount recorded 24.66 inches at Little Sioux. The greatest monthly rainfall was 14.89 inches at Keosauqua in June; least monthly amount, trace at Estherville, Rock Rapids in December. The greatest amount in any 24 consecutive hours was 12.10 inches, at Bonaparte, June 10th. The average number of days on which .01 of an inch or more of rain fell was 97.

WIND AND WEATHER.—The prevailing direction of wind was Northwest. Highest velocity reported, 59 miles an hour, in Sioux City, from the Northwest on May 3rd. Average daily movement, 201 miles. There were 164 clear days, 98 partly cloudy, and 103 cloudy days; as against 164 clear days 97 partly cloudy, and 105 cloudy days in 1904.

CLIMATE AND CROP REVIEW. 1905.

The mean temperature of the year 1905 was 47.3°, which is 0.4° below the normal. The daily average for the year was 1° above the mean of 1904. The average precipitation for the state, 36.51 inches, was 4.79 inches above normal, and 7.77 inches above the average in the preceding year.

January and February were colder than usual, the average for the former being 11.2°, and the latter 12.8°, or nearly 7° below normal. Considerable snow fell, and there was much stormy weather during those months. The fields generally were well covered by snow during the coldest periods, affording protection to winter grain and grasses.

The last week in February was generally moderate, and March was phenomenally warm, the mean temperature for the month being 9.1° above normal. Springlike conditions were continuous, except about 6 days in the second decade. The frost disappeared and the surface dried off rapidly. Much preparatory work was done the first half of the month, and considerable seeding of spring wheat, oats and barley was done in the latter half, Winter wheat, rye and clover showed but little damage from effects of freezing, and fruit buds were apparently unharmed. The season for farm work and growth of vegetation was about a week earlier than the average.

April brought unusually variable temperature, the average for the state being 1.8° below normal. Severe frosts were reported in all districts in every week, causing apprehension for safety of fruit buds. In portions of the southern section excessive moisture retarded plowing and seeding, but in the central and northern districts there was little hindrance to field work. At the close of April the season was somewhat earlier than usual in respect to growth of grass and foliage, and more than the usual amount of plowing and other farm work had been done. And during the last three days of the month corn planting operations were in progress in favored localities. About the usual acreage of oats, spring wheat and barley was sown in April.

The temperature in May was 2.1° below normal, and the rainfall was 1.82 inches above the average. The larger portion of the excess of moisture fell in the northern half of the State, in the first and second decades of the month. Frosts were noted in all districts about the 5th and 26th, and at numerous stations the temperature fell to 32° or below; but the damage to vegetation was light. During the first week in May conditions were generally favorable for preparing the ground and planting corn on the best drained lands. The weather was wet, cool and backward from about the 7th to the 17th, causing delay in planting operations and retarding germination of seed in the ground. The balance of the month was variable, with some more than the average amount of moisture; but fair progress was made in planting, and cultivating the early planted fields. Wheat, oats, barley, rye, meadows and pastures made good growth in May. The average conditions of grain and grasses were nearly normal at the close of the month.

June was about normal in temperature, and the rainfall was 1 inch above the state average. The distribution of rainfall was very unequal, ranging from 1.80 inches at Forest City to 14.89 at Keosauqua. The greatest excess was recorded in the southeast district, and in the northwest counties. The first week was warm and mostly dry, affording ideal conditions for growth of crops and cultivation of corn and potatoes. Some corn planting was done, in localities previously too wet, as late as the 12th to 15th of the month. The rainfall on the 9th and 10th was excessively heavy and destructive in VanBuren and adjoining counties: but the copious showers in other parts of the state were timely and beneficial to all crops. The third week was normal in temperature and amount of sunshine, with conditions favorable for cleaning out the weedy fields, and general farm work. The month closed with a showery period of three to four days. Haying operations were begun somewhat earlier than usual, and the first cutting of clover suffered damage by the wet weather. The corn crop was doing fairly well in the larger part of the state at the end of the month.

The daily mean temperature of July was 3.8° below normal and the rainfall was 1.44 inches below the average of previous years. The first half of the month brought the bulk of the wet weather and conditions were more favorable during the latter half for harvest of hay and grain. The conditions were not altogether favorable in the early part of the month for finishing the cultivation of corn. The fields were not generally clean as could be desired when laid by. The warmest period was from about the 13th to 20th during which corn made

rapid advancement. Spring wheat, rye and barley ripened under favorable conditions, and the work of harvesting was well advanced in the latter half of July. As a whole July was a favorable month. With but little damage from excess or deficiency of moisture. The crops of wheat, oats, barley and rye secured were better in quality and yield than was deemed possible in the early part of the season. At the close of the month corn gave promise of more than an average crop.

August was above normal in temperature and rainfall. The mean temperature, 74.3° was 2.3° above normal, and 3.7° degrees higher than the daily average in July. From the first week to the close of the month the temperature was near or above the normal line. The rainfall was generally timely, and not greatly in excess of local needs in any part of the state, the distribution being more than usually favorable. In the state the average number of clear days was 16, and 9 were partly cloudy, affording ample sunshine to hasten growth of all belated crops. At the close of the month the corn crop was generally in the full roasting ear stage or glazed, giving promise of reaching maturity in advance of the average date of killing frosts. Good progress was made during the month in threshing wheat oats and barley; but in many localities these grain suffered some damage from exposure to showers while in the shock. There was a heavy growth of aftermath in meadows, and the pastures were about as green as in springtime. The potato crop suffered materially from blight. The corn crop was seriously damaged by root worms in fields that had been planted two or more seasons in succession.

September was about 2° above normal in temperature, with a small excess of rainfall. The coldest period of the month was the first decade and the warmest and brightest was the third decade. The distribution of rainfall was quite unequal, more than half the state receiving less than 3.00 inches, the heaviest amounts being recorded in portions of the southwest and northwest districts. During the stormy period from the 14th to the 18th severe windstorms swept over considerable areas in all districts, aggregating over one-third of the state. Corn was prostrated to an unusual extent, resulting in material damages in regions that were most severely storm-swept. The extraordinary weather of the last decade was of inestimable value in bringing to maturity the late planted portion of the corn crop, affording ideal conditions for cutting fodder, threshing grain, putting up second crop of clover, aftermathand wild hay, fall plowing etc. At the close of the month fully 98 per cent of corn was well matured. And most of the corn planted as late as June 15 was well ripened. An increased acreage of winter wheat was sown in September, and made an excellent stand. About the usual acreage of winter rye was sown.

The first decade of October was warm and generally dry and clear, with conditions favorable for ripening all belated crops, and drying out the corn crop preparatory to husking, which was in progress in the latter part of the month. The last decade was also very dry and clear, altogether the month of October was notable for its large percentage of sunshine and agreeable weather. The first killing frosts were reported about the 11th and 12th in all districts, after all crops were well matured. Pastures were green, affording excellent grazing throughout the month. All minor crops, garden truck and fruit were harvested in due season, under favorable co ditions. Except some damage to flattened corn by wet weather from the 15th to 20th, the conditions during October were all that could be desired.

The average temperature in November was 3.2° above normal. There was a large excess of clear or partly cloudy weather, as compared with the average. Conditions were unusually favorable for gathering corn, and all kinds of field work usual to the season. The bulk of the corn crop was husked in good condition for cribbing or shipping. Pasturage was unusually good for grazing stock. Fall wheat and rye were looking well, and much fall plowing was in evidence in all parts of the state.

The closing month of the year was one of the fairest and most agreeable winter months ever known in this section. Altogether the crop season of 1905 will be remembered as one that contributed largely to the prosperity of the state and nation.

ERRATA IN ANNUAL SUMMARY, 1904.

FORT DODGE.—Mean temperature for Feb., recorded 13.4° on page 20, should have been 13.0°. Annual temperature recorded 45.1° on pages 15 and 20, should have been 45.0°.

INDEPENDENCE.—Mean temperature for Feb., recorded 9.8° on page 20, should have been left blank.

OSCEOLA.—Mean temperature for Dec., left blank on page 20, should have been 24.0°.

VINTON.—Mean temperature for Sept., recorded 95.3° on page 20, should have been 65 3°.

ALGONA.—Total precipitation for December recorded 1.27 inches on page 21, should have been 1.37 inches. Annual precipitation recorded 22.76 inches on pages 15 and 21, should have been 26.86 inches.

DAVENPORT.—Total precipitation for June recorded 2 28 inches on page 21, should have been 1.44 inches. Annual precipitation recorded 27 05 inches on pages 15 and 21, should have been 26. 21 inches.

FAYETTE.—Total precipitation for the months of Sept., Oct., Nov., and Dec. left blank on page 21, should have been 6 08 inches, 2.03 inches, Trace and 2.30 inches respectively. Annual precipitation left blank on pages 15 and 21, should have been 32.67 inches.

INDEPENDENCE.—Total precipitation for Feb., recorded 4.0 inch on page 21, should have been .45 inch. Annual precipitation recorded 21.62 inches on pages 15 and 21, should have been 21.67 inches.

OSCEOLA.—Total precipitation for Dec., left blank on page 21, should have been 1.50 inches.

STORM LAKE.—Annual precipitation recorded 24.19 inches on pages 16 and 22, should have been 26.46 inches.

TOLEDO.—Annual precipitation left blank on pages 16 and 22, should have been 22.86.

Annual Precipitation Chart 1905.

INDEX TO SPECIAL ARTICLES.

Published in monthly and annual reports of the Iowa Section, Climate and Crop Service, from the time of issue of the first report in May, 1890, to and including the year 1905.

Subject.	Report.	
Aerolite, observation of	May	1890
Ames, Rainfall records, 1876-1890	May	1890
Beet Sugar, best Climate for production of	Nov.	1890
Climate, permanence of	Anuual	1890
Climatology of Iowa	Annual	1890
Clouds, Classification of	June	1890
Cold Waves	Dec.	1890
Crop and Weather Reports, value of	Nov.	1890
Crop Statistics	Nov. and Annual	1890
Cyclones and Tornadoes	Sept.	1890
Fact vs Exaggeration	July	1890
Forage Plants, fungus diseases of	Aug Sept. Oct. and Dec.	1890
Hailstorm, a phenomenal	Aug.	1890
Insects in Meadows and Pastures	Oct.	1890
Iowa Climate and Soil	May	1890
Iowa, Climate and Healthfulness	May	1890
Iowa Climate	June	1890
Iowa, Physical Features of	Annual	1890
