CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECAST OFFICIAL,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

DES MOINES:
BERNARD MURPHY, STATE PRINTER
1902.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

J. C. FRAZIER, PRESIDENT, Bloomfield.
W. W. MORROW, VICE-PRESIDENT, Afton.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
WM. M. BEARDSHEAR, President Iowa State College.
B. P. NORTON, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—C. E. CAMERON, Alta.

METEOROLOGICAL STATIONS AN OBSERVERS.

From the following, weekly and monthly reports of Meteorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve
Algona	C. D. Pettibone
Alta	D. E. Hadden
Alta (near)	W. J. Minard

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIII. JANUARY, 1902. No. 1.

NOTES.

The value of a midwinter snow storm in the winter wheat belt may be estimated by its effects in the eastern markets.

* * *

There are numerous indications of a considerable increase in the acreage of corn the coming season. This is especially true as to the sections where the yield was smallest last season. Better, however, than an increase in the area planted would be more thorough preparation of soil and more careful cultivation of the crop during the critical stages of growth. More bushels per acre should be the aim, rather than more acres devoted to the crop. To accomplish this, the farmer should use great care in testing his seed as well as in the culture of the crop in due season.

* * *

The idea that drowning persons take much water into the lungs has seemed to be unquestioned. But it has been long opposed by Prof. W. K. Whitford, who in forty years has successfully treated many patients apparently dead from drowning, and who now asserts, as the result of many examinations, that practically no water enters the lungs. The mistaken view has caused the waste of much valuable time. He has found heat—energetically and persistently applied—to be the most important agent in resuscitation, and with this, aided by artificial respiration and stimulation, he has restored patients that have been submerged an hour.—*Exchange.*

* * *

"Still we are a nation of farmers," remarks the Philadelphia *Ledger* anent census returns, "which show that in 1900 there were 5,700,000 farms under cultivation as compared with 4,564,691 in 1890. This may be deemed a remarkable increase, showing that the growth of our industries is symmetrical, the farmers keeping pace in the march forward. The single discouraging feature of the situation is the increase of tenant farming. This is accounted for, however, to some extent by the lease of lands by immigrants who are intending purchasers. As the area of unoccupied arable lands in the United States becomes less and less, it is altogether probable that future censuses of the country will show a comparative decline in the number of farms. The heavy increase in the past ten years is in the nature of a surprise, though the inducements of fine crops and fair prices have doubtless given a spur to land investments since 1896."

GEOLOGICAL AGENTS AFFECTING THE EARTH.

The atmosphere plays its part in geological operations. Its corroding power, backed by rain and wind, helps to decay and disintegrate those rocks which are exposed to its influence. Rain completes the work thus begun. Wind blows dust, sand and volcanic ashes over large tracts of earth—in fact, over the whole of it.

It is only of late years that geologists have discovered that fine volcanic dust is carried over the whole of the earth's surface and plays a very important part in the deep sea deposits. On deserts and nearly rainless regions blown sand will wear away the hardest rocks by beating against them. Some sandstone formations appear to have been piled up by winds.

Winds cause ocean currents, waves and storms. The great denuding power of the sea is largely due to the atmosphere. Some parts of the English coasts are being rapidly washed away. Plants and animals have their distribution considerably affected by winds and ocean currents. Again, whether living in water or on land, animals live on the oxygen supplied from the atmosphere, and land plants absorb carbonic acid from the same source.

Rain acts in two ways: (1) chemically by dissolving certain substances, such as lime, out of the rocks, and (2) mechanically by wearing down their surfaces as it flows over them. Any old building—a ruined castle or cathedral, for instance—shows a "weathered" surface resulting from the action of rain and wind. In sandstone structures the details of carving are often lost, and on old tombstones the lettering can hardly be deciphered. Springs are due to rainwater collecting in rocks and rising to the surface. Rivers are fed by rains and springs.

A river is a very powerful geological agent. In the hardest rocks rivers gradually carve out a valley or gorge. This is accomplished partly by chemically dissolving certain mineral substances, but chiefly by mechanical erosion, the stones, sand and mud wearing away the bed of a stream as they run and tumble over it.

The finest examples of river action are the famous canyons of Colorado, which in some places are gorges 5,000 or even 6,000 feet deep, with vertical sides. But, as already pointed out, rivers have a constructive action quite as important as their destructive action. By bringing down their burden of sediment into lakes, estuaries and seas they build up great piles of rock and "sow the dust of continents to be."

Glaciers are rivers of ice fed by the "eternal snows" of high mountain ranges such as the Alps. They wear out their own valleys as rivers do; they transport mud, sand and stones to great distances, in some cases sending them sealed up in icebergs to float far out to sea and on melting deposit their burdens on the sea floor. Off the coast of Newfoundland northern icebergs are depositing a great mass of "glacial drift."

The sea is a great denuding agent; but its work is more constructive than destructive. It is the workshop where nearly all the stratified rocks have been accumulated and ranged in layers or strata. The rivers and ocean currents continually bring in fresh supplies of debris even for hundreds of miles.

Man, compared with the lower animals, produces but little effect as a geological agent. Still the human race has considerably modified the distribution of plants by cutting down forests and by cultivating certain plants to supply food. So with animals. Certain useful species have been cultivated and enor-

OBSERVERS' NOTES.

ALTA—*David E. Hadden:* Ideal weather during first and second decades of the month, but cold and wintry the last decade. On 22nd at 7:30 p. m. a vertical bar was seen on the planet Venus. On the 22nd about 11:55 P. M. a brilliant detonating meteor passed from east of zenith to near the east horizon; loud report followed three or four minutes later.

BONAPARTE—*B. R. Vale:* A remarkably mild and pleasant month. Roads fine for January.

CENTERVILLE—*Jas. S. Hamilton:* An unusually favorable month in everything but stock water which is scarce. Feed high priced; three inches of snow on ground.

CLEAR LAKE—*John Cobb:* About seven inches of snow at close of month.

CLINTON—*Dr. Luke Roberts:* Month over three degrees warmer than January average. Rainfall 1.18 less than normal. Per cent of cloudiness 28, or 22 per cent less than normal. Wind movement 4,240 miles—700 miles below normal. About four inches of snow at close of month.

COLUMBUS JUNCTION—*Prof. H. E. Simpson:* Dry, clear weather characterized the month, there being no precipitation from the 1st to 19th.

ESTHERVILLE—*Leslie Littell:* Very warm and dry, except the last week which was coldest of the season.

GRUNDY CENTER—*E. S. King:* Finest weather possible 1st to 20th; from 20th to 31st very frosty and disagreeable.

RIDGEWAY—*Arthur Betts:* Mild month, two and one-half degrees warmer than December. Precipitation heavy and about all came in last decade; 228 hours of sunshine. From 7th to 10th fields were in good working order.

BELATED REPORT.

TIPTON—*December:* Mean temperature 23.2 degrees; highest 48° on the 1st; lowest, 15° below zero on the 14th; greatest daily range 30 degrees; prevailing direction, northwest. Number of clear days 10, partly cloudy 4, cloudy 17.

CLIMATOLOGICAL DATA FOR JANUARY, 1902.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIII. FEBRUARY, 1902. No. 2.

NOTES.

A fir tree nearly 18 feet in diameter growing near Tacoma, Washington, is to furnish a log 22 feet long for exhibition at the St. Louis fair.

***

In Italy three furnaces of 500 electric horse power have been erected for the manufacture of pig iron, by electric heat, under the Stassano patent.

***

In this section a large amount of ice has been secured during the past winter, and its quality is extra fine. Ice has become a very important product, involving a considerable amount of capital and labor.

***

Nature has a large corps of sanitary agents and doctors, viz: food, pure air, sunshine, beauty of landscape, change of scenery, recreation, exercise, cleanliness, rest and sleep. Nature-opathy is a very safe system to follow.

***

Hon. S. H. Mallory, meteorological observer at Chariton, Iowa, writes: "My barometer broke the record on the 28th, the reading at 7 A. M. and 2 P. M. being 27.86 inches, which is the lowest ever observed by me." This was the actual reading, of course—not reduced to sea level.

***

An interesting metereological station is that of Mammoth Tank, on the line of the Southern Pacific railway, in San Diego county, Cal. The mean annual rainfall for twenty-three years has been 1.81 inches; maximum temperature, 130 degrees, on August 1878, 17; hottest month, July, with a mean of 98.5 degrees.—*Exchange*.

***

Mr. Edward Dodson, an English explorer, has recently returned from a prolonged sojourn in the great desert of Tripoli, Northern Africa. This portion of the country has never been thoroughly explored, and indeed has not been visited by a European for over fifty years, so that Mr. Dodson's results are of inestimable value. One of the greatest achievements of the expedition was the exploration of the great petrified forest at Murzuk. Throughout this whole area which extended for several miles petrified trees were found, varying in circumference from 7 feet to a few inches. Every branch of this forest was of course lying prone, and this together with the presence of marine shells showed that this part of the Great Sahara had at one time been submerged. On one occasion the party passed through a strange experience. They were surrounded by thunder-storms. No less than five distinct storms were in progress all 'round, and the guns and spears of the party became surrounded by a halo of phosphorescent light.—*Scientific American*.

ERRATA IN JANUARY REVIEW.

ATLANTIC—January total precipitation recorded, 1.90 inches, on pages 8 and 11, should have been 1.70 inches. Total snowfall recorded, 19.0 inches, on page 8, should have been 17.0 inches.

FORT DODGE—January minimum temperature recorded, 24° on the 27th, on page 7, should have been 30° on the 28th.

NEW HAMPTON—January mean temperature recorded, 19 6° on page 7, should have been 19.2°. Mean maximum temperature recorded, 29.3° on page 10, should have been 28.3°.

SHELDON—January total precipitation recorded, .61 inch on pages 7 and 11, should have been .71 inch. Total snowfall recorded, 6.1 inches, on page 7, should have been 7.1 inches.

FEBRUARY WEATHER IN THE UNITED STATES.

EXTRACTS FROM NATIONAL CLIMATE AND CROP BULLETIN.

February, 1902, averaged decidedly cold in the central valleys, southern states, over the southern part of the Lake region and in the Atlantic coast districts south of New England. In the lower Missouri, Ohio, central and lower Mississippi valleys the average daily deficiency in temperature ranged from 6° to 12°, the most marked departures occurring in the central Mississippi and Ohio valleys, while along the middle and south Atlantic and east Gulf coast the deficiency generally ranged from 6° to 8°. Over the northern portion of the upper Lake region, in Minnesota, the Dakotas, throughout the Rocky Mountain regions and on the Pacific coast, except in extreme southern California, the month averaged milder than usual, the temperature excess ranging from 6° to 9° over the greater part of the districts named, the most marked departures occurring in the central and northern Rocky Mountain districts and in the Red River of the North Valley.

No maximum or minimum temperature records were broken during the month. The maximums were generally below 50° in the upper Lake region and over portions of northern New England and the upper Missouri valley; they exceeded 80° in extreme southern Florida and from central and southern Texas westward to southern California. The lowest minimum temperatures, ranging from —20° to —30°, occurred in the upper Missouri and Red River of the North Valleys. The southern limit of freezing temperature extended from central Texas eastward to the Florida coast in the vicinity and south of Jacksonville.

In the Atlantic coast and east Gulf districts, with the exception of northern New England and small areas along the immediate South Atlantic coast, the precipitation of February was very heavy, occurring principally near the close of the month. From the east Gulf coast northeastward to southern New England the total precipitation generally ranged from 4 to 6 inches, more than 8 inches occurring over southern Alabama and extreme west Florida, and causing destructive freshets in many of the rivers of this region. Throughout the central valleys, Lake region, central and West Gulf states, and over the

eastern Rocky Mountain slope the precipitation was lighter than usual, being decidedly deficient from Texas and northern Louisiana north-eastward over the central Mississippi, lower Missouri and Ohio valleys, including the central portion of the Lake region, where it was from 1 to more than 3 inches below the normal. On the Pacific coast the precipitation was decidedly in excess of the average, being unusually heavy in all districts, except extreme southern California. Along the coast northward of San Luis Obispo the total precipitation generally exceeded 8 inches, ranging from 12 to 19 inches in northern California and from 8 to 25 inches on the coasts of Oregon and Washington.

At the close of the month but little unmelted snow remained on the ground, except in the extreme northern portions of the Lake region and New England.

In the lower Missouri and upper Mississippi valleys, to the northward of the Ohio river and in the Middle Atlantic states, the month, although cold, was generally favorable for the prosecution of such farm work as is usually performed in winter. In the Southern States the conditions were not favorable for farm work. Moderate rainfall has partially relieved drought in eastern Texas, but elsewhere in that State drought conditions continue. On the Pacific coast the temperature has been favorable, and the rainfall abundant.

The northern portion of the winter wheat belt was generally well protected by snow during the month, and an improvement in the condition of winter wheat is indicated over the northern portions of Ohio, Indiana, Illinois, and Missouri, the outlook being less favorable over the southern portions of these states and in Kentucky, Tennessee, and Arkansas. The severe sleet storm near the close of January left a large portion of the Ohio Valley covered with ice, which remained on the ground for a considerable part of February, the effects of which it is feared will prove unfavorable. In Nebraska and Kansas the crop as a whole is in promising condition. In California the condition of wheat has materially improved, except in a few sections where the rains came too late to save the early sown. In western Oregon the crop is in excellent condition, and it is generally promising in eastern Oregon where, however, considerable has been winter killed. In Washington the severe cold of the latter part of January caused serious injury in localities, but where not injured by cold it has made good growth.

CLIMATE AND CROP DATA IN SCHOOL WORK.

We are in receipt of copies of the *Normal Eyte*, a weekly paper published in the interest of the Iowa State Normal School at Cedar Falls, in which we find articles recommending and illustrating the use of the MONTHLY REVIEW of the Iowa Climate and Crop Service in school work, especially in teaching arithmetic and geography. Under the general head of "Training," after giving numerous examples as to the methods to be employed in the use of climate and crop data in arithmetic classes, the editor says:

Why use this material for this purpose. In the first place the population of the state is decidedly rural. It thus would happen that the interests of the greater portion of the people of the state would be drawn upon to supply much of the material used in the teaching of the common subject of arithmetic in our schools. As a matter of justice the farming interests of the country would have fair recognition in this way in furnishing a reasonable proportion of the matter of the problem used in the schools by the children. Since each child in the state is so closely related in the experience to the agricultural industries it would be an advantage to use matter that stands in such immediate relation to his personal experiences and in this manner link the experiences and interests of the home with those of the school. Not the least of the benefits to come from this plan is the fund of general information about the common conditions of life that the pupil incidentally acquires. The idea of the barometer, velocity of winds, amount of precipitation, what the leading crops of the state are, average yield per acre, and the prices that these various products bring would thus be easily learned. When one stops long enough to realize what a general want of intelligence there is in such matters he can see that there is room for such work, especially when it can be done in this way without demanding extra time in a course already somewhat crowded. In fact, instead of stealing time, the added interest that would thus come to the arithmetic work would make the teaching in that subject so much more effective that time would be saved. Here is one simple case in which the much lamented waste in education can be prevented in a slight degree at least.

Referring to the use that may be made of the climatic and crop data in teaching geography, the editor gives the following valuable suggestions:

"Since observation and experience must furnish the point of contact in teaching any child it would be sensible to base the instruction as to climatic conditions of the globe and the products incident to these conditions upon the personal experience of the pupil in his own locality, supplemented and made more effectual by the excellent data and varied information that the director of the weather bureau for this state prepares and sends out. A knowledge of the extremes of heat and cold, winds, storms, lightning, precipitation, natural climatic conditions, and the equally natural variation from what is the normal condition for the state should be correlated with the more abstract statement of the text book. Crops raised at home, other products of the state, and the value of these all may contribute to give the geography a reality that is not often done in the ordinary school. These things properly associated with the soil, seasons, and climate that unite to produce them are a rich fund of materials with which the student is thus equipped in his attempts to understand regions remote but with similar climate, or near but having modified conditions. As an illustration of the facts that these reports furnish and which would be of marked help in explaining the importance of the amount of rainfall in producing a crop a few statements of facts gathered from the report of 1900 are given. "The average precipitation for the state is a little over 30 inches per year; and in the last decade the lowest amount was 21.95 inches in 1894, and the highest 37.45 inches in 1896. The normal for the three summer months is 11 inches. In 1894 the total for the summer months was only 4.88 inches; and in 1900 the amount was 14-78, or 10 inches above the low water mark. The difference of about 10 inches in the critical months of the crop season accounts for the fact that the output of cereals in 1900 was more than twice the total produced in 1894. Fully 70 per cent, on the average, of our annual precipitation falls in the six crop months, and over 37 per cent of the yearly total comes in the three summer months. So there is in Iowa a wet and dry season about as well defined as in some of the tropical countries. * * * * * * During the past eleven years the average from April first to October first has been 21.67 inches, with some noteworthy departures above and below. In 1896 it was 29.33 inches, and in 1900, 25.74 inches. But in 1894, the memorable year of the great drouth, the amount was only 13.39 inches, and about half of that total fell in April and September, leaving the four months in which the bulk of crop growth was made with very scant moisture." There is not space here to work out the many points of interest and value that can be seen from such data. Closer observation of the seasons and of the aspects of nature in general should result. Superstitions about permanent changes in climate, effects of the moon, and so forth will not be so readily drawn from one season's experience. From these facts about his own state the pubil should be more able to understand other countries. A little more intelligence on the matter of the weather and climatic conditions governing it would make it more difficult for the political demagogue to win votes by representing conditions that are purely the result of the weather as attributable to the acts of the party in power. One illustration of the use made of these fact is given. To show how important to the interests of our state is the rainfall during the growing or crop months the comparison of the average of

the corn crop for the state in 1894 and in 1900 is given. In '94 the average was 14 bushels per acre, in 1900 it was 40.3 bushels per acre. Other crops in about the same ratio. These reports are valuable in other respects in ways that it is not possible to take space t omention, but the thinking teacher will find profitable use to make of all such aids in the study of Iowa geography and in the interpretation of statements about other countries.

A kind of training of no small value can be given the pupils by the use of statistics thus so easily obtainable in the diagrammatic and graphic representation to which such statistics so readily lend themselves. What more valuable exercise in testing the judgement and skill of a class than to let them show the variation of the rainfall in our own state through a period of years by the rise and fall of a line as it is traced across the page according to a definite scale? Crops, prices, and total values are available for innumerable exercises that lead to a better understanding of the every day affairs of life and a quickened interest in school work because of the pleasure the pupil gets from seeing things work out into some definite results. Ability to make things live and assume meaning in graphic illustration is of very great value to any person. Inventive and illustrative power and the power to direct his own activities may thus be given many a child in such a way as to lead to incalculable benefits in making him thoughtful and in trying his own powers.

In these weather and crop reports there is a mine that the teacher may work to the lasting benefit of the class when teaching Iowa geography and in making him master of the greater world that lies beyond through his fund of illustrative materials that he has from his own experiences. Try it ''

A SUN MOTOR.

So powerful are the sun's rays when at their height, that on every square yard of the earth's surface there falls the equivalent of three horse-power. The sunshine on a four-acre lot at noonday represents an energy equal to that now taken from Niagara. Enough heat falls on a steamship's deck, if it were all gathered up and applied to the propeller, to drive the vessel along at its usual speed. The world uses 800,000,000 tons of coal every year, and wastes nine-tenths of it in the using, while upon an area less than twenty miles square of the Sahara Dseert the sun is pouring as much heat as that coal contains.

For thousands of years inventors have sought how to put this enormous power to use. The schoolboy hears the story of Archimedes, how twenty years before Christ he set on fire the ships of the enemy in the harbor of Syracuse by concentrating on them the heat of scores of mirrors. John Ericsson, the builder of the Monitor; turned his attention to the problem, and in 1870 produced his first solar machine. Then for fourteen years he labored to perfect his motor. The best he could do was to produce about one horse-power from a surface of 100 square feet, thus using only a thirtieth of the actual energy of the sun. His method was to condense the heat upon a boiler of water by mirrors.

About the same time a Frenchman, Mouchot, produced similar results. The latter afterwards put his discoveries to practical use by building a machine light enough to be carried on a man's back. It is useful for distilling water on the ocean or in arid regions, and will distill 2½ quarts in an hour. The French have put this method of distilling to use in Algiers on an extensive scale.

We do not need to go to the Sahara to find desert. The arid plains of the great west are a needy field. There the sun shines with scarcely a cloud. Given a cheap power to pump the water, these barren plains would ''blossom like the rose,'' and the power is there in limitless abundance if only it can be used. In southern California, at South Pasadena, an experiment is now in progress that holds out a hope of redemption to the whole of that great western country. It is a solar motor built on the same general principle as that followed by Ericsson, but brought to a perfection that seems to promise practical usefulness.

The essential part of the motor is a huge glass reflector, somewhat the shape of an umbrella with its top cut off. The inner surface is lined with 1,788 small mirrors, so arranged that they reflect the sunlight upon a boiler located at the center, corresponding to the handle of the umbrella. The great disc is circular, with a diameter of thirty-three and one-half feet at its broad edge, narrowing down to fifteen feet at the inner opening. It is mounted on a steel frame strong enough to resist a wind of 100 miles an hour. The mounting is necessary, in order that the axis or center may always point exactly to the sun. The disc weighs several tons, but is moved into place in the morning with a few pounds' pressure by the hand. An indicator shows when it is exactly in focus.

The position once fixed, it automatically keeps its face to the sun, being regulated by a clock, like the mounting of a great telescope. As the sun becomes concentrated upon the boiler there arises, first, a vapor like the morning dew; then the heat begins to quiver within the magic circle and along the black water tube. In an hour there is a jet of steam, which is led into the compound engine and begins to turn the centrifugal pump; and the sun is ''drawing water'' at the rate of 1400 gallons a minute. When the sun descends to the horizon, the heat no longer plays upon the boiler, and the motor stops, ready to take up its task on the coming day.

Many people who see this machine at work ask what makes it go. They seem absolutely unable to understand the idea, simple as it is. Those who do comprehend fail to appreciate the enormous power at work. Thrust a piece of copper into the focus and it will melt directly. Let the rays fall upon a piece of wood, and the flames will shoot up as by magic. Were man to climb into the circle, he would be burned to a crisp in a few seconds. Think of the possibilities of such a machine to the future melodrama!

The Pasedena motor is the result of numerous experiments by some Boston capitalists. They built a silver reflector at enormous cost, only to abandon it. They built a machine modeled after Ericsson's, but it failed to do the work. They built a third machine at Longwood, and a fourth was set up at Denver. Now comes the Pasedena model and with it success. Not that it is the best that can be made, for already inventors are suggesting improvements; but it actually does work, and does it well and cheaply. Better and larger machines will undoubtedly follow. It is safe to say that, with even the present development, the wheels of the world would not stop should every pound of her coal have been consumed.—*Kuhlow's*.

AN AGRICULTURAL REVIVAL.

The writer is attending and conducting a great many farm institutes this year and notes with much pleasure the marked increase of interest and attendance at these meetings. It is not too much to say that there is a great agricultural revival in progress all over the country, a desire on the part of the men who till the soil to be better informed, to pursue better methods, to improve all grades of seed and stock, to improve the conditions of the farm home, to be more in touch with the spirit of progress which is dominating and shaping all lines of business in this country. The constantly increasing value of farm lands compels a more intelligent and economic handling of them to secure paying returns.—J. S. TRIGG, in *Rockford Register*.

BAROMETRIC RANGE IN DES MOINES.

The records of the United States Weather Bureau station at Des Moines since its establishment in 1878, show a range of 2.13 inches in the actual reading of the barometer. The highest actual

reading was 30.00 inches on February 23, 1889; and the lowest observed reading (not reduced to sea level) was 27.87 inches on February 28, 1902. So the last day of February broke all previous records for low barometric pressure in this section. It was a notable storm from start to finish.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—The mean pressure for the month was 30.08 inches; highest observed 30.59 inches at Sioux City on the 8th; lowest observed 28.67 inches at Davenport on the 28th; range for the state 1.92 inches.

TEMPERATURE.—The monthly mean temperature, as shown by records of 110 stations, was 17.6°; which is 4 1° below the February normal for this state. The monthly means by sections were as follows: Northern section, 16.6°; Central section, 16.8°; Southern section, 19.3°. The highest monthly mean reported was 22 2° at Thurman; lowest mean, 12.8° at New Hampton. The highest temperature reported was 62° at Humboldt on the 27th; lowest reported 2.° below zero, at Galva on the 2d. The average monthly maximum was 52 2°; average monthly minimum 14.2° below zero. The greatest daily range was 46° at Elkader; average of greatest daily ranges 32.5°.

PRECIPITATION.—The average precipitation for the state, as shown by records of 128 stations, was 0.73 of an inch, or 0.33 inch below normal. The averages by sections were as follows: Northern section, 0.69 of an inch; Central section, 0.74 of an inch; Southern section, 0.75 of an inch. The largest amount reported was 2.39 inches at Belle Plaine; least amount 0.02 of an inch at Thurman. The greatest daily precipitation reported was 1.40 inches at Belle Plaine on the 27th. Average number of days on which .01 or more precipitation fell, 4.

WIND AND WEATHER.—Prevailing direction of wind, northwest; highest velocity reported 46 miles per hour, from northwest at Sioux City, on the 28th. Average number of clear days 13; partly cloudy 8; cloudy 7.

OBSERVERS' NOTES.

ALTA—*David E. Hadden:* Cold during first decade; much snow on ground until middle of the month; light rain, turning to snow closed the month.

AMANA—*Conrad Schadt:* Ground well covered with snow during the cold weather prevailing three-fourths of the month, affording protection to rye, fall wheat and roots of trees and shrubs.

BONAPARTE—*B. R. Vale:* A solid, pleasant and profitable month; good roads, and good weather for feeding stock.

BRITT—*Geo. P. Hardwick:* A fine winter month; last half very mild.

CENTERVILLE—*Jas. S. Hamilton:* Roads good, and fine weather for feeding or hauling, except last two days.

CLINTON—*Dr. Luke Roberts:* The temperature of the air did not rise above 31° during first and second decades, and the mean for that period was 10°. The minimum for the month was 11° below zero on the 5th The coldest day was the 2nd, which gave a mean of 4.5° below zero. Prevailing wind from the west; highest velocity 20 miles an hour, on the 4th; total wind movement 3,140 miles, or 1,470 miles below normal. Precipitation 1.18 inches, or .81 of an inch below normal. Up to 27th there had fallen only .23 of an inch of water, mostly in form of snow. Ice harvest large and quality good. The winter season which has just closed was a fair sample of Iowa winter weather. Those who had out of door work to do could prosecute their business with little interruption, and most of them took advantage of these conditions. The average amount of rainfall for the winter seasons—December, January and February—for the last twenty-three seasons. is 5.60 inches. The least amount in any one season was 2.14 inches, occurring in 1898-99. The next least in 1901-02, being 2.69 The greatest seasonable amount was 8.79, occurring in 1885-86. It will be seen that the season just closed was deficient; below normal 2.91 inches. The mean temperature of these 23 winter seasons was 22.1 degrees. The season giving the highest mean temperature was that of 1901-02, being 33.0 degrees, and that of 1899-00, 31 degrees. The lowest mean was in 1884-85, being 12.2 degrees, or a range of 20.8 degrees.

COLUMBUS JUNCTION—*H. E. Simpson:* Another dry month. Fair and cold with excellent sleighing most of the month. Warm and wet at close.

ELKADER—*Chas. Reinecke:* Ice went out of the Turkey river on 27th.

ESTHERVILLE—*Leslie Littell:* First half of month cold and ground covered with snow; last half warmer. Ducks and geese flying northward at close of month.

FONDA—*H. P. Barrow:* A very fine winter. First flight of ducks northward on the 26th.

HUMBOLDT—*Humboldt:* Month remarkable for good weather; hay plenty, also fair supply of corn; real estate advancing.

OLIN—*Nathan Potter:* Month cold up to 27th; good sleighing and no hard storms prior to 27th; never better for feeding stock.

OVID—*H. C. Miller:* Sleighing good from Jan. 26th to Feb. 17th.

RIDGEWAY—*Arthur Betts:* Temperature 1° above normal. Last three days frostless. Sunshine 223 hours. One peal of thunder on 25th at 11:30 P. M. Last week delightful; flies and "crusaders" put in appearance.

FAIRFIELD—*Wm. Mendenhall:* Rings around the moon on 13th and 22nd; also lighter rings on 17th, 18th and 19th. On the evening of the 18th there was a fine spectrum at the edge of a thin cloud to the south of the moon.

IOWA FALLS—*J. B. Parmalee:* A brilliant spectacular display of parhelia was observed on morning of the 4th, continuing with nearly full effects from 8 A. M. to 12. The primary and secondary circles, with regular sundogs at right and left, were unusually fine, exceeding any similar display ever noted here. The rainbow colors were nearly as bright as were ever seen in a summer shower.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIII. MARCH, 1902. No. 3.

NOTES.

In respect to population Iowa is eleventh in the list of states and territories of the United States. In area Iowa ranks twenty-fourth. In percentage of arable soil compared to the area this state is easily first.

* * *

The present area of the United States, territories and insular possessions is 3,690,822 square miles, or about one fourteenth of the land surface of the earth. Only three countries, the British Empire, the Russian Empire and the Chinese Empire have unquestionably a greater area than the United States, and these are the only countries having a greater population. Including Alaska and the islands, the total population June 1, 1900, was 84,233,069.

* * *

A news special states that during a thunderstorm on night of March 10, Mr. Charles Pierce, residing near New Hartford, Butler county, was killed by lightning. It was the first thunderstorm of the season.

* * *

It is said that birds serve as weathercocks when they are perched on trees or bushes, as they usually face the wind if it blows with sufficient force to ruffle feathers.

* * *

An instrument for indicating and recording the approach of thunderstorms is in use at St. Ignatius College, Cleveland, Ohio. The apparatus comprises a relay, a sounder, a coherer, two condensers, a choking coil, two batteries of two and four dry cells, a clock with recording cylinder, and a copper collector fixed to the tower roof. The action of the storms upon the recorder is as follows: If, at some distance from the receiving station, there is a violent discharge of electricity within a cloud, the electrical oscillations it occasions will impinge upon the collector on the roof and close the coherer circuit. The waves, however, pass the coherer without obstruction, thereby building bridges for the battery current in this circuit. The relay in the coherer circuit is energized, and closes the recorder circuit in the usual manner.—*Scientific American*.

* * *

The spectrum of lightning, which has been photographed at Harvard university, through a telescope provided with an objective prism, is not always the same, but curiously resembles the spectra of new stars, such as that in Perseus. Many of the lines appear to be due to hydrogen.—*Exchange*.

* * *

At Portland, Texas, experiments have been made with Beaumont oil as an exterminator of insects. It has been found effective as an insecticide, and not harmful to plants when applied in the form of emulsion.

* * *

The largest rainfall on earth has been recorded at Cher Punji, on the bay of Bengal, but the most violent thunderstorms ever observed are probably those of French Guiana. At Cape Orange, some forty miles south of Cayenne, a French naval officer saw the rills of the coast hills turned into waterfalls by a cloudburstlike storm, while the crashing thunder peals were incessant and often almost deafening, so much so, indeed, that some of the sailors began to mutter long forgotten prayers.—*Exchange*.

* * *

With his electro-magnetic gun, Prof. Birkeland, who has been experimenting at Christiana, expects to hurl 1,000-pound projectiles much farther than they can be thrown by explosives.—*Exchange*.

* * *

The great West, according to the census figures, now produces 90 per cent of the gold, silver and copper output of the United States, 75 per cent of the iron and cereals, 65 per cent of the swine, 50 per cent of the milch cows, and 60 per cent of all other cattle in the land. Of manufactured products, the city of Minneapolis alone sends to market 16,000,000 barrels of flour every year, and Elgin sends 3,000,000 pounds of butter. The Great Lakes bring forward on their surface 150,000,000 bushels of grain every year, and the Detroit river floats four times as much tonnage as the Suez canal. Chicago starts by rail for the markets of the east 150 tons of provisions every hour in the day. In the territory embraced in the "Louisana purchase," for which this government paid $15,000,000, the states now existing produce every year grain to the value of $345,000,000, and the people hold real estate the total value of which is placed at $3,500,000,000. These figures give some idea of the wondrous value of the great West, after less than a century of development under American management. In mining, agriculture and industrial pursuits it stands today without a rival in the world, and its prosperity has really but just begun to manifest itself. Another century of intelligent labor will transform it into an empire of productiveness, the like of which has never before been seen.—*Exchange*.

THE WORK OF THE WEATHER BUREAU IN 1901.

The excellent service rendered by the Weather Bureau during the past year has been recorded by its chief in the report which he has just submitted to the Secretary of Agriculture. The Bureau and its staff have time and time again demonstrated their usefulness, notably during the Galveston hurricane, one of the most destructive tornadoes that ever swept the country.

The work of the year has been more or less a continuation of

that previously begun. Better means for obtaining ocean forecasts by international co-operation have been obtained. Three additional forecasting districts have been established. The last appropriation bill passed by Congress provides for three additional forecast officials, who are to take charge of these districts. The line of work pursued in previous years by the climate and crop service divisions was continued. Unfortunately, few persons realize how complete is the system adopted by the Bureau for the dissemination of information to the crop growers. Paid and skillful officials to the number of 1200 outside of Washington report on all matters concerning weather, crops, climate, and statistics; at the central office in Washington 200 officials alone are employed; 180 fully equipped meterological stations are centered over the United States and its dependencies, each conducted by trained officials; and in every state and territory a central observatory is located, to which all subordinate officers in the state report, and to which all volunteers give their information. The telegraph circuits of the Bureau have been equipped with ingenious devices for the rapid distribution of daily meteorological reports. Temperature and rainfall reporters telegraph their data daily from the growing fields to certain cotton, corn and wheat centers. Storm-warning display men are stationed along the Atlantic, Gulf and Pacific coasts and in the lake region. A weather bureau man is to be found on the floor of every important board of trade or exchange in the country. He publishes weather and crop information, and charts, the weather report on a large map.

Particular attention has been given to the distribution of forecasts by means of the rural delivery. There are now 365 centers. Some 42,000 families in the farming districts are supplied with the latest weather protection. The rural free delivery places the frost and cold-wave warnings in the hands of those who can make the most valuable use of them.

In wireless telegraphy the Bureau has endeavored to secure a more powerful transmitter, a sensitive receiver, and a selective means whereby messages can be differentiated. The first of these problems has been successfully solved; the second is nearing a successful solution; and the third, although well demonstrated theoretically, has not been fully tested in practice.

The experiments conducted by the grape growers in France and Italy for the purpose of preventing hailstorms, by the use of explosives fired from especially designed cannon, has attracted the attention of the Bureau. It is the opinion of scientists both in America and Europe that hailstorms cannot be prevented by such means. With the experience of a few years ago with our own rainmakers before it, the Weather Bureau sees no reason for expending thousands of dollars in uselessly cannonading the heavens.

Of the minor work conducted by the Bureau, mention should be made of the installation of sixty new storm-warning towers and of the inauguration of the study of meteorology in the schools and colleges of the country.—*Scientific American*.

CLIMATE OF THE KLONDIKE.

The following article from the January number of the Monthly Weather Review, issued by the Meteorological Bureau of the Dominion of Canada, gives some interesting data relative to the climate of Dawson and the Klondike:

A somewhat broken series of observations at Dawson and various other places in Yukon Territory between 1895 and 1898, and a continuous series at Dawson during the past three years, afford data for estimating with a fair degree of accuracy the average climatic conditions of the Klondike. The average annual mean temperature is about 22°; the mean of the three summer months is about 57°, July being 61°; and of three winter months—16°, with January—23°. Spring may be said to open towards the end of April, the last zero temperature of the winter usually occurring about the 5th of this month. May, with an average temperature of 44°, is by no means an unpleasant month and the 23rd is the average date of the last frost of spring. Daily observations during five summers indicate that on the average the temperature rises to 70° or higher on 46 days and to 80° or higher on 14 days; 90° was recorded in Dawson in June, 1899, and 95° in July of the same year. These temperatures with much bright sunshine and an absence of frost during three months, together with the long days of a latitude within a few degrees of the Arctic Circle, amply account for the success so far achieved by market gardeners near Dawson in growing a large variety of garden produce, including lettuce, radish, cabbage, cauliflower and potatoes, and warrant the belief that the hardier cereals might possibly be a successful crop both in parts of Yukon Territory and in the far northern districts of the Mackenzie River Basin. August 23rd would appear to be the average date of the first autumnal frost, the temperature rapidly declining towards the close of this month. Although night frosts are not infrequent in September, the month as a whole is mild with a mean temperature of 42°. October may be fairly termed a winter month, the mean temperature being but 22°.5 and the first zero of winter recorded on the average about the 18th. Ice usually begins to run in the Yukon about the second week but it is not until quite the end of the month or early in November that the river is frozen fast. The temperature on the average during a winter falls to 20° below zero or lower on 72 days, to 40° below or lower on 21 days, to 50° below or lower on 7 days, and to 60° below or lower on two days. In January, 1896, 65° below was registered at Fort Constantine, and in January, 1901, 68° below was recorded at Dawson.

Observations of rain and snow have until the close of last summer been very fragmentary, but it is probable that the summer rainfall near Dawson is usually between seven and nine inches, and that the total snowfall of the autumn and winter is between 50 and 60 inches.

Dawson being situated near the river, with high hills or mountains on all sides, is well protected from the winds, and a feature of the town, and indeed of the neighboring country, is the long periods of calm weather which occur.

DESTINATION OF THE SUN.

More than a century ago Sir William Herschel was able to fix roughly what we call the apex of the sun's way in space, or the point among the stars toward which they were directed. Herschel found that a comparison of old stellar observations seem to indicate that the stars in a certain part of the sky were opening out, as it were, and that the constellations in the opposite part of the heavens seemed to be drawing in or becoming smaller. There can be but one reasonable explanation of this. We must be moving toward that part of the sky where the stars are separating. Just so a man watching a regiment of soldiers approaching will see at first only a confused body of men. But as they come nearer, the individual soldier will seem to separate, until at length each one is seen distinct from all the others.

Herschel fixed the position of the apex at a point in the constellation Hercules. The most recent investigations of Newcomb, published only a few months ago, have, on the whole, verified Herschel's conclusions. Later investigators have increased the precision of our knowledge, until we can now say that the present direction of the solar motion is known within very narrow limits. A tiny circle might be drawn on the sky to which an astronomer might point his hand and say: "Yonder little circle contains the goal towards which the sun and planets are hastening today." Even the speed of this motion has been subjected to measurement and found to be about ten miles per second.

The objective point and the rate of motion thus stated exact science holds her peace. Her genuine knowledge stops, and we can proceed further only by the aid of that imagination which men of science need to curb at every moment.

But let no one think that the sun will ever reach the so-called apex. To do so would mean cosmic motion on a straight line, while every consideration of celestial mechanics points to motion on a curve. When shall we turn sufficiently upon that curve to detect its bending? It is a problem that we must leave as a rich heritage to generations that are to follow us. The

visionary theorist's motion of a great central sun controlling our own sun's way in space must be dismissed as far too daring. But for such a central sun we may substitute a central center of gravity, belonging to a great system of which our sun is but an insignificant member. Then we reach a conception that has lost nothing in the grandeur of its simplicity, and is yet in accord with the probabilities of sober mechanical science. We cease to be a lonely world and stretch out the bonds of a common relationship to yonder stars within the firmament.—*Popular Science Monthly.*

CAUSE OF HAZY SKIES.

In a reply to a letter, asking the cause of autumn haze, the Chief of the United States Weather Bureau recently prepared a letter, part of which is quoted in what follows: The dry haze is undoubtedly due to fine particles of dust. The finest dust is composed of one or all of the following substances, namely, fine particles of soil or the dead leaves of plants, smoke or ashes from wood fires, salt from ocean spray, the shells or scales of microscopic silicious diatoms, germs of fungi, spores of ferns, pollen of flowers, etc. In the still air of the damp nights these dust particles settle slowly down, and the morning air is comparatively clear. During the daylight the sun warms the soil, which heats the adjacent air, and the rising air currents carry up the dust as high as they go. Under certain conditions which are named in the letter the layer of dust reaches higher and higher every successive day. During long, dry summers in India it reaches to 7,000 feet with a well-defined upper surface that is higher in the daytime than at nighttime. This is a general explanation of dry haze weather and applies to Indian summer also. The reason why we have more of such weather in the autumn is because there is then less horizontal wind and less rising air.—*Scientific American.*

REMARKABLE AURORA AT ALTA, IOWA.

About 9 o'clock in the evening of March 29, 1902, a bright auroral beam was observed in the southeast sky at an altitude of about 30 degrees. When first seen it was more or less obscured by light clouds and its true nature was hard to determine. It was a perpendicular, pale, narrow streak of light, about 5 degrees in length and about one-half degree in width, with the star γ in the constellation Virgo almost exactly in the middle of the beam. About 20 minutes later the clouds cleared away and the beam was a beautiful object, resembling strongly a fine comet of a pale greenish-white color; ten minutes later it reached its maximum brightness, when it was a deep yellow to orange color, and had moved about a degree further north. Underneath, toward the horizon, was a dark region, above which was a faint auroral glow. Five minutes later the phenomenon disappeared and did not re-appear again. Its position in the southeast quadrant of the sky was unusual, and many people supposed the light to be a comet. It is a noteworthy coincidence that a large bright region of faculæ was observed nearly at the east limb of the sun in North heliographic latitude 30 degrees, the following day.

DAVID E. HADDEN.

April 1, 1902.

MARCH WEATHER IN THE UNITED STATES.

Extracts from National Climate Crop and Bulletin.

In the Pacific coast states and middle and southern Plateau regions the month averaged colder than usual, the average daily deficiency ranging from three to five degrees over eastern California, portions of Oregon and the greater part of the middle and southern Plateau regions. In the southern states the temperature averaged nearly normal, although most stations show a slight excess, except at Key West, Fla., where it averaged one degree below normal. Over the northern portion of the country east of the Rocky mountains the month averaged decidedly mild, especially from the Missouri valley to the New England and middle Atlantic coasts, where the daily excess ranged from six to ten degrees, being most marked at the northerly stations.

The precipitation in March, 1902, was lighter than usual in the central Missouri, upper Mississippi and central Ohio valleys, over the northern portions of the Lake region, on the Atlantic coast from southern New Jersey to south Carolina, along the central and west Gulf coasts, and over the central and northern Plateau districts, including central California. The deficiency amounted to more than one inch in eastern North Carolina and southeastern Virginia, in the central Ohio valley, along the central and west Gulf coasts, and over limited areas in the Lake region, central Missouri valley, and northern Plateau districts. There was more than the average precipitation for March in New England, the northern portions of the middle Atlantic states, the east Gulf states, over the northern portion of the central and west Gulf states, and from northern Texas northward over the eastern Rocky mountain slope, including the upper Missouri and Red River of the North valleys. In the east Gulf states and northern New England the precipitation was unusually heavy, exceeding the average from one to five inches in New England and from two to eight inches over the greater part of the east Gulf states, a small area in extreme western Florida receiving from thirteen to twenty-eight inches. The rainfall on the Pacific coast was also in excess of the average, except in central California, the excess ranging from one to three inches from northern California along the immediate coast to the Puget sound region.

At the close of the month there was a small amount of snow on the ground over limited areas in the mountain districts of West Virginia and Pennsylvania and also over scattered areas in the lower Lake region and upper Missouri valley.

The weather conditions of March were generally favorable for farming operations in the states of the Missouri, upper Mississippi, and Ohio valleys, and on the Atlantic coast north of North Carolina. The month was also favorable in Florida, Texas and Oklahoma, but over the greater part of the central and east Gulf states it was unfavorable, largely on account of excessive rains. Throughout the central and east Gulf states farm work is from two to three weeks late, and in many sections much land has been badly washed. On the Pacific coast the month was cool, and the season is generally backward.

There has been a very general and in some sections a marked improvement in the condition of winter wheat in the states of the central valleys, although much of the late sown is in poor condition, and some will be plowed up for other crops. The cool weather on the Pacific coast has retarded the growth of winter wheat. In California some damage has been done by heavy rains, but, on the whole, the crop is in promising condition. In Oregon the condition of the crop is less promising than usual, especially in the eastern part of the state. An improvement is indicated in Washington, although considerable reseeding was necessary.

Some spring wheat was sown over the southern portion of the spring wheat region at the close of the month.

Oat seeding is well advanced in the states of the Missouri valley, and is progressing in the Ohio valley and middle Atlantic states. Fall sown oats in the southern states have been winter killed to a great extent.

Corn planting has begun as far northward as Kansas and Missouri, and preparations for planting are in progress farther north. In Texas the bulk of the corn crop has been planted and some is being cultivated. Considerable planting has also

been done in the central and east Gulf and south Atlantic states.

In Texas and Florida cotton planting is well advanced, but in Georgia, Alabama, Mississippi, and Louisiana none has yet been planted, and very little ground has been prepared owing to heavy rains.

The general outlook for fruit, excepting peaches, is encouraging.

CLIMATOLOGY OF THE MONTH.

BAROMETER—The mean pressure for the month was 29.94 inches; highest observed 30.59 inches at Davenport and Des Moines on the 17th and 18th; lowest, 29.07 at Dubuque on the 1st; range for the state, 1.52 inches.

TEMPERATURE—The monthly mean temperature for March, as shown by records of 101 stations, was 39.1°, which is 5.9 above normal. The monthly means by sections were as follows: Northern section, 36.9°; Central section, 39.3°; Southern section, 41°. The highest monthly mean was 44.5° at Thurman; lowest, 34.9° at Larchwood. The highest temperature reported was 79° at Winterset on the 25th; lowest, 12° below zero at Estherville on the 17th. The average monthly maximum was 69.4°; average monthly minimum, 1.5° below zero, The greatest daily range was 46° at Sibley, Monticello and Thurman; average of greatest daily ranges, 34.6°.

PRECIPITATION.—The average precipitation for the state was 1.45 inches, as shown by records of 121 stations. This amount is .30 inch below normal. The averages by sections were as follows: Northern section, 1.20 inches; central section, 1.73 nches; Southern section, 1.42 inches. The largest amount reported was 4.33 inches at Cumberland; least amount, 0.13 of an inch at Algona. The greatest daily amount reported was 3.00 inches at Cumberland on the 10th. The average number of days on which .01 or more precipitation was recorded was 7.

WIND AND WEATHER.—Prevailing direction of wind, southeast; highest velocity, 58 miles per hour at Sioux City on the 16th. Average number of clear days, 9; partly cloudy, 11; cloudy 11.

WEATHER AND CROP CONDITIONS.

March was warmer than usual, the mean temperature ranging from four to seven degrees above the normal. Wintry weather of considerable severity prevailed from the 1st to the 4th and from the 15th to the 19th, but the balance of the month was mostly springlike and unusually favorable for early farm operations. The soil was in excellent condition for plowing, and seeding of spring wheat and oats was well advanced before the close of the month. The season opened from ten days to two weeks earlier than the average in this section. The cold wave and high wind, prevalent from the 16th to the 18th, caused some damage to winter wheat in the southern and central counties, and to spring seeding in all parts of the state; but the aggregate of injury was not heavy. The average precipitation was below normal, but there was ample moisture to facilitate plowing and for germination of grain. Grass and winter grain would have made better growth if the rainfall had been more copious.

OBSERVERS' NOTES.

ALBIA—*E. R. Reeve.* Heavy fog on the 7th. On 13th plowing and sowing in operation. Heavy thunder on 15th at 6 A. M.

ALTA—*David E. Hadden.* March was generally pleasant, with much wind, especially on 14th to 16th. Some seeding of wheat and oats during last week in the month.

AMANA—*Conrad Schadt.* On the 14th sowing wheat begun, but was stopped by cold snap beginning on 16th; work resumed on 24th.

ATLANTIC—*J. W. Love.* Robins appeared on 9th and bluebirds on the 10th. First thunder-storm on 10th.

BONAPARTE—*B. R. Vale.* First half mild, but two severe cold periods in last half. Soil very dry.

BRITT—*Geo. P. Hardwick.* Snow on first two and last two days, but otherwise the ground was bare. Very high winds the 15th, 16th and 26th. Wheat and oats sown 24th to 27th.

CENTERVILLE—*James S. Hamilton.* Oats about all in and ground very dry for the time of the year. Roads fine. Feed and water scarce.

CLINTON—*Dr. Luke Roberts.* The month commenced with a typical March day—a genuine infant blizzard Temperature quite moderate up to 17th, when there was a sudden drop from thirty-five degrees to one above zero. After two days of vigorous winter, the balance was warmer. There were six storm days, with an aggregate of 2.19 inches, or .35 of an inch below normal. The maximum velocity of wind was 26 miles on hour on the 16th; total wind movement 5,680 miles—a little below normal. The mean temperature was 39.5 degrees, or 6 6 above normal. The number of clear days was six; partly cloudy 7, and cloudy 18.

COLUMBUS JUNCTION—*Prof. H. E. Simpson.* Ice went out from junction of Iowa and Cedar rivers March 6th.

EARLHAM—*Geo. Phillips.* A fine month for March; considerable farming done with ground in good condition; some grass in pastures for stock.

ESTHERVILLE—*Leslie Littell.* March came in and went out like a lion. Sudden changes from spring days to wintry conditions. There were flowers in the woods and frost flowers on windows.

FAYETTE—*R. Z. Latimer.* Robins came on 10th; seeding was finished on 27th and some gardens were made. Month went out blustery.

FOREST CITY—*J. A. Peters.* Some wheat sown on 12th; oats seeding begun on 24th; ground frozen on 31st.

GRAND MEADOW—*F. L. Williams.* Plowing begun on 28th and soil worked fairly well; feed for stock scarce in this section.

GRINNELL—*A. O. Price.* A dry March. Sod plowing begun earliest in many years; oats and wheat sown and gardens being made.

GRUNDY CENTER—*Ed. S. King.* Some seeding and sod plowing done; ground dry and rain needed.

GUTHRIE CENTER—*W. F. Brann.* Seeding begun about the 26th; fall wheat looks well but not much sown.

HOPEVILLE—*M. T. Ashley.* Most of oats sowed; plowing for corn begun; some gardens made.

KEOSAUQUA—*J. H. Landes.* Last week of the month was fine farming weather; oats are all sown.

OLIN—*Nathan Potter.* Some plowing and seeding done in March; cold and disagreeable at close of month.

OVID—*H. C. Miller.* Oats about all sown during the last week; some early potatoes planted and gardens made.

PACIFIC JUNCTION—*H. H. McCartney.* On 16th a bright parhelia was observed shortly after sunrise; very brilliant sunrise on 30th.

RIDGEWAY—*Arthur Betts:* Warmest March on record here, 17 dates frostless; 229 hours of sunshine; anemones almost in bloom on 14th, but the only cold wave about that time checked their growth; many were in bloom on Easter; fifty peals of thunder were heard on the 10th; some plowing and seeding done.

STORM LAKE—*Prof. M. L. Fuller:* Lake cleared of ice in twenty-four hours on the 14th; froze again on 16th, remained till the 21st. A fine month for preparing ground for farming, but little over half the normal precipitation, which is 1.51 inches. Month has been drier but four times in eighteen years.

TIPTON—*Geo. W. Barclay:* On the 11th larks, robins and blackbirds were seen. On the 12th commenced plowing sod and seeding.

WASHTA—*H. L. Felter:* Some wheat sown as early as the 20th, and considerable seeding done; ground in good condition.

ERRATA IN FEBRUARY REVIEW.

COLUMBUS JUNCTION—Total precipitation recorded .91 inch on pages 8 and 11 should have been .92 inch.

MONTICELLO—Mean temperature recorded 14.6 degrees on page 7, should have been 15.6°.

PERRY—Amount of precipitation on the 28th, recorded .28 inch on page 11, should have been .20 inch.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECAST OFFICIAL,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

ALLIED PRINTING TRADES UNION LABEL COUNCIL DES MOINES

DES MOINES:
BERNARD MURPHY, STATE PRINTER.
1902.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

J. C. FRAZIER, PRESIDENT, Bloomfield.
W. W. MORROW, VICE-PRESIDENT, Afton.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
WM. M. BEARDSHEAR, President Iowa State College.
B. P. NORTON, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—C. E. CAMERON, Alta.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Meteorological data are received by the Iowa Weather and Crop Service.

Afton ..... Hon. N. W. Rowell
Albia ..... E. R. Reeve
Algona ..... C. D. Pettibone
Alta ..... D. E. Hadden
Alta (near) ..... W. J. Minard
Amana ..... Conrad Schadt
Ames ..... Exp. Station
Atlantic ..... J. W. Love
Audubon ..... Frank Mott
Baxter ..... W. T. Thorp

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIII. APRIL, 1902. No. 4.

NOTES.

Prof. Bailey, of the astronomical observatory of Harvard College, has been sent to the observatory at Arequipa, Peru, to study the peculiarities of the planet Eros, which is the most remarkable of the minor planets, or asteroids, of the solar system. The observatory in Peru is one of the stations established by Harvard, and the conditions there will be most favorable for observations of Eros at the time of its opposition. Very careful work will be done by Prof. Bailey, with the best appliances obtainable.

* * *

It is interesting to notice that the United States Weather Bureau has recently been testing Prof. Fessenden's system of wireless telegraphy at Roanoke island, N. C. The wireless telegraph might be of especial use to the weather bureau, by enabling inaccessible or remote localities to be telegraphically reached without involving the expense of carrying and maintaining a wire or cable. Moreover, for the business of making weather reports only a few daily words are necessary, and in cases where no other business is forthcoming, a telegraph wire or cable might be prohibitively expensive The Fessenden system is particularly different fram the Marconi system in not employing a coherer for the detection of the incoming electric waves. The two systems also differ materially in other respects. It is interesting to observe that Prof. Fessenden is reported as stating that the waves of wireless telegraphy do not penetrate appreciably beyond one foot below the surface of the sea and three feet below the surface of the land traveled over. Pupin, we believe, takes a similar view.—*Electrical World and Engineer.*

* * *

The present area of the United States and insular possessions and territories amounts to 3,690,822 square miles, which is about one-fourteenth of the land surface of the earth. Only three countries, the British empire, the Russian empire, and the Chinese empire, have unquestionably a greater area than the United States, and these are the only countries having a greater population than the United States. Including Alaska and the islands under the flag, the total population June 1, 1900, was 81,233,069.

* * *

It has been discovered that electricity may be made serviceable in seasoning woods, preserving them from decay and rendering them measurably fire proof. By the force of an electric current the green timber may become quickly impregnated with the salts that are used to prevent decay and render the wood less liable to combustion.

* * *

At Reading, Pa., a refrigerating company has been organized and a plant is being constructed, to supply kitchens, larders and living rooms of residences with cool air to mitigate the high temperature of the mid-summer season. The coolness will be furnished to customers in form of anhydrous ammonia sent through pipes, after the manner of steam, hot water and gas distribution.

* * *

Electric heating has not as yet come into extensive use, except in electric cars, where only moderate warmth is required. But some progress has been made in an experimental way, and in localities where cheap water power can be utilized in operating a transmission plant the electric system may be made advantageous to the public. It is the cleanest form of heating that is known.

* * *

Science is superceding pure luck and chance in prospecting for the precious metals in the mining districts. The work is done by the aid of electric batteries, with ingenious arrangement of electrodes and instruments for measuring resistance of the currents at different portions of the surface. The instruments work with almost unerring certainty, and by this means the secret stores of golden wealth will be discovered.

* * *

Rural free delivery of mails is a double-headed benefaction to the people who are so fortunate as to be located on a route. They get the benefit of the prompt delivery of mails, and in order to secure this the condition is imposed that the roads must be kept passable at all times. The road improvement is really the better part of the new system.

* * *

Hon. L. G. Powers, chief statistician for agriculture of the twelfth census, estimates that the per capita consumption of wheat in the United States amounts to five and a half bushels per year. This is considerably above the estimates accepted by other writers on statistics of consumption and production.

* * *

As determined from the census returns for 1900 the center of population of the United is four miles east and two miles south of Columbus, Ind. That is about fifty mile south of Indianapolis. The point is marked by a stake, and the returns of the census of 1910 will cause the center to pull up the stake and move westward and a little northward, probably over the Illinois line a few mlles. It is sure to maintain its westward course for the next fifty years or more.

* * *

Two eminent scientists, one of whom is a professor in the medical institute and the other a house surgeon in a hospital, have invented a new apparatus for purifying vitiated air in crowded places where it is difficult to provide adequate ventilation. The process is an application of properties possessed by the compound sodium bi-oxide, which absorbs the carbonic acid gas that constitutes the impurity of the air.

* * *

Cattle finished off on corn ranging from 60 to 65 cents per bushel, are not oppressively dear at $6 50 to $7 00 per hundred pounds. If anybody is guilty of extortion in the meat business

it is not the farmer, who must fatten on high-priced feed or sell poorly fed animals. It appears to be an impracticable proposition to afford best cuts of meat at low prices when feed stuffs are at high figures.

OUR NATIVE PASTURE PLANTS.

Pastoral pursuits were among the first peaceful industries to engage the attention of man, and today the pastoral industries of the greatest nations surpass all others in importance and are second to none in actual money value. The great grazing regions of the world are the steppes of Russia, the pampas of South America, the almost boundless pastures of Australia (supporting more than 112 000,000 sheep and yielding one fourth of all the world's supply of wool), and the vast plains and mountain slopes of the interior of our own country. In a broad sense, these are the world's great pasture lands, and the pasturage they supply furnishes the bulk of the world's beef, wool, and other animal products entering into its commerce. The cattle, horses and sheep of the United States number over 100,000,000, valued at $1,829,000,000. The vast capital these represent is absolutely dependent upon the greatest of all our natural resources, our grasses and forage plants. These annually sustain industries valued at nearly $2,000,000 000, industries upon which the very existence of the human race is dependent. The figures giving the value of all our beef consumed at home and abroad, our mutton, our milk, butter and cheese, and the hides and wool, and numerous other animal products which minister to our pleasure and comfort, show a surprising multiplication of industries dependent upon our forage supplies. The amount of hay produced in the United States is estimated in round numbers at 70,000,000 tons—scarcely more than enough to feed our cattle, horses and sheep during three months of the year. This hay crop, valued at $400,000,000 must be supplemented by 210,000,000 tons from other sources. This amount, or seventy-five per cent of the hay and forage necessary to maintain our stock, is furnished by our pastures and grazing lands. The question of what does this pasturage consist is thus an exceedingly interesting one, and almost equally interesting, and even more important, is that of how shall this forage supply be maintained and its productiveness and feeding value increased.

While it is true that the bulk of our hay crop, possibly ninety-five per cent or even more, is composed of grasses and other plants introduced from foreign countries, it is equally true that the bulk of our pasturage is composed of grasses and fodder plants indigenous to the soil. It may be safely stated that ninety-eight per cent of our pasture plants are natives. This is especially true of the cattle ranges of the West. It will be seen, then, that our supply includes practically all of our native grasses; and many plants of other families upon which cattle depend more or less for subsistence—for the cattle range over all our wild lands, and the grasses with which these lands abound numbering throughout the country many hundreds of species, every one producing a mite at least of the general forage supply—may be classed with our native pasture plants. To enumerate them all would be wearisome; and we must be content to consider those regarded as of special importance, either on account of their abundance or adaptation to peculiar conditions. Our native pasture plants vary according to the soil and climate, especially as these are affected by altitude and latitude, and, owing to the breadth of our territory and dividing mountain chains, great variation also occurs with change of longitude. We can broadly classify our pasture plants into those of the wooded regions and those of the treeless areas; the former occur both upon the Atlantic and Pacific slopes, and the latter occupy the vast interior of the country.

The characteristic grasses of the wooded areas, or of those regions where the rainfall exceeds twenty-five or thirty inches, produce a continuous turf or sod, while those of the treeless plains and foothills of the mountain ranges in the interior and of the desert regions, the so-called bunch grasses, do not form a continuous sod, but grow in more or less scattered tufts or bunches. The Western stockman has long been familiar with these bunch grasses of the cattle ranges, and justly prizes them for their nutritious and fattening qualities, while the Eastern farmer knows only those grasses which make a clean, unbroken sod and a rich, succulent growth, such as is formed by Kentucky blue grass, the best and most highly prized of all turf-forming species. It is true that bunch grasses occur in the wooded regions of the East, and it is also true that turf-forming grasses are found in the arid, treeless regions of the interior, but such are the exception, and their presence does not conflict with the general statements here made.—*F. Lamson-Scribner in Department of Agriculture's Yearbook, 1900.*

RAINFALL AND WHEAT.

J. T. Willis investigated the relation of the rainfall to the wheat product per acre in South Australia for the six winter months (the growing season there) and found that for the seven best years there was a yield of 12.4 bushels of wheat with 18.5 inches of rain; for the next best years there were ten bushels of wheat with 15.4 inches of rain, and for the six worst years there were 6.6 bushels of wheat with 13.5 inches of rain. The product of wheat in the first case was nearly twice as great as in the last. If such a relation holds for the United States, it is easy to undeastand what great effect a general drouth may have on the food product. If the amount of wheat raised in the United States were reduced one-half, or even one-third by a year of deficient rainfall, it is easy to imagine an enormous strain on the business of the country, and with a succession of such years the effect might mean disaster. Such a deficiency in the wheat supply, with wheat at eighty cents a bushel, would mean for a single year a direct loss in wealth of more than $100,000,000; it would mean that nearly all the wheat which is usually shipped abroad would be needed at home; it would mean that thousands of railroad cars and ships, which ordinarily transport this grain, would lie idle; that hundreds of men, who usually handle this grain in transport, would be out of employment; that farmers in large numbers would be unable to meet their obligations; and consequently that banks and business of all kinds would suffer.—*Popular Science Monthly.*

AGRICULTURE IN ALASKA.

Writing in the *National Geographic Magazine*, C. C. Georgeson, of Sitka, special agent of the Department of Agriculture in charge of Alaska investigations, says that a traveler may go from one end of the Yukon to the other in summer without seeing snow. On the other hand, vegetation, large forests and such delicacies as wild raspberries, red currents, huckleberries and cranberries will be found in profusion. In places the grass grows as high as a man's head. Mr. Georgeson mentions thirty or forty places along the coast, at the Sitka and Kenai experiment stations and at many points in the interior, where practically all of the cereals of the temperate zone, most of the vegetables and a considerable variety of cultivated flowers have been grown with much success for several years. The Chamber of Commerce at Dawson exhibits fine barley, oats and wheat that have been grown there. Fine spring wheat has been raised at Sitka for three years past. At Rampart, 65 degrees north latitude, winter rye sown in the fall came out in the spring in perfect condition, though the temperature fell to 70 degrees below zero in the winter; the grain matured by the first of August. Barley sown in May of 1901 was ripe by the middle of August. Oats and potatoes thrive in many places. Cattle are kept at every considerable settlement, except Nome. The Alaska Commercial Company has for many years kept cattle, sheep and Angora goats at Kokaik, they requiring but little feed or shelter, except in an occasional storm during winter. In Mr. Georgeson's opinion Alaska can furnish home-

steads of 320 acres each to 200,000 families. She has abundant resources to support a population of at least 3,000,000 persons. At present settlers can get title to land only at a prohibitive cost, and Alaska will not be settled as long as this condition prevails. Stock raising must be a leading branch of Alaska farming, and 320 acres of land is the least amount which a settler should have to make farming a success.—*Ex.*

STRUCK TWICE BY LIGHTNING, AND LIVES.

The Creston *Gazette* reports the remarkable experience of Mr. Geo. Schweers, of that city, who was the victim of two severe lightning strokes on the night of April 25th, and survived to describe his sensations and is making a rapid recovery. Mr. Schweers was walking rapidly homeward during the prevalence of a furious storm, and was stricken to the earth and rendered unconscious by a bolt of lightning resembling a ball of fire, which struck a large tree a few feet distant from the walk. The heavy rainfall restored him to consciousness, and after a time he was able to walk slowly homeward, though partially paralyzed from the shock. Upon reaching the doorstep of his home a second bolt descended close by and he was again overcome and rendered unconscious for another short period. After being restored, it was discovered that his hair and eyebrows were singed and the exposed portion of his skin was blackened by the flash that struck him down. It was a phenomenal event and a marvelous escape from death.

WEATHER AND CROP CONDITIONS.

The month of April was slightly cooler and much drier than usual, the abnormal conditions prevailing for the most part through the first and second decades. The last decade was seasonably warm, and copious showers mitigated the protracted drouth. The worst features of the month were the frequent dust storms and strong gales, which caused considerable damage to windmills, trees and light structures, and wrought some damage to newly seeded grain crops in exposed localities, by uncovering the grain or blowing the loose soil into drifts. The conditions, however, were generally favorable for field work, and more than usual progress was made in seeding and preparing the ground for planting corn. In southern localities the planters were started about the 28th to 30th of April. The germination of small grain was retarded by the cold and dry weather in the first half of the month, but there was considerable moisture below the dry surface to quicken growth when the soil became warmer during the last decade.

At the close of the month the grain crops were making a fair stand and the crop outlook was generally promising. The foliage and bloom on fruit trees appeared very near the normal period. There was a fair prospect for apples, plums and cherries, but peach buds were not in evidence, and the smaller fruits did not give promise of full average crops. Pastures and meadows were late in starting, but the growth was fairly good at close of April. On the whole the crop season made a favorable start, and farm work has been more than usually favored by weather conditions.

CLIMATOLOGY OF THE MONTH.

BAROMETER—Mean pressure for April, 29.98 inches; highest observed, 30.42 inches, at Sioux City on the 7th; lowest, 29.10, at Sioux City on the 25th; range for the state, 1.32 inches.

TEMPERATURE—The mean temperature for the state, as shown by records of 114 stations, was 48.2°, which is about 1.3° below the normal for April. The highest monthly mean was 53.1°, at Thurman, and the lowest 44.2°, at Estherville. The means by sections were as follows: Northern section, 46.3°; central section, 48.1°; southern section, 50.3°. The highest temperature reported was 96° at Clarinda, on the 20th; lowest, 9°, at Larrabee, on the 7th. The average monthly maximum was 87.5°; average monthly minimum, 18.9°. The greatest daily range was 59°, at Glenwood; average of greatest daily ranges, 39.5°.

PRECIPITATION.—The average precipitation for the state, as shown by records of 130 stations, was 1.71 inches, or 1.50 inches below normal. The averages by sections were as follows: Northern section, 1.34 inches; Central section, 1.60 inches; Southern section, 2.19 inches. The largest amount reported was 4.15 inches at Bonaparte, Van Buren county; least amount reported, .40 of an inch at Glenwood. The greatest daily rainfall reported was 2.95 inches, at Sioux Center on the 25th. The average number of days on which .01 inch or more of rain fell was 5.

WIND AND WEATHER.—The prevailing direction of the wind was N. W.; highest velocity reported 74 miles per hour, from the north at Sioux City on the 25th. The average number of clear days was 14; partly cloudy, 11; cloudy, 5.

OBSERVERS' NOTES.

ALTA—*David E. Hadden.* A dry and windy month, with gales and dust on the 11th, 21st and 22nd. On the afternoon of the 25th a gale blew down windmills, trees, etc, Fine aurora during early morning of the 11th, showing colored effects, streamers, curtains, etc.; the maximum display was at 1 to 2 a. m. Ground in excellent condition for farm work all the month.

AMES—*T. S. Hunt, I. A. C.* Highest windstorm occurred on the 22nd; the air being darkened with dust. Considerable seed uncovered.

BONAPARTE—*B. R. Vale.* 4.15 inches of rain fell the last half of the month. From January 1st to April 1st the amount was 2.94 inches; and yet only the surface of the soil is wet. Grass and grain starting.

BRITT—*Geo. P. Hardwick.* Month dry with high winds and dust storms; vegetation made slight start; ground in fine condition for cultivation; farm stock generally thin in flesh.

CHARITON—*S. H. Mallory.* Severe electric storm, high wind, rain and hail during the night of the 24th and 25th.

CLARINDA—*A. S. Van Sandt.* High wind and dust storms on 20th, 21st, 22d and 25th.

CLINTON—*Dr. Luke Roberts.* Solar halo on 3d; lunar halo on 19th and 20th; thunderstorms on 24th and 25th. The 21st was warmest April day I have recorded, the mean being 74 8°. The rainfall was 1 36 inches below normal; mean temperature 0.7° below normal; movement of wind, 5,020 miles, which is 420 miles below normal, but greater than for the last four Aprils.

COLUMBUS JUNCTION—*Prof. H. E. Simpson.* A very clear, dry month, until the drouth was well broken on the night of 24th by heaviest rain in nearly two years. High winds and dust storm caused much discomfort here and suffering in the regions of Cone and Muscatine Island.

CORNING—*Jerome Smith.* An unprecedented dust storm from 11 A. M. till 8 P. M. on the 22d. Violent southwest wind on the 25th from 3 to 10 P. M.

EARLHAM—*George Phillips.* A good April for farm operations; trees beginning to come into leaf at close of month.

ESTHERVILLE—*Leslie Littell.* First half of month dry and cool, with frost every night; last half warmer, with fine rains.

FAYETTE. *R. Z. Latimer.* The 11th and 22d were noted for heavy dust storms; many windmills were blown away. Seeding of small grain was begun March 27th and continued into April.

FOREST CITY—*J. A. Peters.* A very windy month; much of the grain that was sown in March did not come up till after the rain on the 25th and 26th. Ground mostly ready for corn planting at close of month.

GREENFIELD—*J. G. Culver.* Very strong westerly gales 21st to 25th; several barns and cribs and a large brick dry-house destroyed on the 25th; dust storms almost equal to spring of 1880.

GRUNDY CENTER—*Ed. S. King.* A good month for work, but too dry for best growth of crops; corn ground nearly all plowed before May 1.

HARLAN—*C. A. Reynolds.* The roads have been excellent, but dust storms were unusual and very disagreeable.

JEFFERSON—*Isaac Young.* On the 21st a cloudburst and wind scooped out seventeen acres of oats on farm of E. Burchmiller in Bristol township. It made a clean sweep of the field.

KEOSAUQUA—*J. H Landes.* Late rains have given the crops much needed moisture and vegetation is growing rapidly. Everybody happy, because the long drouth is broken.

LEMARS—*S. E. Cole.* Storm on the 25th, began with thunder shower at 3 a. m; heavy wind at 4 p. m and hail, with snow at 6 p. m.

LOGAN—*Mrs. M. B. Stern.* Dry and windy; heavy winds on the 22nd and 25; windmills destroyed and buildings unroofed.

OLIN—*Nathan Fetter.* Precipitation, 1 30 inches; all vegetation backward; some corn planted during last week in April; fruit blooms all right yet.

OVID—*H. C. Miller.* On the 4th solar phenomenon at 7 a. m.; one-fourth circle directly above sun with concave side up in clear sky; on the 22nd dust storm all day; could see but short distance.

PRIMGHAR—*O. R. Bailey.* On the 25th a very heavy wind and rain; much damage done to small buildings and windmills.

RED OAK—*J. S. Cole.* On the 21st, 22nd and 25th wind and dust storms; wind very high south-west afternoon of 25th.

RIDGEWAY—*Arthur Betts.* The most sunny April on record —317 hours. Dandelions in bloom on the 15th; awful gales on 11th and 22nd, breaking down large trees and blackening an almost cloudless sky with dust; at end of month grass and grain were growing finely.

STORM LAKE—*Prof. M L. Fuller.* Dust storm on 11th and 22nd, the latter very severe. On the 25th violent gale, damaged light buildings.

WASHTA—*H. D. Fetter.* Plum trees partly in bloom on the 30th; terrible gale with rain of 1.50 inches on the 25th.

WEST BEND—*Ph Dorweiler.* Many windmills wrecked by wind on the 25th and 26th.

ERRATA IN MARCH REVIEW.

CEDAR RAPIDS—March. Total precipitation recorded, 1.75 inches on pages 8 and 12, should have been 1.55 inches.

FAIRFIELD—March. Total precipitation recorded, 1.33 on pages 9 and 12, should have been 1 42 inches.

FT MADISON.—March. Total precipitation recorded, 2.67 inches on pages 9 and 12, should have been 2.57 inches.

LARCHWOOD.—March. Total precipitation recorded, 1.81 inches on pages 8 and 12 should have been 1.14 inches.

WEST BRANCH—March. Total precipitation recorded. 1.93 inches on pages 8 and 13, should have been omitted.

WAVERLY.—March. Mean minimum temperature recorded 28.0 degrees on page 11, should have been 28.9 degrees. Mean temperature recorded, 37 4 degrees on page 8, should have been 37.8 degrees.

RELATED REPORT.

SHELDON.—March. Mean temperature, 36.8°; highest 68° on the 25th; lowest, 6° on the 17th; greatest daily range, 44; total precipitation, .56 inch; greatest in 24 hours, .20 inch; total snowfall, 1 9 inches; prevailing direction, south. Number of clear days, 13; partly cloudy, 5; cloudy, 13; rainy, 11.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIII. MAY, 1902. No. 5.

IOWA CROP REPORT, JUNE 1, 1902.

NUMBER OF ACRES, AND AVERAGE CONDITION JUNE 1ST, OF THE STAPLE FARM CROPS.

Reports of county and township correspondents show the following results as to the number of acres and average condition on June 1st, of staple farm crops at the outset of the crop season of 1902:

CORN.—The total number of acres planted appears to be 9,208,980,—an increase of 521,500 acres, or about 6 per cent, as compared with the acreage of 1901. The average condition of corn in respect to stand and vigor of plant on June 1st was rated at 97 per cent, as against 90 per cent on the corresponding date last year. Due consideration should be given to the fact that since June 1st both the acreage and condition of corn have been materially lowered by the excessive rains in extensive areas of the state, causing damaging erosion of slopes and flooding of bottom lands. In view of this condition a revised estimate of the acreage of this important crop will be called for on July 1st.

WHEAT.—The acreage of winter wheat is shown to be only 48.449 acres, which is very nearly the amount returned by township assessors last year. The number of acres of spring wheat is placed at 1,152,985 acres, which is 14,695 acres above the area seeded in 1901. The condition of winter wheat is rated 96 per cent, and spring wheat 99 per cent.

OATS.—Acreage, 3,770,620 acres,—a decrease of 28,600 acres, compared with last year. The average condition of the crop is placed at 98 per cent, as against 89 per cent at same date last year.

BARLEY.—Number of acres, 594,670; decrease, 9,490, compared with last year. Condition, 100 per cent, as against 93 in 1901.

RYE.—Number of acres, 53,150,—a slight decrease; condition, 99 per cent.

FLAX.—Number of acres seeded, 94,760; decrease, as compared with last year, 9,380 acres. Condition of crops, 98 per cent, as against 89 per cent at corresponing date in 1901.

POTATOES.—Acres planted, 138,484,—an increase of 2,184 acres. Condition, 103 per cent, as against 95 per cent June 1, 1901.

MEADOWS.—Number of acres, 2,515,000; decrease since last year, 176,550 acres. Condition June 1st, 96 per cent, as against 90 per cent last year.

PASTURES.—Number of acres, 7,820,140 acres, a decrease of 287,300 acres, compared with last year.

CONDITION OF LIVE STOCK.—Cattle, 96 per cent; sheep, 97; hogs, 96; spring pig crop, 92; horses, 97; foals, 98.

CONDITION OF FRUIT.—Apples, 70 per cent; plums, 72; cherries, 70; pears, 70; peaches, 40; grapes, 72; strawberries, 80; raspberries; 71; blackberries, 67.

The correspondents estimate an average of about 7 per cent of last year's corn crop in the hands of the producers.

WEATHER AND CROP CONDITIONS.

May was warm and showery, affording a marked contrast to the preceding month. The average daily excess of temperature was about four degrees, and the average excess of rainfall was 1.42 inches. There was unusually great inequality in the distribution of rainfall, ranging from .87 of an inch at Washta, Cherokee county, to 18.04 inches at Grand Meadow, Clayton county. The area of the marked deficiency was limited to a small portion of the northwest district. The northern section received the heaviest rainfall, and the eastern half of that section the bulk of that amount. But the soil was very dry, and in excellent condition to absorb and retain a goodly portion of the copious moisture; and despite the interruption of frequent rainy days the work of planting corn progressed rapidly between showers, so that before the close of the month the corn area was practically planted. The seed was generally good, and a fair stand of corn was secured, with not more than the usual amount of replanting. Cultivation was begun early, and in portions of the state where the rainfall was about normal, or less than normal, the crop was most thoroughly cleaned and made most satisfactory progress. As a whole corn was rated in high condition on June 1st.

The copious rains, though not so favorable for corn planting and cultivating, were highly favorable to grass in pastures and meadows, and caused a heavy growth of all small grain crops. Except in portions of the northwest district spring wheat, oats and barley showed a tendency to rankness, causing some apprehension of damage by lodging and rust. The potato crop was generally very promising at close of the month, and garden truck was seldom in better condition at the corresponding date.

Secretary Greene, of the State Horticultural Society, issued for June 1st the following summary as to condition of fruit: Apples, 65 per cent; American plums, 51; cherries, 40; currants, 70; grapes, 70; red raspberries, 42; black raspberries, 57; blackberries, 47; strawberries, 63 per cent.

ERRATA IN APRIL REVIEW.

CENTERVILLE.—Mean temperature recorded 51.6 degrees on page 8, should have been 51.5 degrees.

STUART.—Mean temperature recorded 50.2 degrees on page 7, should have been 49.2 degrees.

PLOVER.—Minimum temperature recorded 55 degrees on the 22d, on page 10, should have been 35 degrees.

THE NEW AGRICULTURE.

From an interview with James Wilson, secretary of agriculture, at Columbia, Mo.:

"Agriculture is in its infancy. We have not yet begun. It is a new subject; so new, in fact, that its possibilities cannot now be comprehended. It is a vast field, and only the smallest part of it has yet been covered. It is true that agriculture has already developed rapidly, and the influences of the industry are great and far reaching, but the idea I wish to convey is that so little has yet been accomplished, in comparison with what may be done, that even those familiar with the subject will find it difficult to fully comprehend the full importance and meaning of the new agriculture. The government is devoting special attention to the subject, and at present there are agricultural experiment stations in every state in the Union.

"New institutions for the advancement of the study of husbandry are being established. While there are many agricultural colleges in the country that are doing great work for the advancement of scientific husbandry, by giving the farmers an opportunity to educate their sons in the science of agriculture, it is to be regretted that it is not given more attention by state universities. The study of agriculture should be a part of the university training and should be taken up on entering school and continued until graduation. The earlier the study is taken up the better. It should not only be taught in the universities, but in the minor schools and colleges. I believe that even as a primary study it would be productive of much good, and, in fact, the instruction should begin with the very beginning of a child's education.

"There are specialists of many kinds in the various departments of agriculture, but in none of them is so much special study required as in agricultural colleges. The study of husbandry covers such a broad field that a student, in order to be qualified for becoming himself an instructor, must be a specialist in many ways. The study of chemistry and its relations to the composition of the soil is by itself a vast field for special study. I am much pleased with the recent work of many of the agricultural colleges, but many of them can doubtless be much improved."

MAGNETIC DISTURBANCE CAUSED BY THE EXPLOSION OF MONT PELEE.

(From the National Geographic Magazine.)

In explosive violence the eruption of Mont Pelee was to Krakatoa but the bursting of a bubble. Krakatoa was heard distinctly 3,000 miles away; the sound of Mont Pelee penetrated only two hundred. Krakatoa sent its dust round the globe; the dust of Mont Pelee was carried less than 300 miles. But in one very important respect, the electrical phenomena accompanying the explosion, Mont Pelee apparently surpassed Krakatoa; for the first time in the history of volcanic eruptions, so powerful electro-magnetic waves were shot out by a bursting volcano that magnetic needles 2,000 and 5,500 miles away were disturbed for many hours.

Mr. O. H. Tittmann, superintendent of the United States coast and geodetic survey, reports that the magnetic needles at the coast survey magnetic observatories at Cheltenham, Maryland, at Baldwin, Kansas, and also in the Hawaiian Islands, were disturbed on the morning of May 8th at the time of the volcanic explosion at Pelee. The needles are very delicately suspended, and register automatically by photographic means the minutest variation in the direction and intensity of the earth's magnetic force. The magnetic disturbance began at the Cheltenham observatory at a time corresponding to 7:53, St. Pierre local mean time, and at the Baldwin observatory 7:55, St. Pierre time. Reports from St. Pierre state that the explosion of Mont Pelee occurred a few minutes before 8 o'clock in the morning. A clock in St. Pierre was stopped at 7:50 A. M. The magnetic disturbance was thus almost instantaneously recorded at the survey observatories. The needles were disturbed again on May 20th, at the time of the second eruption of the mountain.

The disturbance of the magnetic needles was plainly due to magnetic effects, and was in no sense caused by purely mechanical vibrations. It is the first instance that magnetic effects caused by the eruption of distant volcanoes have ever been recorded at magnetic observatories. Mechanical vibrations of magnetic needles caused by earthquakes have been previously noted. For instance, the Guatemalan earthquake on April 18, 1902, caused a distinct mechanical vibration of the magnetic needles for at least one-half an hour, but no magnetic disturbance was registered. The distinct magnetic effect of the morning of May 8th pulled the magnetic needles aside from their usual direction for many hours.

Dr. L. A. Bauer, head of the magnetic work of the survey, has not yet received information from the observatory at Sitka whether any magnetic disturbance was registered at this point at the same time, nor has he received information from foreign observatories. Until such information is received, of course we cannot state definitely that the remarkable magnetic disturbances registered on the mornings of May 8th and of May 20th, at Cheltenham and Baldwin, were due to the eruptions in the West Indies, but the very remarkable coincidence in time makes this conclusion probable.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure for May, 29.94 inches; highest observed, 30.36 inches, at Dubuque, on the 9th; lowest, 29.33 inches, at Sioux City, on the 19th; range for the state, 1.03 inches.

TEMPERATURE.—The mean temperature for the state, as shown by records of 107 stations, was 63.8 degrees, which is about 4.1 degrees above the normal for May. The highest monthly mean was 67.8 degrees, at Keosauqua, and the lowest 59 0 degrees, at New Hampton. The means by sections were as follows: Northern section, 61.8 degrees; central section, 64.0 degrees; southern section, 65 6 degrees. The highest temperature reported was 97 degrees at Sigourney, on the 20th; lowest, 25 degrees, at Cresco, on the 10th. The average monthly maximum was 88.7 degrees; average monthly minimum, 38.4 degrees. The greatest daily range was 50 degrees, at Pacific Junction; average of greatest daily ranges, 37.7 degrees.

PRECIPITATION.—The average precipitation for the state, as shown by records of 127 stations, was 5.39 inches, or 1.42 inches above normal. The averages by sections were as follows: Northern section, 6.69 inches; Central section, 5 02 inches; Southern section, 4.46 inches. The largest amount reported was 18.04 inches, at Grand Meadow, Clayton county; least amount reported, .87 inch at Washta. The greatest daily rainfall reported was 5.45 inches, at Grand Meadow, on the 18th. The average number of days on which .01 inch or more of rain fell was 13.

WIND AND WEATHER.—The prevailing direction of the wind was southeast; highest velocity reported, 50 miles per hour, from the south, at Sioux City, on the 20th. The average number of clear days was 10; partly cloudy, 12; cloudy, 9.

OBSERVERS' NOTES.

ALTA—*David E. Hadden.* May was wet and cloudy, with cool nights; light frost noted in low places on morning of 27th; all crops were looking fine at close of month; plums and cherries were injured by heavy rains while in bloom, and yield will be light.

ATLANTIC—*J. W. Love.* Two brilliant "moon dogs" at 1 A. M on 19th. There was not a clear day in the entire month; light frosts on 27th and 28th.

AUDUBON—*Frank Mott.* The storm of the 19th was quite destructive. On the 17th a small tornado passed about ten miles southwest of this place. Clipping from the Audubon *Republican* gives details of this storm It was from 100 to 300 yards wide and about three miles in length of track. Property destroyed estimated at $10,000, and happily no lives were lost. The storm appeared about 5:30 P. M. as a whirlwind of dust. There were two whirling columns visible at the outset, but they soon merged forces and swept everything in their limited range. It was a typical "twister," though small and not long-lived. Everything in its pathway was left plastered with mud.

BONAPARTE—*B. R Vale.* A good month for corn culture and growth of small grain; rains came too late to make good meadows; pastures fair.

BRITT—*Geo. P. Hardwick.* The storm periods were from 1st to 6th, and from 17th to 24th. Excessive rains occurred in the county. On 2nd hail fell sufficient to whiten the ground. On 24th a small tornado was observed in southwest part of county; amount of damage was slight.

CHESTER—*C. H. Meredith.* On the 4th, thunderstorm with heavy rain and much damage to crops On 17th cloudburst one mile north of station, causing high water, and much stock was drowned. Total at station for May, 14.62 inches.

DECORAH. The records show for the month 11.63 inches of rainfall, but these figures do not tell the full story of disaster by flood, caused by a sudden downpour amounting to 3.35 inches, on May 21st. Prior to that date the total was far above normal. The soil was saturated, so that the heavy rain of the 21st was all poured into the streams and carried swiftly away. In Decorah the depression known as Dry Run became a raging torrent, causing higher water and greater damage to property than was ever known before in the history of that city. Two lives were lost, adding a tragic element to the sudden and fearful visitation. The damage to property has not been estimated, but it must have amounted to many tens of thousands, judging by the reports published in Decorah *Republican*, of May 22nd.

FOREST CITY—*J. A. Peters.* Plum trees in bloom on the 5th; small grain and corn looking well at close of month.

GRUNDY CENTER—*Ed S. King.* The best kind of growing weather for crops; meadows look extra fine in spite of a dry April.

INWOOD—*Ch. Erickson, Jr.*—Weather generally good for crops; some need of rain the last few days.

JEFFERSON—*Isaac Young.* On evening of the 20th the edge of a severe hailstorm passed over Rippey; hailstones as large as hen's eggs fell in great numbers, causing some loss of windows.

LANSING—*Jacob Ackerman.* On the 21st the heaviest flood visited this section that has been known in many years.

LARRABEE—*H. B. Strever.* At end of month vegetation was suffering for rain; light frost on the 27th.

LEON—*Millard F. Stookey.* On Thursday evening, May 1st, between 4:30 and 5:00 o'clock, a tornado formed south and west of Van Wert, and moved into Clarke county; much property was destroyed and several persons were injured.

OLIN—*Nathan Potter.* A very favorable month for all farm work; just rain enough to put everything at its best.

OSAGE—*G. D. Pattengill.* The rainfall (9.58 inches) has been more than double the normal for May at this station. A record of rainfall in this county, kept continuously since February, 1880, shows but one month that exceeded the present, namely, September, 1881, when a fall of 11.01 inches was recorded.

RIDGEWAY—*Arthur Betts.* Temperature average 1.5° above normal. Waterfall excessive; 279 hours of sunshine; thunderstorms on 16 days; last frost on April 24th; violets May 2d.

WASHTA—*H. L. Felter.* A very dry May in south part of Cherokee county. Total rainfall at this station 0.87 inch.

WEST BEND—*Ph. Dorweiler.* Month favorable for farmers; corn all planted and mostly coming up. On the 3rd and 4th severe windstorms blew over some barns and windmills.

GRAND MEADOW—*F. L. Williams.* Rainfall for the month at this station 18.04 inches. Of that amount 5.45 inches fell on the 18th, the heaviest ever recorded for a single day at this point. About 7:30 P. M, on the 3d a small "cyclone" passed over this section, blowing down fences, roofs and apple trees. Much damage has been done by floods by the greatest rainfall ever known in a single month.

BELATED REPORTS.

WHITTEN—April. Mean temperature, 46.8 degrees; highest, 89, on the 21st; lowest, 18, on the 7th; greatest daily range, 36; total precipitation, 1.93 inches; greatest in 24 hours, 1.66, on the 25th; total snowfall, trace; prevailing direction, northwest. Number of clear days 14, partly cloudy 9, cloudy 7, rainy 8.

CRESCO—December. Mean temperature, 15.4 degrees; highest, 40 degrees, on the 1st; lowest, 29 degrees, on the 14th; greatest daily range, 40; prevailing direction, northwest; number of clear days 15, partly cloudy 4, cloudy 12.

CENTRAL STATION, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECAST OFFICIAL,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

ALLIED PRINTING TRADES UNION LABEL COUNCIL DES MOINES

DES MOINES:
BERNARD MURPHY, STATE PRINTER
1902.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE WENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

J. C. FRAZIER, PRESIDENT, Bloomfield.
W. W. MORROW, VICE-PRESIDENT, Afton.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
WM. M. BEARDSHEAR, President Iowa State College.
B. P. NORTON, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—C. E. CAMERON, Alta.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Meteorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve
Algona	C. D. Pettibone
Alta	D. E. Hadden
Alta (near)	W. J. Minard
Amana	Conrad Schadt
Ames	Exp. Station
Atlantic	J. W. Love
Audubon	Frank Mott
Baxter	W. T. Thorp
Bedford	E. E. Healy
Belknap	A. W. Rankin
Belle Plaine	S. P. Vandike
Bonaparte	Hon. B. R. Vale
Britt	G. P. Hardwick
Buckingham (Traer P. O.)	Dr. W. A. Daniel
Burlington	I. S. Shontz
Bussey	Agent C. B. & Q. Ry
Carroll	Moses Simon
Carson	Agent C. B. & Q. Ry
Cedar Rapids	Electric Light & Power Co
Centerville (near)	Jas. S. Hamilton
Chariton	Hon. S. H. Mallory
Charles City	Chas. O. Schmidt
Chester	C. H. Meredith
Clarinda	A. S. Van Sandt
Clear Lake	John Cobb
Clinton	Luke Roberts
College Springs	A. M. Finley
Columbus Junction	Prof. H. E. Simpson
Corning	Jerome Smith
Council Bluffs	Agent C. R. I. & P. Ry
Cresco	Anthony Marshall
Cumberland	Agent C. B. & Q. Ry
Danville	Agent C. B. & Q. Ry
Davenport	*J. M. Sherier
Delaware	Wm Ball
Decorah	F. H. Baker
Denison	Prof. W. C. Van Ness
Des Moines	*Geo. M. Chappel
De Soto	R. D. Minard
Dows	A. C. Fuller
Dubuque	*E. H Bowie
Earlham, R. F. D	Geo. Phillips
Eldon	T. Madden
Elkader	Chas. Reinecke
Emerson	Agent C. B. & Q. Ry
Estherville	Leslie Littell
Fairfield	J. C. Blackford
Fayette	R. Z. Latimer
Fort Dodge	C. R. I. & P. Agent
Ft. Madison	Miss L. A. McCready
Fonda	H. P. Barron
Forest City	J. A. Peters
Galva	D. W. Farnsworth
Gilman	Jas. L. Wylie
Gladbrook	Agent C. G. W. Ry
Grand Meadow (Postville P. O.)	F. L. Williams
Greene	J. L. Cole
Greenfield	J. G. Culver
Grinnell	Prof. S. J. Buck
Grinnell (near)	A. O. Price
Grundy Center	Ed King
Guthrie Center	W. F. Braun
Hampton	E. C. Grenelle
Harlan	C. A. Reynolds
Hazleton	G M. Miller
Hopeville	M. T. Ashley
Humboldt	H. S. Wells
Independence	E. F. Wulfke
Indianola	Prof. L. Tilton
Inwood	Chris. Erickson
Iowa City	Prof. A. A. Veblen
Iowa Falls	J. B. Parmelee
Jefferson	Isaac Young
Keokuk	*Fred. Z. Gosewisch
Keosauqua	Prof. J. H. Landes
Knoxville	Casey & Belville
Lacona	Agent C. B. & Q. Ry
Lansing	Jacob Ackerman
Larchwood	Ralph Twamley
Larrabee	H. B. Strever
Lenox	J. L. Hurley
Le Mars	Dr. T. E. Cole
Leon	Millard F. Stookey
Logan	Mrs. M. B. Stern
Maquoketa	Frank Keeney
Marshalltown	Branch S. Jones
Monticello	C. E. Heisey
Mooar	Thos. T. Brady
Mount Vernon	Rev. J. W. Hubbard
Mt. Ayr	A. F. Beard
Mt. Pleasant	Dr. Frank T. Stevens
Murray	Agent C. B. & Q. Ry
New Hampton	R. H. Gurley
Newton	Hon. J. P. Beatty
Northwood	Dr. J. H. Darey
Odebolt	E. Starner
Ogden	E. Sayre
Olin	Hon. Nathan Potter

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIII. JUNE, 1902. No. 6.

SEASONABLE NOTES.

J. S. Trigg, of the Rockford Register, says: "The year 1857 was so wet all through the West that it came about that corn was worth $1.00 per bushel, and hay only $1 50 per ton."

* * *

Observation of climate and crops in Iowa, extending over a period of a third of a century, leads to the conclusion that greater damage has been wrought by excess of rainfall in the critical period of crop growth and the harvest season, than from the occasional visitations of severe drouths in this favored portion of the Mississippi valley. This state as a whole never experienced a regular famine-breeding drouth, or anything near a total failure of crops. The most destructive drouth came in 1894, but the total cereal output of that season amounted to 256,000,000 bushels, and the total value of soil products was over $137,000,000. The grain and forage was very superior in quality, and there was no distress caused by shortage. On the other hand our very wet seasons bring a great bulk of vegetation, generally somewhat deficient in quality; and if excessive rains continue through the harvest season the aggregate of loss becomes almost incalculable. It is impossible to ripen the cereal crops and the hay crop and save them in good order without a good long period of dry weather and sunshine in midsummer and the early fall. The best crops in Iowa have been grown and secured in seasons when the rainfall was about or a little below the normal in the period of ripening and harvesting. There is a measure of truth in the old proverb: "Farmers are scared to death in very dry seasons and starved to death in very wet seasons." The golden mean between the extremes is what we should be thankful for, and that is what we have in Iowa oftener than seasons of great ex cess or deficiency.

* * *

Conditions have not been exactly favorable this season for renewed discussion of the old question as to change of climate, the effects of forests on rainfall, and the probable retrogression of this region towards the desert type. It will come up again, however, when the pastures begin to get short and the hot winds blow,—not this year but some other year.

* * *

Dry years conserve fertility, while excessively wet seasons leach the soil and carry away the best elements of plant growth. On this point J. S. Trigg says in his farm notes: "The greatest loss to those sections of the Mississippi valley which have been visited with such tremendous floods this season has not been in the crops or bridges destroyed, but rather in the loss in soil fertility by erosion over millions of acres of choice farm land, every farmer contributing not a little of the best part of his farm to the rushing waters which carried it off in solution to the ocean."

In a season like the present the farmers who have silos are in clover,—or rather the clover may be saved in good order in the silo whether wet or dry. When the harvest time is wet it is easier to can the fodder than to cure it. For all seasons, in fact, the silo is a valuable adjunct to a farm where stock must be fed during nearly half the year.

* * *

No, there are no reasonable grounds for the conclusion that the climate is changing, and that all our summers are going to be very wet in the years to come. We shall have enough good old-fashioned dry seasons to keep the soil in its place and prevent washing all our fertility away to the Gulf.

ELECTRIC SHOCKS.

(American Manufacturer.)

Three papers on this subject, recently read before the Institution of Electrical Engineers, should, at the present juncture be read with general interest. The first details quite a number of experiments with shocks at 500 volts pressure, and in that connection it is shown that alternating currents are many times more painful than direct currents, the sensation, however, being of a different nature. The dangers of shocks at that pressure have been largely exaggerated and misunderstood by laymen. The writer points out that dry wood and dry boots, without large nails, offer so strong a resistance to electric current that it is quite safe to touch an overhead trolley wire whilst standing on a dry tram-car, or even when standing on the ground or on the rails—this he states from his own personal experience However, in wet weather the case is largely altered, but even the boots must be very thoroughly saturated to permit enough current to pass to produce a severe shock. With third-rail electric railways a like immunity exists, as, with dry and sound boots, scarcely anyone can feel a shock whilst standing with one foot on the live and the other on a track rail. A shock is experienced with damp or wet boots, but neither the sensation nor the degree of wetness of the boots can be measured with any accuracy. It is further demonstrated that the conditions under which 500 volts shocks cause death are very exceptional indeed. The author of the second paper, in dealing with cases of shock received up to 2,000 volts pressure, arrives at the conclusion that in spite of recent agitation, there is really nothing more dangerous in the alternating system than in the direct current. It is in effect solely a question of voltage, and of the conditions being favorable. As a great number of conditions are required to be favorable, it would appear to be really difficult to get killed, even with a high voltage. Practically speaking, in fact, the chances of danger are no greater than in other occupations.

IOWA CROP REPORT JULY 1, 1902.

CONDITION OF STAPLE FARM CROPS JULY 1ST, AND REVISED ESTIMATE OF THE ACREAGE OF CORN.

Reports received from county and township correspondents of the Iowa Weather and Crop Service, July 1st, make a better showing of the average condition of the staple crops than has been anticipated, in view of the heavy and frequent storms, low temperature and cloudy weather prevalent the larger part of June. The reports bear evidence of being made on conservative lines; and they are made by men who have had many years experience as crops reporters.

CONDITION OF CROPS JULY 1st. Corn 92 per cent, a decline of 5 points since June 1st: winter wheat, 96; spring wheat, 97; oats, 95; rye, 98; barley, 97; flax, 99; potatoes, 108; hay crop, 99; pastures, 107; apples, 65; plums, 50; grapes, 65.

At the corresponding date in 1901, the averages were as follows: Corn, 90 per cent; winter wheat, 98; spring wheat, 93. oats, 85; rye, 95; flax, 94; barley, 93; potatoes, 92; hay crop, 76; pastures, 80; apples 51; plums, 70; grapes, 90.

REVISED ESTIMATE OF CORN ACREAGE.

The blanks issued for the July report called for a revised estimate of the acreage of corn, compared with the number of acres harvested last year; and reporters were requested to make due allowance for reduction of acreage as the result of excessive storms and floods since June 1st. The tabulated reports show a material reduction, the revised aggregate for the state being 8,693,900 acres, which amount is 504,780 acres less than the estimates of the previous month. These figures as given by counties will stand as the basis of figures as to the final output of the corn crop for the current season.

WEATHER AND CROP CONDITIONS.

June, 1902, was an abnormal month in respect to temperature, amount of rainfall and excess of cloudiness. The daily average temperature for the state was about 5 degrees below normal, and the daily average of the last decade was about 11 degrees colder than the first decade of the month,—a reversal of usual conditions. At the central station the records show only 49 per cent of sunshine for the month, and about 75 per cent of mean relative humidity. On the mornings of the 21st and 22d frost was observed at numerous stations, with some damaging results in the N. W. district. The average rainfall was 7.16 inches, which is 2.90 inches above normal. The heaviest amounts were recorded in the central district, and the lowest in several counties of the N. W. district. One striking feature was the fact that showers fell in some portion of the state every day in the month. The average number of clear days for all stations of record was only 8, as against an average of 22 cloudy or part cloudy days. As a result of these abnormal weather conditions farming operations were greatly retarded, and in the wettest portions field work was wholly impracticable except at short intervals between showers. On the river bottoms in the central counties many thousand acres of corn, small grain and meadows were flooded and the crops practically ruined. But despite all the drawbacks fully three fourths of the corn acreage had been fairly well cultivated, and the average condition of early planted fields was promising at the close of the month. The oats crop grew unusually rank on rich lands in all sections where the rainfall was at or above normal, and there was a tendency to rust. At the close of the month oats and spring wheat were filling well, and were standing up remarkably well though bulky in straw. Winter wheat, rye and clover harvest was begun, but the wet weather was unfavorable for securing hay and grain. Potatoes, pastures and garden vegetables made great advancement. The wet weather was very favorable for new seeding of grasses.

SEVERE JUNE STORMS.

Numerous local windstorms of considerable severity occurred during the month, causing an unusually large aggregate of damage to buildings, windmills, and trees. There were no reports indicating the development of a tornado at any place during the month, or of the loss of human life.

The most widespread and destructive storm of the month occurred in the early morning of the 25th, from 1 to 3 o'clock. It originated in eastern South Dakota, and expended the greater part of its force in that state, though a large measure of damage was wrought in the northwestern counties of Iowa. The following items are copied and condensed from the Sioux City Journal of June 26th: "Reports show the path of the storm covered a space about fifty miles wide and extended from Pierre, S. D., to a point near LeMars, Iowa. Within its track there is not a community that has not suffered a property loss. The storm was in the nature of a fierce tropical gale, which swept across the stricken country with unabated fury for over an hour. It varied in velocity from seventy to eighty miles an hour, and at times reached a maximum velocity of ninety miles an hour. Store fronts and plate glass windows were unable to withstand the strain, and houses were unroofed, barns and corn cribs overturned, and throughout the entire section there is not a windmill standing.

The storm struck Sioux Center, Sioux county, about 1:15 a. m. and raged about two hours. A large amount of damage resulted in that place and vicinity. Among the more valuable buildings destroyed were the Dutch Reformed Church, a large hardware store, a livery barn, and a grain elevator containing 2,000 bushels of grain. In that vicinity three other churches were demolished. At Hawarden and vicinity the storm was very heavy and the damage amounted to thousands of dollars. Rock Valley, Sioux county, and Inwood, Lyon county, were in the pathway of the storm and suffered considerable damage. The force of the storm was largely spent when it reached LeMars, but in Plymouth county at the north it was severe and destructive.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—The mean pressure for June was 29.90 inches; highest observed, 20.27 inches, at Sioux City and Des Moines on 21st and 22d; lowest observed, 29.36 inches at Davenport on the 25th; range for the state, .91 of an inch.

TEMPERATURE.—The month was unseasonably cool, especially in the last half. The daily mean temperature, as shown by records of 113 stations, was 65.2 degrees, which is 4.8 degrees below the June normal. The means by sections were as follows: Northern section, 64.0°; Central section, 65.4°; Southern section, 66 3°. The highest monthly mean was 69.2° at De Soto; lowest, 60.2° at Cresco. The highest temperature reported was 97° at Keosauqua on the 10th; lowest, 32° at Sibley on the 22d. The average monthly maximum was 89.9°; average monthly minimum, 38.4°. The greatest daily range was 42° at Larrabee. Average of greatest daily ranges, 33°.

PRECIPITATION.—The average precipitation for the state, as shown by records of 120 stations was 7.16 inches, which is 2.90 inches above normal. The averages by sections were as follows: Northern section, 5.54 inches; Central section, 8 11 inches; Southern section, 7.83 inches. The largest amount reported was 16.04 inches at Grundy Center; least amount reported, 1.46 inches at Sheldon. The greatest daily rainfall reported was 6.60 inches at Buckingham on the 5th. The average number of days on which .01 inch or more of rainfall was reported, 14.

WIND AND WEATHER.—Prevailing direction of wind, southeast and northwest; highest velocity reported, 48 miles per hour from the west at Sioux City, on the 15th. The average number of clear days was 8; partly cloudy, 11; cloudy, 11.

OBSERVERS' NOTES.

ALGONA—*C. D. Pettibone.* Great growth of grass and small grain during the month.

ALTA—*David E. Hadden.* Wind of almost hurricane force occurred shortly after midnight on the morning of the 25th,

about four and one-half to five miles north of Alta, breaking trees, moving barns off foundations, etc. June, 1902, was unusually cool, wet and cloudy. Light frost in low places on 21st.

ATLANTIC—*J. W. Love*. Severe electrical storm, with .70 of an inch of rain in fifteen minutes, on the 21st. Frost on 21st, but did not seem to do any damage. Last half month cool and wet.

BELKNAP—*A. W. Rankin*. Crops are standing excessive rain remarkably well; oats going down some, but with good weather a fair crop is assured.

BONAPARTE—*B. R. Vale*. Precipitation for month 9.94 inches, and 16.78 inches since April 20. August, 1898, gave us 10.55 inches—the only month exceeding this in last twelve years. A very cool, cloudy and wet month.

BRITT—*Geo. P. Hardwick*. Cool and wet—unfavorable for cultivation of corn; pastures and potatoes good; short fruit crop except strawberries; this place has been comparatively free from wind storms.

CENTERVILLE—*Jas. S. Hamilton*. Rain, 6.97. The month brought no severe storms of wind or rain.

CLARINDA—*A. S. Van Sandt*. Rainfall on the 5th, from 5 P. M. to 6:35 P. M., 4.20 inches, causing much damage to sidewalks and bridges in town; the excessive rain extended eight miles north, fourteen miles south, six miles east and fourteen miles west.

CLINTON—*Dr. Luke Roberts*. June, 1902, broke all recorded amounts of rainfall for the last twenty-four years. 9.90 inches of rainfall in this locality in any one month is considered extraordinary. The number of storm days was also excessive, there being 17. This was equaled once in June during the above mentioned period, and that was in 1893, when there was a precipitation of 9.30 inches of water. A normal amount of rainfall for June in this locality is 4.67 inches, so that the last June record was in excess 5.23 inches, which might be considered a very liberal amount for any full month.

There were five storm days during the month which brought over one inch of rain each. With all this excess of waterfall we ought to feel grateful that it was spread out over so many days that it would have time to find its way into the soil and subsoil, for it was needed, instead of giving a raging flood as has been the case in many parts of the country. We read of large extent of territory being deluged, devastating whole farms and districts, so that entire crops were totally destroyed. The maximum velocity of the wind was 13 miles an hour, being much below normal.

9.90 inches of rainfall is over one-fourth of an average yearly rainfall, that being about 34 inches. The total amount of rainfall for May and June was 15 94 inches, crowding hard onto a six months' normal precipitation, This, however, has been exceeded once; in 1892 the total rainfall for May and June was 17.80 inches, being fully up to a half year normal

The maximum temperature for the month was 94 degrees, being 1.9 degrees below normal, and the minimum temperature was 40 degrees, or 2.8 degrees below normal, and occurred on the 28th. The mean temperature for the month was 66.1 degrees, or 3.7 degrees below normal, and the coldest June during the last twenty-four years. The mean temperature of the first decade was 68 5 degrees, second decade 70 degrees and third decade 59.7 degrees.

This shows that the last of the month was colder than the first. I cannot recall a year when the temperature averaged as cold during the summer solstice as in 1902. The warmest spell of the month was from the 10th to the 15th inclusive, the average being 74 degrees.

EARLHAM—*George Phillips*. An unusually cold and wet June. Frost the 21st and 22d, but no damage was done; there were thirteen thunder-storms, and a brilliant electrical display the night of the 25th.

FOREST CITY—*J. A. Peters*. Light frost on 22d did some damage to corn on low land; very wet and cold for corn.

GRAND MEADOW—*F. L. Williams*. Month cold and wet, with little sunshine; corn very small and poor color; grain heavy and lodging badly.

GREENFIELD—*J. G. Culver*. Oats on rich lands lodging; no clover saved yet; corn in fair condition but beginning to yellow.

GRINNELL—*A. O. Price*. And the rains descended more or less for eighteen days; moist for corn, but fine for grass and potatoes.

GRUNDY CENTER—*E. S. King*. A very wet month with a total of 16.14 inches. Rain fell on twenty-four days; on the 6th and 12th very heavy downpours did much damage; small grain heavy and rusting; corn yellow and weedy; good grass crop.

GUTHRIE CENTER—*W. F. Braun*. Too much rain for small grain and cultivation of corn; oats heavy and wheat rusting badly.

HUMBOLDT—*H. S. Wells*. Rain 8 00 inches and well distributed; only damage has been on low ground; corn improving slowly; other grain and grass good.

INWOOD—*Chris. Erickson*. The heavy windstorm of the 25th did great damage to windmills, barns and trees; corn shows effects of heavy frost on 20th and wind the 25th.

LARRABEE—*H. B. Strever*. Light frost on morning of the 21st. A severe windstorm occurred 2 to 3 A. M. on 25th; a few houses were partly unroofed, several barns were blown off their foundations and windmills generally blown down.

LOGAN—*Mrs. M. B. Stern*. The month has been remarkable, not so much for the amount of rain as for the cloudy weather and number of showery days; no bad storms.

MONTICELLO—*C. E. Heisey*. Continued rains made corn yellow on low ground; small grain looking fine; oats lodged in many places.

OLIN—*Nathan Potter*. Cloudy weather, with frequent thunder showers and low temperature, especially last half of the month,

PACIFIC JUNCTION—*H. H. McCartney*. Electric disturbances remarkably light in this vicinity so far this season.

RIDGWAY—*Arthur Betts*. Coolest June on record here, almost like May; 267 hours of sunshine; on many days the solar rays were apparently devoid of heat; rain on eighteen dates; much of the corn looks yellow.

SIBLEY—*H. G. Doolittle*. Frost on 21st on low ground; also on 22d, injuring corn and gardens seriously.

SIOUX CENTER—*J. de Ruyter*. Severe wind-storm at 1 A. M. on 25th; hundreds of barns were totally destroyed, but only a few dwellings; no loss of life. Loss in town, 20,000; crops damaged by storm; corn very backward

STOCKPORT—*C. L. Beswick*. Severe wind-storms on 10th and 11th unroofed buildings and damaged trees. It began raining on 27th and did not stop until morning of 30th.

SPIRIT LAKE—*W. C. Drummond*. On morning of the 21st, although the mercury indicated 38 degrees, in some localities it froze corn and garden vegetables. Last ten days cold and disagreeable.

TIPTON—*George W. Barclay*. June was noted for severe thunder-storms, the number of cloudy and rainy days and low average minimum temperature. Rainfall for four months, 19 05 inches.

VILLISCA—*C. E. Matteson*. Small grain damaged by excessive rains; corn needs sunshine and warmth.

WHITTEN—*Dr. Frank P. Butler*. Iowa river the highest it has been for thirty years; could go from Mill to Union in a boat on the 12th.

1902

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

J. C. FRAZIER, PRESIDENT, Bloomfield.
W. W. MORROW, VICE-PRESIDENT, Afton.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
WM. M. BEARDSHEAR, President Iowa State College.
B. P. NORTON, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—C. E. CAMERON, Alta.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Meteorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve
Algona	C. D. Pettibone
Allerton	Ed. T Burns
Alta	D. E. Hadden
Alta (near)	W. J. Minard
Amana	Conrad Schadt
Ames	Exp. Station
Atlantic	J. W. Love
Audubon	Frank Mott
Baxter	W. T. Thorp
Bedford	E. E Healy
Belknap	A. W. Rankin
Belle Plaine	S. P. Vandike
Bonaparte	Hon. B. R. Vale
Britt	G. P. Hardwick
Buckingham (Traer P. O)	Dr. W. A. Daniel
Burlington	I. S. Shontz
Bussey	Agent C. B. & Q. Ry
Carroll	Moses Simon
Carson	Agent C. B. & Q. Ry
Cedar Rapids	Electric Light & Power Co
Centerville (near)	Jas. S. Hamilton
Chariton	Hon. S. H. Mallory
Charles City	Chas. O. Schmidt
Chester	C. H. Meredith
Clarinda	A. S. Van Sandt
Clear Lake	John Cobb
Clinton	Luke Roberts
College Springs	A. M. Finley
Columbus Junction	Prof. H. E. Simpson
Corning	Jerome Smith
Council Bluffs	Agent C. R. I. & P. Ry
Cresco	Anthony Marshall
Cumberland	Agent C. B. & Q. Ry
Danville	Agent C. B. & Q. Ry
Davenport	*J. M. Sherier
Delaware	Wm Ball
Decorah	F. H. Baker
Denison	Prof. W. C. Van Ness
Des Moines	*Geo. M. Chappel
De Soto	R. D. Minard
Dows	A. C. Fuller
Dubuque	*E. H Bowie
Earlham, R. F. D	Geo. Phillips
Eldon	T. Madden
Elkader	Chas. Reinecke
Emerson	Agent C. B. & Q. Ry
Estherville	Alvero O Salisbury
Fairfield	J C. Blackford
Fayette	R. Z. Latimer
Fort Dodge	C. R. I. & P. Agent
Ft. Madison	Miss L. A. McCready
Fonda	H. P. Barron
Forest City	J. A. Peters
Galva	D. W. Farnsworth

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIII. JULY, 1902. No. 7.

IOWA CROP REPORT, AUGUST 1, 1902.

Reports of crop correspondents of the Iowa weather and crop service show the following average condition of the staple farm crops, August 1st.

Corn, 93 per cent; spring wheat, 84; oats, 83; barley, 89; flax, 91; hay, 100; potatoes, 107; apples, 66; plums, 51.

In 1901 at the corresponding date, the averages were as follows: Corn, 55 per cent; spring wheat, 84; oats, 75; barley, 83; flax, 74; hay, 70; potatoes, 34; apples, 35; plums 40.

WEATHER AND CROP CONDITIONS.

July 1902 was about normal as to temperature, the state average being about 73 degrees; but the month broke all July records in respect to high average amount and distribution of rainfall, the frequency of showers with heavy downpours and severe windstorms, and the wide extent of damaging floods from overflow of all the principal streams of the state. The average precipitation was 8.67 inches, which is about 5 inches above normal, and the reports of all stations of record show an excess. As in the preceding month of June, the records show a measurable amount of rainfall every day during the month, at one or more stations. These adverse conditions greatly retarded the cultivation of late corn, and harvesting the matured crops of hay and small grain. The saturated grain fields were rendered too soft for operation of harvesting machinery. The heavy storms of rain and wind caused lodgment of oats, wheat, barley and grass to a much greater extent than was ever known in previous years, and this added greatly to the labor and difficulty in securing the heavy burdens of grain and hay. There has been, therefore, a much larger per centage of loss of acreage and damage to quality of these crops than was ever known in this state in recent years. But despite these unusual drawbacks, by strenuous labor between showers, the farmers of Iowa secured a large amount of hay in fair condition, and the small grain crops have been put in shock or stack with much less loss than seemed imminent during the prevalance of the heavy storms. Corn in upland fields that have been well tilled is in very promising condition, being bulky and heavily eared. Despite the unusually large loss of acreage, the total output for the state will be above the average of the past decade, if seasonable weather prevails in the balance of the season. Potatoes have exceeded all recent records. All kinds of garden truck have made heavy growth. Apples have suffered materially from windstorms, and the crop is below the average.

CLIMATE AND COMMERCE.

Figures compiled from the treasury bureau of statistics for the fiscal year ended June 30th, relative to the exports of breadstuffs, provisions and beef, afford a basis for measurement of the effects of adverse climatic conditions of the season of 1901 upon our foreign commerce. The drouth of last year was far-reaching in its effects, as shown by the marked reduction in the exportation of corn and other agricultural products from the principal ports. In corn and cornmeal there was a decrease amounting to 186,000,000 bushels as compared with the shipments of the preceding year. In oats and oatmeal there was a marked reduction. The reduction in value of the exports of breadstuffs, clearly traceable to the drouth, amounted to $75,000 000. In beef and beef cattle there was also a shortage amounting to $11,000,000 in the value of exports. The climatic conditions, by the reduction of our normally large surplus, materially affected our usually heavy balance of trade for the year.

SEASONABLE NOTES.

The following press dispatch, giving details of a fatal shock by lightning, illustrates the danger of contact with wires, rods, or iron windmills during the prevalence of thunderstorms:

CARROLL, July 18.—A daughter of Garrett Simon, living four miles east of Carroll, was killed by lightning during yesterday's storm. The young lady was at the well, over which there is a high windmill, when the storm came up. The storm was accompanied by a terrific electrical display. While the girl was watching the storm lightning struck the gearing of the windmill and followed down the wire which is used to throw the mill in and out of gear to a bolt in the framework about five feet from the ground. From the bolt the lightning shot out, striking the young lady in the head and killing her instantly. Her clothing caught fire, but was extinguished quickly by the rain, which had begun falling. The face was burned and blistered by the intense heat.

* * *

The sun, drawing its attendant planets, is journeying through space at the rate of eight to twelve miles a second. Its path is often supposed to be orbital, and to extend around the cluster of stars known as the pleiades in a period of millions of years. From observations on 280 stars, studying their approach or recession with the spectroscope, Prof. W. W. Campbell has placed the point towards which we are now heading in the constellation Hercules, nearly nineteen degrees south of Alpha Lyra or Vega.—*Ex.*

* * *

F. Rovessi, a French botanist, states that an abundant fruiting usually follows a year of drouth, and that a very wet season is followed by one of small fruit production. This is due in a large degree to the maturing of the branches which carry the floral buds, and in the ripening of these branches the water which they contain plays an important part. It is stated that branches arising directly from the trunk or occurring in the interior of the top contain a large amount of water, and as a result are poorly matured at the end of the growing season. These branches suffer severely on account of the winter's cold, and as a result many are destroyed, and the tree naturally pruned. It is claimed that the location of the flower-bearing

branches conforms to the same rule. They are most numerous on the slender branches in which the water conduction is limited, on account of the distance of transfer, and they are also most numerous if the branch assumes a vertical position, in which by the added action of gravity there is a diminution of water content. In this manner the form of the tree, as well as the location of the flower-bearing branches, is determined by conditions influencing the maturity of branches, and the maturing of branches, as well as the number of flowers and fruits, depends to a great degree upon the amount of water which the plant receives.

* * *

Editor Trigg, of the Rockford *Register*, says: "If the removal of the timber in the north country provoked the drouths of the past five years somebody must have set out a couple of trees up there this spring."

* * *

Don't shed tears on account of the weather, be it wet or dry. They add to the humidity in wet weather, and are too salty for irrigation of crops in a drouth.

* * *

It is reported that hailstones nearly three pounds in weight fell during a recent storm at Jessore, in Bengal. Stones of that sort generally fall in some other place—if at all.

* * *

The rainfall variations of the nineteenth century have been traced by Herr Hann from the monthly and yearly means of Padua, Klagenfurt and Milan. The rainfall of the driest year was from 42 to 62 per cent. of the general mean, and that of the wettest year was 151 to 152 per cent. There were 34 dry years and 29 wet years. A 35 year period, corresponding to that of Bruckner, seems to be shown, the wet years—as recorded since 1725—having been 1738, 1773, 1808, 1843, 1878, while the extremes of drouth were reached in 1753, 1788, 1823, 1859 and 1893.—*Exchange*.

* * *

While the recent hail in the vicinity of Denver did some harm, the amount of good it did more than compensated for it. The scourge of grasshoppers with which the city was threatened was destroyed in a few minutes. After the hail the fields east and south of the city, which were being devasted by the pests, were found to be carpeted with dead grasshoppers. There were hardly enough of them left to make a showing. Gardeners and ranchmen east of the city unite in saying that as an effective cure for grasshoppers they will take an active hailstorm every time. Alfalfa fields which two weeks ago were threatened with total destruction by the hoppers are now coming up green and fresh and full crops are assured. Hereafter when threatened with a grasshopper plague the Arapahoe farmer will pray for hail.—*Denver Times*.

STORMS PRODUCED BY COUNTER ATMOSPHERIC CURRENTS.

On the front of an advancing cold wave there is often a long band of rain area stretching from the Great Lakes to the Gulf of Mexico, but without cyclonic formation, the precipitation being in fact caused by the upward lift of a warm southerly current which overflows the wedge-shaped cold wave in its southward movement. This is a dynamic uplift by overflow, instead of by vortical gyration, and it is sufficient to cause condensation and precipitation by the mechanical action of an underflowing stratum of very low temperature. * * * * In the summer season, local thunderstorms are quite as likely to happen in the midst of an area of high pressure as in that of low pressure, but here the vertical convection distinctly exists and arises from a superheating of the lower strata. If buoyancy of the lighter air is the principal cause of the gyration of cyclones, then we should expect to find a similar rotatory motion developed in the formation of cumulus clouds and thunderstorms in hot summer weather, when the vertical component is evidently strong. But, on the contrary, while the ascension of the heated air is clearly visible in these clouds, there is usually no evidence of gyration of the cyclonic type. * * * * * * It can be proved conclusively from observations that two counter currents flow together at the places where tornadoes are formed, where the tropical hurricanes are generated, and also where the cyclones of the middle latitudes are produced. These currents are especially active in the strata one or two miles above the ground, and this is probably the reason why they have not received due attention in constructing the theory of storms. It may be concluded that the local overheated central region does not exist in cyclones as the chief cause of their motion, and that the theories fail which depend upon it.—*Review of Ferrel's and Oberbeck's theories of the local and the general circulations, by Prof. F. H. Bigelow, in the Monthly Weather Review for April, 1902.*

THE INFLUENCE OF SUN SPOTS.

Since the discovery of the periodicity of sun spots a large place in scientific literature has been occupied by articles tending to establish some connection between this and variable terrestrial phenomena. It is natural that it should be inferred that any considerable change in the sun must bring about numerous direct or indirect consequences upon the earth, but one who has given the subject no attention will be startled to find that the following list contains but a portion of the terrestrial phenomena asserted, on more or less authority, to be influenced by the sun-spot cycle: Magnetic and electrical conditions, including the aurora borealis; air temperature; barometric pressure; humidity; the winds; cloudiness; rainfall; depth and quantity of discharge of rivers; retreat and advance of glaciers; number of shipwrecks; bank failures and commercial crises; the crops; prices of grain; famines; wars, and even flights of butterflies.

It would probably be easier to show that the number of articles concerning sun spots in scientific periodicals has an 11-year period than to prove all the above-mentioned relations to the general satisfaction.

The question before us is this: Through what physical connection is the presence of sun spots associated with variations in terrestrial magnetism and with meteorology? * * *

Almost without exception, writers on this subject who have ventured an opinion have attributed these meteorological changes to alterations in the amount of the solar radiation. There seems to be a preponderance of suggestion that the sun radiates more at sun-spot maximum, although there are not wanting many who hold precisely the contrary opinion.—*The relation of the sun-spot cycle to meteorology, by C. G. Abbot in the Monthly Weather Review for April, 1902.*

REVOLUTIONIZING FARM LIFE.

(*Des Moines Register-Leader.*)

Public attention is usually occupied with events that are of the day, and that pass. Great changes that are fundamental often go on unnoticed. To-day a great change, amounting to a revolution in farm life, is in progress. The rural telephone, rural free delivery, and the trolley lines are bringing so many of the advantages of the town to the country that the rising generation will never be able to realize how its fathers lived. The older men can still recall the old farm village, remote from railways, where year after year everything centered about the petty affairs of an isolated community, neighbor's children marrying neighbor's children, and making new homesteads on the

borders of the old. A day's journey by team was an extended trip, and a visit to the city an event of widespread interest. The railway and telegraph ruined this old-time village. But the revolution they worked a generation ago was nothing compared to the revolution that is now going on, a revolution that will in ten years make the farm the ideal home of the well-to-do.

To-day more than 4,000,000 farmers in the United States have daily mail delivered at their doors. This is the report of the assistant postmaster-general. As a result of this daily mail they are sending out an average of two letters where before they sent one. When rural free delivery was first proposed it was ridiculed as a fad, a new means of squandering the public money. It is now in operation in every state in the Union excepting Montana, where mountainous roads thus far have made it impracticable. Even in Alaska there is a route from Nome to Gold River. The department estimates that with the present month 8,600 routes will be in operation, averaging twenty-five miles in length. It is safe to predict that during President Roosevelt's term every thickly settled farm section will have its daily mail.

The rural telephone is not so far along as rural mail delivery, and the trolley line is only being experimented with in the west. But who will venture that in ten years all the important farm roads of Iowa will not be lined with wire and many of them laid with tracks?

Hitherto it has been the dream of the farmer to save enough to enjoy at last the conveniences and luxuries of town life. Already the change may be noticed. They are building their new homes on the farm. With the facilities they now enjoy the town does not present so many attractions. The change is most fortunate. When in states like Iowa the men who have made their money out of the soil spend it in improving and beautifying their farm homes we shall present to the world the truly ideal community.

TABLE SHOWING RAINFALL AT McGREGOR, IOWA, SINCE 1894.

YEAR.	January.	February.	March.	April.	May.	June.	July.	August.	September.	October.	November.	December.	Total.
1895	1.26	.61	.78	1.05	2.44	2.55	1.87	2.31	3.10	.70	1.96	2 14	20 77

FRANK LARRABEE.

In a note accompanying the above table Mr. Larrabee says: "I notice the average rainfall for the past eight or nine years has been below normal some six inches, which may account for so many springs and wells going dry and so many forest trees dying.".

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.95 inches; highest observed, 30 39 inches at Sioux City on the 10th; lowest observed, 29.63 inches, at Sioux City on the 16th; range for state, .76 inch.

TEMPERATURE—The monthly mean temperature for the state, as shown by records of 108 stations, was 73 1°, which is 0.6° below normal. By sections the mean temperatures were as follows: Northern section, 71.9°; central section, 73.3°; southern section, 74.2°. The highest monthly mean was 76 5° at Keokuk; lowest monthly mean 70.2°, at Alta, Fayette, New Hampton and Northwood. The highest temperature reported was 99°, at St. Charles on the 17th; lowest temperature reported, 41°, at Clinton on the 1st. The average monthly maximum was 92.9°; average monthly minimum, 50.9°. Greatest daily range, 43° at Plover; average of greatest daily ranges 30.4°.

PRECIPITATION—Average precipitation for the state, as shown by records of 125 stations, was 8.67 inches, which is 4 99 inches above normal. The averages by sections were as follows: Northern section, 8.35 inches; central section, 8.84 inches; southern section, 8.82 inches. The largest amount reported was 13 57 inches, at Odebolt; least amount reported, 4.87 inches, at Keokuk. The greatest daily rainfall reported was 6.25, inches, at Ovid on the 17th and 18th. Average number of days on which .01 of an inch or more was reported, 13.

WIND AND WEATHER—Prevailing direction of the wind, southwest; highest velocity reported, 47 miles per hour, from the south, at Sioux City, on the 5th. Average number of clear days, 14; partly cloudy, 10; cloudy, 7.

ATMOSPHERIC PRESSURE.

STATIONS.	Mean barometer reduced.	EXTREMES.

OBSERVERS' NOTES.

ALTA—*David E. Hadden.* Month cool and very wet—12 24 inches. A severe thunderstorm, accompanied by wind of almost hurricane force, on early morning of the 5th, and another late in the afternoon of same day, damaged shade trees windmills, etc., and caused grain to lodge badly.

AMANA—*Conrad Schadt.* The Iowa river rose again very high this month, doing damage by inundating crops. A very destructive windstorm passed from west to east at 3:45 P. M. on the 8th of July. It was a straight blow or squall, about one and a half miles wide, with one or more small "twisters" within its limits. A barn belonging to Wenzel Jerusha was demolished, and a man who had taken refuge therein was killed. It is reported that thirteen barns and one house were destroyed in the pathway of the storm, within a distance of sixteen miles. Tapering clouds were observed and roaring heard with terrific thunder. Many trees were uprooted or broken in groves and orchards. The last decade was favorable for harvesting.

AUDUBON—*Frank Mott.* Destructive flood in the valley of the Nishnabotna. Oats are badly down.

BONAPARTE—*B. R. Vale.* Rain 8.06 inches, following June with 9 94, making a total of 18.00 inches for the two months. This exceeds the record of 1898—the wet year—by about 6

inches. The following figures from records at this station showing rainfall for June and July, and totals for the two months and the full year, were furnished for publication in the Bonaparte *Record:*

YEAR.	JUNE.	JULY.	JUNE AND JULY.	ANNUAL.
1891	3.55	4.64	8.19	———
1892	3.93	4.79	8.72	39.92
1893	4.27	2.40	6.67	32.30
1894	1.82	.19	2.01	25.81
1895	2.95	5.27	8.22	31.98
1896	2.30	6.63	8.93	36.47
1897	6.43	2.91	9.34	26.97
1898	9.01	3.15	12.16	54.45
1899	1.65	22.8	8.93	26.87
1900	2.73	1.95	4.68	31.81
1901	2.26	.94	3.20	16.34
1902	9.94	8.06	18.00	*27.68

*To August, 1902.

BRITT—*Geo. P. Hardwick.* A showery month, but no severe winds here, though several heavy storms passed nearby; much uncut tame hay at close of month; ground too soft for harvesting machinery; fruit crop short.

CHARITON—*S. H. Mallory.* Following records show rainfall at this station for July, during past eight years:

1902	10.07 inches	1898	6.94 inches
1901	4.25 inches	1897	1.74 inches
1900	6.29 inches	1896	9.06 inches
1899	7.20 inches	1895	4.33 inches

CLINTON—*Dr. Luke Roberts.* The meteorological conditions of July, 1902, were in marked contrast with those of 1901; the former being over wet and cool, and the latter over dry and hot. The number of days on which a measurable amount of rain fell was 16. This beats any July record, but the last preceding June went one better. Total precipitation was 7.79 inches. This amount of rainfall has been exceeded but once in any July preceding, and that was in 1879, when there was 8.07 inches, being in excess of July, 1902, rainfall by only .28 of an inch, but the rainfall for 1879 only covered seven days, thus averaging over an inch for each rain day. The normal July rainfall is 4.12 inches.

The maximum temperature for the month was 95 degrees, occurring on the 17th, being two degrees above normal. The minimum temperature was 47 degrees, occurring on the 1st, being one degree below normal. The mean temperature was 73.4 degrees, being only two-tenths of a degree below normal. The warmest July was in 1901, giving a mean temperature of 80.2 degrees, and the coolest July was in 1882, with a mean of 68.8 degrees, giving a range of 11.4 degrees. There were 12 days with maximum temperature, 90 degrees or above. The first decade was the warmest.

The per cent of cloudiness was 48, being 14 above normal. There were 8 clear days (last year 20), 16 part cloudy and 7 cloudy.

The last decade of the month only gave .54 hundredths of an inch of rain, the cloudiness diminished and temperature rose, thus giving more favorable conditions for the growing crops and securing such as are ready for harvesting. The month closed with brightened prospects for a liberal harvest, especially in corn. The oats crop in eastern Iowa has been much damaged by lodging, but nearly a normal yield will be secured. The outlook at the close of July for plentiful harvests in the United States as a whole was inspiring. In Iowa, the copious precipitation during the month has established a normal condition of moisture in the soil, replenishing the exhausted water courses that feed the springs.

□ EARLHAM—*George Phillips.* First half of month cloudy and wet; grain badly lodged and much hay spoiled; close of month brought better weather; no threshing done yet.

GRAND MEADOW—*F. L. Williams.* The wettest and worst season for haying ever known here; hardly a load that was not rained on; small grain harvest very late and grain badly lodged; no oats cut before the 31st.

GRINNELL—*A. O. Price.* July breaks the records for rain. Even the hillsides are so wet as to stall reapers.

GRUNDY CENTER—*E. S. King.* Small grain generally saved except on lowest ground; corn above average; harvest two weeks late.

HAMPTON—*E. C. Grenelle.* The heaviest rainfall for July since government records were begun here, in June, 1888.

HARLAN—*C. A. Reynolds.* The Nishnabotna valley was overflowed and bridges washed out, and access to the city almost impossible on the 8th, 9th and 10th.

HUMBOLDT—*H. S. Wells.* Rain, 8.81 inches. Much tame hay to make at close of the month; wheat and oats nearly all cut and some stacked; stock suffers greatly from flies and mosquitoes.

LOGAN—*Mrs. M. B. Stern.* Heavy rains caused much damage by overflowing meadows and corn fields on low ground.

MONTICELLO—*C. E. Heisey.* Lots of hay ruined by frequent rains; oats in some fields hardly worth cutting, corn on high ground never looked better.

MT. PLEASANT—*Frank S. Stevens.* Great damage to crops by high water; Skunk river reached the highest mark since 1851.

RIDGEWAY—*Arthur Betts.* A warm, wet month; only exceeded in temperature by July, 1901, and August, 1900, and in rainfall by last May. Thunderstorms on 14 days; sunshine 302 hours, or 65 per cent; at close of the month farmers are reaping an abundant harvest.

SIGOURNEY—*Mrs. R. F. Ashbaugh.* A most terrific thunderstorm on night of 13th and 14th, with 3.47 inches of rainfall. No serious damage.

STOCKPORT—*C. L. Beswick.* Severe electrical storm and heavy rainfall on 14th between midnight and 4:30 A. M.; 4.40 inches of rain; lightning killed several head of stock and struck several buildings.

STORM LAKE—*Prof. M. L. Fuller.* Precipitation 10.49 inches, which has been equaled but once in 18 years, viz: in June, 1891, when 14.70 inches fell. On the 8th to 9th 4.80 inches fell, and this has been equaled but once at this station, viz: on June 21, 1891, on which day 7.78 inches fell.

TIPTON—*Geo. W. Barclay.* The first and second decades of July were very wet. Prospect good for a "bumper" corn crop; oats and hay above average.

VILLISCA—*C. E. Matteson.* A month of heavy rainfall and difficult harvest, but a fine prospect for corn except on low lands.

WEST BEND—*Ph. Dorweiler.* Wettest month on record here. Much hay and grain spoiled.

BELATED REPORT.

COLUMBUS JUNCTION—June, mean temperature, 61.4°; highest, 92°, on the 12th; lowest, 30°, on the 22d; greatest daily range, 41°; total precipitation, 7.77 inches; prevailing direction, west; greatest rainfall in twenty-four hours, 1.44 inches on the 11th; number of clear days, 12; partly cloudy, 9; cloudy, 9; rainy, 16.

CENTRAL STATON, DES MOINES, IOWA.

J. R. SAGE,
DIRECTOR.

GEO. M. CHAPPEL,
LOCAL FORECAST OFFICIAL,
U. S. WEATHER BUREAU, ASS'T DIRECTOR.

ALLIED PRINTING TRADES UNION LABEL COUNCIL DES MOINES, IA.

DES MOINES:
BERNARD MURPHY, STATE PRINTRR
1902.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

J. C. FRAZIER, PRESIDENT, Bloomfield.
W. W. MORROW, VICE-PRESIDENT, Afton.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
WM. M. BEARDSHEAR, President Iowa State College.
B. P. NORTON, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—C. E. CAMERON, Alta.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Meteorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve
Algona	C. D. Pettibone
Allerton	Ed. T Burns
Alta	D. E. Hadden
Alta (near)	W. J. Minard
Amana	Conrad Schadt
Ames	Exp. Station
Atlantic	J. W. Love
Audubon	Frank Mott
Baxter	W. T. Thorp
Bedford	E. E. Healy

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIII. AUGUST, 1902. No. 8.

WEATHER AND CROP CONDITIONS.

The characteristic features of the months of June and July were continued throughout the larger part of August, with prevalence of cool, cloudy and showery weather, making it altogether the wettest and most unfavorable season for cultivation of crops and harvesting hay and grain that has been experienced in Iowa for the past thirty-three years The mean temperature of August, 69.1°, was about 2° below normal, and the average rainfall, 5.58 inches, was 3.51 inches above the normal amount. Cool nights, cloudy days, frequent showers, excessive humidity of the air and saturated soil, retarded the ripening of corn and rendered it well nigh impossible to carry on the usual harvest operations. At the close of the month corn was about two weeks later than usual, with rank growth of stalks and very heavily eared The late planted portion of the crop was green as in June, and its immature condition indicated the need of a full month of warm and dry weather to bring it to the stage to withstand killing frosts. The oats crop suffered greatest damage in shock and stack, and a very large percentage has been ruined. Spring wheat was injured, but the total loss was not so great. Barley was discolored and much of it rendered unmarketable. The hay crop was badly damaged, but there has been partial compensation in the growth of unusually heavy aftermath. Potatoes have suffered materially by rot and blight of tops, greatly reducing the final output of one of the most promising crops ever grown in the state. Pasturage was very rank in growth, and the fields were unusually weedy. The wild hay crop will be materially lessened by excessive rains and floods Garden truck has made phenomenal growth, except in the line of melons.

CORN AND ITS BY-PRODUCTS.

When the chemists are finally through with their experiments on corn the farmer will rise up and proclaim with more enthusiasm than ever before that "corn is king" Wheat, oats and barley, and every other cereal will have been relegated each to its comparatively narrow sphere in the economic world, and the agricultural possibilities of the United States will have reached a stage of development far beyond the dreams of the wildest enthusiast.

Sixty years ago corn was considered fit only for the feed of animals and the production of bourbon whisky. Today it is the basis of thirty or forty manufactured products, each of which is daily proving a valuable article in the commercial world. Within the last two months a company has been organized with $80,000,000 capital in New York which is to deal in nothing else than corn—buying the shelled grain and manufacturing and selling its by-products.

In one year this concern—the Corn Products Company—will consume as much corn as all Europe buys in a small export year, and nearly half as much as Europe uses in a big export year The annual capacity of the company's factories is estimated at 75,000,000 bushels of corn, or 1,500,000 bushels a week, and all of this immense amount of grain will be utilized in by-products

It would be hard even in these enlightened days to convince the average farmer boy that the product of his labor in the hot summer days is more than feed for cattle and hogs, stuff to be run through a distillery, or perhaps the grist of a miller who manufactures cornmeal. Yet the corn field is the place from which are drawn such products as beer, corn oil, starch, sugar, rubber, mucilage, gumdrops, wall paper, soap, ink, salad dressing, and a dozen other materials which enter into the demands of everyday life.

The possibilities contained within a grain of corn began to unfold themselves nearly forty years ago, or thirty years after Thomas Kingsford, an English chemist, began to extract starch from corn in Colgate's factory at New Bergen, N. J. His researches set an example to other chemists, and today practically all the starch used in the United States is made from corn. Thirty years ago practically no glucose was produced in the United States, and now the exports alone amount to $8,000,000 or $9,000,000 annually, while the foreign product made from rice, wheat, potato and sago starches cannot compete with the home product.

There are four parts to a kernel of corn—the outer covering, the hull or bran; then the hard, flinty or glutinous part; then the starch, and last the little white point which extends through the tip and is called the germ.

Of the four parts the germ, about the size of a wheat kernel, is the most interesting, and, when its weight is considered, the most valuable. Its history is like that of the cottonseed, for only a few years ago it was looked upon as a nuisance and the starch and glucose manufacturers spent money to get rid of it. Machines cracked each grain, the mass was given a bath, and the light germ floated out, while the starch, bran and gluten remained behind.

After the chemists found that the despised little germ contained an oil worth more than any other constituent of Indian corn the waste ceased. Now the germs are put under hydraulic pressure of something like two tons to the square inch and the oil is squeezed out of them. The little coats of fiber left become a base for oil-cake and go back to the cattle.

Corn oil is of golden color, transparent, and so sweet and ure that it often serves as a substittue for olive oil. Unlike other vegetable oil, it will stand for years in any climate or temperature without changing its color or becoming rancid. For a barrel of 380 pounds the manufacturer in Chicago gets about $23, or six cents a pound—nice price for what was thrown away years ago.

Corn rubber has all the outward characteristics of India rubber, even to the odor. It is made of corn oil squeezed out

of the germs. The oil undergoes a sulphur treatment and a baking, and a rubber substitute results.

The main point in favor of corn-rubber is that itcan be sold for about one-tenth the price of Para rubber, which costs about $1 a pound. The corn rubber can be used in rubber boots, bicycle tires, sheet rubber, water proofing, rubber heels, linoleum—in nearly all classes of goods. Its greatest use is probably in machinery, as packing for valves. The fact that corn oil is not affected by the air again proves of value, for its rubber products resist oxidation, remain pliable and do not crack as do most of the rubber substitutes made from vegetable oils

The oil is also used for cattle feeding in corn oil-cake of which it forms about ten per cent. Little of this is fed to American stock, most of it going to Hamburg and Antwerp to be fed to European cattle.

Europe is a heavy consumer of corn oil and every year demands more. The first big shipments were in 1899 when Europe took $838 000 worth. The next year the export reached the value of $1,598,000, and last year it was $2,045,000. Vegetable oils enter largely in the manufacture of soft soap, and the Europeans find corn oil the most satisfactory, despite its price of $23 a barrel.

The size of the kernel considered, the principal constituent of corn is the starch. To extract that the shelled corn is placed in vats about a thousand bushels of corn to 8,000 gallons of water. In the water is a sma l portion of sulphuric acid, just enough to soften the kernel, loosen the glutinous matter and free the germ. After thirty or forty hours the water is drawn off to be evaporated so tha any of the corn it has absorbed may be recovered. In former years this water was wasted, now the phosphates and albuminoids in it amount to from one to one and one-half pounds to a bushel of corn that has been soaked It is then mixed with the by-products which sell as cattle feed.

The mass left behind after the water was drained off is run through mills, taking off the hulls, breaking up the glutinous matter and freeing the germs. The gluten, starch and hull are ground fine and passed over silk bolting-cloth.

The hull or bran remains on top, but the starch or gluten pass through. The gluten and starch get another bath and the starch, being the heavier remains behind. The starch is now in solid form, and after the last water is dried out the product is ready for the market.

In that state it may be used for the laundry, brewery or confectionery, or sold in the same can with baking powder, but it stands a good chance of staying in the factory and undergoing changes that will make it grape sugar, glucose or dextrin.

Dextrins are gums or paste To make of starch a substitute for gum arabic it is treated with nitric acid and then baked. As dextrin the starch fixes dyes and colors on fabrics, particularly calico, and also may be used in paper boxes, oilcloth, ink, wall paper, for gumming envelopes and stamps or whenever strong adhesive paste is required.

Glucose and grape sugar are the greatest single derivatives of cornstarch. To make glucose or grape sugar the starch is treated with muriatic acid, and after pressure the acid is neutralized by carbonate of soda. The acid is affixed to the sodium, forming common salt, and every trace of the carbolic acid remaining is carried off. By varying temperature, pressure and degree of acidity a variety of sugars can be produced. When the acid treatment or "conversion" is carried to the furthest grape sugar is produced. When the action is less complete a thick, colorless syrup, glucose, is produced To make a table syrup of glucose ten per cent. of cane syrup, sorghum or molasses is added.

The grape sugar taken from starch does not resemble cane sugar, for the large amount of water in the corn prevents crystalization or granulation. All the efforts to overcome this defect have failed. Now about all the waterfree sugar is used in the manufacture of beer and wine.

With the main body of starch and the germ of the kernel used, the hull, or bran, and gluten is left The gluten is dried in filter presses and in its dry state about one third of it is starch, which the chemists are unable to extract. As gluten meal it is fed to cattle and mixed with the bran it becomes gluten feed The cobs and husks are left behind for other uses, and the stalks have found their place as forage.—*Prof. Gudeman in "Flour and Feed" for July.*

NOTES.

A correspondent of the *Times-Republican*, writing from Waterloo, Iowa, says: "James Van Ordsol & Son, of Rowley, have an orchard that has yielded 300 bushels of apples, while last year it did not produce a bushel The trees which last year showed signs of dying are now bearing profusely. Mr. Van Ordsol thinks the apple crop in Iowa depends more on rain than anything else."

That proposition being accepted as true, it must be evident that irrigation of orchards in dry seasons will greatly increase the output of fruit. And it will pay.

* * *

Celluloid, for which such varied uses have been found, was originally produced as a substitute for fast vanishing ivory. The imitation itself is now imitated by the remarkable preparation of a Dutch inventor, who treats with acid and glycerine the waste pulp from the manufacture of potato flour and dries and grinds the resulting compound. Mixed with water, the powder is molded like plaster of paris, forming an easily worked substitute for ivory, bone, celluloid and other materials. —*Ex.*

* * *

Electric tests have shown Prof. T. C. Bose that the pulsation in plants is similar to that in man and animals. Poisons kill in the same degree, chloroform gradually lessens the pulsations, recovery follows anesthetics, and poisonous drugs stimulate the pulsations and benefit as in human beings. A continuation of these experiments, Prof. Bose believes, may yield some solution of the great problem of life and death.—*Ex.*

* * *

During the ten years ending with 1900 a systematic record of all Italian earthquakes was kept by the central meteorological office at Rome. Dr. A. Cancani finds that not less than 3,361 were noted, only those shocks perceptible without instruments being counted. The results seem to indicate that January and March are more liable to earthquakes than other months, and that the shocks occur most often in the first hour after midnight and are fewest between 5 and 8 P. M.—*Ex.*

* * *

One of the most remarkable and interesting products of German chemistry is the cubic inch of radium lately prepared for Professor Curie. It cost $2,000 and required the use of several tons of barium salts It shines like a lamp also exciting phosphorescence in other materials like zinc sulphide. So energetic is this action that a small particle lights up a mass of zinc sulphide a thousand times as large, and this phosphorescence continues a considerable time after removal of the radium —*Ex.*

* * *

The Chicago *Live Stock World* of September 4, said: "James Hall of Clarinda, Iowa, claims the distinction of hauling to market the first load of the 1902 crop of Iowa corn It was husked August 27, and sold at forty cents per bushel It was of the Golden Cap variety, and was remarkably well developed as to size of ear and grain and was hard enough to show that it is safe from frost. Mr. Hall said that he would get fifty bushels or more per acre from it."

SCARCITY OF BIRDS.

EDITOR MONTHLY REVIEW: This has been a very hard season on our Iowa birds, and I think most of them have been killed by the severe storms. After one storm in August many hundred dead birds were picked up in this town. The blue bird seems to have stood the weather the best of all the birds. Bluejays, blackbirds, woodpeckers, and all the snipe tribe are very scarce. Even the crow is not near as plenty as usual. Last season I could stand at my door and see thousands of blackbirds, today not one The yellowhammers that generally gather in the timber when the first cold "north wind" comes in September are not here I have been out this morning and counted the birds, I saw two yellowhammers, six bluejays, ten bluebirds, six swallows and one small sand-snipe. Last year I could see more than ten thousand birds any morning in the month of September. It may be that the reason they are not here is that there is no feed for them, but my judgment is that most of them have been killed by the storms —*John G. Smith*.

Algona, September 8, 1902.

CARRYING CAPACITY OF PIPE.

The following table gives the carrying capacity of culvert or drain pipe in gallons per minute:

SIZE OF PIPE	1 inch fall per 100 feet	2 inch fall per 100 feet	3 inch fall per 100 feet	6 inch fall per 100 feet	9 inch fall per 100 feet	1 foot fall per 100 feet	2 foot fall per 100 feet	3 foot fall per 100 feet
3 inch	13	19	23	32	40	46	64	79
4 inch	27	38	47	66	81	93	131	136

24 inch	2396	3387	4152	5871	7202	8303	11744	14466

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.97 inches; highest observed, 30.24 inches, at Dubuque on the 21st; lowest observed, 29.67 inches, at Davenport and Des Moines, on the 18th; range for state, 0 57 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 109 stations, was 69.1°, which is 2.0° below normal. By sections the mean temperatures were as follows: Northern section, 67.4°; central section, 69.2°; southern section, 70.6°. The highest monthly mean was 72.8° at Council Bluffs; lowest monthly mean, 65.2° at Dows. The highest temperature reported was 98°, at Perry, on the 19th; lowest temperature reported, 37°, at Sibley, on the 11th. The average monthly maximum was 91.2°; average monthly minimum, 45.0°. Greatest daily range, 46°, at Toledo; average of greatest daily ranges, 29.9°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 123 stations, was 6.58 inches, which is 3 51 inches above normal. The averages by sections were as follows: Northern section, 5.45 inches; central section, 6.76 inches; southern section, 7.53 inches. The largest amount reported was 15.47 inches at Columbus Junction; least amount reported, 1.57 inches, at Dubuque. The greatest daily rainfall reported was 6.96 inches at Allerton on the 25th and 26th. Average number of days on which .01 of an inch or more was reported, 11.

WIND AND WEATHER.—Prevailing direction of the wind, southeast; highest velocity reported, 44 miles per hour, from the northwest, at Des Moines, on the 19th. Average number of clear days, 11; partly cloudy, 11; cloudy, 9.

ATMOSPHERIC PRESSURE.

STATIONS.	Mean barometer reduced.	EXTREMES. Highest reduced barometer.	Date.	Lowest reduced barometer.	Date.

OBSERVERS' NOTES.

ALGONA—*C. D. Pettibone*. Most of small grain badly damaged; corn needs three weeks good weather in September to mature.

ALTA—*David E. Hadden*. August was unusually cloudy, cool and wet. The rainfall exceeded the twelve years' normal by 2.68 inches. The daily mean temperature was less than 1 degree below average for same period.

AMANA—*C. Schadt*. Cool, wet and unfavorable for the main work of the farmer, stacking and threshing. Much grain was spoiled. With favorable weather corn promises a bountiful crop.

AUDUBON—*Frank Mott*. Highest water of the season on 25th in the Nishnabotna river; grain in shock much injured.

BONAPARTE—*B. R. Vale*. Rain 8 12 inches, with 18 for July, and 33 inches since April 20th; corn continues green and growing.

BRITT—*Geo. P. Hardwick*. A rainy month, delaying harvesting, threshing and haymaking; grain badly grown in shock; potatoes rotting; corn uneven and late; too wet for plowing.

CHARITON—*S. H. Mallory*. Rainfall for August 8.23 inches. Record for past seven years as follows:

August, 1895	3 84 inches
" 1896	7 03 "
" 1897	0.69 "
" 1898	1.41 "
" 1899	4.51 "
" 1900	4.85 "
" 1901	0.61 "

CLINTON—*Dr. Luke Roberts*. Ninety-one degrees marked the maximum temperature for August, 1902, and 46 degrees was the minimum; the former was 5 degrees below normal and the latter just normal. In August, 1881, 1887 and 1890, the maximum temperature reached 101 degrees. During the last twenty-two years there were eleven corresponding months with a minimum temperature below that of 1902, the lowest of which was 40 degrees, occurring in 1893. The mean temperature of the warmest day, the 2nd, was 78 degrees, being 2.3 degrees below normal. The coldest day, the 23rd, gave a mean

of 61.3 degrees. The coldest August day in the last twenty-four years was the 22nd, in 1890, the mean being 55 degrees The mean temperature for the month was 68.4 degrees, being 2 1 degrees below normal. There were only three Augusts during the last twenty-four years that gave a lower monthly mean, and they were consecutive, occurring in 1883, 1884 and 1885.

The per cent. of cloudiness was 47, being 13 per cent. above normal. This high percentage has not been exceeded, in August, during the last twenty-four years, but was just equalled twice—1882 and 1891. There were nine storm days during the month, the aggregate precipitation being 4 08 inches, which is in excess of normal, 1.14 inches. The greatest precipitation during any twenty-four hours was 1 33 inches, occurring on the evening of the 19th, between the hours of 6 and 11, the principal part of which fell between 8:45 and 10 o'clock. This was a great storm, but Clinton being on the northern border did not get its full force as did those living a few miles south where it came in such sheets that man would suffocate in trying to breast it. A few cattle and hogs were reported drowned on the left bank of the Mississippi river, twelve or fourteen miles south of Clinton. This storm was accompanied with thunder and lightning and some wind. Some damage was done to corn on the low land, and also to cut grain not yet secured. The balance of the storms were light, but of some annoyance to farmers who were threshing in the field or stacking grain. No rain fell after the 25th and the weather was favorable to corn and other unmatured crops. The run of wind was light, total movement being 2,220 miles, which is but a little below normal. The prevailing wind was from the northeast and its maximum velocity did not exceed fifteen miles an hour, which was favorable to standing corn.

The greatest August rainfall was in 1885, when the total was ten inches, being precipitated during eleven different days. The least August rainfall was 0 47 of an inch, occurring in 1901.

COLUMBUS JUNCTION—*H. E. Simpson*. On 21st and 22nd water at the junction of Iowa and Cedar rivers stood at the highest stage since spring of 1881.

CORNING—*Jerome Smith*. Most severe electric storm of the season on night of 5th, from 10:45 P. M. to 12 M.

DENISON—*W. C. VanNess*. Nearly every storm during month was accompanied by lightning.

EARLHAM—*Geo. Phillips*. A very cloudy, wet August. Oats and timothy in shock nearly ruined. A brilliant electric storm on night of 14th.

GRAND MEADOW—*F. L. Williams*. Month was very wet for so light amount of rainfall. Stacking unfinished and little threshing done. Corn needs four weeks to ripen.

GREENFIELD—*J. G. Culver*. Light frost reported on 11th; rains damaged wheat and oats in shock materially; corn needs fifteen to twenty days to mature.

GRINNELL—*A. O. Price*. Over 28 inches rain during three summer months; aftermath never better.

GRUNDY CENTER—*E. S. King*. A rainy and bad month for harvesting. One fourth threshing done, one fourth grain in stack, and balance in shock and damaged badly; heavy aftermath in meadows.

GUTHRIE CENTER—*W. F. Brann*. Oats badly damaged by excessive rains; corn doing well.

HUMBOLDT—*H. S. Wells*. Rain 7.36 inches. Grain has suffered in shock and stack, and much hay spoiled.

MONTICELLO—*C. E. Heisey*. Much cloudy and wet weather prevented threshing; oats growing in shock and badly damaged.

MT. VERNON—*J. W. Hubbard*. A most remarkable August for thunderstorms and rainfall.

PACIFIC JUNCTION—*H. H. McCartney*. On night of 2nd, 11:30 P. M to 1 A. M., continuous fall of rain with hail falling throughout the shower. Extremes sometimes meet, but they appear to be a year apart; note last year's record, mean temperature 75 5°, and rainfall 1.26.

RIDGEWAY—*Arthur Betts*. Coolest August on record; 297 hours of sunshine. Rattlesnakes and blue racers more plentiful than in years.

WEST BEND—*Ph. Dorweiler*. Much damage by wet weather to grain in shock; corn backward; roads bad and streams high.

BELATED REPORTS.

CRESCO.—July, mean temperature, 70.5°; highest, 90° on the 16th; lowest, 49° on the 1st; greatest daily range, 31°; total precipitation, 8.41 inches; greatest in 24 hours, 2.00 inches on the 20th; prevailing wind direction, southwest. Number of clear days, 14; partly cloudy, 15; cloudy, 2; rainy, 10.

FOREST CITY.—July, mean temperature, 71.6°; highest, 92° on the 30th; lowest, 53° on the 10th; greatest daily range, 34°; total precipitation, 6 58 inches; greatest in 24 hours, 1 79 inches on the 2d; prevailing wind direction, southwest. Number of clear days, 17; partly cloudy, 5; cloudy, 9; rainy, 14.

SCRANTON.—July, mean temperature, 74.1°; highest, 96° on the 16th; lowest, 51° on the 9th; greatest daily range, 32°; total precipitation, 11.30 inches; greatest in 24 hours, 3.70 inches; prevailing wind direction, south. Number of clear days, 16; partly cloudy, 9; cloudy, 6; rainy, 8.

ERRATA IN JUNE REVIEW.

ALTA.—Mean temperature recorded, 62.4° on page 7, should have been 62.9°. Mean temperature recorded 52.0° on page 9, should have been 53.0°.

AMES.—Total precipitation recorded 10.02 inches on page 7, should have been 10 01 inches. Mean temperature recorded 65.8° on page 7, should have been 65 6°. Mean minimum temperature recorded 56.4° on page 9, should have been 56 1°.

CEDAR RAPIDS.—Highest temperature recorded 89° on the 11th and 14th, on page 7, should have been 12th and 14th.

GREENE.—Total precipitation recorded 5.67 inches on pages 7 and 11, should have been 4.67 inches.

GREENFIED.—Total precipitation recorded 6.29 inches on pages 8 and 11, should have been 6.27 inches.

GRUNDY CENTER.—Total precipitation recorded 16.14 inches on page 11, should have been 16 04 inches.

LENOX —Mean temperature recorded 6.70° on page 8, should have been 65.3°. Mean maximum temperature recorded 77 2° on page 10, should have been 73.9°.

MARSHALLTOWN.—Mean temperature recorded 64.2° on page 7, should have been 65 9°. Mean maximum temperature recorded 73.0° on page 10, should have been 76 3°.

OSCEOLA.—Total precipitation recorded 5.37 inches on pages 7 and 11, should have been 5.42 inches. Twenty-four hour rainfall recorded .11 inch on the 23rd, should have been .16 inch.

STOCKPORT.—Twenty-four hour rainfall recorded .15 inch on the 23rd, should have been .25 inch.

IOWA CITY.—Mean temperature recorded 66.5° on page 7. should have been 66.6°.

ERRATA IN MAY REVIEW.

OGDEN.—Total precipitation recorded 6.53 inches on page 8, should have been 6.61 inches. Twenty-four hour rainfall recorded .30 and .24 inch respectively on page 11, on the 10th, and 24th, should have been .03 inch and .25 inch respectively

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW
OF THE
Iowa Weather and Crop Service.

VOLUME XIII. SEPTEMBER, 1902. No. 9.

WEATHER AND CROP CONDITIONS.

The month of September was a fitting close of the most unfavorable crop season in Iowa since 1869. The daily average temperature for the month was 5.2 degrees below normal, and the average rainfal was 1.36 inches above normal, with a large percentage of cloudiness. Field work was much retarded by the saturated condition of the soil, and corn and other unripened crops made very slow progress toward maturity. The period of low temperature from 11th to 13th, with frosts and ice in all parts of the state, caused great injury to corn on low ground, the damage being the heaviest in the northern half of the state where the crop was least advanced. The reports indicate that the amount of soft corn, that will possess but little value except for immediate feeding, will be much greater than usual, ranging from 25 per cent in the southern section to above 60 per cent in the northern section. In bulk all field crops have been much above the average, but the quality has been much impaired, and a very large per cent of the small grain was practically destroyed The conditions have not been favorable for fall plowing and seeding Pasturage has been unusually heavy, though the quality of grasses was not up to the normal standard. The potato crop is better than was indicated by previous reports, and apples developed finely from effects of abundant moisture. An unusually large amount of forage has been grown, but the value of the fodder will be below the standard in feeding value. The output of sound corn will depend in a large measure upon conditions in October. A long period of drying weather is needed to dry out the crop preparatory to cribbing.

TWO ABNORMAL SEASONS.

The seasons of 1901 and 1902 represent climatic extremes in respect to temperature and precipitation. Last season was excessively hot and dry, breaking the records as to sustained high temperature; this season has been thus far unseasonably cool, and it will rank among the wettest seasons ever known in this state. The following tables will show the monthly averages of temperature and precipitation for the two years for the state, giving a striking exhibit of departures from the normal:

SEASON OF 1901, JANUARY 1 TO OCTOBER 1.

MONTHS.	TEMPERATURE DEGREES.		PRECIPITATION INCHES.	
	AVERAGES.	DEPARTURES FROM NORMAL.	AVERAGES.	DEPARTURES FROM NORMAL.
January	23.7	† 6.5	0.74	— 0.48
February	17.5	— 4.0	1 01	— 0.04
March	34 2	† 1.0	2.64	† 0.89
April	49.9	† 0.4	1.79	— 1.41
May	60.7	† 1.0	2.35	— 1.62
June	72.3	† 2.3	3.71	— 0.55
July	82.4	† 8.7	2.34	— 1.34
August	73.8	† 2.7	1.29	— 1.78
September	63.3	— 1.0	4 77	† 1.47
Totals			20.64	—4.86

† signifies plus.

SEASON OF 1902, JANUARY 1 TO OCTOBER 1.

January	22.4	† 5.3	0.88	— 0.34
February	17.6	— 4.1	0.73	— 0.33
March	39.1	† 5.9	1 45	— 0.30
April	48 2	— 1.3	1.71	— 1 50
May	63 8	† 4 1	5.39	† 1.42
June	65.2	— 4.8	7.16	† 2.80
July	73.1	— 0.6	8 67	† 4.93
August	69.1	— 2.0	6.58	† 3 51
September	59 1	— 5 2	4.35	† 1.36
Totals			37.92	† 11.71

† Signifies plus.

From the above records it will be seen that the average amount of rainfall for the state for the nine months ended September 30, 1902, was 11.71 inches above normal, and 17.28 inches in excess of the total for the corresponding period in 1901. The total for this year, thus far, is 37.92 inches, and for the six crop months it was 32 15 inches. Last year, during the crop months the amount was 16.25 inches, and of that amount 4 77 inches fell in September, when it was not needed for development of corn. In the four critical crop-growing months last year it was excessively hot and abnormally dry, while in the corresponding months this season it was unseasonably cool and excessively wet. The swing of the meteorological pendulum is strikingly illustrated in these two abnormal seasons.

NOTES.

The main iron electric light tower in San Jose, Cal., which is 220 feet in height, and may be seen from nearly all parts of Santa Clara Valley, will be used for the display of weather signals to farmers and fruit growers. Flags by day and colored lights at night will be used to give warning of the approach of frost, and thereby timely preparations may be made to save the fruit by the smudging method.

* * *

On some of the big grain ranches of the northwest straw is used as fuel to drive the engines, and the fires are fed by automatic appliances, the straw being carried to the fire box by steel conveyors.

* * *

According to the pomologist of the agricultural department the center of apple production in the United States has shifted since 1890 to a point west of the Alleghenies. The west is making steady advancement in general fruit growing as well as in the production of apples.

* * *

The pollen theory of hay fever has been proven by two German investigators to be untenable. The number of pollen particles in the air during the hay fever season is very small, an average of twenty-five to each cubic meter, and the nasal and throat secretions of hay fever patients show less pollen than those of healthy persons. Very few micro-organisms appear in the pollen. As to the bacteria that may excite hay

fever, little or nothing was learned, and it is still uncertain how such germs may be transmitted.—*Exchange.*

* * *

At a meeting of the American Institute of Electrical Engineers in New York city, President Scott said that since the organization of the institute, in 1884, the value of electrical installations in the United States outside of telegraph and telephone plants had increased from $1,000,000 to over $4,000,000,000. "The United States," he added, "with only one-fifth of the population of Europe and Great Britain, has two and one-third times the kilowatt capacity in power stations, and three and one-half the mileage of electric railways. The power houses in operation and under contract in New York city would replace all the central stations for lighting and power in Great Britain or Germany; they would operate all the electric railways of Great Britain and Europe combined; one alone would be sufficient for the railways of Germany, and the output of a single generator would run all the railways of Switzerland."

* * *

Iowa never had a dry year when the waste and loss of crops was equal to that of this wet one of 1902.—*Rockford Register.*

* * *

In Iowa about 30 per cent of the corn acreage lies in the southern third of the state, 45 per cent in the central third, and 25 per cent in the northern third of the state. Dividing the state into three sections running north and south, we find that the eastern third contains about 25 per cent of the total corn acreage of the state, the central third has 36 per cent, and the western third 39 per cent.—*Murray's Price Current.*

UNSEASONABLE WEATHER IN THE UNITED STATES.

The cause of unseasonable weather is not demonstrable. Neither is it possible in all cases to determine which of the general atmospheric conditions that are associated with unseasonable weather partake of the nature of cause and which of effect.

It has been observed that summer periods of low temperature are associated with barometric pressure below the normal and abundant rainfall, and that summer periods of excessive heat are associated with barometric pressure about or above the normal and a marked deficiency in rainfall. It has also been observed that winter periods of excessive cold are associated with barometric pressure above the normal and little or no precipitation, and that periods of high temperature in winter are associated with barometric pressure below the normal and rain or snow. It has been observed further that the general atmospheric conditions referred to are associated with areas of high and low barometric pressure that traverses the United States. In summer the atmosphere over regions subjected to unusual cold and abnormally heavy rainfall is dominated by areas of low barometric pressure, or general storms, that follow unusual tracks for the season, and the atmosphere over regions subjected to unusual heat is undisturbed by the passage of general storms, and is dominated by an extensive and almost stationary area of high barometric pressure. In winter periods of excessive cold are experienced in connection with areas of high barometric pressure of great magnitude that advance from the British Northwest Territory, and also in connection with general storms that follow abnormal southerly paths, and periods of unusually warm weather occur in connection with a succession of general storms that pursue abnormally northerly paths.

A study of the daily meteorological charts of the Northern Hemisphere shows that the general atmospheric conditions over the United States that are associated with unseasonable weather in any part of the country are, in turn, associated with atmospheric conditions that obtain over at least a great part of the Northern Hemisphere. The international charts show that when a period of abnormal weather prevails over a considerable area of the United States, there is a disarrangement of the normal distribution of atmospheric pressure over a great part of the Northern Hemisphere. They show that in the presence of unseasonable weather in any part of the Northern Hemisphere the so-called permanent continental and oceanic areas of high and low barometric pressure present abnormal aspects, and there is an interruption in the normal succession and progression of the areas of high and low barometric pressure of the middle latitudes —*Prof. E. B. Garriott, in the Monthly Weather Bureau for June, 1902.*

SUN SPOTS AND THE WEATHER.

It can hardly be doubted that systematic fluctuations exist in weather conditions. A succession of cold years is followed by several warm years, and a dry epoch follows a wet one. Can we connect these fluctuations with any known phenomenon, and do the variations recur with sufficient regularity to be called periodic and to admit of their being forecast?

Many attempts have been made to establish a connection between the periodicity of sun spots and the fluctuations in weather conditions. It is first necessary, however, to establish the sun-spot period. In the *Monthly Weather Review* for April, 1902, Prof. A. Wolfer, of Zurich, Switzerland, publishes a table showing the relative number of sun spots that have been observed each month since January, 1749. The numbers in the table have been plotted, and from the curves it appears that the so-called 11-year period, that is, the time between successive occurrences of maximum or minimum numbers of spots, is not a uniform interval, but has varied, since 1749, between 9.0 years and 13.6 years.

The duration of the period of increase of sun spots after a minimum, as also the duration of the period of decrease after a maximum, also shows a variation. Dr. Norman Lockyear, of England, thought the former had a cycle of 35 years, but Wolfer finds evidence that the periods of both increase and decrease have cycles of 55 years, and that the ratio between the two has the same cycle. He also finds that a short period of increase is followed by a high maximum of relative sun-spot numbers.

There are thus two sun-spot cycles with which to compare weather fluctuations: (1), the 11-year period in the relative sun-spot number, and (2), the 55-year cycle in the time of duration of the increase or decrease in the spot numbers. It can hardly be claimed that a relation has as yet been established between the 11-year period and the weather, and it will require many more years of observations than we now have to establish a relation with the 55-year period.—*Monthly Weather Review.*

BENEFITS OF THE WEATHER BUREAU.

(*The Homestead.*)

How many people ever stop to think of the relation existing between the weather bureau and farming? It may be safe to say that the majority do not think there is any relation whatever, except in so far as we are all more or less interested in the weather. In fact, there are many people who can talk of nothing else.

Everybody has some kind of an idea that the department of agriculture attends to the agricultural interests of the country —looks after what is needed, makes suggestions and experiments and publishes what is to many dreary reports in which it is often difficult to get farmers themselves interested. To the average human anything that contains columns of figures is of

little interest unless the figures have a personal relation to his own affairs.

The most interesting bureau nevertheless, under the department of agriculture, is the weather bureau. Without the facts being laid before them it would be rather difficult to convince those living in the interior of the country of the truth of this statement. Not that these people are indifferent to the weather itself, but they reason that no office or bureau or organization created by man can in any way have anything to do with the weather, either in creating it or regulating it. They are of much the same belief as the pious gentleman who would have nothing to do with lightning rods. He considered them devices for defying the power of the Almighty.

In the long ago it was a huge joke to be told that anyone could forecast the weather, and it was a greater joke to many for a good while after the predictions were begun, and some there are perhaps who consider it a joke even now. Still, after a careful record has been kept during the last five years it is shown that only 5 per cent. of the predictions have been unfulfilled. The sailing of ships are governed by what the weather man says and thus numerous lives and vast amounts of property are yearly saved. The storm that devasted Galveston three years ago was predicted by the weather bureau, but was unheeded, just as many similar warnings of danger have been unheeded and will so continue. In 1897 the great flood in the lower Mississippi valley was foretold two weeks in advance and the warnings of the approaching danger were repeated and it is estimated that at least $14,000,000 worth of live stock and farm products were saved in consequence of the precautions taken because of the predictions. Along the sea coast the storm predictions are listened to, for experience has shown the necessity.

Fruit growers are particularly benefited by weather predictions. There are some sections of the country where the fruit grower watches the storm signals as closely almost as the mariner watches the compass and by this means he saves sometimes his entire crop, at other times saving a large percentage of it. Shippers of delicate and perishable fruits are governed by the weather bureau. When a cold wave is predicted the fruit is not shipped until the danger is passed, otherwise without anything to govern the shipper's action the loss would in many instances be disastrous.

ELECTRIC TREATMENT OF SEED CORN.

According to a current newspaper paragraph a farmer residing in Marshall county, Iowa, achieved remarkable success this season by treating his seed corn to an electric bath a short time before planting. He filled a barrel with corn and water, placing a piece of zinc at top and bottom of the barrel; and then, by the aid of the electric light plant of Marshalltown, the contents of the barrel received an electric current of 500 volts, continued twenty minutes. After the corn was thoroughly dried it was planted in an upland field of average fertility, in which corn had been planted nine consecutive years. The crop was remarkable for the development of stalks, which attained an average of about eight feet in height, and the thirteen-acre field brought forth an average of about seventy bushels per acre. This is the story, in brief, of this notable experiment in electro-plating seed corn, and the story is given currency for what it is worth. It will serve, at least, as an illustration of the fact that this is distinctively an age of experimentation on all lines, and that there is a general belief in the marvelous potentiality of electricity. It should be stated, however, that a thirteen-acre field yielding an average of seventy bushels per acre is by no means very rare in Iowa. There has been a prodigious growth of stalks and ears this season in many favored localities, as a result of frequent showers. Possibly electricity has been a potent factor—who knows? We have certainly noted more than the usual amount of electrical force expended in the form of terrific thunderstorms, but it is not quite safe to assume that lightning was the potent factor in the production of big potatoes, squashes, grasses, cornstalks and weeds. And it would require very careful, painstaking and scientific experimentation, continued through several seasons, to give full assurance that the germs of any kind of seed may be quickened by treating them to electric shocks prior to planting. In the production of corn, especially, timeliness in planting, promptness and perseverence in cultivating, abundant sunshine, warmth and moisture at the critical stages of growth, with a fertile and friable soil, are the prime essentials. Careful selection and preservation of seed corn is vastly better than all attempts at awakening the sleeping germs by a shake-up with 500 volts of electricity. There is no dynamo that can beat the harrow and cultivator, strenuously applied to the cornfield in due season.

DESTRUCTIVE POWER OF LIGHTNING.

To the editor —On the 5th of September about 5 p. m. the writer, in company with a threshing crew of sixteen men, saw a terrific display of the power of electricity. Being driven from our work by a severe storm we took refuge in a large barn, a few rods distant from a small grove of burr oak trees. The tree nearest the barn was about 18 inches in diameter. The height of the tree was about 25 feet. During the storm the lightning flashes, though not more than usually frequent, were intensely bright and the thunder was peculiarly explosive, like discharges of heavy artillery. While a number of us were looking out of the barn door in the direction of the grove a blinding flash of lightning enveloped the tree above described, followed by an explosion, like dynamite, blowing the tree to splinters and scattering the debris over a half acre of ground. The direction of the flash was upward. The whole tree seemed to be lifted bodily several feet above ground and then blown to pieces. Two large pieces each weighing more than a man could comfortably carry, were blown about seventy-five feet, one to the northwest and the other to the northeast. These pieces were splintered, but held together at one end. The mass of debris in form of splinters, limbs and leaves, were thrown toward the northwest, northeast, southeast and southwest, with but little between those points. The explosion did not jar the earth, but seemed to be wholly in the air. Pigs within two and three rods of the tree were not hurt, but the men in the barn were more or less shocked. The flash, as shown by testimony of all the eye witnesses, was apparently upward and the tree seemed to be lifted bodily and then was blown to pieces. This class of timber growing in scattered groves, is very tough, hard and difficult to split with maul and wedge, and the explosive force must have been very great. A few rods distant, in the same grove, a tree about the size of the one described was struck during a storm in July, but the stroke was downward, the trunk was uninjured except where the electric current tore off the bark in its passage to the ground. From my observation I am led to believe that many strokes of lightning are from the earth upward. I should like to have the opinion of the editor of the Monthly Review as to this point.

Geo. W. Barclay,
Tipton, Iowa, Sept. 8th 1902. Vol. Observeer.

Note. Answering the above request for an expression of opinion relative to the upward motion of stroke, we would say that some of the ablest scientists sustain that view. In Bulletin No. 26 issued by the Weather Bureau and edited by Messrs. McAdie and Henry, we find the following paragraph:

"There is no reason to doubt that the discharge takes place sometimes from earth to cloud. That is to say, that while we now consider a lightning flash as something like the discharge of a condenser through its own di-electric, made up of excess-

ively frequent alternations, say something like 300 000 times per second, the spark or core of incandescent air may seem to have had its beginning at the earth's surface. That is to say the air gap breaks down first at a point near the earth."

A BAD YEAR FOR THEORIES.

The present season has disposed of a whole lot of fanciful theories as to the law governing droughts and rainfall. For years past the papers have teemed with articles based upon the assumption that the destruction of the forests of the country was diminishing the rainfall and producing disastrous droughts; that the drainage of the swamp lands and shallow lakes and the draining of the farms were largely responsible for the dry weather, and many there were who believed in these theories. Now here comes the summer of 1902 with such a general and unusual fall of rain during a four months' period all through the Mississippi valley region that all these fancy theories are completely exploded. The truth is that trees grow where rain falls, and the rain does not fall because the trees grow. The drainage of the soil does just as much to keep it moist in a dry time as it does to keep it dry in a wet one. Nothing which man does or can do can enlarge or diminish the rainfall or prevent floods or droughts in the smallest degree. At best man can only modify effects of both, and this he can do and does by drainage, conservation of moisture by proper tillage and tempering the force and aridity of the winds by planting forests, and by removing them can produce floods, dry up the springs, destroy the water powers and convert forest areas into bleak and desert territory, but he never runs the waterworks under any circumstances. The records of fifty or more years show that seasons or periods of extreme drought and excessive rainfall come in cycles; likewise seasons of extreme heat and cold. A season which gives the exact mean or average of heat, cold and precipitation is much rarer than one which goes to extremes in some form or other.—*J. S. Trigg in Rockford Register.*

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.97 inches; highest observed, 30.40 inches, at Des Moines, on the 13th; lowest observed, 29.49 inches, at Davenport on the 27th; range for the state, 0.91 inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 103 stations, was 59.1 degrees, which is 5.2° below normal. By sections the mean temperatures were as follows; Northern section, 57.9°; Central section, 59.3°; Southern section, 60.2°. The highest monthly mean was 62.6° at Burlington; lowest monthly mean, 55.0° at New Hampton. The highest temperature reported was 88°, at Denison; Sibley, Sigourney and Council Bluffs on the 2nd and 7th; lowest temperature reported, 23° at Galva on the 11th. The average monthly maximum was 82.5°; average monthly minimum, 31.7°. Greatest daily range, 50° at Galva; average of greatest daily ranges, 37.0°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 118 station, was 4.35 inches, which is 1.36 inches above normal. The average by section were as follows: Northern section, 3.63 inches; Central section, 4.49 inches; Southern section, 4.93 inches. The largest amount reported was 10 41 inches at Otumwa; least amount reported, 1 65, at Clear Lake. The greatest daily rainfall reported was 4.31 inches at Chariton on the 30th. Average number of days on which .01 of an inch or more was reported, 9.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 41 miles per hour, from the northwest; at Sioux City, on the 8th. Average number of clear days, 15; partly cloudy 6; cloudy 9.

OBSERVERS' NOTES.

ALTA—*David E. Hadden.* First killing frost on 12th; blue sunlight on 14th.

ATLANTIC—*J. W. Love.* September was very cool, with much rain the last ten days. Ice on 12th and 13th.

AUDUBON—*Frank Mott.* Rain of 23d caused streams to overflow.

BONAPARTE—*B. R. Vale* Rain, 3.51, keeping fields wet and practically no plowing done; corn maturing slowly; pastures excellent.

BRITT—*Geo. P. Hardwick.* The corn being late in maturing the frost of 12th and 13th cut short both corn and fodder; will be about half an average yield.

CLINTON—*Dr. Luke Roberts.* The mean temperature for September, 1902, was 58.8 degrees, being 3.1 degrees below normal. During the last twenty-four years there were five Septembers which gave a lower mean temperature, namely: 1879, 56.8 degrees; 1883, 57.4 degrees; 1888, 57.0 degrees; 1890, 58 5 degrees, and 1896, 58.3 degrees. The rainfall was 3.79 inches or 67 hundredths of an inch above normal. There were ten days on which a measurable amount of water fell, three of which gave copious amounts, 0.60 on the 5th, 1.25 on the 17th, and 1.09 on the 23d. There was little thunder and lightning on the 5th, 8th and 27th.

The departures from normal which made September gloomy and unlike the accustomed pleasant autumnal days, which are looked for in Iowa, can not be credited to its temperature or precipitation, but to its abnormal cloudiness and humidity. The record was broken in the high per cent of cloudiness and low per cent of sunshine. The number of cloudy days was 13, part cloudy 9 and clear 8. The per cent of cloudiness was 16 above normal. While the frequent small rains were beneficial to the soil, they, together with the above conditions, made it impossible to secure crops in good condition, or mature corn so as to be saved from further deterioration. In Clinton county corn has not been injured by frosts, but by other abnormal conditions, and at the close of the month there was no visible prospects for improved conditions before freezing weather will be liable to get in its damaging work on corn. The whole growing season has been one of anxiety and alarm. The

weather seemed unseasonable all the way along, drenching rains and frequent showers, cloudiness and chilliness. Crops that did well in growth were of inferior flavor or spoiled in an attempt to harvest in good condition.

Apples have done quite well in eastern Iowa, but on cutting them, even those of fair size and complexion, would reveal the habitation of worms. There is no crop which has escaped harmful influences. Green corn came the nearest to being excellent in flavor. Melons and the squash family were inferior in flavor.

CORNING—*Jerome Smith.* Heavy frost on 12th but no damage done except on low ground.

FOREST CITY—*J. A. Peters.* Eighty-five per cent of corn is soft and much of it worthless; too wet for fall plowing.

GUTHRIE CENTER—*W. F. Brann.* Frost and rain damaged corn 25 per cent; not much corn in shock; no fall wheat sown.

LOGAN—*Mrs. M. B. Stern.* The month has been unusually cold; frost did much damage to late corn.

RIDGEWAY—*Arther Betts.* Temperature 2.5 degrees below normal; 233 hours of sunshine. This place has not had killing frost yet, and delicate vegetation is green and beautiful. Corn slowly ripening; pastures fine.

BELATED REPORTS.

PRIMGHAR.—June. Total precipitation 2,10 inches. Greatest in 24 hours .70 inch on the 12th, 13th and 25th. Number of rainy days 3.

PRIMGHAR.—July. Total precipitation 5.46 inches. Greatest in 24 hours 1.00 inch on the 3rd. Number of rainy days 8.

ERRATA IN JULY REVIEW.

AUDUBON.—Mean temperature recorded 73.0° on page 8, should have been 73.2.° Mean minimum temperature recorded 61·5° on page 9, should have been 61.8°.

DENNISON.—Mean temperature recorded 73 4° on page 7, should have been 71.8°. Mean maximum temperature recorded 85.3° on page 9, should have been 82.1°.

GALVA.—Daily precipitation recorded .00 and .10 inch, on the 5th, and 17th, respectively on page 11, should have been .50 and .15 inch respectively.

MARSHALLTOWN.—Percipitation recorded .86 inch on the 3rd, on page 11, should have been .68 inch.

OSCEOLA.—Precipitation recorded 1.35 inches on the 2nd, on page 11, should have been .35 inch.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

J. C. FRAZIER, PRESIDENT, Bloomfield.
W. W. MORROW, VICE-PRESIDENT, Afton.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
WM. M. BEARDSHEAR, President Iowa State College.
B. P. NORTON, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—C. E. CAMERON, Alta.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Meteorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve
Algona	C. D. Pettibone
Allerton	Ed. T Burns
Alta	D. E. Hadden
Alta (near)	W. J. Minard
Amana	Conrad Schadt
Ames	Exp. Station
Atlantic	J. W. Love
Audubon	Frank Mott

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIII. OCTOBER, 1902. No. 10.

NOTES.

A school for corn and live stock judging will be held at the Iowa State College at Ames January 5 to 17, 1903 A general invitation is extended to all farmers of the state to attend and to bring samples of corn to add to the exhibit. It will be a valuable school of instruction for young or old farmers.

* * *

The horticultural department of the Iowa Experiment Station has placed in cold storage one hundred varieties of Iowa apples to determine their relative keeping qualities, and the best temperature for preservation of fruit. The apples have been carefully selected and packed, and were procured at Corning, in the heart of the southwestern Iowa apple district. The experiment will be watched by both producers and dealers.

* * *

About 50 earthquakes yearly, according to Prof. John Milne, disturb the world throughout its mass. Between January 1, 1899, and January 1, 1902, the world shaking earthquakes numbered 196, of which 25 originated west and south of Alaska, 14 west of Central America, 16 west of the Antilles, 12 west of the Andes, 29 east of north Japan, 41 south and east of Java, 17 north of Mauritius, 22 on the east side of the north Atlantic, 8 on the west side of the north Atlantic, 3 in the north Atlantic, and 14 in the Balkan, Caucasian and Himalayan regions. These sources are near the base of the steepest flexures, are all submarine except the last three, and their boundary ridges are mostly lined with volcanic peaks. Both on land and under the sea the great earthquakes seem to be accompanied by a deepening of the furrows and an elevation of the flanking ridges. The elevation may reopen long sealed volcanoes, as in the eruptions in the Antilles in 1692, 1718, 1766, 1797, 1802, 1812, 1836 and 1902. The small earthquakes—of which 10,000 a year are recorded in the world—have no sensible connection with volcanoes.—*Ex.*

* * *

The body temperature of insects, unlike that of mammals, varies greatly. A recent investigator, P. Bachmetjew, finds that when the insect is at rest the temperature is near that of the surrounding air, but that it rises rapidly with active movements. The temperature endurance of insects proves to be about the same as that of plants. The species tried were immovable at 31 degrees Fahrenheit, began to move the wings at about 53 degrees, commenced to buzz at 68 degrees, showed signs of uneasiness at 104 degrees and died at 113 degrees.—*Ex.*

WEALTH FROM WASTE.

(*Manufacturers' Record.*)

Mr. Frank H. Mason, the United States consul-general at Berlin, is rendering efficient service in these times by furnishing through the United States State Department valuable information about the manufacture and use in Germany for fuel of briquettes made from brown coal, carbonized peat, coaldust, etc., and has suggested that manufacturers and domestic consumers in this country may turn their attention to the utilization of some raw material which now is practically wasted. Briquettes, according to Mr. Mason, form the principal fuel of Berlin and other German cities, and are used for steam firing and for heating in various manufactories. Their advantages are that they are clean and convenient to handle, they light easily and quickly, and burn with an intense flame, and they make practically no smoke, and are, withal, the cheapest form of fuel for most purposes. There were in operation in Germany at the close of 1900 eighty-nine manufactories of fuel briquettes, some of which produced 100,000 tons annually. The manufacture of briquettes is controlled by a syndicate, and the growth of the manufacture was from 482,495 tons, at $3.02 a ton, in 1891, to 1,566,385 tons, at $3.17 a ton, in 1901. The syndicate produces to a large extent briquettes from coal screenings which require a matrix or binder of some plastic inflammable material, and for this purpose 116,956 tons of mineral pitch, costing on an average $10 25 a ton, were used in 1900. The first report on this subject, made on August 16 last, has been followed by one in the advance sheets of the consular reports of the State Department for October 11. This is devoted largely to a description of the machinery for making briquettes from peat. Discussing the subject generally, Mr. Mason says:

"Briquette works are divided in respect to the material employed into two general classes, viz., those which make briquettes from brown coal (lignite) or carbonized peat, with or without the addition of a bituminous matrix or binder, and second, those which use as a basic material coaldust or slack—the waste of soft coal mines. Of the latter class, Messrs. Franz Haniel & Co. of Ruhrort-on-the-Rhine, who have works at several points along the Rhine, are representatives. The great Gruhl establishment at Bruhl, the 'Donatus' works at Liblar, near Cologne, and the Thuringian Aktiengesellschaft, at Deuben, near Halle, are typical examples of factories which make briquettes from brown coal, which is abundant and cheap in many sections of Germany. In the last named establishment no matrix or binder is used. The lignite is crushed, moistened with water to the consistency of mortar, then passed through the machine, which, by compression under heat, develops the bitumen in the material and renders the mass so plastic and adhesive that it molds rapidly into smooth, glistening briquettes of a black or dark brown color, which are practically smokeless and leave after combustion a reddish-brown ash. All processes of this kind are based upon the fact that lignite is a vegetable coal of more recent formation, and therefore less perfectly carbonized structure than anthracite or bituminous coals, has lower caloric value, and requires to be compressed and further carbonized by artificial means. Turf

or peat is a still more recent formation, and requires proportionately more artificial preparation to produce a high-class fuel; hence the several more or less successful patented processes for carbonizing peat into so-called peat coal, an artificial product which can be either used in irregular lumps or molded into briquettes.

"From what has been previously reported on this subject, it will be apparent that in all that concerns the manufacture of briquettes from brown coal, or from the slack and waste of bituminous coal mines the processes employed in France and Germany have long passed the experimental stage and become a standard commercial industry. If Americans are really interested in the suject, there is no need that they should risk any large sums of money in uncertain experiments. They have only to study the machinery and methods employed in European countries compare their crude materials with those found and used here, and they can thus start at the point of technical knowledge which Europeans have reached after many years of experience. When, some ten years ago, the attention of American iron-makers was called to the German system of making blast-furnace coke in retort ovens, which saves the valuable volatile elements of the coal, it was thought worth while by certain of them to bring over two carloads of Connellsville coal to be coked as a test by the German process The complete success of that experiment decided the introduction of the standard German type of coking oven into the United States.

"Something similiar it would seem, might profitably be done with the materials which Americans have not yet succeeded in converting into satisfactory briquettes There are experienced engineers and a dozen mannfacturers of briquette-making machinery who would gladily co-operate in these tests, and would furnish machinery adapted to working the material thus technically defined. Upon a basis of such tests, plans and estimates could be obtained for the erection of plants in the United States with specified daily capacity"

FOR BIGGER GRAIN CROPS.

The Department of Agriculture is trying to push plant breeding in this country. It is a branch of farming work that is pursued much more diligently in Europe than in the United States, and if it were carried on as it should be on this side of the water most important benefits would accrue to the producers of our crops Only within the last few years has it been realized that plant life is to a wonderful extent under man's control. He is almost able to act the part of a creator in the vegetable world, so greatly is it in his power to modify species by hybridizing and by artificial selection.

The government is already conducting such work on quite an extensive scale, and wishes to urge private individuals to take up further and continue the work along the lines that have already been marked out. In England the average yield of wheat is over 30 bushels to the acre, but in this country it is below 15 bushels, the difference being mainly due to the fact that in Great Britain highly productive varities of the grain have been secured through a long period of selection and breeding. It is recorded by the department of agriculture that in ten years the Minnesota Experiment Station by means of careful breeding, produced a new variety of wheat which yielded nearly 25 per cent more grain than its parent variery, which was the best grown in the state up to that time. An increase of 25 per cent or 5 bushels to the acre would add to the world's supply of wheat 625,000,000 bushels, which at 80 cents a bushel would be worth $500,000,000 per annum. An increase of only one bushel an acre would augment the world's crop 125,000,000 bushels, representing a value of $100,000,000. At the present time the United States produces about one-fifth of the world's wheat supply.

The breeding of corn in the United States has resulted in a very marked improvement. Prof. Hays, of the University of Minnesota, states that the farmers of America, without realizing the fact, have been conducting with maize the most extensive breeding experiment ever carried on, and by selection have greatly increased the yield of their cornfields. Corn is such a large plant that each ear is taken in the hand in husking out the crop, and thus the agriculturalist has been able to choose the very best yielding plants out of immense fields. Hence it has come about that ears of corn today are much larger than they were half a century ago. Yet, says Prof Hays, in another half century the farmers might easily add another 25 per cent to their cropf of maize —*Flour and Feed*.

FARMING IN THE OLDEN TIME.

The American of the Revolutionary period was an extremely poor farmer. Looking back on his methods and his work, it is hard to say which were the most crude, his implements or his ideas He used a wooden plow; he was afraid an iron one would "poison the soil" He had not learned that glanders was contagious, and would work and stable healthy stock alongside of stock affected by it, and wonder what there was in the soil, air or climate that carried them off. He didn't understand the use of fertilizers, and instead of spreading his barnyard manure on his fields he let it accumulate around his barn until the approaches were impassable Then he dug the barn out and moved it Instead of rotating crops to save his soil, he planted according to the phases of the moon. There were few sheep in the country, and other live stock was poor and scanty In Virginia the belief prevailed that it would kill cows to house and milk them in the winter. Transportation was poor and continued so for a long time. The roads could not have been worse. Markets were scattered and far between.

Each farm attempted to be self-sustaining in as large a degree as possible What the farmer couldn't grow or his wife couldn't make they went without. Wasteful methods of tillage eventually exhausted a soil originally rich, and in the reign of Andrew Jackson agriculture had fallen into such an alarming state of neglect and inefficiency that the government had to come to its relief.

Through the efforts of Henry L Ellsworth, commissioner of patents, a bureau was established in the patent office, which developed into the department of agriculture By aid of that department farming has been made a science.—*Ainslie's Monthly*.

NATIONAL CLIMATE AND CROP SUMMARY.

The Climate and Crop Bulletin of the United States Weather Bureau for October, 1902, says:

"The month, as a whole, was very mild, with rainfall generally sufficient, and while the latter was excessive over a large part of the Atlantic coast and Gulf districts, but little injury resulted therefrom, except in the early part of the month. In the central valleys the conditions were generally favorable for hardening corn, but a considerable portion of the crop in the Lake region and over the northern portions of Mississippi and the Missouri valleys is yet soft.

"Rains caused considerable injury to cotton during the early part of the month, especially in the central and western portions of the belt. The weather of the middle and latter part of the month was more favorable, and the development of a fair top crop in some localities resulted .At the close of the month picking was still in progress, and with delay of frosts considerable will yet be gathered, the most favorable prospects for top crop being reported from northern and central Texas.

"Winter wheat seeding made satisfactory progress and was largely completed by the close of the month in the principal

winter wheat states. The early sown has, as a rule, germinated well, good stands being generally reported. Fly is, however, quite extensively reported from the states of the Ohio and central Mississippi valleys."

THE SEASON OF 1902 IN NORTHEAST IOWA.

We had a wet summer. Over 2 feet waterfall for May, June and July. For August and September the rainfall was moderate, and October was very dry. We had our first killing frost Tuesday morning, October 14th, the first frost since April 24th. The cornfields were slowly dying of old age and the corn was ripe. The tenderest vegetation up to that time, was green and beautiful, such as citrons, tomatoes, ground cherries, cucumbers squashes, pumpkins, late corn, pencillaria, sorghum and geraniums. A delightful fall—the best in many years Oats yielded from 30 to 50 bushels per acre. Corn despite the wet summer is a fair crop, though in some late pieces the ears are very deficient. Potatoes are a light crop and potato rot is general. Beans are a fair crop and the bean weavel is not found this year, because the summer was so cloudy that there were few butterflies to deposit the eggs There were a good many potato bugs in their season, but very few young ones ever hatched out. Apples were less than average, and the quality was poor. Hay has been excellent and many farmers have cut their 2d crop. Pastures were extra good and cows have kept up unusally well in their milk. The price of eggs has kept up better than common, from 12 to 16 cents all the season. We have had wild flowers in the greatest profusion, but birds, with the exception of hawks crows and blue jays, have been less plentiful than usual. Nearly everyone has put in a good stock of walnuts, butternuts and hazelnuts for the winter. Clover fields are beautiful, the country is exceptionally healthy, the people are in good spirits and are prospering finely. Surely we have no reason to complain.

ARTHUR BETTS.

Ridgeway, Winneshiek Co., Nov. 2d.

WEATHER AND CROP CONDITIONS.

The weather conditions in October were very nearly normal in state averages. The mean temperature was about 3 degrees above normal, and the amount of sunshine was about the October average. The average rainfall was slightly above normal for the state at large, though portions of the central and southern sections received a considerable excess. In the northern section the general conditions were excellent for drying out corn and for the usual fall work. A good beginning was made in cribbing the matured portion of the corn crop In the central and southern districts fall plowing was much delayed by the saturated condition of the soil. Thrashing stacked grain revealed extensive damage to wheat and oats from excessive rains in the harvest season. The reports indicate a fair yield and generally good quality of potatoes. The crop of fall and winter apples was better than was indicated by reports during the growing season The season's products of cabbage, turnips, beets, squashes, and pumpkins were unusually large. The amount of forage grown was unusually heavy, though it was much impaired in quality by excessive moisture.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 30.02 inches; highest observed, 30 36 inches at Dubuque, on the 30th; lowest observed, 29 37 inches at Keokuk, on the 12th; range for the state, .99 inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 112 stations, was 53.5 degrees, which is about 3° above normal. By sections the mean temperatures were as follows: Northern section, 51.4°; Central section, 53 5°; Southern section, 55 7°. The highest monthly mean was 58.4° at Winterset; lowest monthly mean, 47.3° at Plover. The highest temperature reported was 83°, at Ida Grove and Council Bluffs on the 10th and 22d; lowest temperature reported, 20° at Plover on the 14th. The average monthly maximum was 77.6°; average monthly minimum, 27.2°. Greatest daily range, 46° at Sibley; average of greatest daily ranges, 35 7°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 130 stations, was 2.54 inches, which is 0.26 of an inch above normal. The averages by sections were as follows: Northern section, 1.24 inches; Central section 2.60 inches; Southern section, 3.78 inches. The largest amount reported was 6.66 inches at Newton; least amount reported, 0.28 of an inch at Sioux Center. The greatest daily rainfall reported was 3 71 inches at Newton on the 17th. Average number of days on which .01 of an inch or more was reported, 5.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 42 miles per hour, from the southwest, at Des Moines on the 25th. Average number of clear days, 16; partly cloudy, 8; cloudy, 7

OBSERVERS' NOTES.

ALTA—*David E. Hadden.* An ideal October, with Indian summer weather most of the time. An energetic electric storm in early morning of 21st.

AMANA—*Conrad Schadt.* Many tender plants still green at close of month; pastures fine and hay making still going on.

ATLANTIC—*J. W. Love.* Light snow on 13th; thunderstorm on 23d with no rain.

BONAPARTE—*B. R. Vale.* Precipitation for six months—April 20th to October 19th—40.41 inches. Last two weeks settled weather; corn hardly fit to crib; no fall plowing.

BRITT—*Geo. P. Hardwick.* Pleasant month, with but little frost; vegetation unusually green, except corn; insect life plentiful; farm work retarded by wet soil.

CLINTON—*Dr. Luke Roberts.* October, 1902, was marked by no abnormal weather conditions, but was a fair October average, and a happy contrast to the four or five months preceding.

The maximum temperature was 78 degrees, occurring on the 22d and 23d, being 4.2 degrees below normal, while the minimum temperature, 28 degrees, which occurred on the 14th, was 4 2 degrees above normal. The mean temperature, 52 degrees, was 2 degrees above normal. Ten Octobers during the last 24 years gave higher mean temperature, the highest of which was 57 8 degrees, occurring in 1900. The lowest mean temperature for the same period was 44.2 degrees, occurring in 1887 and 1895.

The warmest day was the 25th, which gave a mean temperature of 66 5 degrees, being 1.2 degrees below normal, while the coldest day, the 28th, gave a mean of 5.7 degrees above normal. Light frosts on the 6th, 20th, 28th and 31st and a killing frost on the 14th Even this was harmless, as it interfered in no way with fall pasturage, and crops were past injury. Apparently grass was as green and fresh at the close of the month as during the last two preceding months.

There were 9 days on which a measureable amount of rain fell. A copious precipitation occurred on the 17th, commencing at 4:30 P. M. and ending at 7 A. M. on the 18th, the principal downpour occurring between 9 and 10:30 P. M. of the 17th. Total amount 1.45 inches, being nearly one-half of the month's precipitation, which was 3.15 inches. This amount was .73 of an inch above October normal.

There were 8 cloudy days, 8 partly cloudy and 15 clear. The per cent. of cloudiness was 44, being 4 per cent. above normal. The movement of the wind was 3,680 miles, being slightly above normal.

FERTILE—*Geo. W. Paschen.* Corn cutting finished about the 5th with larger acreage than usual; corn husking begun the 20th.

FOREST CITY—*J. A. Peters.* Pastures extra at close of month; very little plowing done; corn too soft to crib; hog cholera bad.

GRAND MEADOW—*F. L. Williams.* Very favorable month for farm work; corn very soft; oats light.

GRINNELL—*A. O. Price.* Month pleasant; threshing finished; fall feed never more plentiful.

GUTHRIE CENTER—*E. S. King.* A remarkably fine month for fall work and for drying out corn; potatoes yield 100 to 150 bushels per acre; second crop grain on stubble fields heading out.

JEFFERSON—*Isaac Young,* During thunderstorm on 17th lightning killed several head of cattle, and windmills were blown down south of Jefferson.

OLIN—*Nathan Potter.* Month favorable for drying corn, and it is now in fairly good condition to crib; 40 per cent more or less hurt by frost.

RIDGEWAY—*Arthur Betts.* A lovely October; temperature normal; first killing frost here since April 24th on October 14th; corn half a crop.

ST. CHARLES—*R. D. Minard.* Precipitation January 1st to June 1st 8.45 inches; June, 6.71 inches; July, 12.77; August, 7.58; September, 6.06; October, 5.82. Total for ten months, 47.39 inches.

WEST BEND—*Ph. Dorweiler.* A fine month; threshing mostly done, and much grain in damaged condition; corn husking in progress.

ERRATA IN AUGUST REVIEW.

INDIANOLA.—Mean temperature recorded 65.4° on page 8, should have been 70.0 degrees. Mean maximum temperature recorded 73 8 degrees on page 9, should have been 78.9 degrees. Mean minimum temperature recorded 57.0 degrees on page 9, should have been 61 0 degrees.

MONTICELLO.—Mean temperature recorded 68.6 degrees on page 7, should have been 67.4 degrees. Mean maximum temperature recorded 82.0 degrees on page 10, should have been 79.8 degrees.

RUTHVEN.—Mean temperature recorded 68.1 degrees on page 7, should have been 68.0 degrees Mean maximum temperature recorded 77.8 degrees on page 10, should have been 77.7 degrees.

ERRATA IN JULY REVIEW.

OSKALOOSA.—Total precipitation recorded 7.71 inches on page 8, should have been 8.79 inches.

BELATED REPORTS FOR SEPTEMBER.

COLUMBUS JUNCTION.—Mean temperature 60.7°; highest 85°; on the 7th; lowest 33° on the 13th; greatest daily range 32; total precipitation 4.00 inches; greatest in 24 hours 1.60 inches on the 23rd; prevailing direction, northwest. Number of clear days 13, partly cloudy 11, cloudy 6, rainy 9.

CRESCO.—Mean temperature 56.3°; highest 78° on the 7 and 15th; lowest 31° on the 12th; greatest daily range 30; total precipitation 2.93 inches; greatest in 24 hours .96 inches on the 5th; prevailing direction, southeast. Number of clear days 20, partly cloudy none, cloudy 10, rainy 8.

FAYETTE.—Mean temperature 57.0°; highest 82° on the 7th; lowest 26° on the 13th; greatest daily range 40°; total precipitation 3.86 inches; greatest in 24 hours 1.41 inches on the 5th; prevailing direction, northwest Number of clear days 17. partly cloudy 1, cloudy 12, rainy 9.

COLLEGE SPRINGS.—Mean temperature 58 8°; highest 83° on the 6th, 7th and 26th; lowest 34° on the 13th and 27th; greatest daily range 41°; total precipitation 3.50 inches; greatest in 24 hours 1.73 inches on the 23rd; prevailing direction, southwest. Number of clear days 15, partly cloudy 7, cloudy 8, rainy 5.

KNOXVILLE.—Mean temperature 60.0°; highest 83° on the 7th; lowest 33° on the 13th; greatest daily range 33°; total precipitation 6.68 inches; greatest in 24 hours 2.20 inches; prevailing direction, northeast and northwest. Number of clear days 16, partly cloudy 2, cloudy 12, rainy 9.

LARRABEE.—Mean temperature 57.7°; highest 83° on the 7th; lowest 29° on the 12th and 18th; greatest daily range 37°; total precipitation 3 45 inches; greatest daily rainfall 1.04 inches on the 20th; prevailing direction, northwest. Number of clear days 17, partly cloudy 7, cloudy 6, rainy 8.

ODEBOLT.—Mean temperature 59.4°; highest 85° on the 7th; lowest 30° on the 12th; greatest daily range 40°; total precipitation 3.41 inches greatest in 24 hours 1.12 inches. Number of clear days 19, partly cloudy 5, cloudy 6, rainy 8.

VILLISCA.—Mean temperature 59.9°; highest 83° on the 7th; lowest 30° on the 13th and 28th; greatest daily range 43°; total precipitation 4.78 inches; greatest in 24 hours 2.50 inches; prevailing direction, northwest. Number of clear days 12, partly cloudy 9, cloudy 9, rainy 9.

ROCKFORD.—Total precipitation 2 23 inches; greatest in 24 hours 1.00 inch; prevailing direction, northwest. Number of clear days 25, partly cloudy 1, cloudy 4, rainy 4.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIII. NOVEMBER, 1902. No. 11.

IOWA CROPS—FINAL REPORT, 1902.

AVERAGE YIELD PER ACRE, TOTALS FOR THE STATE AND AVERAGE PRICES, DECEMBER 1, 1902.

Following is a summary of crop reports received from the correspondents of the Iowa Weather and Crop Service, showing the average yield per acre and totals for the State of staple farm products for the past season, and the average prices at the farms or nearest stations December 1, 1902. As the larger portion of the season's output will be consumed on the farms, and marketed in the form of beef, pork, mutton, horses, dairy and poultry products, etc., the actual value of the crops is materially higher than is shown by the figures representing the local prices obtainable at this time.

THE CORN CROP.—In bulk, expressed in bushels, the corn crop is reported to be a little above the ten year average, the yield per acre being about 34 bushels, and the total for the state grown on an area of about 8,700,000 acres, is 296,950,230 bushels

On account of the unfavorable character of the crop season, and the unusually variable condition of the corn crop a special report was called for in answer to inquiries as to the average yield of hard and soft corn, the percentage that is sound and merchantable, the local price of sound corn and the feeding value of the softer portion of the crop. The tabulated reports show the following results of this investigation: Dividing the state into three sections, or belts three counties wide crossing east to west, we find that in the northern section (thirty counties) the sound corn is estimated at 29 per cent; in the central section (thirty-eight counties) it is 48 percent; and in the southern section (thirty-one counties) the average is 64 per cent. For the state as a whole the average condition appears to be 47 per cent sound and merchantable, and 53 per cent graded as soft, chaffy or unmerchantable. The total yield by sections is as follows: Northern section, in round numbers, 73,000,000 bushels; central section, 129,000,000 bushels; southern section, 94,000,000 bushels.

The average local price of the sound corn is reported to be 35 cents per bushel, and the average feeding value of the softer portion is estimated at 22 cents per bushel.

This serves as a basis for estimating the total value of the corn crop this year in round numbers at $83,000,000. Last year the yield was 227,000,000 bushels and the value $113 000,000. In 1900 the total yield was 345,000,000 bushels, and the value, at the current prices, $93,000,000.

WHEAT.—The acreage of winter wheat is small, and the total yield appears to be only 825,045 bushels, an average of eighteen bushels per acre. In spring wheat the yield is thirteen bushels per acre and a total of 12,680,800. The total yields of both winter and spring wheat is 13,532,845. The quality of wheat is generally poor, on account of the very wet harvest, and the price of winter wheat is reported to be 55 cents, and spring wheat 52 cents. The total value of the crop appears to be $7,0 2,640. Last year the yield was 18,295,000 bushels and the value was $10,976,000.

OATS.—This crop suffered greater damage than any other cereal from effects of excessive rains, and it has been impracticable to secure reports as to the extent of total loss, and the quality of the grain that was secured in condition to repay the cost of threshing. The returns from correspondents indicate an average yield of 31 bushels per acre from the portion of the crop that was secured and threshed. Making a liberal deduction from the acreage planted in each county we have a total of 92,907 960 bushels, as against 114,000 000 bushels last year, and 138 000 000 bushels in 1900. The average local value of this year's product appears to be 24 cents per bushel and the total $22,297,910. Last year's oats crop was valued at $40,209,000.

BARLEY.—Estimated yield per acre, 25 bushels, and total yield, 15 380,940, valued at 33 cents per bushel, or a total of $5,075,710. Last year's crop was 14,654,000 bushels, worth $6,447,000.

RYE.—Average per acre, 17 bushels; yield, 882,830 bushels; worth 40 cents per bushel, and the total, $353,132. Last year's crop, 859,630 bushels, valued at $411,762.

FLAX.—Product, 725,350 bushels; yield per acre, 8 bushels. Value about $1.00 per bushel. Last year's crop, 916,880, worth $1,182,000.

POTATOES.—Product 91 bushels per acre; total yield, 12,051,670 bushels. Price 34 cents; total value, $4 097,567. Last year's product, 5,098,000 bushels, valued at $4,588,000. In 1900 the crop was 10,850,000 bushels, worth $4,340,000.

HAY (TAME).—Product 4,439,040 tons,—an average of 1.8 per acre. Value $6.80 per ton; total value, $30,171,592. Last year's output, 3,711,000 tons, valued at $30,721,000.

HAY (WILD).—Average yield 1.3 tons per acre; total yield, 1,203,860 tons, worth $5.50 per ton; total value, $6 615,730. Last year the product was 1,268,700 tons, worth $7,992,000.

The estimated value of sweet potatoes is about $320,000. Sorghum, $250,000; broom corn, $40,000. Timothy seed is estimated at $750,000; clover seed unknown and not ascertainable as to value.

Corn fodder in shock and fields probably worth half as much as last year, or about $10,000,000.

Pasturage bulky early and late and worth at least $35,000 000

Fruits and vegetables are estimated at $9,500,000, which is a conservative figure.

[Coontinued on Page 5.]

FINAL CROP REPORT, 1902.

TABULATED CROP SUMMARY.

CROPS.	TOTAL PRODUCT, BUSHELS.	FARM VALUE DEC. 1, 1902.
Corn	296,970,230	$ 83,432,708
Wheat	13,512,845	7,032,610
Oats	92,907,900	22,297,900
Barley	15,187,940	5,075,710
Rye	882,830	353,132
Flax	755,750	755,350
Potatoes	12,051,670	4,097,567
Hay (tame)	*4,439,040	30,171,592
Hay (wild)	*1,202,860	6,615,730
Sweet Potatoes		320,000
Sorghum		259,000
Broom Corn		40,000
Timothy Seed		750,000
Corn Fodder		10,000,000
Pasturage		35,000,000
Fruits and Vegetables		9,500,000
Total soil products		$ 215,722,339

* Tons.

As to the corn crop, it is proper to add that a considerable percentage is still ungathered and subjected to the vicissitudes of the weather, which at this time is unfavorable for securing the full product. The figures as to all the crops are submitted as the best that can be secured at this time, under exceptional conditions.

The grand total for last year was 274 million dollars, and in 1900 it was in round numbers 229 million dollars.

NOTES.

The captain of the British ship Anglesey reported that on September 20th off Cape Horn, the vessel sailed through a great ice field, in the midst of which was a gigantic iceberg over 100 feet high and about 100 miles long. It had been pushed off the great polar ice-cap of the Antarctic.

* * *

In an article on Alfalfa in Argentine, published in *Orange Judd Farmer*, by B. W. Snow, it was stated that for pasturage one acre of alfalfa is found to be equivalent to four acres of native grasses.

* * *

Meteorology considered as a system of research into the laws of the motions of the atmosphere is not a matter that can be prosecuted successfully by any short-lived spasmodic or discontinuous system of work. It must be undertaken by permanent co-operation and the long-continued labors of all nations; the important mountain observations should especially be maintained intact from generation to generation without any thought of discontinuing their work. Each pair of high and low stations is really of more importance to meteorology than any dozen stations at sea level. The time will doubtless come when Mount Washington, Pike's Peak and numerous other high stations in this country will be permanently occupied. The reports from both of these stations were frequently of great use to the editor in his early forecast work, and it is only a question of time when we shall learn how to make use of them on every occasion.—*Prof. Cleveland Abbe in U. S. Weather Review for August, 1902,*

* * *

At the recent Live Stock Exposition in Chicago Secretary Wilson made an address, from which the following paragraphs are taken:

"The meeting you have here now is the most magnificent expression of the world's progressive history. What a long time we waited for all this. Forty years ago Congress endowed agricultural stations and later experimental stations for the purpose of helping the farmer toward the establishment of the science of breeding and feeding, among other things, and what an illustration we have to-day with regard to tho latter. Our people are beginning to learn something about feeding. Our 2,500,000,000 bushels of corn, grown this year, is to go to market, the greater part of it, through our domestic animals.

"Our people are learning how to feed economically and prevent waste There is a great difference between shoveling grain into a snow bank and feeding stock a well-balanced ration in a stable or well-protected shed.

"A man cares for a crop all summer, works hard in the summer, gets it piled up; he has so much corn, he has so much oats, and he has got hay and straw and all that. Well, the question comes up then, does that man know how to feed the stuff so as to make the most money out of it? Generally he does not know. As a general proposition a very great waste occurs all over the United States in the feeding of our nutrients to our domestic animals, but there is hope held out by the presence of young gentlemen from colleges that we are to have scholars in the land along those lines, and that we are getting them rapidly. We have thousands of men studying in our agricultural colleges the sciences that make for greater profit on the farm.

"The United States is doing more for research along these lines for the American farmer than all the other countries in the world. The Department of Agriculture at Washington has more money at its disposal for research along these lines than Harvard and Yale and Columbia and this big Chicago university and Leland Stanford all put together.

"I want to call your attention a moment to the magnitude of the live-stock interests. Our animal production a year amount to $900,000,000 in the United States—$900,000,000 annually is the product of all our domestic animals in the United States. The dairies amount to $472,000,000. The little speckled hen of the barnyard cackles out $181,000,000 worth every year. We sent abroad last year our live animals and animal products $244,000,000 in round numbers; the year before it was $253 000 000—$250,000,000 worth of things going from the United States. Our cattle exports, live cattle last year, amounted to $32 000 000; our horses to $11,000,000; our sheep to $2,000,000. What we use at home—we have the greatest market in the world here—and what we send abroad added together makes that $900,000,000. Those are the interests, gentlemen, that we represent. You can take all the cotton and all the wheat and the oats and put them all together, and they all don't equal the livestock industry in its products."

METEOROLOGY AND MAGNETISM.

From a rapid survey of the cosmical meteorological problem, it is obvious that meteorology has large interests in solar and terrestrial magnetism. The annual reports of magnetic observatories are usually published several years after the records are made, hence, if meteorology is to insure any progress in seasonal forecasting, it evidently must possess its own magnetic apparatus, so that the state of the solar-terrestrial field may be known in connection with current meteorological phenomena. It must be conceded that considerable scientific skill will be required to bring this system of cosmical forces into control for the benefit of mankind, but I do not see how it can be doubted that the true pathway of research is already open before us. It is to be hoped that meteorologists generally will take up these cosmical problems, and compute the necessary homogeneous systems, so that it may become possible to advance promptly to practical results.—*Prof. Frank H. Bigelow in the Mouthly Weather Review for July, 1902.*

WEATHER FIXES TRAIN LOADS.

The following extract from the *Pittsburg Dispatch* is copied from the U. S. Monthly Weather Review for September, 1902:

"There is a closer relation between the weather bureau and the operation of freight trains than is generally known. On the Pennsylvania lines, and in reference to train movements from

Pittsburg to the west and northwest, this is particularly the case.

"Every day at noon the freight transportation department of the lines receives the weather report for the ensuing twenty-four hours from Observer Cox, of Chicago. His district extends from the Rocky mountains to the line dividing eastern Indiana from Ohio, and his standing for accuracy is such that, in the winter season particularly, the make-up of trains is arranged in accordance with Cox's reports—that is, the hauling capacity of a freight engine is decided upon on receipt of the daily bulletin. To this end four classes are arranged, designated alphabetically. The report being favorable places the engine's load in class A, or full capacity, 1,750 tons. Class B denoted a reasonably good weather report, but limits the locomotive's load to 1,625 tons. Still worse weather means a reduction of the load to 1.475 tons, or 150 tons less than class B. When Mr. Cox announces specially bad weather the order goes out for class D, which means that no engine shall leave Pittsburg for the west with more than 1,225 tons. In this way delays through storms and snowfalls and extreme low temperature are greatly lessened.

"In the case of stock trains, class A is not 1,750, but 1,450 tons, and for high class freight running at higher speed than ordinary freight, this class means only 1,525 tons per train, with the same allowance for the three lower classes as is given above.

"The load having been established in the office of the superintendent of freight transportation in accordance with the weather report, the order of the superintendent goes out to the trainmasters and thence to the yardmasters, who arrange the engine's load in accordance with instructions. It is doubtful if the United States Weather Bureau finds more practical application anywhere than in operating freight trains out of Pittsburg to the West."

WEATHER CROP CONDITIONS.

November was over 8° warmer than usual and there was also more than the normal amount of precipitation, humidity and cloudiness. These conditions as to the weather, and the prevalent excess of moisture in the fields retarded the corn harvest to considerable extent, and at the close of the month more than the usual amount of that important crop was still afield, with the advent of winter close at hand. The fall has been somewhat in line with the preceding wet summer, making it quite difficult in large areas of the state to secure the corn crop in condition to prevent further damage And yet the work was pushed rapidly as possible with all the help that could be secured.

Pasturage was green and abundant throughout the month. The potato crop was generally harvested in good condition before the middle of November.

CLIMATOLOGY OF THE MONTH NOVEMBER, 1902.

BAROMETER.—Mean pressure, 30.01 inches; highest observed, 30.34 inches, at Sioux City, on the 10th; lowest observed, 29.61 inches, at Sioux City, on the 12th; range for state, .73 inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 108 stations, was 41.2 degrees, which is 8.4° above normal. By sections the mean temperatures were as follows: Northern section, 38.1 degrees, Central section, 41.8 degrees; Southern section 43.7 degrees. The highest monthly mean was 48.2°, at Keokuk; lowest monthly mean, 35.4°, at Sibley. The highest temperature reported was 79°, at Carroll, on the 1st; lowest temperature reported, 4°, at Chester, on the 30th. The average monthly maximum was, 69.5°; average monthly minimum, 16,0°. Greatest daily range, 46°, at Denison; average of greatest daily ranges, 31.4°.

PRECIPITATION. — Average precipitation for the state, as shown by records of 127 stations, was 2.13 inches, which is .71 of an inch above normal. The averages by sections were as follows: Northern section, 2.08 inches; Central section, 1.94 inches; Southern section, 2 37 inches. The largest amount reported was 4.19 inches, at Stockport, least amount reported, .16 of an inch, at Sioux City. The greatest daily rainfall reported was 2.20 inches, at Charles City, on the 14th. Average number of days on which .01 of an inch or more was reported, 7.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 42 miles per hour, from the south, at Sioux City, on the 7th. Average number of clear days, 9; partly cloudy, 7; cloudy, 14.

OBSERVERS' NOTES.

ALTA—*David E. Hadden.* November, 1902, was generally cloudy, wet and warm. First snowstorm on the 25th.

AUDUBON—*Frank Mott.* Corn about two thirds in crib.

BAXTER—*W. T. Thorp.* About three-fourths of corn gathered, and 50 per cent merchantable.

BONAPARTE—*B. R. Vale.* Only 3.18 inches of rain in November, but the soil is too wet to plow; corn gathering much hindered; first snow on 29th; stock still on pasture.

BRITT—*Geo. P. Hardwick.* A damp, cloudy month, especially the second decade; unfavorable for cribbing corn; lung disease fatal to hogs.

CLINTON—*Dr. Luke Roberts.* Cloudiness for the month was 66 per cent. The number of cloudy days was 16; partly cloudy 6; clear 8. Mean temperature 43.8°, or about 8 9° above normal; rainfall 2.51 inches,—about .59 of an inch above normal.

EARLHAM—*Geo. Phillips.* About [20 per cent of corn in the fields.

GRAND MEADOW—*F. L. Williams.* Month very cloudy but favorable for fall work; much plowing done and corn generally gathered.

LOGAN--*Mrs. M. B. Stern.* Month remarkable for damp and cloudy weather; bad for soft corn.

RIDGEWAY—*Arthur Betts.* A green November, and extremely mild. Only 111 hours of sunshine; from 9th to 16th no sun appeared; first snow on ground 26th; ripe pumpkins unharmed in fields up to 25th; observer ate an excellent watermelon fresh from the field on the 17th and picked flowers from snow drifts December 1.

WAUKEE--*E. J. Leonard.* Weather unusually mild; on majority of the mornings there was no visible white frost.

BELATED REPORTS.

OGDEN.—July. Mean temperature, 73.4°; highest, 95°, on the 25th; lowest, 52°, on the 10th; greatest daily range, 32°; total precipitation, 8 87 inches; greatest in 24 hours, 1.60 inches, on the 8th; number of rainy days, 11.

SPIRIT LAKE.—August. Mean temperature, 68.4°; highest, 91°, on the 8th; lowest, 41°, on the 12th; greatest daily range, 37°; total precipitation, 6 08 inches; greatest in 24 hours, 1.60 inches, on the 30th; prevailing direction, northeast and south; number of clear days 7, partly cloudy 11, cloudy 13, rainy 9.

SPIRIT LAKE.—October. Mean temperature, 51.3°; highest, 83°, on the 22d; lowest, 24°, on the 28th; greatest daily range, 34°; total precipitation, .48 inch; greatest in 24 hours, .48 inch, on the 31st; total snowfall, trace; prevailing direction, south; number of clear days, 20; partly cloudy 5, cloudy 6, rainy 1.

ERRATA IN SEPTEMBER REVIEW.

GRUNDY CENTER. — Mean temperature recorded 59.0° on page 8, should have been 58.0°.

LANSING.—Mean temperature recorded 60.2° on page 8, should have been 60.1°. Mean maximum temperature recorded 71.9° on page 10, should have been 71.8°.

LOGAN.—Mean temperature recorded 59.4° on page,8 should have been 59 3°. Mean maximum temperature recorded 70.6° on page 11, should have been 70.4°.

NEW HAMPTON.—Mean temperature recorded 55.0° on page 8, should have been 55.8°. Mean minimum temperature recorded 43.6° on page 11, should have been 45.1°.

WAVERLY.—Mean temperature recorded 58.7° on page 8, should have been 58.6°. Mean minimum temperature recorded 49.0° on page 11, should have been 48.9°.

WILTON JUNCTION.—Mean temperature recorded 60.5° on page 8, should have been 61.0°. Mean maximum temperature recorded 71.6° on page 11, should have been 72.6°.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Meteorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve
Algona	C. D. Pettibone
Allerton	Ed. T Burns
Alta	D. E. Hadden
Alta (near)	W. J. Minard

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIII. DECEMBER, 1902. No. 12.

TWO ABNORMAL YEARS: 1901—1902.

An interesting study in climatology is afforded by comparison of the monthly weather records of 1901 and 1902, which may be regarded as types of climatic extremes. They certainly attest the fact that variableness is a marked characteristic of the climate in this midland valley. Within the past biennial period the extremes did not exactly meet, but they came together more closely than usual. While there is no evidence of a change in the general climate of this section, yet the records show sudden changes and great variability in the weather conditions as affecting the output of crops and the comfort of the people.

The following table shows the monthly averages of precipitation and temperature and the departures from normal in 1901 and 1902, for the state of Iowa:

RECORDS OF 1901.

MONTHS.	TEMPERATURE DEGREES.		PRECIPITATION INCHES.	
	Monthly means.	Departures from normal.	Monthly averages.	Departures from normal.
January	23.7	†6.5	0.74	-0.48
February	17 5	-4.0	1 01	-0.04
March	34.2	†1 0	2.64	†0 89
April	49 9	†0.4	1.79	-1.41
May	60.7	†1.0	2 35	-1 62
June	72 3	†2.3	3.71	-0.55
July	82 4	†8.7	2.34	-1.34
August	73 8	†2.7	1.29	-1.78
September	63.3	-1.0	4.77	†1.47
October	54.2	†4.0	1.98	-0 30
November	35.8	†3.0	0.86	-0.56
December	20 5	-3.1	0.93	-0 45
Yearly means	49.0	†1 8	24.6	-5 68

RECORDS OF 1902.

January	22 4	†5.3	0.87	-0.34
February	17.6	-4 0	0.73	-0.33
March	39.1	†5.9	1.45	-0.30

November	41.2	†8.4	2.13	†2.13
December	20.1	-3 5	2.23	†0.85
Yearly means	47.8	†0.6	43.82	†13.52

†Signifies plus. -Minus.

It will be noted that in the mean temperature of the two years the difference was only 1.2°; but in the three summer months the daily average temperature was 7° higher in 1901 than in 1902. And following the cool and excessively wet summer of 1902 the daily temperature of September was 5 2° below normal, which so disastrously affected the corn crop in the ripening period.

The most striking contrast in these two years was in the amount of rainfall in the critical months of the crop season. The crops in 1901 suffered materially from effects of excessive heat, and the quality of the products of 1902 was greatly impaired by excessive rains, floods and winds. The precipitation in 1901 was 5 68 inches below normal, and in 1902 it was 13 52 inches above normal, or 19 20 inches in excess of the amount in the preceding year. This difference in rainfall was most marked in the period from May 1st to September 1st, the amount for 1901 being 9 69 inches, and in 1902 27 80 inches. These figures represent the averages for the state, and this implies that considerable portions of the state received very much more than the total above given.

In 1901 there were 178 clear, 103 partly cloudy, and 84 cloudy days In 1902 the numbers were 145 clear, 109 partly cloudy and 111 cloudy days. The average number of days on which .01 inch or more rain fell for all stations of record, was 74 in 1901 and 100 in 1902. The excess of cloudiness and rainfall in the latter year occurred mainly in the crop season. As a matter of course, with such a notable difference in the precipitation, the last year brought much greater amount of destruction to property by wind, hail and lightning. The people who are most interested in the crops of the state were seriously alarmed and excited on account of the drouth and heat of 1901; but though less frightened, they really suffered greater damage from effects of the abnormal conditions in 1902.

PREVENTION OF LOSSES BY LIGHTNING.

By request the following paper was written by the Section Director, to be read at the annual meeting of the Clay County Farmers Mutual Insurance Association, at Spencer, Iowa, December 20, 1902. It is simply a re-statement of facts and deductions that need to be more widely disseminated:

"In farm property insurance the chief element of hazard is the destructive effect of lightning. If that could be eliminated the assessments levied upon the members of farmers' mutual insurance associations would be relatively light. This is well understood by officials and agents who are charged with the duty of adjusting and paying losses The aggregate of loss due to lightning in this state is fearfully heavy, and in proportion to the amount at risk the heaviest burden falls upon farm animals One of the mutual insurance companies doing a state-wide business in fire and lightning reports that the losses of live stock by lightning this season amounted to $3 95 per $1,000 at risk; and by eliminating the lightning hazard the loss on farm property would be only $1.49 per $1,000.

"By the insurance system we may, in some measure, help to bear one another's burdens, but the actual losses are never fully equalized in that way. But even if the losses were fully paid, and borne by all the people, it would still be our duty to prevent loss and destruction of property and thereby lessen the public burden.

"A large portion of the losses caused by both fire and lightning may be prevented by the exercise of due care and caution. This is certainly true as to ordinary fires, and losses by lightning are also measurably preventable Of course, it is impracticable to afford absolute protection to all farm buildings, stacks of grain and hay, and farm animals in the fields, but by means of properly constructed lightning rods on the more valuable buildings, and ground wires on all wire fences, three fourths of this class of losses may be prevented

"As a result of investigations during a series of years, sufficient facts have been collected to justify the conclusion that about two thirds of the farm animals killed in the fields by lightning were in close contact with wire fences. In many instances they were killed in bunches of three to fifteen, and in some cases lightning struck the fences many rods distant from the places where the dead animals were found. There is no longer any doubt as to the deadly effects of wire fences during prevalence of thunderstorms.

"Every strand of wire is an electric conductor, and sometimes shocks are felt by contact with wires even when the storm is quite distant. In the construction of telegraph and telephone lines all electrical engineers use ground wires to protect their poles and instruments against damage by lightning. And in the construction of wire fences a similar measure of precaution should be taken, especially if the fences inclose fields where animals are pastured. All that is necessary is to furnish sufficient wire connection to enable the electric current to reach the moist earth.

"The same principle is involved in the protection of buildings against the destructive effects of lightning discharges. A properly constructed lightning rod, having connection with moist earth, is simply the most convenient highway for electric currents to travel in Nature's efforts to restore the equilibrium between earth and clouds.

"Experience, and the investigations of the most eminent electricians of the world, all attest the efficacy of lightning rods in the protection of buildings. The fact that in rare instances rodded buildings have been damaged or burned does not militate against the fact that rods do afford protection. The failures are due to faulty construction, either in respect to the metallic points at the top, lack of connection with moist earth at the bottom, want of continuous connection of the metal in the rods, or insufficiency in size or number of rods to carry the most powerful discharges. A rod may be big enough to carry safely nine out of ten electric discharges, but the tenth one may be a very heavy overcharge, causing more or less destruction; just as a culvert underneath a road may be big enough to carry the floods of ordinary showers, and insufficient for the waters of a cloudburst.

"Statistics show that the risks of loss of life and property by lightning are fivefold greater in the farming districts than in the larger towns and cities. The evident reason is that in the cities a large measure of protection is afforded by the net work of wires on the streets, and amount of metal used in construction of buildings. This fact sustains the argument in favor of well-grounded rods and wires for protection of farm property.

"All the elements and forces of nature are beneficent, and within certain limits they may be made to serve human needs. This is an age of marvelous achievements in the mastery of the elements, and in utilizing the hitherto wasted energies and resources of the earth and air. We have tamed the electricity of the air and made it to haul our railway cars, light our streets, stores and dwellings, turn the wheels in workshops, and cook our food in kitchen ranges. Having accomplished all this, shall we supinely admit that we are utterly without power of self-protection against the electric currents that leap from clouds to the earth during the storms of summer? It would appear that it is no more presumptuous to attempt the exercise of control of lightning than to harness that same force and hitch it to our carriages in place of horses and mules. The same wire cables that will transmit a thousand horse power current of electricity a distance of 200 miles without loss of force, will also serve to carry a similar bolt safely from roof to earth."

EXTRACTS FROM NATIONAL BULLETIN.

December averaged somewhat milder than usual in the central and southern Rocky Mountain districts, in the Pacific coast States, over the northern portions of the upper Lake region and along the immediate south Atlantic coast, the average daily temperature excess being less that 3°, except over the middle Plateau region where it ranged from 3° to 4°. Nearly normal conditions prevailed over the interior portions of the South Atlantic States and along the Gulf coast, although there was a slight but general deficiency in temperature in these districts. Throughout the central valleys, lower Lake region, and New England the month was colder than usual, being decidedly cold in the central and upper portions of the Missouri Valley, where the average daily deficiency ranged from 8° to 11°. In the upper Mississippi, lower Missouri and Ohio valleys, the lower Lake region, northern portion of the Middle Atlantic States, and in New England the temperature deficiency generally ranged from 3° to 5°.

Over much the greater part of the country east of the Rocky Mountains the precipitation was in excess of the average for December, the central valleys and nearly the whole of the Lake region and Atlantic coast districts receiving from 1 to over 2 inches more than usual, while in portions of the lower Ohio Valley and western Tennessee the total precipitation ranged from 6 to 10 inches or 4 to 6 inches more than the December average. The north Pacific coast also received more than the December average but over the greater part of California and generally throughout the plateau districts there was less than the average, the deficiency in portions of central and southern California ranging from 1 to 3 inches. There was however, in extreme southern California more than the average. There was a decided deficiency over the greater part of the west Gulf States and slight deficiencies over limited areas in southern Florida, the south Atlantic States and lower Lake region. The most marked deficiency is shown in northern, central, and eastern Texas, where it ranges from 0.50 inch to more than 2 inches.

In the principal winter wheat States the month averaged cold with more than the usual amount of precipitation. The temperature conditions were, however, not unfavorable to winter wheat until the last decade, when the States of the upper Mississippi and Missouri valleys experienced temperatures ranging from zero to 28° below. During this period the Ohio Valley States were generally well protected with snow covering, but in the central Mississippi and lower Missouri valleys the crop was exposed. Only slight damage, however, seems to have resulted, and at the close of the month the crop appears to be very promising. Complaints of injury by fly are not extensive and are largely confined to the Ohio Valley.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 30.13 inches: highest observed, 30.77 inches, at Des Moines, on the 8th; lowest observed, 29.22 inches, at Davenport, on the 2d; range for state, 1.55 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 109 stations, was 20.1 degrees,

which is 3.5 degrees below normal. By sections the mean temperatures were as follows: Northern section, 17.4 degrees; central section, 20.4 degrees; southern section, 22.4 degrees. The highest monthly mean was 27.0 degrees, at Keokuk; lowest monthly mean, 14.6 degrees, at Alta and Estherville. The highest temperature reported was 59 degrees, at Albia, on the 1st; lowest temperature reported, –20 degrees at Estherville, on the 26th. The average monthly maximum was 47.2 degrees; average monthly minimum –10 9 degrees. Greatest daily range, 41 degrees, at Charles City and Sheldon; average of greatest daily ranges, 30 8 degrees.

PRECIPITATION—Average precipitation for the state, as shown by records of 123 stations, was 2.23 inches, which is 0.85 of an inch above normal. The averages by sections were as follows: Northern section, 2.32 inches; central section, 2 13 inches; southern section, 2.24 inches. The largest amount reported was 5 51 inches, at Ridgeway; least amount reported, .67 inch, at Ottumwa. The greatest daily rainfall reported was 2.15 inches, at Le Mars, on the 20th. Average number of days on which .01 of an inch or more was reported, 8.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 50 miles per hour, from the northwest, at Sioux City, on the 24th. Average number of clear days, 9; partly cloudy, 6; cloudy, 16.

OBSERVERS' NOTES.

ATLANTIC—*J. W. Love.* Month very fair, with considerable sleighing.

BONAPARTE—*B. R. Vale.* Ground not frozen till latter part of month. Precipitation for the year, 47.61 inches; 1898 gave us 54.45 inches, but it was more seasonable and gave us better crops except corn.

BRITT—*Geo. P. Hardwick.* There was snow sufficient for sleighing through the month; some unhusked corn yet in fields; much ice on level ground.

CARROLL—*Moses Simon.* Finest sleighing for years.

CHESTER—*C. H. Meredith.* Severe blizzard on December 3d. Precipitation for month, 4.37 inches.

COLUMBUS JUNCTION—*H. E. Simpson.* The cyclonic storm periods of the month have been exceptionally well marked. Rain turning to sleet and to snow, followed by high northwest winds and brief intervals of clear, cold weather, have been characteristic of each nine day period.

EARLHAM—*Geo. Phillips.* A cold, cloudy month; considerable corn still afield at close of month.

ELKADER—*Chas. Reinecke.* Total precipitation for 1902, 50.10 inches; highest temperature 95°, July 30th; lowest temperature 30°, below zero, January 28th.

FOREST CITY—*J. A. Peters.* Considerable corn in fields yet; sleighing good during month.

GRAND MEADOW—*F. L. Williams.* The month was cold and ground covered with snow; roads drifted; stock doing well.

GRINNELL—*A. O. Price.* A good many acres of corn in fields at close of month.

HUMBOLDT—*H. S. Wells.* Melted snow 1.57 inches; snowfall, 15 7 inches; rainfall for year, 40 inches.

JEFFERSON—*Isaac Young.* Ground was full of water when it froze solid; likely to be a late spring for farm work.

LOGAN—*Mrs. M. B. Stern.* Month has been cloudy and wet; lack of sunshine the worst feature.

OLIN—*Nathan Potter.* December was remarkable for excessive cloudiness; most of snow melted at close of month.

OSKALOOSA—*Jos. Boyd.* Month was noted for cloudy weather and fog. No frost in ground up to the 25th.

RED OAK—*J. S. Cole.* Total precipitation during the year, 47.26 inches; snowfall, 32.9 inches.

RIDGEWAY—*Arthur Betts.* December temperature normal; precipitation remarkably heavy, 5.51 inches; 111 hours of sunshine; dug parsnips December 2d, just as winter was setting in; ground began to freeze 4th; all thawed out on 21st; tremendous rain on 20th.

Ridgeway data for 1902—Snowfall, 44.1 in.; melted snow, 7.93 in.; rainfall, 40.61 in.; total precipitation, 48.54 in ; mean temperature for the year, 47.4; hours of sunshine, 2,843, which is 118 less than normal. First 4 months averaged 8 4 hours per day; next 4 months 9.3 hours per day, and last 4 months 5.8 hours per day. We have had years with less sunshine. Thunderstorms on 67 dates. The year was noted for big storms: January 20th, 1 51 in ; February 27th, 1 20 in.; May 4th, 1.42 in.; May 17th, 2.38 in ; May 21st, 1 57 in ; June 12th, 1.05 in ; June 25th, 2.22 in.; July 2d, 1 47 in.; July 20th, 2 43 in , July 22d, 1.00 in.; July 25th, 1 06 in.; July 30th, 1 01 in.; September 5th, 1.18 in.; November 14th, 1 16 in.; December 2d, 1.82 in.; December 15th, 1.28 in ; December 20th, 1 52 in

STOCKPORT—*C. L. Beswick.* Total precipitation for 1902, 50.74 inches.

VILLISCA—*C. E. Matteson.* Total precipitation for 1902, 51.17 inches. Rivers overflowed banks 7 times during the year.

WAPELLO—*G. W. Schofield.* Precipitation for the year 1902 was 48.73 inches. In 1901 the total was 17.03 inches; in 1900, 30.98 inches; in 1899, 22.34 inches.

WAUKEE—*E. J. Leonard.* Very little frost in ground until about Christmas; much corn yet in fields.

WATERLOO—*M. L. Newton.* The following table shows the monthly precipitation at this station for the year 1902; also the monthly averages for the past twenty years, and the maximum amount recorded in the different months of the twenty-year period and the date of its occurrence:

MONTHS.	1902—inches.	20-year averages—inches.	Maximum in any year—inches.	Date of maximum.
January	0.93	1.19	2.20	1893
February	1.47	1.10	2.55	1893
March	3.29	1.92	3.54	1893
April	1.28	3.20	5.30	1889
May	8.54	5.16	11.20	1892
June	6.81	5.64	14.00	1890
July	10.61	4.61	10.61	1902
August	7.70	3.68	11.00	1885
September	4.86	4.70	12.00	1887
October	1.50	3.18	7.20	1889
November	1.83	1.75	4.00	1884
December	1.94	1.16	1.94	1902
Sums	49.76	37.29		

ERRATA IN OCTOBER REVIEW.

BONAPARTE—Mean temperature recorded 57.9° on page 8 should have been 55 9°. Mean minimum temperature recorded 47.8° on page 9, should have been 43.8°.

BRITT—Mean temperature recorded 50.9° on page 7, should have been 50.4°. Mean maximum temperature recorded 62.7° on page 9, should have been 61.7°.

CEDAR RAPIDS—Mean temperature recorded 54.2° on page 7, should have been 55.2°. Mean maximum temperature recorded 63.3° on page 9, should have been 65.3°.

DECORAH—Maximum temperature recorded 73° on the 21st and 23rd on page 7, should have been 74° on the 8th.

DELAWARE—Mean temperature recorded 51.2° on page 7, should have been 51.0°.

DOWS—Mean temperature recorded 51.0° on page 7, should have been 50.9°. Mean minimum temperature recorded 39.7° on page 9, should have been 39.5°.

IDA GROVE—Mean temperature recorded 52.8°, on page 7, should have been 52.2°.

IOWA FALLS—Mean temperature recorded 50.2° on page 7, should have been 50.7°.

LENOX—Mean temperature recorded 56.4° on page 8, should have been 54 6°.

PLOVER—Mean temperature recorded 47.8° on page 7, should have been 48.9°. Mean minimum temperature recorded 32.0° on page 10, should have been 35.20°.

SCRANTON—Mean temperature recorded 52 5° on page 7 should have been 52.6°.

HAMPTON—Mean maximum temperature recorded 65.4° on page 9, should have been 65.1°. Mean temperature recorded 53.4° on page 7, should have been 53.3°.

ERRATA IN NOVEMBER REVIEW.

FOREST CITY—Total precipitation recorded 3.34 inches on pages 9 and 11, should have been 2.34 inches.

OSKALOOSA—Maximum temperature recorded 73° on the 12th, on page 8, should have been 11th.

RED OAK—Mean temperature recorded 45.9° on page 8, should have been 44.2°. Mean maximum temperature recorded 56.2° on page 10, should have been 52.9°.

SCRANTON—Mean maximum temperature recorded 47.8° on page 10, should have been 47.7°. Total snowfall recorded 0.8 inch on ppge 8, should have been 0.3 inch.

SHELDON—Mean temperature recorded 36.8° on page 7, should have been 37.0°.

BELATED REPORTS.

FAYETTE.—November. Mean temperature 40.2°; highest 66° on the 1st, 11th, 12th and 13th; lowest 11° on the 30th; greatest daily range 31°; total precipitation 2.13 inches; greatest in 24 hours 1.21 inches on the 14th; total snowfall 3.1 inches; prevailing direction, southwest and northwest; number of clear days 9, partly cloudy 4, cloudy 17, rainy 6.

DOWS.—November. Mean temperature 39.5°; highest 69° on the 1st; lowest 17° on the 30th; greatest daily range 32°; total precipitation 2.22 inches; greatest in 24 hours 1.40 inches on the 15th; total snowfall, trace; prevailing direction, south; number of clear days 11, partly cloudy 7, cloudy 12, rainy 6.

SPIRIT LAKE.—December. Mean temperature 16 2°; highest 53° on the 1st; lowest 20° on the 26th; greatest daily range 29°; total precipitation 1.46 inches; greatest in 24 hours .40 inch on the 3rd and 15th; total snowfall 9 5 inches; prevailing direction, south; number of clear days 10, partly cloudy 2, cloudy 19, rainy 6.

VILLISCA.—November. Mean temperature 42.8°; highest 74° on the 11th; lowest 15° on the 27th; greatest daily range 30°; total precipitation 2.20 inches; greatest in 24 hours 1.06 inches on the 14th; prevailing direction, northwest; number of clear days 9, partly cloudy 11, cloudy 10, rainy 6.

APPENDIX--ANNUAL SUMMARY, 1902.

CLIMATOLOGY OF THE YEAR 1902.

BAROMETER.—The mean pressure for the year was 30.01 inches. The highest observed pressure was 30.96 inches on January 28th at Dubuque; lowest pressure, 28.67 inches, on February 28th at Davenport. Range for the state 2.29 inches.

TEMPERATURE.—The mean temperature for the state was 47.8°, which is 0.6° above normal. The highest temperature reported was 98° on July 30th at Charles City. The lowest temperature reported was 31° below zero on January 27th at Atlantic. Range for the year 129°.

PRECIPITATION.—The average amount of rain and melted snow for the year, as shown by complete records of 99 stations, was 44.31 inches, which is 14.01 inches above the normal and 19.69 inches above the average amount for 1901. The greatest amount recorded at any station for the year was 58 80 inches at Columbus Junction; least amount recorded 20.14 inches at Sioux City. The greatest monthly rainfall was 18 04 inches at Grand Meadow in May; least amount, a trace, at Cresco in March; the greatest amount in any consecutive 24 hours was 6 96 inches at Allerton, August 25th and 26th. The average number of days on which .01 inch or more of rain fell was 100.

WIND AND WEATHER.—The prevailing direction of wind was northwest. Highest velocity reported, 74 miles an hour, in Sioux City, from the north, on April 25th. Average daily wind movement 211 miles. There were 145 clear days, 109 partly cloudy, and 111 cloudy days.

REVIEW OF THE CROP SEASON, 1902.

January, 1902, was warmer than usual, the daily mean temperature being about 5 degrees above normal, and the average precipitation for the state was b low normal. February temperature averaged about 4 degrees below normal, and the precipitation was less than the normal amount, the larger part coming about the close of the month The winter as a whole was about as moderate and favorable as the average in this section.

March was warmer than usual, the mean temperature ranging from 4 to 7 degrees above the normal. Wintry weather of considerable severity prevailed from the 1st to the 4th and from the 15th to the 19th, but the balance of the month was mostly springlike and unusualy favorable for early farm operations. The soil was in excellent condition for plowing, and seeding of spring wheat and oats was well advanced before the close of the month. The season opened from ten days to two weeks earlier than the average in this section. The cold wave and high wind, prevalent from the 16th to the 18th, caused some damage to winter wheat in the southern and central counties, and delayed spring seeding in all parts of the state. The average perecipitation was below normal, but there was ample moisture to facilitate plowing and for germination of grain.

April was slightly cooler and drier than usual, the abnormal condition prevailing for the most part through the first and second decades. The last decade was seasonably warm, and copious showers relieved apprehensions of a serious drouth. The worst features of the month were the frequent dust storms and strong gales, which caused considerable damage to windmills, trees and light structures, and wrought some injury to newly seeded grain crops in exposed localities, by uncovering the grain or blowing the loose soil into drifts. The conditions however, were generally favorable for field work, and more than usual progress was made in seeding and preparing the ground for planting corn. In southern localities the planters were started about the 28th to 30th of April. The germination of small grain was retarded by the cold and dry weather in the first half of the month, but there was considerable moisture below the dry surface to quicken growth when the soil became warmer during the last decade. At the close of the month the grain crops were making a fair stand and the outlook was generally promising. The foliage and bloom on fruit trees appeared very near the normal period. There was a fair prospect for apples, plums and cherries, but peach buds were not in evidence, and the smaller fruits did not give promise of full average crops. Pastures and meadows were late in starting, but the growth was fairly good at close of April.

In marked contrast with the preceding month, May was warm and showery. The daily excess in temperature was about 4°. The average rainfall for the state was 5.39 inches, which is 1.42 inches above normal. There was great inequality in the distribution of rainfall, ranging from 87 of an inch at Washta, Cherokee county, to 18.04 inches at Grand Meadow, Clayton county. The area of the marked deficiency was limited to a small portion of the northwest district. The northern section received the heaviest rainfall, and the eastern half of that section the bulk of that amount. But the soil was very dry, and in excellent condition to absorb and retain a goodly portion of the copious moisture; and despite the interruption of frequent rainy days the work of planting corn progressed rapidly between showers, so that before the close of the month the corn area was practically planted. The seed was generally good, and a fair stand of corn was secured, with not more than the usual amount of replanting. Cultivation was begun early, and in portions of the state where the rainfall was about normal, or less than normal, the crop was most thoroughly cleaned and made most satisfactory progress. Generally corn was rated in high condition on June 1st. The copious rains, though not so favorable for corn planting and cultivating, were highly favorable to grass in pastures and meadows, and caused a heavy growth of all small grain crops. Except in portions of the northwest district spring wheat, oats and barley showed a tendency to rankness, causing apprehension of damage by lodging and rust. The potato crop was generally very promising at close of the month, and garden truck was seldom in better condition at the corresponding date.

June was an abnormal month in respect to temperature, amount of rainfall and excess of cloudiness. The daily average temperature for the state was about 5° below normal, and the daily average of the last decade was about 11° colder than the first decade of the month—a reversal of usual conditions. At the central station the records show only 49 per cent of sunshine for the month, and about 75 per cent of mean relative humidity. On the mornings of the 21st and 22d frost was observed at numerous stations, with some damaging results in the northwest district. The average rainfall was 7.16 inches, which is 2.90 inches above normal. The heaviest amounts were recorded in the central district, and the lowest in several counties of the northwest district. One striking feature was the fact that showers fell in some portion of the state every day in the month. The average number of clear days for all stations of record was only eight, as against an average of twenty-two cloudy or partly cloudy days. As a result of these abnormal weather conditions farming operations were greatly retarded, and in the wettest portions field work was wholly

impracticable except at short intervals between showers. On the river bottoms in the central counties many thousand acres of corn, small grain and meadows were flooded and the crops practically ruined. But despite all the drawbacks fully three-fourths of the corn acreage had been fairly well cultivated, and the average condition of early planted fields was promising at close of the month. The oats crop grew unusually rank on rich lands in all sections where the rainfall was at or above normal, and there was a tendency to rust. At close of the month oats and spring wheat were filling well, and were standing up remarkably well though bulky in straw. Winter wheat, rye and clover harvest was begun, but the wet weather was unfavorable for securing hay and grain. Potatoes, pastures and garden vegetables made great advancement. The wet weather was very favorable for new seeding of grasses.

In respect to temperature, July was about normal, the average for the state being 73 degrees; but the month broke all records as to amount and distribution of rainfall, frequency of showers, severe wind squalls and extent of overflow of the principal rivers of the state. The average precipitation was 8.67 inches, or about 5 inches above normal, and the reports of all stations of record showed an excess. As in the preceding month of June, the records showed a measurable amount of rainfall every day during the month, at one or more stations. These adverse conditions greatly retarded the cultivation of late corn, and harvesting the matured crops of hay and small grain. The saturated grain fields were rendered too soft for operation of harvesting machinery. The heavy storms of rain and wind caused lodgment of oats, wheat, barley and grass to a much greater extent than was ever known in previous years, and this added greatly to the labor and difficulty in securing the heavy burdens of grain and hay. There was, therefore, a much larger percentage of loss of acreage and damage to quality of these crops than was ever known in this state in recent years. But despite these unusual drawbacks, by strenuous labor between showers, the farmers secured a considerable amount of hay in fair condition, and the small grain crops were put in shock or stack. Corn in upland fields that had been well tilled was in fair condition, being bulky and heavily eared. Potatoes exceeded all recent records. All kinds of garden truck made heavy growth. Apples suffered materially from windstorms.

The abnormal features prevalent in June and July continued throughout the larger part of August, the cool, cloudy and showery weather making altogether the wettest and most unfavorable season for cultivating crops and harvesting hay and grain that has been experienced in Iowa during the past thirty-three years. The daily mean temperature for August was 2 degrees below normal, and the average rainfall, 5.58 inches, —— 3.51 inches above the normal amount. Cool nights, cloudy days, frequent showers, excessive humidity of the air and saturated soil, retarded the ripening of corn and rendered it well nigh impossible to carry on the usual harvest operations. At the close of the month corn was about two weeks later than usual, with rank growth of stalks and very heavily eared. The late planted portion of the crop was green as in June, and its immature condition indicated the need of a full month of warm and dry weather to bring it to the stage to withstand killing frosts. The oats crop suffered greatest damage in shock and stack, and a very large percentage has been ruined. Spring wheat was injured, but the total loss was not so great. Barley was discolored and much of it rendered unmarketable. The hay crop was badly damaged, but there was partial compensation in the growth of very heavy aftermath. Potatoes suffered materially by rot and blight of tops.

The month of September was also cold, cloudy and wet. The daily average temperature being 5 degrees below normal and the rainfall, 4 35 inches, was 1 36 inches above the average for that month. The generally saturated condition of the soil retarded field work, and corn and other unripened crops made slow progress toward maturity. The period of low temperature from the 11th to the 13th, with frost and ice in all districts, caused great injury to belated corn, especially on low ground and in the northern half of the state, where the crop was least advanced. All reports indicated very heavy damage from the untimely frosts and continued prevalence of unseasonable weather.

October was nearly normal in amount of rainfall, though portions of the central and southern sections received a considerable excess. The temperature was about 3 degrees above, normal and there was a fair amount of sunshine. In large areas the soil was too wet for plowing, and many corn fields were not dry enough for harvesting the crop. November was warmer than usual, with excess of moisture, humidity and cloudiness. The conditions were measurably unfavorable and at the close of the month fully 25 per cent of the corn crop was still afield and much of it was lying on the ground and covered with snow. The wintry conditions prevalent throughout December afforded but little opportunity to secure the unharvested portion of the crop.

The season was generally very productive in respect to the bulk of all soil products, but the quality has been much impaired, and a large percentage of small grain and corn was practically destroyed. The final reports show a full average yield of corn in bushels per acre, but fully 55 per cent of it was below the merchantable grade, and its value in the markets was correspondingly low. Pasturage has been unusually heavy though in quality it was below the normal standard. The potato crop, as a whole, was much better than in recent years, though there was some loss from rotting. Apples yielded more abundantly than was anticipated in midsummer.

ERRATA IN 1900 ANNUAL.

HARLAN.—Precipitation for December recorded .71 inch on page 21, should have been .90 inch. Total precipitation recorded 29.95 inches on page 21, should have been 30 14 inches.

MT. PLEASANT.—Mean temperature for September recorded 63.5° on page 19, should have been 63.6° Mean temperature for the year recorded 49.7° on page 19, should have been 49.8°

CRESCO.—Annual mean temperature 44.9°; highest 106° on July 24; lowest —29° on December 14.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. JANUARY, 1903. No. 1.

EDITORIAL NOTES.

Marconi has expressed the opinion that wireless messages sent across the Atlantic will cost ten cents per word at the outset, and will eventually be transmitted at a one cent rate.

* * *

The Rockford *Register* says: "Iowa furnishes more winter tourists for California than any other state. They go from this state because they are able to go, and they are able to go because they live in this state."

* * *

Marconi took advantage of a recent storm to test the effects of adverse weather conditions on his wireless telegraph system, and the messages were successfully transmitted while storms were raging at both ends of the line.

* * *

An inventive genius mounted two windmills on a wagon, the wind serving as power to haul the wagon to any place desired. A pulley on a shaft driven by the windmills can be belted and used for driving various kinds of farm machinery. Thus saith a newspaper item.

* * *

The meteorological station at Mason City has been re-established, with Mr. J. S. Mills serving as voluntary observer. Mr. Mills is highly recommended and takes a deep interest in the service. It is desirable that a permanent station shall be maintained at that important commercial center.

* * *

We have received a valuable table showing the monthly and annual rainfall at Clermont, Fayette county, Iowa, for the years 1877 to 1902, inclusive, the data being the records of observations by Augusta Larrabee and William Larrabee, Jr. The table will be published in the annual report for 1902.

* * *

It is not often that famine visits a country as a result of excessive rainfall, the periodical famines of central Russia and India being invariably caused by drought, but in the northern districts of Sweden and in Finland a famine involving the lives of over 100,000 people exists to-day as a result of the excessive rainfall of the year 1902.—*J. S. Trigg, in Rockford Register.*

* * *

We hear reports now and then of discoveries of oil in Iowa. Well, there's plenty of oil in the soil of this state—oil in paying quantities. But the best of it is not to be found in gushers, or by boring. It's the oil of corn, and it can be produced in great abundance by planting, cultivating and harvesting that great staple product. There may be traces of oleaginous matter in the lower rocks, but there is some uncertainty about striking paying quantities of patroleum in this section. As to corn-oil, however, there's no doubt whatever, and it's good for millions of revenue.

* * *

At the recent annual congress of the Swiss Society of Natural Science, held at Berne, a new and interesting theory as to the origin of the appearance of the higher atmosphere, which is popularly styled as the "blue sky," was advanced by M. Spring, a well known scientist of Liege. Hitherto the azure tint has been supposed to be due to the refraction of light upon minute corpuscles disseminated in the air M Spring however, has conceived a new explanation of the phenomenon. He has carried on a number of experiments with luminous rays under almost all conceivable conditions, injecting them into agitated solutions, and into a glass tube containing pseudo solutions, such as chlorides of aluminum, of absolute limpidity; but although he could obtain red, yellow, violet, etc , under no circumstances could he obtain blue, until by the use of electricity he secured a perfectly pure atmosphere in which blue was clearly discernible. M. Spring therefore concludes that the blue of the sky is purely electrical in origin, and is an essential quality of the air.—*Scientific American.*

AUSTRALIAN DROUGHTS AND THE MOON.

Mr. H. C. Russell, Director of the Observatory at Sydney, New South Wales, has published in the Journal and Proceedings of the Royal Society of New South Wales, for the year 1901, a memoir on the relation of the moon's motion in declination and the quantity of rain in that colony, in which the author concludes "that rain is clearly shown to come in abundance when the moon is in certain degrees of her motion south; but when the moon begins to go north then droughty conditions prevail for seven or even eight years. This phenomenon repeated for three periods of nineteen years each constitutes a marvellous coincidence, such that there must be a law connecting the two phenomena."

The influence of the moon on the weather is a matter that will not be downed by the exercise of any amount of common sense. According to the most ancient notions, the moon ought to have and must have a controlling influence in excess of the sun's, and every one who seeks to demonstrate its power is liable to become infatuated with the study. The moon has so many variations north and south of the equator, north and south of the ecliptic, to and from the earth, from new moon to full moon, conspiring with the sun and opposing the sun, that it does seem as though one ought to be able to make its periodical oscillations agree with some of the many variations in the aspect of the weather. However, we know of but one relation between the moon and the earth's atmosphere that can be said to have been settled upon a rational basis, and that is the matter of atmospheric tides. Laplace stated that the semi-

diurnal lunar tide in the atmosphere ought to amount to about 0.003 inches of barometric pressure for equatorial stations, and this agrees with the results of observations carried on at Batavia, Java. His formulæ also showed, although we believe he did not state the fact, that as the moon moves north and south of the equator monthly, there ought to be a fortnightly tide, or a general pull of the atmosphere southward for two weeks and northward for two weeks. This, we believe, was first demonstrated as an observable quantity by A.Poincare, a civil engineer of Paris, and a member of the Meteorological Society of France. From his articles published by that society in 1885–1888, we learn that the average barometric pressure on parallels of latitude around the whole globe, as measured on the International Maps published by the United States Weather Bureau, give the following results: The pressure on latitude 40° minus that on latitude 10° is plus 1 88 millimeters when the moon is in the extreme south and plus 4.82 millimeters when the moon is in the extreme north. The normal difference is plus 3.35. This indicates that when the moon is furthest north there is a slight accumulation of atmosphere in the Northern Hemisphere, amounting to an increase of 1.47 millimeter, or 0.06 inch of pressure on the parallel of 40°.

Now, all lunar phenomena go through rather rapid periodic changes. What happens in one part of a lunar month is offset by an opposite effect in the other half of that month, or what happens at the time when the sun and moon conspire is offset by an opposite effect a few months or years later when the sun and moon oppose each other. When the moon is far south and begins to go north, according to Mr. Russell, droughty conditions prevail and continue for seven or eight years. But the strange part is that the moon begins to go north from her extreme southern position every month without exception, not only just before the seven or eight year drought, but during the whole of that long period, and continues to do so during the whole of the succeeding rainy period. How can her beginning to go north be rationally supposed to be a basis for predicting droughts in one case and rains in another?

But if we lay aside all these vagaries about the moon, and recognize Mr. Russell's meteorological induction that droughty conditions do prevail for seven or eight years in Australia, followed by years of rain, and that this cycle of droughts and rains has been repeated about three times since 1840, then, we have a fair observational basis upon which to build a rational explanation. Now, this periodicity, or rather the irregular succession of good seasons and bad seasons is a fact recognized in every portion of the world We have also enough data to show that in most cases a drought in one portion of the globe is accompanied by rains in other portions, and that the regions of excess and deficiency of rain move over the surface of the globe month by month and year by year. They do not move in courses so nearly parallel as to justify long range predictions any more than do our storm centers, but the movements are certainly governed by laws, and we can begin to generalize as a first step in the process from induction to deduction. For instance floods in the upper Nile, due to rains in the highlands of central Africa, mean that an unusual proportion of moisture has been taken from the southeast trade wind current, and that, therefore, when that has turned northeastward over the Indian Ocean, and has become the southwest monsoon of India, it will bring droughts over the western portion of that country. A drought in New South Wales, or on the southeast side of Australia, means a deficiency in the easterly winds blowing on that coast, and especially so in the rainy season, or December, January, February and March. But this means that the great area of high pressure over the Indian Ocean at the latitude 30° south has been pushed farther west than usual, or in other words that the general circulation of the atmosphere in that region has been disturbed. Now, such a disturbance, continued over several months or even years, can hardly be produced by the rapidly changing moon; it might be due to secular changes in the quantity and quality of the solar heat, but is most of all likely to be simply the result of accumulations of pressure, temperature and moisture in various portions of the earth's atmosphere. Australia has about the same area as the United States, but lies on the average about 15° nearer the equator. This latter feature gives it soil temperatures and monsoon influences similiar to those that prevail in northern Africa, so that it may itself produce an appreciable disturbance of the general circulation in the southern half of our atmosphere. But the principal cause of the droughts in Australia and India is undoubtedly to be found in the changes going on periodically in the relation between the general atmospheric pressure and resultant circulation in the south and in the north, or between Cape Colony and Australia, China and eastern Siberia. In this large portion of the globe a system of circulation prevails that is affected but comparatively little by what goes on to the west of it and north of it. A large quantity of air enters into this region from the Anarctic Ocean and passes out of it as the southwest monsoon of southern Asia to eventually become the westerly winds of the North Pacific. We may, therefore, look for some connection by this roundabout way between the droughts and rains of Australia, or southeastern Asia, and those of northwestern America.—*Prof. Cleveland Abbe in U. S. Weather Review, Nov. 1902.*

WEATHERING ROCKS.

Rain, assisted by the dissolved gases and surrounding air, acts chemically on rock surfaces, producing changes known as weathering. Next to beds of rock-salt and gypsum (calcium sulphate) limestone is the rock which is dissolved most readily. The waste of the hard and massive surface is often shown only by the way in which it becomes studded with less soluble nodules or fossils originally hidden in its substance. Sir Archibald Geikie has calculated that by the acid-laden rain of towns one-third of an inch is removed from the surface of marble monuments in a century. Insoluble sulphides, such as that of iron, are rapidly oxidized by air in the presence of moisture to form soluble sulphates, and when this process goes on in the pores of a rock the expansion of the chrystalized salts splits the block into thin layers. This action is the basis of the common way of making alum. In the case of granite and most other rocks the process of weathering is more complicated. Some of the minerals are decomposed. In felspar, for instance, the silicates of potash, soda, and lime are changed to corbonates which are washed away, while the silica and the more resisting silicate of alumina remain as a soft crust of kaolin or china clay, valuable for making porcelain. Granite has been found weathered in this way in South America to the depth of 600 feet. Rocks containing iron usually become brown or reddish in color, although the freshly broken rock may be white or gray. The lines of stratification and joints of rocks are sometimes etched out by weathering, so that the face of the cliff assumes the appearance of a gigantic wall of masonry. The crumbling of rocks in rainy regions is assisted by the action of the sun in drying and warming the surface, which may then be splintered into flakes by a shower of cold rain. Rain soaking by capillary attraction through the weathered crust and into the pores of the solid rock is frozen in cold weather, and the ice, expanding as it forms, acts like a multitude of minute wedges driven simultaneously in all directions. When the thaw comes, the bases of the cliffs and banks are strewn with weather crusts and stones, often of a great size, broken off in this way.—*Mill, in "Realm of Nature."*

PRECIPITATION AT WATERLOO, IOWA.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 30.02 inches; highest observed, 30.44 inches, at Dubuque, on the 8th; lowest observed, 29.29 inches, at Dubuque, on the 6th; range for state, 1 15 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 105 stations, 23.0 degrees, which is 3.5 above normal. By sections the mean temperatures were as follows: Northern section, 19.8 degrees; central section, 22 8 degrees; southern section, 25.8 degrees. The highest monthly mean was 27.8, at Red Oak; lowest monthly mean, 17 5, at New Hampton. The highest temperature reported was 60°, at Balknap, on the 1st; lowest temperature reported, -12°, at Clear Lake, on the 11th. The average monthly maximum was 46 7; average monthly minimum, -6.2. Greatest daily range, 45°, at Carroll; average of greatest daily ranges, 32.1.

PRECIPITATION.—Average precipitation for the state, as shown by records of 120 stations, was 0.28 inch, which is .74 of an inch below normal. The averages by sections were as follows: Northern section, .21; central section, .29; southern section, .28. The largest amount reported was 1 46 inches, at Fort Madison; least amount reported, a trace, at Charles City, Carroll, Cumberland, Afton, Atlantic, Thurman and Winterset. The greatest daily rainfall reported was .70 inches at Danville on the 2nd. Average number of days on which .01 of an inch or more was reported, 4.

WIND AND WEATHER.—Prevailing direction of wind, northwest; highest velocity reported, 72 miles per hour, from the northwest, at Sioux City, on the 6th. Average number of clear days, 13; partly cloudy, 7; cloudy, 11.

The month was unusually favorable for feeding stock, and or gathering the unharvested portion of the corn crop. Fall wheat and rye, of which a small acreage was sown, were not materially injured by freezing weather.

OBSERVERS' NOTES.

AFTON—*N. W. Rowell.* On the 7th the wind was 40 to 50 miles an hour, the high wind prevailing 24 hours

ALTA—*David E Hadden.* Gale with blinding snowstorm raged from 8 P. M of the 6th to sunset on the 7th; some slight damage done Last week of the month was warm, and December's legacy of snow was nearly all gone.

AMANA—*C. Schadt.* Excepting a few days January was mild; cattle still finding green grass in protected places.

ATLANTIC—*J. W. Love.* The mildest January in 12 years. No rain, and only a trace of snow three times; zero temperature only on two days.

BONAPARTE—*B. R Vale* A mild month, too soft at times; stock did well on blue grass meadows and pastures all the month.

BRITT—*Geo. P. Hardwick.* Mild weather excepting severe wind on 7th and 8th; ground nearly bare at close of month; stock healthy; some corn yet in fields; hay scarce.

CLINTON—*Dr. Luke Roberts.* Cloudiness 59 per cent. or 8 per cent above normal. Precipitation 1.03 less than normal; country roads better than usual; two weeks of sleighing; ice crop excellent and abundance secured Mean temperature for January 22.7° being 4.1° above normal. Maximum velocity of wind twenty-seven miles an hour on the 7th. and again on 29th; total wind movement for the month 4000 miles.—nearly 1000 miles less than normal.

DENISON—*W C Van Ness.* A very mild and pleasant January, easy on stock and feed.

EARLHAM—*Geo. Phillips.* A fine January; farmers finished picking corn; some young cattle dying.

GRAND MEADOW—*F L. Williams.* On the 6th the mercury in barometer was down to 27 80 inches; month as a whole a pleasant one; stock wintering well.

GRINNELL—*A. O. Price.* Little snow and generally fair weather; fine for stock.

GRUNDY CENTER—*E. S King.* A good month for gathering corn. but not all picked yet.

OLIN—*Nathan Potter.* A pleasant winter month, with no extremes; much corn gathered; stock in fine condition.

RIDGEWAY—*Arthur Betts.* Mild January; no excessive cold; distant lightning after sunset on 6 h and 26th; 142 hours of sunshine; forest ground has remained unfrozen; farmers grubbing every day; crows and other birds numerous.

ERRATA IN DECEMBER REVIEW.

CHESTER.—Total precipitation recorded, 3.35 inches, on page 7, should have been 4 37 inches. Total snowfall, recorded 6.2 inches, on page 7, should have been 10.2 inches.

DE SOTO.—Mean temperature, recorded 22 2 degrees, on page 7, should have been 23.5 degrees. Mean maximum temperature, recorded 29.4 degrees, on page 9 should have been 29.7 degrees. Mean minimum temperature, recorded 15.1 degrees, on page 9, should have been 15.3 degrees.

HAMPTON.—Total snowfall, recorded 15.4 inches, on page 7, should have been 16 4 inches

LACONA.—Total precipitation, recorded 3.80, on pages 8 and 11, should have been 3.60 inches.

OVID.—Maximum temperature, recorded 41 degrees, on page 8, should have been 47.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

owa Weather and Crop Service.

VOLUME XIV. FEBRUARY, 1903. No. 2.

EDITORIAL NOTES.

Snowfall in the Texas "Panhandle" of sufficient depth to op railway traffic was a recent novelty, breaking the weather cords in that region for the past twenty years.

* * *

On the average the winter has been fairly mild and favor- le for this latitude. December was a little colder than usual, t January was warmer than the average, and February ought no very severe storms. The forecast made by some eatherwise people, that the winter's snowfall would be corre- ondingly heavy as the summer's rainfall, came far short of rification.

* * *

A farmers' mutual insurance company of a county in a estern state paid $2,375 on thirty-nine losses during the year. this amount $2,284.84 was for losses caused by lightning, ock killed, while only $129 75 was paid out for fire losses. his goes to show that lightning in these days of barbed wire nces is a very destructive agent —*J. S. Trigg*.

* * *

The bureau of forestry will this year begin experimenting nong the sand hills of northwestern Nebraska, to see if they ay be made to grow valuable timber. A nursery has been tablished at Halsey, Nebraska, and seed of yellow pine, jack ne, and red cedar will be planted this spring About 100 res will be uses for experimental work this year, and it is pected in time to extend the forest over a large part of the ebraska reserves The experts believe the experiment will be ccessful.

* * *

Mr. C. W. Hawley of Fort Dodge, contributes an interesting scription and a graphic representation of parhelia observed himself and others about 11 a m. on February 7th. There ere three brilliant "mock suns" within a bright aureole circling the zenith and in contact with the sun at the south. he phenomenon continued about half an hour The sky was ue, with a light haze, following snowfall of about six inches rlier in the day It was a rare but not an unprecedented sight der certain peculiar atmospheric conditions Observer L. E. urdick at Storm Lake observed the phenomenon, and made a ncil sketch of the rings and luminous spots.

* * *

In a signed letter addressed to the editor of the Cincinnati *rice Current*, Prof. Willis L. Moore, chief of the weather ureau, says: "No reputable scientist will today essay to make ng-range predictions. With our present knowledge of eteorological science such forecasts cannot be made with any arked degree of accuracy. Of course, anyone, with a proper nsideration of the weather that usually occurs in a season,may ake long range predictions and have some of them verified, ut such work is worse than useless. If it were possible to ake reliable long-range forecasts the weather bureau, with its rps of trained scientists, would surely do such work for the eople, as no one can overestimate the immense benefit that gricultural and commmercial interests would reap from a nowledge of what the weather would be during an advancing rop season."

THE DISTRIBUTION OF RAINFALL.

(*A. S. Henderson Ph. D., in November, 1902, Harpers.*)

Rainfall, an agency at first sight so humble, is, through the ultimate dependence of all life upon vegetation, an essential link in the chain which connects the lowest and the highest forms of life. The difference in the vegetative covering in low lands is due not so much to variation in sunshine or tempera- ture as to the differences in the distribution of the third factor —moisture.

The moisture of the atmosphere has not until recently been so thoroughly studied as temperature or pressure and winds. Yet it plays an all important part in the world's economy. Water is the life blood of the organic world, penetrating to all parts of it, purifying the air and fertilizing the land. As cloud it screens the earth' surface from the scorching sun's rays and protects it from excessve radiation. When it is deficient, extremes of temperature are great and vegetation is scanty; when it is abundant, climate is relatively equable and vegeta- tion is prolific. The distribution of water available for plant growth is therefore a question of supreme practical importance.

The measurement of rainfall is very simple when proper precautions are taken. The amount precipitated is usually expressed in terms of the depth to which it would cover the land were none to sink into the ground and none to be evapor- ated. Millions of observations have been made on rainfall. The map of the rainfall of the world is based on returns from nearly 9,000 stations, and if we consider fifteen years as the average period of observation at each station, which is consid- erably under the mark, it represents 50,000,000 observations taken in different parts of the world.

The scientific study of rainfall distribution has been mainly the work of the last quarter of a century. The first tempera- ture map of the world was made by the great Humboldt in 1817; that of pressure by Dr. Buchan of Edinburg in 1869; while the first quantatitive map of rainfall was made just twenty years ago by Prof Loomis of Yale. Since that time Dr. Supan of Gotha and the present writer have independently made public maps, embodying more recent results, in 1898.

By examining a map of the rainfall of the world, we notice at once that rain is very unevenly distributed. In many inter- tropical lands over eighty inches falls every year, while arctic circles are correspondingly dry. Arctic aridity and equatorial rains are partly expressions of the temperature differences. The warmer air holds more water in a state of vapor than the colder air, and the same degree of cooling brings about a much greater precipitation in the hotter regions. A cubic foot of air over the Caribbean Sea at 80° F. can hold 10.95 grains of water in the state of vapor, whereas at Boston at 50° F. it can hold 4 09 grains, and over Hudson Bay at 20° F. only 1.30 grains. Supposing the cubic foot of air at these places was suddenly cooled by 10° F. which is roughly what would happen were it rap- idly elevated to 3,000 feet above the sea, then it could contain only 7.99 grains of water vapor at the Caribbean Sea, 2.86 grains over Boston, and 0.84 grains over Hudson Bay, forcing 2 96 grains to be precipitated in the first case, 1.23 grains in the second case, but only 0.46 grains in the third. Without going into further details, it is obvious from this that the possibilities

of heavy precipitation due to cooling diminish from the thermal equator to the thermal poles.

The divisions of the world by rainfall are of the greatest practical consequence. Each has its characteristic vegetation, and, speaking generally, the economic products of one region of each group can be grown in any corresponding region as far as climate is concerned. An instance in point is the similar distribution of Mediterranean climates and Mediterranean fruits.

Many economic problems in which rainfall is a factor present themselves for consideration, of which one or two may be mentioned as typical. There is an inferior and a superior limit of rainfall for each crop. Very little wheat is grown in the United States to the drier western side of the line where the mean annual precipitation is twenty inches. In England wheat growing is concentrated in the eastern counties, where the rainfall is less than thirty inches per annum, and in Scotland it is cultivated in similarly dry areas. In South Australia special attention has been paid by Sir Charles Todd to the relationship between the yield of the wheat crop and rainfall. The figures of average rainfall and average yield for the agricultural lands of south Australia show how very close is the connection between them.

Natural grass and fodder plants flourish best where the rainfall is uniformly distributed, and their economic value, as measured by the number of animals they can support, steadily increases with rainfall Mr. J. T. Wills shows that in Australia land receiving less than ten inches of rainfall per annum is worth next to nothing unless it can be irrigated; with ten inches of rain eight or nine sheep can be kept per square mile; with about twenty inches of rain, 640 sheep per square mile, eighty times as many; and with thirty-four inches of rain in Buenos Ayres, a square mile will support the enormous number of 2560.

The day of the medicine man with his rain-making charms is past. The future belongs not to the magician who attempts to interfere with the laws of nature, but to the man of science who can state with something approaching to certainty how they will operate under given conditions. Of all those who contribute to the cause of human progress, and the transferrence of human activites from the sphere of the accidental to the sphere of the causal, none perhaps are concerned with weightier issues than the men who patiently and persistently, day by day and season by season, measure and compare, compare and measure, the rainfall of their little districts. We may forgive the meteorologist his uninteresting statistics when we reflect that in their trustworthiness and in their right interpretation may lie the future of an abundant food supply and even of industries yet undeveloped.

PRACTICAL VALUE OF THE WEATHER SERVICE.

(From J. S. Trigg's Farm Notes.)

It costs this country $1,250,000 annually to maintain the weather signal service, and a friend writes us asking what it amounts to and what goood it does. Where a man's view is contracted so that he can only take in his immediate local conditions it is not strange that such a question should be asked. This service from a small beginning has been gradually extended so as to cover nearly the whole country. It furnishes the only reliable data as to rainfall, force of winds, varying temperature and barometrical readings. The reports from its agents are tabulated in each state, and very accurate forecasts can thus be made of coming marked changes in the weather. The value of these reports as applied to the coast and lake shipping interests is almost inestimable, while for the agricultural and horticultural interests of the country immense good results. A warning recently given out by the weather bureau saved the people of Florida millions of dollars, and a late notice given of a coming cold wave prevented shippers of perishable products from losing an enormous sum of money. The records thus made of the rainfall in any locality constitute the most reliable information to be obtained as to whether such locality is fit for settlement and cultivation or not. Perhaps if the weather service assumed to be wise enough to forecast the weather a year ahead, as do some so called weather prophets, those who doubt its value might have more faith in it. It is one of the best organized and most useful departments maintained by the general government.

IOWA FARM PRODUCTS.

Concerning some of the major and minor products of Iowa, William E Curtis of the *Chicago Record-Herald*, writes as follows:

George Fayette Thompson of the bureau of animal industry of the Agricultural Department has been making a very interesting comparison between Iowa and other of the great agricultural states in this respect, and secretary Wilson approves the totals. In 1900 the number of poultry in Iowa over three months old was 20,043 343, and they were worth $6,535,464 A comparison of values with previous census years cannot be made, as the census of 1890 only gave values. The value of poultry products for one year, when compared with that of poultry for one year is sufficient to cause astonishment For instance, the value of poultry on the farms of Iowa, as has been stated, was $6,535,464 while the poultry and eggs sold off the farm amounted to $19,508,526. Of the latter sum $10,016,707 was for eggs and $9,491,819 was for poultry. The number of dozens of eggs laid in Iowa in 1899 was 99,621,920, which was an increase of about 20,000,000 dozen over 1889. The average price per dozen of the eggs was 10 cents. The value of all animal products on the Iowa farms was $169,858,981, poultry products forming 11.5 per cent of the whole. The animals sold; with a value of $113,078,523, and the dairy products, with a value of $27,516,870, were the only two products worth more than poultry and eggs. The statement below shows the relative position of poultry in the farm economy of Iowa:

Animals sold	$113,078,523
Corn	97,297,707
Oats	33,254,987
Hay and forage	30,042,246
Dairy products (milk, butter and cheese)	27,516,870
Poultry and eggs	19,016,707
Wheat	11,457,808

LET IN THE SUNSHINE.

Spring is coming and with it sunshine and greater warmth. Do not shut out the sunshine. It is Nature's great healer and preventive of sickness. In the Mammoth Cave of Kentucky, there is a wonderful uniformity of temperature and because of this there was a belief that consumptives might be benefited by a residence there. So huts were built and the experiment tried. It was not a success. There was quiet there; there were no adverse winds, but there was darkness, impenetrable darkness, where artificial light was not used. There was no sunshine, and its absence counteracted all the benefits derived from pure air, uniformity of temperature and quiet.

Invite the sunshine into your home. Don't allow the house to be so shaded by trees that it will be darkened or dampened thereby. Especially let the sunshine into the sick room. The patient needs its health-giving as well as cheering rays. The sunlight will not only warm, but purify the air and destroy

ɔase germs. As vegetation sickens, dies or has an unhealthy wth in the shade; so animal life loses its vitality, droops and ɜ without the invigorating influence of sunshine. Don't shut the sunshine!—*Iowa Health Bulletin.*

CLIMATOLOGY OF THE MONTH.

BAROMETER—Mean pressure, 30.16 inches; highest observed, 68 inches, at Des Moines, on the 18th; lowest observed, 29.37 hes, at Davenport, on the 3d; range for state, 1.31 inches.

TEMPERATURE—The monthly mean temperature for the te, as shown by the records of 108 stations, was 19.8 degrees, ich is 0.2 degree below normal. By sections the mean tem- atures were as follows: Northern section, 17.2 degrees; ıtral section, 20 2 degrees; southern section, 22.1 degrees. The ghest monthly mean was 26 4 degrees at Keokuk; lowest nthly mean, 14 2 degrees, at Estherville. The highest tem- rature reported was 56 degrees, at Eldon on the 2nd; lowest nperature reported, -21 degrees, at Clear Lake, Estherville d Sioux Center, on the 16th, 17th and 18th. The average nthly maximum was 45 7 degrees; aveage monthly minimum, 3 4 degrees. Greatest daily range, 44 at Villisca; average greatest daily ranges, 35.8.

PRECIPITATION—Average precipitation for the state, as own by records of 120 stations, was 1.18 inches, which is 09 an inch above normal. The averages by sections were as llows: Northern section, 1.02 inches; central section, 1.13 inches; uthern section, 1 38 inches. The largest amount reported was 25 inches at Danville; least amount reported, .30 of an inch, Galva. The greatest daily rainfall reported was 1 50 inches Indianola, on the 4th. Average number of days on which 1 of an inch or more was reported, 4.

WIND AND WEATHER—Prevailing direction of the wind, rthwest; highest velocity reported, 52 miles per hour, from e northwest, at Sioux City, on the 28th. Average number of ear days, 13; partly cloudy, 7; cloudy, 8

OBSERVERS' NOTES.

ALTA—*David E. Hadden.* Blizzard nearly all day the 3d. Second decade very cold; warm and thawing latter part of month.

ATLANTIC—*J. W. Love.* February was a pleasant month. Quite an electrical display in southeast on night of 2d.

BONAPARTE—*B. R. Vale.* A pleasant month; coldest of the season 16th to 20th; roads very muddy at close of the month.

BRITT—*Geo. P. Hardwick.* Excepting from 15th to 20th the month was comparatively mild, with light snowfall, allowing stock feeding in stalk fields.

CLEAR LAKE—*John Cobb.* No bad storms; ideal weather most of the month.

CLINTON—*Dr. Luke Roberts.* February, 1903, was a disappointment to many weather prophets who had avertised an extra cold month as well as a very stormy one. While there was one excessively severe and widespread storm period about the middle of the month, its behavior during other portions entitles it to be entered in the column of mild Februaries.

The month came in cloudy and sustained that record to the number of three cloudy days above normal and three per cent of cloudiness above normal, while the clear days were one less than normal. The storm days were 8 in number, each giving light precipitation, so that the total rainfall was only 1 29 inches, being 67 hundreths of an inch below normal This was principally in the form of snow which, in depth, measured 9½ inches. There were three days, the 16th, 17th and 18th, which gave a mean temperature below zero of 1.5 degrees, 1.7 degrees and 1 degree respectively. The mean temperature for the month was 23 9 degrees, or 2 6 degrees above normal. The maximum temperature was 52 degrees, occurring on the 27th, being 1.3 degrees above normal.

Following is given some season comparisons of the last 25 winters, that is the time embraced in the three months commencing on the first of December. There is found great variation both in rainfall and temperature, especially in the latter. The mean daily temperature for this period was 21 4 degrees. For the winter just closed the mean temperature was 23 degrees or 1.6 degrees above the 25 year average, which is a small variation from normal, but enough to entitle it to a place among the warmer winters.

The highest average winter temperature for the 25 years, was 31 degrees, credited to the winter of 1899–00. The lowest average was 14 degrees, occuring in the winter of 1892–93, making a range of 17 degrees, which aggregated by its multiplication with the number of days in a winter, which is 90, would give to the latter winter 1,260 degrees of heat less than is embraced in the former.

The maximum temperature for the 25 winters was 67 degrees credited to February, 1891. The minimum temperature was 36 degrees below zero, credited to January, 1884. Approximating this terrible cold period may be mentioned a record of 33 degrees below zero in February, 1885, and one of 30 degrees below zero in December, 1886. It will be noticed that these three low records occured in three continuouos winters. Those winters can never be lost to the memory of those who experienced the inflexibility of the extreme and prolonged cold, when the minimum temperature would range from 4 to 36 degrees below zero for 16 consecutive days, and the earth frozen six feet down.

The total precipitation for the 25 winters was 11.75 feet. About one-half of that amount came in the form of snow, equaling fifty feet in depth, or an average of two feet per winter. The winter of 1884–85 furnished four feet of snow.

EARLHAM—*Geo. Phillips.* Cool and cloudy; ground bare at close of month; first flight of wild ducks on 27th.

ELKADER—*Chas. Reinecke.* Ice went out of Turkey river on 27th.

GRAND MEADOW—*F. L. Williams.* Month generally pleasant; no bad storms.

RIDGEWAY—*Arthur Betts.* Month mild; 3° above normal; 220 hours of sunshine; coldest weather of the winter 15th to 21st, with a mean of 5 degrees; about one-tenth of the corn remains to be husked.

BELATED REPORTS.

FAYETTE—January. Mean temperature, 19.3°; highest, 43° on the 29th and 31st; lowest, -9 on the 12th; greatest daily range, 33; total precipitation, 04 inch; greatest 'in 24 hours .04 inch; total snowfall 0.5 inch; prevailing direction, northwest Number of clear days 12, partly cloudy 8, cloudy 11, rainy 1.

MT. PLEASANT—January Mean temperature; 24.2°; highest, 52° on the 16th; lowest, -5° on the 12th, greatest daily range 34; total precipitation .15 inch; greatest in 24 hours, .10 on the 4th; prevailing direction, northwest; total snowfall, 1.0 inch. Number of clear days 12, partly cloudy 9, cloudy 10, rainy 2.

PELLA—January. Mean temperature, 24.4°; highest, 49° on the 31st; lowest, -5 on the 12th; greatest daily range 34; prevailing direction, northwest. Number of clear days 13, partly cloudy 0, cloudy 18.

VILLISCA—January. Mean temperature 26.4°; highest 50° on the 15th and 16th; lowest, -5° on the 12th; greatest daily range, 36; total precipitation .05 inch; greatest in 24 hours; .05 inch; total snowfall, 0.5 inch; prevailing direction, northwest. Number of clear days 12, partly cloudy 13, cloudy 6, rainy 1.

STOCKPORT—January. Total precipitation .39 inch; greatest in 24 hours .10 inch on the second; total snowfall 3.8 inches; prevailing direction, northwest. Number of clear days 14, partly cloudy 3, cloudy 14, rainy 8.

ERRATA IN JANUARY REIVEW.

ALTA—Mean temperature recorded 23.6° on page 6, should have been 21.6°. Mean minimum temperature recrded 15.5° on page 8, should have been 11.5°.

COLLEGE SPRINGS—Mean temperature recorded 27.4° on page 7, should have been 27 2°. Mean minimum temperature recorded 18 7° on page 8, should have been 18.4°.

COLUMBUS JUNCTION--Mean temperature recorded 24 4° on page 7, should have been 24 5°. Mean maximum temperature recorded 32 3° on page 8 should have been 32.6°.

BURLINGTON--Maximum temperature recorded 53° on the 1st, should have been 66° on the 28th on page 7.

GRINNELL--Total snowfall recorded 3 8 inches on page 6, should have been 2 8 inches.

OGDEN—Mean temperature recorded 23.0° on page 6, should have been 23.7°. Total precipitation recorded .16 inch on pages 6 and 10, should have been .18 inch.

OTTUMWA--Total snowfall recorded 3.8 inches on page 7, should have been 4.8 inches.

CLIMATOLOGICAL DATA FOR FEBRUARY, 1903.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. McDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Meteorological data are received by the Iowa Weather and Crop Service.

Afton	Hon. N. W. Rowell
Albia	E. R. Reeve
Algona	C. D. Pettibone
Allerton	Rex Shriver
Alta	D. E. Hadden
Alta (near)	W. J. Minard
Amana	Conrad Schadt
Ames	Exp. Station
Atlantic	J. W. Love
Audubon	Frank Mott
Baxter	W. T. Thorp
Bedford	E. E. Healy
Belknap	A. W. Rankin
Belle Plaine	S. P. Vandike
Bonaparte	Hon. B. R. Vale
Britt	G. P. Hardwick
Buckingham (Traer P. O.)	Dr. W. A. Daniel
Burlington	I. S. Shontz
Carroll	Moses Simon
Cedar Rapids	Electric Light & Power Co
Centerville	C. J. Brower
Chariton	Hon. S. H. Mallory
Charles City	C. H. Priebe
Chester	C. H. Meredith
Clarinda	A. S. Van Sandt
Clear Lake	John Cobb
Clinton	Luke Roberts
College Springs	A. M. Finley

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. MARCH, 1903. No. 3.

EDITORIAL NOTES.

The up-to-date Iowa Idea is to plant and harvest in 1903 the biggest and soundest crop of corn ever grown in this state. We need it in our business.

* * *

Within the past month we have received the sad news of the passing away of two of the most faithful co-workers in this service, Hon. S. H. Mallory, of Chariton, and Mr. H. C. Miller, of Ovid. The communities in which they lived, and the people of the state at large, have suffered a serious loss by the death of these public spirited and intelligent citizens.

* * *

The department of geology and mining engineering of the Iowa State College has been engaged in the study of Iowa clays during the past three years and finds that everyone of the ninety-nine counties in the state contains clay suitable for the manufacture of clay products. In 1901 the state ranked eighth in total clay production. Ninety-three counties marketed clay wares valued at $2,737,825, consisting chiefly of common building brick and drain tile, constituting 2.48 per cent of the production of the entire country, which amounted to $110, 211,587, In the cheaper clay wares, building brick, drain tile, hollow block and burnt clay ballast, she produced 4.45 per cent of a production of about $51,000,000 in those lines.

* * *

Science is touching agriculture and horticulture in many ways in plant breeding, cross fertilization, in the spraying and limitation of insect pests, in analyses of all foodstuffs as animal rations, in soil physics whereby the soil is fitted for its work, in animal husbandry, the feeding and breeding of all domestic animals—in fact, there is no other business in which man is engaged where science touches him more helpfully or with which it works more harmoniously.—*J. S. Trigg.*

THE UNITED STATES AS A STORM CENTER.

There are several reasons for believing that this continent is the peculiar theater for the interchange between the heat and the cold of the Northern Hemisphere, and that the Euro-Asian Continent plays a very different role in the meteorological economy of this hemisphere. For it is well known (1) that while the American Continent is the place for the profuse generation of cyclones, Europe is the region for their dissipation, and in Asia very few cyclones occur except along the ocean borders; (2) that the velocity of motion of the atmosphere generally is about twice as great over North America as over Europe. This points to a profound difference between the actions of the atmosphere in these two regions, but one cause of it at least is easily perceived. It has been shown that the currents which are especially concerned in forming cyclones are contained for the most part within two or three miles of the ground, though their accompanying effects may extend much higher. Hence, any barriers of elevated ground, as mountain ranges, which tend to deflect the flow of the lower strata, must strongly influence the formation of the cyclones themselves, if they are to be referred to the counter flow of long horizontal currents of different temperature rather than to local vertical convective currents.

The great range of the Himalaya Mountains stretching east and west is such a barrier to the flow of the tropical and polar currents in that region, and the result is that true cyclonic movements are almost excluded from the interior of Asia. On the other hand the Rocky Mountain range, stretching north and south along the western districts of North America, favors the counter flow from the tropics and the polar regions by deflecting the westward current of the tropics toward the north, and the eastward drift of the higher latitudes toward the south. The same tendency is favored by the location of the high pressure belt in the latitude of 35°, which causes a high pressure area to form over the middle Atlantic Ocean, while the Rocky Mountain range breaks through the midst of it The result is to produce a powerful anti-cyclonic center of action over the Atlantic Ocean, which maintains a strong northward component from the West Indies toward the interior of the continent. At the same time the American Continent causes the isobars and isotherms to loop southward, and thus in consequence to draw the Siberian atmosphere in a direction nearly parallel to the Rocky Mountain range. These physical conditions are a constant incentive to the formation of countercurrents which meet on the Canadian and United States territory, with the result that 75 per cent or 80 per cent of the storms of the Northern Hemisphere are generated in these districts.—*Relation between the general circulation and the cyclones and anti-cyclones, by Prof. Frank H. Bigelow, in the Monthly Weather Review for May, 1902.*

HOW THE AIR IS WARMED.

BY PROF. G. D. SWEEZY, LINCOLN, NEB.

The great furnace from which we get most of our heat is the sun. It sends to us little waves of heat—many thousands of these tiny waves every second; but they pass so easily and quickly through the air that they have little effect upon it on their way down; but they do warm the ground upon which they fall. for they cannot get through that so easily, and when the ground gets warm it soon warms up the air which lies upon it. This it does in two ways. In the first place, the bottom of the atmosphere actually touches the ground and rests upon it and is warmed by it just as a flat-iron is warmed when it is set on the stove; the heat creeps slowly up from the hot griddle of the

stove into the bottom of the flat-iron, or from the warm earth into the lower air. This process is called conduction. Then again, the earth warms the air in another way. If you hold your hand near the ground when it has been well heated in the sunshine, you will feel the warmth coming to your hand from the ground even if you do not touch it. This is called radiation; that is, the heat is radiated from the earth in little waves much like those which come down from the sun; but there is this difference—the heat waves radiated from the warm soil do not vibrate as rapidly as those which come from the sun, and for this reason they cannot pass through the air so easily. They are mostly stopped before they get very high up into the air, and so the air is warmed by them. That is why it is cold high up in a balloon; the sun is shining there just as much as it is at the surface of the earth, but its rapid waves pass by on their way down and do not warm the air much, and the slower waves coming back from the warmed earth do not get up so high, but mainly warm the lower air, in which the plants and trees live and grow. And so the earth's atmosphere acts as a blanket to keep the earth warm by letting in the heat waves from the sun more readily than it lets out the slower heat waves coming back from the warmed earth. The glass which is put over a hotbed acts in just the same way; it lets the sun's heat come in but will not let the heat arising from the ground get out, and so the plants are kept warm.

For fifteen years past the temperature of the soil has been measured daily at the state farm at seven different depths, ranging from one inch to three feet, and a study of the results recently has brought out many interesting conclusions.

For example, it appears that in every month of the year the surface of the ground averages warmer than the air; this shows that it is the ground which first feels the effect of the solar heat and is warmed by it and then it imparts its heat to the air, rather than the air warming the soil. The warmed surface layers also impart their heat to the deeper soil, but more slowly, so that at a depth of three feet the highest and lowest temperatures of the year are not reached till about a month later than they occur at the surface. At a depth of three feet the range between summer and winter is only thirty-four degrees, instead of a hundred and more, as it is in the air at the surface. The greatest depth to which the ground freezes in the winter is most commonly eighteen or twenty inches; twice since 1890 it has frozen to a depth of more than three feet, viz., in 1895 and in 1899.

PROGRESS AND OPPORTUNITY.

Pittsburg Gazette.

"Do you ever stop to consider young man," said the old stager, "how much you depend upon applied electricity? There goes the telephone bell now. A newspaper office without a system of telephones would be on a par of a 'home without a mother,' or nearly so. Click, click, I hear the telegraph instruments working there in the other room. That's right, my boy, push the button and let us have light. You see electricity comes at every turn. Light and the news—that's light, too—come with the electric touch, I came up an electrically operated elevator just now, and the other day when I was looking over the plant, I noted that your presses on the ground floor and your Mergenthaler machines on the top floor were all run by electricity. Wonderful machines, rapid, efficient, accurate, splendid; wonderful energy that makes them go.

"Young man, these things have all been developed, except the telegragh, within the span of your life. Most of them within the last two decades, yet there are foolish young fellows who con the names of the great and wealthy and lament that the door of opportunity is not as wide open as when those men made their start in life. Nonsense. The door of opportunity was never as wide open as now. Fame and wealth were never as ready to be embraced by ambition and brains as at this moment. Never.

"The inventions that have been made will be surpassed by those yet to come. We have but begun to realize the differentations of voltage, potentials and electro-motive force. The door of opportunity stands wide for the man whose think-tank runs at the touch of the electric facet.

"Not only in the electrical field is there opportunity. In chemistry, in engineering, in geology, in biology there are as good opportunities as were ever improved by Berthelot, Bequerel, Roebling, Lyell or Darwin. In plain business there are rich fields as rich as any worked by Rockefeller or Morgan. In industry Carnegie and Havemeyer have not exhausted the possibilities. In exploration the whole world has not been covered by Humboldt and Captain Cook. There is always opportunity, but the man who grasps it must have force and persistence, energy and brains. That's all. It's a great world, or queer world, a funny world—yes, it is a real good world to live in and be active."

WHAT "CATCHING COLD" MEANS.

The old-fashioned cold has been ousted to some extent from its former position in domestic medicine by the more modern influenza. An attack of influenza is a much better excuse for non-attendance at the office or shop than a cold, the latter being commonly regarded as an accommodation bill drawn by laziness on idleness. There is unquestionably such a thing as a cold—that is to say, a deviation from health obviously consequent upon and due to exposure to cold and damp. The initial sensation of cold is followed by more or less pronounced physical discomfort, possibly by more definite signs and symptoms of bronchitis or other disease a frigore. With that predilection for for inexorable logic which characterizes the undiscerning, the average citizen regards every illness commencing with a chill as a cold, losing sight of the fact that there are chills—i. e.: sensations of cold—which are in no wise due to the action of low temperatures. This vulgar error has been productive of serious consequences in mo e than one direction. Nowadays, and rightly, we are all for fresh air. We fear no foe save the ubiquitous microbe, and we fight him with fire and poison, with results that amply suffice to justify this war. It may, on the other hand, be a person with a weak chest who experiences a "chill," and, as it is theoretically impossible ever to exclude the influence of cold, he or she attributes the symptoms which follow—the cough, the sweating, the exporation, etc.—to incautious exposure, whereas this chill merely heralded a rise of temperature incidental to an outburst of tuberculous disease. It would suprise many intelligent people to be told that a chill is a sign that there is fever, and that sweating is usually a sign that the fever is abating. Yet such is the unvarnished fact, and it would be well for it to be generally known. Cold is merely a debilitating agent, the effects whereof will vary according to the individual. It throws a strain on the organic machinery and the weakest part gives. If the machine as a whole is in good trim, nothing happens beyond a little temporary discomfort. In a rheumatic person it may determine pains in the joints; in another, bronchitis; in a third, kidney trouble, and so on—in short, it picks out the weak spots and converts weakness into disease. Colds are notoriously infectious, and the places where colds are most frequently caught are places where ventilation is defective and where microbes abound, as in certain theaters, churches, railway carriages, and the like, so that even the symptoms of the old fashioned cold are, for the most part, the result of microbial infection and not of exposure.—*London Medical Press.*

SOME OLD-TIME DROUGHTS.

The following interesting statement of dry seasons extenting back to days of the Pilgrim Fathers, has been compiled and is worth preserving.

In the summer of 1621, twenty-four days in succession without rain.

In 1530, forty-one days without rain.
In 1657, seventy-five days without rain.
In 1674, forty-five days in succession without rain.
In 1688, eighty-one days in succession without rain.
In 1694, sixty-two days wi hout rain.
In 1705, forty days in succession without rain.
In 1715, forty-six days in succession without rain.
In 1728, sixty-one days in succession without rain.
In 1730, ninety-two days in succession without rain.
In 1741, seventy two days in succession without rain.
In 1749, one hundred and eight days in succession without rain.
In 1755, forty-two days without rain.
In 1762, one hundred and twenty-three days without rain.
In 1773, eighty days in succession without rain.
In 1791, eighty-two days in succession without rain.
In 1802, twenty-three days in succession without rain.
In 1812, twenty-eight days without rain.
In 1856, twenty-four days without rain.
In 1871, forty-two days without rain.
In 1875, twenty-six days without rain.
In 1876, twenty-six days without rain.

It will be seen that the longest drought that ever occured in America was in the summer of 1762. No rain fell from the 1st of May to the 1st of September, making 123 days without rain. Many of the inhabitants sent to England for hay and grain.—*Ex.*

WEATHER AND CROPS.

The month was warmer than usual, with less than the normal amount of precipitation. But the excessive cloudiness and lack of drying winds and sunshine retarded farm work except in dry sandy soil. The fields were excessively wet, and the roads well nigh impassable the larger part of the month. While the spring opened earlier than usual, the condition of the soil made a late start in spring work. Grass and fall grain wintered well.

CLIMATOLOGY OF MARCH 1903.

BAROMETER.—Mean pressure, 30.13 inches; highest observed, 30.50 inches, at Des Moines, on the 11th; lowest observed, 29.75 inches, at Davenport on the 23d, range for state, 0.75 inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 114 stations, was 38.8 degrees, which is 6.6 above normal. By sections the mean temperature were as follows: Northern section, 36.1 degrees; Central section, 39.4 degrees; Southern section, 41.1 degrees. The highest monthly mean was 45 0 degrees at Eldon; lowest monthly mean, 30.8 at Sibley. The highest temperature reported was 82 degrees, at Mt. Pleasant on the 14th; lowest temperature reported, 6 degree at Baxter and Clear Lake on the 1st. The average monthly maximum was 72.1 degrees; average monthly minimum, 11.2 degrees. Greatest daily range, 48 at Monticello; average of greatest daily ranges, 35.3 degrees.

PRECIPITATION.—Average percipitation for the state, as shown by records of 126 stations, was 1.38 inches, which is 0.53 of an inch below normal. The averages by sections were as follows: Northern section, 1.40 inches; Central section, 1.34 inches; Southern section, 1.39 inches. The largest amount reported was 3.90 inches at Le Mars; least amount reported, .15 of an inch at Denison and Ruthven. The greatest daily rainfall reported was 1.80 inches at Keokuk on the 7th. Average number of days on which .01 of an inch or more was reported, 7.

WIND AND WEATHER.—Prevailing direction of the wind, southwest; highest velocity reported, 41 miles per hours, from the northwest, at Sioux City, on the 23d. Average number of clear days, 11; partly cloudy, 7; cloudy, 13.

ATMOSPHERIC PRESSURE.

OBSERVERS' NOTES.

ALGONA—*C. D. Pettibone.* On 17th first robin appeared, wild geese observed flying northward.

ALTA—*David E. Hadden.* Month warm, dry and generally cloudy; mean temperature 7° above, and precipitation 1.09 inches below average of preceding thirteen years.

AMANA—*Conrad Schadt.* Spring opened early, yet no field work could be done till about the close of the month, as the ground was too wet, on account of lack of sunshine and drying winds. Roads have not been in worse condition for many years. Some wheat and oats sown.

ATLANTIC—*J. W. Love.* Wild geese observed on 6th, robbins on 7th, and bluebirds on 8th. Month unusually mild.

BONAPARTE—*B. R. Vale.* Severe electrical storms on 7th, 17th and 18th, the last doing much damage to barns and stock; ground very wet and no farming practicable.

BRITT—*Geo. P. Hardwick.* Month comparatively mild, with little snow or wind; fruit buds forward.

CLINTON—*Dr. Luke Roberts.* March, 1903, gave us her coldest day on the 1st, having been preceded by a windy day with March characteristics, but those conditions had spent their forces at the crossing of the line, and no more "March winds" prevailed until the 23d and 24th, when an average speed of seventeen miles prevailed for thirty hours, commencing at noon of the 23d. The maximum movement of twenty miles an hour occurring during the central portion of the 24th. Snow, by spells, accompanied the wind. Not over two inches of snow fell altogether. This comprised all the snow of the month. Total

precipitation for the month was 2.36 inches, being eighteen hundredths below normal. The greatest precipitation during any twenty-four consecutive hours was 1.10 inches, occurring on the 7th. The maximum temperature was 78°, occurring on the 18th, and was 12° above normal. The minimum temperature was 14° , occurring on the 1st, and was 12.6° above normal.

The warmest day was the 18th, giving a mean of 65.2°, or 13.9° above normal. The coldest day was the 1st, giving a mean of 27°, or 15° above normal.

The total movement of the wind was 3,040, or 2,750 miles below normal, being the smallest run of wind for any March during the last twenty-two years.

It will be observed the departures from normal are greatly in excess, causing a record breaker. On some kinds of trees the buds were putting out at the close of the month.

COLUMBUS JUNCTION—*Prof. H. E. Simpson*. Ice went out of the Iowa and Cedar rivers early on morning of the 7th, followed by a very rapid rise of water on 8th, rising within three feet of high water mark of last August.

FOREST CITY—*J. A. Peters*. Robins came on 11th. No seeding done, frost out of ground.

GRAND MEADOW—*F. L. Williams*. Bluebirds on the 12th, and robins on 17th. All frost out by the 20th; grass well started by end of month; roads very bad.

GRUNDY CENTER—*E. S. King*. Some sod plowing done; clover mostly killed; heaviest snowstorm of season on 23d.

HANLONTOWN—*Miss G. M. Paschen*. First flock of geese observed on 8th; ducks on 18th; robins on 17th. Pussy willows in bud the 13th.

HUMBOLDT—*H. S. Wells*. First robin observed on 17th; fine weather at close of month.

IDA GROVE—*Theo. A. Collett*. On 12th robins appeared; on 14th plowing sod begun; on 17th lawns looked green.

LEON—*M. F. Stookey*. Two inches of snow on morning of 22nd; all off by night; four inches on morning of 23; disappeared by night.

MASON CITY—*J. S. Mills*. Robins and wild ducks on 7th; bluebirds and wild geese on 17th.

OLIN—*Nathan Potter*. Grass three weeks ahead of last year; meadows and ryefields in best of condition; some gardens made.

RIDGEWAY—*Arthur Betts*. Month unseasonably warm, same as in 1902; much thunder; 185 hours of sunshine; much hazy weather and fog; road almost impassable; at end of month soft maples, willows and hazel blossomed out.

WAUKEE—*E. J. Leonard*. First part of month gave promise of an early spring; unusually heavy snowstorms 22d and 23d postponed work in the fields till about 30th.

WAVERLY—*H. S. Hoover*. First wild geese flew north on 5th. Ice went out river on 8th; on 21st planted lettuce, radishes etc.

WEST BEND—*Ph. Dorweiler*. Month warmer than usual; ground too wet to work: roads very bad.

BELATED REPORTS FOR FEBURARY.

FAYETTE.—Mean temperature 18.1 degrees; highest 47 degrees on the 26th; lowest 17 on the 18th; greatest daily range 43 degrees; total precipitation 1.22 inches; greatest in twenty-four hours .70 inches on the 4th; total snowfall 8.7 inches; prevailing direction, northwest. Number of clear days 14, partly cloudy 8, cloudy 6, rainy 4.

WAPELLO.—Mean temperature 23.6 degrees; highest 47 degrees on the 27th; lowest 11 degrees on the 17th; greatest daily range 28 degrees; total precipitation 1.56 inches; greatest in twenty-four hours .90 inches on the 3d; total snowfall 11.5 inches; prevailing direction, northwest; number of rainy days 4.

ERRATA IN FEBRUARY REVIEW.

GRAND MEADOW.—Mean temperature recorded 17 0 degrees on page 7, should have been 18.8 degrees. Mean maximum temperature recorded 24.8 degrees on page 9, should have been 28.4 degrees.

HAMPTON.—Mean temperature recorded 18 6 degrees on page 7, should have been 19.0 degrees. Mean maximum temperature recorded 27.7 degrees on page 9, should have been 28.4 degrees.

BAXTER.—Total precipitation recorded 1.15 inches on pages 7 and 11, should have been 1.05 inches.

BUCKINGHAM.—Total snowfall recorded 5.2 inches on page 7, should have been 4.2 inches.

COLLEGE SPRINGS.—Total precipitation recorded .92 inches on pages 8 and 11, should have been .96 inches.

GUTHRIE CENTER.—Total precipitation recorded .49 inch on page 7, should have been 1.19 inches.

IOWA FALLS.—Mean temperature recorded 16.8 degrees on page 7, should have been 17.0 degrees.

PELLA.—Mean temperature recorded 22 8 degrees should have been 21.8 degrees.

LE MARS.—Maximum temperature recorded 43 degrees on the 22d, on page 7, should have been 44 degrees on the 27th.

MARSHALLTOWN.—Maximum temperature recorded 47 degrees on the 22d, on page 7, should have been 49 degrees on the 10th.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

METEOROLOGICAL STATIONS AND OBSERVERS.

From the following, weekly and monthly reports of Meteorological data are received by the Iowa Weather and Crop Service.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. APRIL, 1903. No. 4.

EDITORIAL NOTES.

The exportation of American agricultural products in March amounted to $81,000,000, an increase of $21,000,000 as compared with March, 1902.

* * *

On the night of April 28th lightning struck a new church at Dedham, Carroll county, damaging the structure to the amount of about $2,000. It was set on fire, but the flames were soon extinguished. Churches should be protected by rods, as they are exposed more than ordinary buildings.

* * *

A correspondent writing under date April 28th, says: "The ground is so saturated from last year's rains that I fear there will be much land hereabout that will not be planted this season, unless it turns off dry very soon." This describes the situation in large areas of the central counties.

* * *

On Sunday, April 19th, large portions of central Europe were swept by a hurricane, accompanied by a heavy fall of snow, which caused a large amount of damage to chimneys, trees, parks and telegraph wires. The brunt of the storm was suffered in Germany, Austria-Hungary and the Polish plains.

* * *

The Turkish government has removed the ban on American pork, which hereafter will be admitted to the empire after the customary inspection.

* * *

The general prospects of winter wheat are exceptionally promising, according to the *Modern Miller*.

* * *

A report of the bureau of statistics of the Treasury Department says: "To sum up in a single sentence comparison of production with exportation, in America, in agricultural and manufactured products respectively, it may be said that, comparing conditions in 1900 with those of 1870, agricultural production has increased 92 per cent, agricultural exportation 132 per cent, production of manufactures 209 per cent and exportation of manufactures 538 per cent."

THE NATIONAL WEATHER REVIEW.

The Monthly Weather Review, published by the weather bureau in the Department of Agriculture, challenges admiration for its high character. It is a work at once scientific and practical, besides furnishing much that is theoretical, suggestive and interesting. Its accumulation of facts and the records thereof must constitute a record of data which may hereafter prove valuable in meteorological science. Many trained and amateur observers are working in its behalf. With headquarters at Washington, D. C., the bureau has a wide area of useful activity. Particularly are the forecasts valuable, beneficial and appreciated. Science associated with the political movements of the day is surely a gratifying index of the advancing civilization of the age.

The issue of January, 1903, besides much varied matter, has an article by Prof. Edwin G. Dexter of the University of Illinois, entitled "Inductive Studies in Weather Influence." Almost every one can appreciate such a topic, for who has not heard of "blue Monday," or felt the "blues" in gloomy weather. The professor traces the influences of the weather as modified by temperature, pressure, precipitation, humidity and cloudiness on the mind and body of man through twelve respects. So much for the effects on man of meteorology, though few think of it in this aspect.

The previous issue is mainly filled with the normal summary of 1902. Other contents furnish an elaborate discussion of cannonading the clouds against hail storms, resulting in its more than probable futility. Also the studies on the snow crystals as they occurred during the winter of 1901-2. Twenty-four and one-fourth full pages of twelve cuts each are given, showing ninety-nine various types.—*Dubuque Trade Journal.*

NITROGEN FOR FERTILIZING.

The principal sources of nitrogen for fertilizers are nitrate of soda and slaughter-house products, of which latter dried blood is the most important. Slaughter-house products are called "organic" fertilizers because produced from the "organs" of animals. The nitrate of soda is obtained from mineral deposits mainly on the west coast of South America. The known deposits are by no means inexhaustible, and unless other beds are found the world a generation or two hence may have serious trouble to secure nitrogenous manures. By that time, however, it is hoped that we shall have learned how to obtain nitrogen from the air on a commercial scale, and at a cost which the industry can bear. Many scientific men are at work on the problem. Prof. A. J. Cook makes the following comparison between nitrate of soda and dried blood:

Nitrate of soda being a soluble salt in a condition for ready absorption by plants ranks first as an available source of nitrogen. It is the cheapest and most direct form of nitrogen for plant feeding. Dried blood as a source of organic nitrogen easily convertible to nitrates in the soil is a first-class product. It is a humus producer more enduring than nitrate and can be used in larger quantity without danger of loss by drainage, but its benefits are more protracted, and it must be expected to act on the crop as quickly, because it must first be nitrified in the soil

by the organisms of nitrification there. It takes a high temperature in the soil for these bacteria to do effective work, so when blood is applied in cold weather it is well to remember it only becomes available as the warmth of spring and summer proceeds.—*San Francisco Chronicle.*

COURSES OF INSTRUCTION.

Among the recent courses of instruction in meteorology and climatology we notice those offered by Dr. J. Paul Goode, Ph. D., instructor in geography in the Wharton School of Economics, in the University of Pennsylvania. There is a short course of four hours a week during the first term of the year entitled 'Climatology and Applications in Economic Geography." It covers the following subjects:

Principles of meteorology; general atmospheric circulation; laws of storms with special attention to the cyclonic storm; charting of weather elements. Application of principles of meteorology to the interpretation of regional climates. Climate as a factor in economic and social development.

There is also in the course for teachers a series of lectures, occupying one hour, given each Saturday throughout the college year, about forty in all, entitled "The Atmosphere and the Ocean."

Part 1. Meteorology; the general atmospheric circulation, the laws of storms, the charting of weather elements, and the interpretation of weather maps. Scientific weather forecasting.

Part 2. Oceanography; the principles of oceanic circulation, action of waves and tides, harbors, sailing routes.

Part 3. Climatology; the regional application of the principles of climate to the world at large.

Dr. Goode has recently accepted a position in the department of geology of the University of Chicago, and will probably give these same courses at that place next year. It is most important that all teachers should profit by such lectures so that the general public may be educated up to a better appreciation of the difference between the daily weather map with the forecasts of the weather bureau and the farmers' almanacs with the forecasts of these astrological editors.—*Monthly Weather Review for February, 1903.*

OUR NATIONAL DOMAIN.

At the annual meeting of the National Geographic Society, February 10, 1903, Mr. Cyrus C. Adams delivered an address on "The United States—Land and Waters," from which the following extract is made:

"Many foreigners who cross our country are impressed by two facts: Its vast extent and its very apparent sparsity of population away from a few great centers. We are among the most populous nations in the world, but our domain south of Canada is so great that with all our 77,000,000 people we have an average density of population of only about twenty-eight to the square mile, in which respect we are comparable with Norway, one of the most thinly peopled countries of Europe. The part of Great Britain occupied by England is one of the most densely peopled regions in the world; but if England had only our density of population its inhabitants would number less than one-fourth the number in Greater London.

"We have really no conception derived from our experience at home of what great density of population means. Perhaps the following facts may give a vivid idea of it. If we were to crowd our 77,000,000 people into Texas and add to them 40,000,000 more, we should have a density of population in that state comparable with that of the lower Yangste valley and the great eastern plain of China between the Yangste and the Hoang rivers. But human experience has recently recorded a still greater density of population than this, and the following is deduced from the census taken last year by the Chinese government and already accepted by statisticians as a fair approximation of the number of persons in China. If we were to place in Texas double the population of the United States or, say, 150,000,000 persons, we should have in that state approximately the density of population that is to be found in the Shantung province. Our nation may never be called upon to confront the problems growing out of such a prodigious congestion of humanity as this; and these illustrations of great density of population are given here only to show one aspect of our enormous territory. China is not half so large as our country, and its natural resources, area for area, are no greater than our own; so the 408,000,000 souls in China, proper, at least give emphasis to the thought that we have as yet scarcely began to scratch the surface of the capacity of this country to support many times its number of inhabitants.

"Another influence of our vast area is permanent, far reaching and most significant. The United States, extending from ocean to ocean, reaching far into the north and far into the south, with vast areas only 1,000 feet or less above the sea, and others of high altitude, has great variety of climatic conditions and therefore great diversity of products; so that we grow nearly all the commodities of the temperate and sub-tropical zones, and not a few products of the tropical zones. We raise the citrus fruits of the Mediterranean, the figs of Smyrna and the dates of the Persian gulf. We find that we can grow the famous Sumatra tobacco which we still import to the amount of millions of dollars every year; that we can produce Egyptian cotton, and Egypt does not raise all that the world would like to consume of that unique and superior fiber. This diversity of products, and our large mineral resources, make the country practically self-sufficient. No nation can become self-sufficient unless it reaches across a continent and embraces a wide latitude like the Russian Empire, Australia and the United States. We really need to import very little except certain raw materials from the tropics which our own colonial possessions may some day supply."

WEATHER AND CROP CONDITIONS.

In respect to temperature and precipitation the month of April was about normal. The soil and subsoil, however, were abnormally moist at the outset, except in fields naturally well drained or thoroughly tiled. The prevalence during the larger part of April of cloudy, misty and humid weather, retarded the necessary drying of the surface, and hindered seeding and plowing operations on a very considerable area of land intended for grain seeding or corn planting. Fair progress was made in seeding and plowing, under somewhat adverse conditions, but the acreage of oats, barley and wheat was somewhat reduced on account of the excessive moisture in some portions of the land intended for these crops. Pastures and meadows made an early start, and cattle were turned on grass somewhat earlier than usual. The cereal crops germinated readily, and made a fairly good stand. The snow storm and freezing temperature at close of the month checked growth, but did not injure field crops. Apples were but slightly injured in the larger part of the state. Cherries and plums suffered the greatest amount of damage.

TORNADO IN CALHOUN COUNTY.

Late in the afternoon of Saturday, April 11th, a small but vigorous tornado was observed about four miles northeast of Rockwell City, Calhoun county. It struck the farm of C. H. Clark, occupied by P. G. Armour, on the west bank of South

Twin Lake, destroying the house and barn and much personal property, and then swept across the lake, raising a column of water in its passage and spending its force within a short distance on the east side. The Armour family found refuge in a cave and escaped personal injury, but their losses were considerable. Mr. H. C. Maulsby, who was driving homeward from the town of Jolly, was caught very near the center of the whirling shaft, and had a rough experience, but was not injured seriously. He wrote a graphic account of his observations and experiences, which appeared in the *Rockwell Advocate*. The air was dense and hot, and conditions were favorable for the development of a tornado. A cloud was noticed in the southwest, moving eastward, which shortly assumed the funnel shape and soon thereafter the lower appendage reached the earth, raising a column of dust and loose articles in its pathway. Driving rapidly southward Mr. Maulsby reached the west bank of the lake, near the Armour residence, a little ahead of the funnel, and drove his team into the grove and awaited the onset of the storm. The roar sounded like a buzzing cylinder, and struck the buildings and grove with an awful crash. Mr. Maulsby affirms that he was caught up in the air, where he was whirled around and around, with everything dark, coming in contact with flying debris of every description, and finally was let down to earth without any sudden jar or serious hurt. His team was badly injured, and a valuable mare that was tied to the hind end of the wagon was lifted bodily and carried into the lake and killed. At this point the tornado was about twenty yards wide, and the debris covered a space two to three hundred yards wide. The length of its track was less than two miles.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.91 inches; highest observed, 30.38 inches at Sioux City, on the 25th and 30th; lowest observed, 29.30 inches at Davenport, on the 2d; range for state, 1.08 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 107 stations, was 49.8 degrees, which is 0.3° above normal. By sections the mean temperatures were as follows: Northern section, 47.6°; Central section, 50.0°; Southern section, 51.8°. The highest monthly mean was 53.8°, at Burlington; lowest monthly mean 44.9°, at Forest City. The highest temperature reported was 86°, at Mt. Vernon on the 11th; lowest temperature reported, 17° at Larchwood on the 30th. The average monthly maximum was 77.4°; average monthly minimum, 25.0°. Greatest daily range, 52°, at Stuart; average of greatest daily ranges, 39.7°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 120 stations, was 2.98 inches, which is 0.03 of an inch below normal. The averages by sections were as follows: Northern section, 3.38 inches; Central section, 2.89 inches; Southern section, 2.67 inches. The largest amount reported was 6.00 inches, at Grand Meadow; least amount reported, 0.74 of an inch, at Logan. The greatest daily rainfall reported was 3.16 inches, at Columbus Junction, on the 10th and 11th. Average number of days on which .01 of an inch or more was reported, 9.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 45 miles per hour, from the south, at Sioux City, on the 27th. Average number of clear days, 11; partly cloudy, 9; cloudy, 10.

OBSERVERS' NOTES.

ALLERTON—*Rex Shriver*. Oats sowing began on 1st. Plums and cherries in bloom on 20th; peaches blooming the 26th.

ALTA—*David E. Hadden*. Compared with the preceding thirteen years April, 1903, was about normal in temperature, and the precipitation was about one half inch below the average.

AMANA—*Conrad Schadt*. Snow, ice and frost on morning of 30th; fruit damaged.

ATLANTIC—*J. W. Love*. Ice formed five nights during April; snow fell on evening of 29th and morning of 30th.

BONAPARTE—*B. R. Vale*. A cold, wet month; not over half the acreage of oats sown; sub-soil, full of water and 4.15 inches of rain fell this month.

BRITT—*Geo. P. Hardwick*. Frosts on two-thirds of the mornings; farm operations backward.

CLARINDA—*A. S. Vansandt*. Hailstones on 11th were very large; one measured 6 inches the larger circumference and 5 inches the shorter.

CLINTON—*Dr. Luke Roberts*. Rainfall 4.93 inches, 2.04 above normal; plenty of moisture and coolness; spring opened early enough, but lack of warmth retarded vegetable growth.

COLUMBUS JUNCTION—*H. E. Simpson*. The spring which opened so early has been set back; fruit seems badly damaged.

ESTHERVILLE—*Earle W. Peterson*. It is a peculiar fact that the first day of the month was the warmest, and the last day the coldest.

FOREST CITY—*J. A. Peters*. Seeding began about 5th; ground very wet; considerable plowing done for corn at close of the month.

GRAND MEADOW—*F. L. Williams*. Month very wet and work backward; grass in pastures good.

RIDGEWAY—*Arthur Betts*. Wettest April on record at this station; a degree warmer than 1902; ground thoroughly soaked; 202 hours of sunshine and seven days without a sun. Large hailstones fell on the 1st and 12th.

WAUKEE—*E. J. Leonard*. Last half of month unseasonably cold; closed with a severe snow storm and freeze for a climax.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. MAY, 1903. No. 5.

IOWA CROPS JUNE 1, 1903.

Reports of the regular crop correspondents of the Iowa Weather and Crop Service, made June 1st, have been received and tabulated for the state at large. The showing as to the acreage, as compared with last year is somewhat better than we had reason to expect in view of the adverse weather conditions and saturated state of the soil in the seeding and planting season. The county reports were generally mailed about the 27th to 30th of June, when the conditions were at their worst for the formation of a fair estimate as to the status of the crops.

The figures as to the acreage of corn, as compared with last year, must needs be revised, and will be included in the report for July 1st. It was impossible to make, during the last week in May, even an approximate estimate of the acreage that will be finally included in the corn harvest of this year. So the figures as to the corn acreage will be omitted from this report. The per centages of the acreage of the other staples are as follows, the figure 100 representing the area of last year:

Winter wheat, 83 per cent; spring wheat, 85; oats, 92; barley, 90; rye, 88; meadows, 101; potatoes, 94; flax, 87.

CONDITION OF CROPS AND FRUIT.—Winter wheat, 96; spring wheat, 93; corn already planted, 75; oats, 93; barley, 96; rye, 94; meadows, 109; pastures, 107; flax, 84; potatoes, 91; apples, 70; plums, 35; peaches, 40; cherries, 35; grapes, 70; strawberries, 90; blackberries, 92; raspberries, 85.

LIVE STOCK.—Cattle, 99; sheep, 99; hogs, 98; spring pigs, 89; horses, 96; foals, 95.

Last year at corresponding date conditions were rated as follows: Corn, 97 per cent; wheat, 99; oats, 98; barley, 100; rye, 99; flax, 98; potatoes, 103; meadows, 96; apples, 70; plums, 72; cherries, 70; grapes, 72; strawberries, 80; raspberries, 71; blackberries, 67.

CONDITION OF FRUIT JUNE 1.

Secretary Green, of the Agricultural Society, has issued the following report:

A summary of the reports for June shows a decline of 10 to 30 per cent in some varieties of fruit since the last report. The lowest percentage is in the Des Moines valley, the next lowest is in the Nishnabotna. The counties east of the Iowa river show the highest percentages in plums, cherries, currants and gooseberries; these fruits, if properly distributed, should bring a good price, as not more than one-fourth the usual crop will be harvested. Apples will be about half a crop in the southwest, from present indications, and three-quarters in the north and east. Strawberries, raspberries and blackberries are well distributed over the state, and will be a good crop unless injured by unfavorable weather conditions later in the season.

A summary for June is as follows: Apples, 68 per cent; pears, 22; plums, 27; cherries, 26; peaches, 30; grapes, 64; currants, 36; gooseberries, 34; red raspberries, 76; black raspberries, 72; blackberries, 90; strawberries, 86 per cent of a full crop.

WEATHER AND CROP CONDITIONS, MAY, 1903.

The month of May, 1903, scored a meterological record fairly comparable with that of May, 1892, which was characterized as the most unfavorable May for farming operations known in Iowa for a quarter of a century. The mean temperature for May, 1892, for the state, was 54°, or 5.7° below normal, and the average rainfall was 8.77 inches, or more than double the normal. In May, 1903, the temperature was 61.6°, which is slightly above normal, and the average rainfall for the state was 8.55 inches, or 4 52 inches above normal, and .22 of an inch below the total for May, 1892. The general weather conditions for the month this year were exceedingly unfavorable, but were notably better than the records show to have been prevalent eleven years ago. The temperature was seasonable except for very short periods at the first of the month and during the heavy storms the last week. The distribution of the rainfall was somewhat variable, ranging in amounts at local stations from 2.88 to 15.45 inches; but the average of each section was above 8 inches. The best conditions as to dryness of soil prevailed in the Mississippi river counties. The great interior basins of the Des Moines, Iowa and Cedar rivers were subjected to very heavy floods about the close of the month, causing much delay in farming operations and damage to all crops. From about the 3d to the 18th conditions were at their best, and during that half of the month the plowing, planting and other farm operations were in progress on the drier lands, with only occasional interruption by showers. Most of the corn that was planted was put in during that period. The protracted and very heavy storms during the last decade rendered field work impracticable in more than four-fifths of the state. At the close of the month not over two-thirds of the usual corn area had been planted. The germination was generally quick and satisfactory in the stand, but the fields soon became very foul from lack of cultivation, and much more than the usual amount of replanting was necessitated as a result of washing and flooding the fields. The general condition of wheat, oats, rye, barley and meadows was better than seemed to be possible during prevalence of the storms. The fruit crop suffered some damage by the frost and freezing temperature the first of the month, but the general condition of apples; berries and grapes is fairly good.

MAY RAINFALL IN IOWA, 1890-1903.

The following table gives the average rainfall for the state, in the month of May, for the period of fourteen years:

Year.	*Inches.*	*Year*	*Inches.*
1890	3.56	1898	4.67
1891	3.18	1899	6.23
1892	8.77	1900	3.31
1893	3.45	1901	2.35
1894	1.87	1902	5.39
1895	3.19	1903	8.57
1896	6.69		
1897	1.92	Average	4.50

SEASONABLE NOTES.

Within the past seven years many articles have been published under the caption "Lessons of the Drought." A new leaf has been turned, and we are called upon to study object lessons set in another chapter of human experience. Sodden fields, impassable roads, flooded bottoms, eroded hillsides, washed out and drowned out crops, furnish timely topics of interest to students of nature, tillers of the soil and business men of the country.

The people of New England, New York, Canada, and other portions of the east, have been stricken by the drought, while our fields were drenched and our people have been contending with the floods. We might swap literature with them just now, giving them the benefits to be derived from all the writings of all the people of this region who have essayed to tell all about the cause of droughts and how to cure them. We may safely loan them all of that sort of dissertations that have been filed away in libraries and lumber rooms, and if they should forget to return the articles we will not be much the poorer. When the metorological pendulum again swings toward the droughty side in this region, as it surely will in due time, we can then depend upon getting at short notice revised and enlarged editions of the essays that tell specifically how the people have been ruining their climate by draining their farms and cutting off trees somewhere or other.

About fifteen years ago, after the west had suffered some damage from drenching rains and floods, a gentleman of note as an author, wrote an elaborate article wherein he attempted to prove by facts and deductions that the heavy downpours of that period were due in considerable part to human agency. His theory was that the increasing use of steam power in this country, in form of stationary engines, locomotives, and steam heat in buildings, had largely added to the humidity of the air arising from solar evaporation, resulting in a vast increase in the total amount of precipitation. His very ingenious and seemingly plausible article was widely disseminated and elicited much favorable comment; but it was not sufficiently vigorous and well rooted to withstand the very severe drought that came with blistering effect within the next year or two. That theory had in reality more scientific backing than the correlated hypothesis that was broached a little later to account for the drought, viz: that it was the result of man's agency in the drainage and cultivation of western lands. The truth is, as we must allow, man is a puny creature when his strength is pitted against the mighty powers that cause the winds, rains and floods.

The world over the people have persistently trenched upon the rivers, floodlands, and shores of lakes and oceans. As a result of their folly thousands upon thousands have been overwhelmed by floods and tidal waves, and the burden of support of the survivors in times of calamity falls upon those who are wise enough to build their homes upon the uplands. The world is big enough and broad enough, and there is room for all its inhabitants upon the slopes and ridges, far above all high water marks. The bottoms that are subject to periodic overflow may be profitably used for pastures, meadows, truck gardens and cornfields in ordinary seasons. The occasional loss of crops would be trifling in comparison with the damage and risk of life resulting from flooding the homes of the poor, who have been induced to locate on cheap bottom lands. For sanitary reasons, as well as immunity from floods, human habitations should not be permitted in flood districts.

See Matt. 7:25. Anent the foolish man "which built his house upon the sand; and the rain descended, and the floods came, and the winds blew, and beat upon that house and it fell: and great was the fall of it." So the same sort of folly was committed in the olden time.

The Iowa lakes are now at the highest stage they have reached in eleven years. Spirit Lake is reported to have risen twenty-two inches, and many of the docks are under water. Those who a couple of years ago predicted the early drying up of those noted summer resort lakes are not saying anything about it just now.

A news special from Ottawa, Canada, dated May 30th, said no rain had fallen there for several weeks, and for the purpose of breaking the drought and preventing the outbreak of destructive fires the mayor requested the minister of militia to bring out his battery of big guns and bombard the heavens to jar down the moisture from the air. The rains will undoubtedly be copious hereafter—this season or some other year.

Observer Arthur Betts, from Ridgeway, Winneshiek county, reports a distinct shock of earthquake at 2:10 A. M. on the 21st of April. It was a low rumbling that shook the house, jarred windows, for space of about ten seconds, the apparent direction of the wave being from S. E. to N. W.

A dispatch from Utica, New York, dated June 10th, says that Prof. Carl Meyers, the rainmaker, accompanied by experts in the use of oxygen and hydrogen, has gone into the Adirondack forest preserves to conduct experiments in rainmaking by use of powerful explosives. Prof. Meyers' apparatus includes balloon bombs eight, ten and twelve feet in diameter, and he is quoted as saying that the local weather conditions would determine the time and method of exploding them. That is a wise thing to do in making such experiments. The barometer, wind direction and humidity should be carefully noted; then when things are just right you may begin firing, as Dewey said to Captain Gridley at Manila Bay. But how strange it seems to be trying to make rain fall in a great forest preserve! Possibly, however, the trees need to be awakened and set to work at their legitimate business as rainmakers. Those bombs will jar 'em.

FLOODS, DROUGHTS AND DISMAL PROPHECIES.

"Is America's Ruin Threatened by an Era of Floods?" Under this alarming headline the Chicago *Inter-Ocean*, of June 7th, published a half-page article written by John P. Brown, secretary of the International Society of Arboriculture, in which was uttered this solemn warning: "Within twenty-five years these great inundations, which have been steadily increasing in number and violence for sixty years, will be general through-

out the continent, and no section will be secure from periodical deluges; and within half a century the great agricultural regions of the continent will be sterile as the deserts of Arizona, or the plains of China." This most deplorable condition, Mr. Brown affirms, we are bringing upon ourselves by the rapid denudation of forest areas, stripping state after state of the fertilizing timber which for ages has chained the soil to the fields, fed the rivers with a steady flow and regulated the water supply.

This solemn warning is evidently uttered to promote the most excellent cause of arboriculture, by scaring people into good works in the line of tree planting. But the end to be attained, though good in itself, does not justify the questionable means employed in its promotion, such as dire prophecies of evil and irrational arguments or assumptions. There are some most convincing reasons that may be urged in favor of conservation of our remaining forest areas, and in behalf of tree planting on some of the slopes, ridges and practically useless lands in these prairie states, but in this work the appeal must be made to intelligent people, who may not be moved by specious arguments and warnings of awful calamities to come. This pessimistic prophecy uttered by Mr. Brown appears very like the familiar scare-crow that was made to do duty in the same good cause during our recent antedeluvian (before the flood) period of severe drought, the only difference observable being that the frightful figure is now togged out in a rubber suit to withstand the latter day wet weather!

When the excessively wet period began, about a year ago, we found a measure of comfort amid our watery woes in the thought that we had secured a short season of rest from being worried by good people who persisted in warning us that the climate of this section is being ruined by drainage of wet lands and cutting timber, and that this region will become sterile from droughts of greater frequency and severity in future years; that we can only be saved from utter desiccation by planting trees and taking up our tile drains. But now comes Prophet Brown, with a new chapter of lamentations, and a fresh batch of predictions of woes to come in the form of floods only a little less in amount than the Noachian deluge.

There is a confusion of tongues among these two classes of prophets, but they all agree that there is no way of escape from the predicted disasters except to take to the woods. Plant trees to save from droughts and make increased rainfall; and to prevent damaging floods, plant more trees. The trees make more rain, and then perform a beneficent office, we are told, by preventing floods by holding back a big portion of the surplus waters. Mr. Brown says the forests regulate the water supply and feed the rivers with a steady flow.

Seriously now, while it is true that in time of excessive rainfall the forests help to retard the outflow of a portion of the surplus waters, yet this is only a half-truth that has been made to give currency to unsound theories. In matter of fact, the capacity of a forest bed to serve as a reservoir of surplus waters depends upon its character as to density, the kind of trees, and the location, whether on rocky hillsides and mountains or level lands in the valleys. Millions of acres of forests on the rocky hillsides possess no appreciable capacity to retain moisture beyond the actual necessity of the trees, and they only serve a mechanical purpose in preventing erosion of the slopes. There are millions of acres of slopes now subjected to erosion that ought to be protected by trees, but that is far from allowing that such slopes would thereby prevent torrential rains or keep water from running down hill. The dense forests on level lands in the valleys do serve a beneficent end in retaining a portion of the surplus water, and in using a goodly portion of it in the growth of timber. In that respect there is but little to choose between a bottom land forest and a well drained and deeply tilled corn field on the same kind of soil, and the difference, if any, is on the side of the latter. That is to say, our best bottom land corn fields soak up and hold back from the streams more water than the average forest beds.

The floods and droughts of this abnormal season appear to have been sadly misplaced to serve as object lessons in support of Mr. Brown's theories and predictions. The early and later rains of nearly the whole continent were poured out upon the well-nigh treeless plains and valleys of the central west, producing disastrous floods, very nearly as heavy as those which visited this region fifty and sixty years ago. At the east from Ohio to Jersey and Maine, a very damaging drought held sway over a region including the Allegheny and Catskill mountains, the great Adirondack forest preserves, the Green and White mountains, and all the most heavily timbered regions of Maine, Ontario and New Brunswick. In large portions of the forests great destruction was caused by fires, and reports stated that even in some of the most dense forests the fires burned beneath the moss down to the roots of the greenest trees. In that time of greatest need the forests of that region did not "feed the rivers and regulate the water supply," nor did they have capacity to retain enough moisture to save the heaviest timber from destructive flames. In times of severe drought the trees consume for their own support the storage of moisture, and then the litter of the forest becomes dry as tinder, constituting an element of destruction instead of a source of water supply for streams.

So it appears that Mr. Brown's theory will scarcely hold water. He affirmed that great inundations have been steadily increasing in frequency and volume for the past sixty years, but refrained from offering evidence to sustain the statement. As a matter of fact, the flood of 1844 at St. Louis scored high water records that have not been reached since that time. In the Des Moines valley the volume of the flood in 1851 was the greatest ever known. And in that early period the cutting of the forests at the head waters of the Mississippi had not progressed very far. It would be an easier task to prove the reverse of Mr. Brown's assertion. Not only in the treeless central valleys, but also in the most heavily timbered regions of the south and east, the student may notice the erosive effects of great floods, which came at frequent intervals in the centuries before the axe of a civilized man had cut a tree to build a cabin. There have been floods and floods all along down the ages of human history, and in the most distant ages the vast forests of all the continents did not avail much in averting great disasters by floods. Note the formation of the vast delta at the mouth of the Mississippi as proving the occurrence of great inundations for unknown centuries.

While giving due credit to forests for their beneficent effects in the retention of a portion of excessive rainfall, we must also recognize the fact that the deeply tilled soils and subsoils of these western prairies perform the same good office in a larger measure, because they possess greater storage capacity than the average forest areas. In this section the floods have never invaded the valleys to any considerable extent until the deep soil, subsoil and drift deposits had been filled down to the impervious bed rock. So it may be proven quite readily that the mulched and moss-carpeted forests of the rocky hillsides, mountains and valleys of the east do not possess nearly as much storage capacity for moisture as an equal area of well cultivated tile-drained farming lands in Iowa.

It is a subject of general remark by people from abroad, as well as residents of this section, that these well-tilled fields possess a marvelous quality for withstanding both droughts and floods, and the reason is obvious. The storage capacity of the soil and the immense deposits of humus afford a large measure of immunity from ill effects of droughts which would ruin the crops on the lighter soils of the east. With a fair supply of moisture at the outset of the season, it has been found possible in this state to grow and ripen a good crop of corn with less than one-third of our normal rainfall for the crop season.

Prophet Brown, in attempting to sustain his prediction of disastrous floods that will ruin this treeless valley, says the excessive rainstorms that visit this section are caused by electrical disturbances, which are due to the absence of trees. Of this he says there is no doubt, and then hedges by saying: "To what extent this is true is not known." Exactly so; and because it is not known it is best not to indulge in dogmatic statements. We have been led to believe that the electrical disturbance in a storm is a result of rapid condensation of vapor and not the cause thereof; and that condensation of vapor into rain is due to dynamic cooling of the humid air. Mr. Br wn's mistake is in confounding causes and effects, like the man who expressed wonder that electricity possesses the power to make the dynamos revolve so rapidly in the power plants at Niagara Falls.

Our prophet who warns us that this valley will soon be washed into sterility in consequence of its treeless condition, does not stop to consider the fact that this region has been treeless very many centuries, and that during this period the rich humus of the soil has been stored up for the support of millions. The process of growth and decay, with alternations of wet and dry seasons, has been in operation for centuries, resulting in making a marvelously fertile plain, far away from the "fertilizing timber." And the fact that it was made rich under the same climatic and treeless conditions, gives us strong faith that it will retain its position as the granary of America for centuries to come.

Our faith in the substantial permanence of general climatic conditions in this valley is so strong that we unhesitatingly advise the farmers of Iowa to hold their farms as the richest legacies they can leave to their posterity for scores of generations. But if we gave credence to much of the talk of our over-zealous arboriculturists, we should exhort friends to get out and take to the woods, or climb a tree.

At the east the drought problem has been the foremost topic, while our people have been worried over the floods. And professional rainmakers exploited their theories while the drought was at its worst. The complex weather problems have been discussed at considerable length in the papers, but the sanest and most well considered article appeared in the editorial columns of the New York *Tribune*. Referring to proposed experiments in rainmaking the *Tribune* said:

"It is not at all strange that people whose interests are affected by the present drought in Canada, New England and the Middle Atlantic states should jump at any chance to secure relief. Some of their projects are, however, unpromising. Scientific men long ago became convinced that the occasional association between bombardment and rain after a heavy battle was purely accidental. They think that the precipitation would have come anyhow, owing to other causes, and point to the fact that many engagements in which artillery was employed were not attended with the same consequences. After testing the theories of General Dyrenforth ten years ago, the United States weather bureau reached the conclusion that explosions in the upper air had no effect whatever. Overlooking those experiments and conclusions, perhaps, one of the *Tribune's* contemporaries in this city promoted a similar venture in 1900, but with absolutely no success. A lot of vine growers in southern Europe are resorting to practically the same means to break up hailstorms. Possibly they, too, will in time conclude that their procedure is foolish. At any rate, it is hardly logical to resort to bombardment both to induce and to stave off precipitation.

"A partial but convincing explanation of the present drought is furnished by the daily weather maps. Any one who possesses the most elementary knowledge of meteorology is aware that rain and snow occur in this country only in connection with the great barometric depressions, which move in a generally eastward direction across the continent. The area in which most precipitation is observed is not at the center, but in advance of it, say from two hundred to five hundred miles. The great majority of these depressions, when they come as far east as the Mississippi valley, follow the great lakes and St. Lawrence valley to the Atlantic. Since the middle of April, however, all storms which have entered the country have departed from that rule. Either they would move out to the southward—perhaps entering the Gulf of Mexico—or they would die out. In the latter case precipitation would cease with the rising of the barometer at the center of the 'low.' To all appearances this abnormal behavior was due to the singular obstinacy of areas of high barometer which lingered over the lakes and blocked the path of the storms.

"Now, eccentricities of that sort are compensated by eccentricities of another kind in another part of the country or the hemisphere. While their cause is not fully understood, most meteorologists worthy of the name believe that both 'highs' and 'lows' are a product of the great currents which flow between equatorial and polar regions, and hence the general circulation of the atmosphere. Sooner or later nature herself, in some mysterious way, effects a readjustment in the distribution of pressure, as it appears on the weather maps. It may be asserted with perfect confidence, therefore, that such a change will occur in the route of rainstorms between the Mississippi and the Atlantic, though one cannot predict the exact time. Anybody can see, however, that the forces involved operate on a colossal scale. Possibly half of the globe will be affected in one way or another when a new chapter of meteorological history opens. To hope to hasten that transition by any means within the power of man, is the height of folly. One might with equal sanity expect to bale out the ocean with a thimble, or obliterate Pike's Peak with a firecracker!"

FORESTS AND FLOODS.

As this is a timely topic in this season of extremes, the following clipping, from the *Evening Wisconsin*, will be of interest:

"Henry Gannett, in the *Bulletin* of the American Geographical Society, attacks the theory set forth in many works on forestry, that the presence or absence of forests exerts an influence on the rainfall; and the *Monthly Weather Review*, edited by Prof. Cleveland Abbe, endorses his opinion. He also denies that floods in American rivers are more frequent than formerly, as a consequence of the removal of forests from their drainage areas. This relieves the lumbermen of Wisconsin from the imputation of homicide, for if the old and exploded notion were correct, the men who chop down trees in Wisconsin might be held morally responsible for the drowning of people in Louisiana caused by high water in the Mississippi

"The situation which exists in the arid regions of the earth, Mr. Gannett says is due to their physiography. The forms of their mountains, cliffs and canons are not such as are found in moist climates and attest that the regions in which they exist have been arid 'for thousands if not millions of years.' Popular theory regarding them has put the cart before the horse. 'Want of rain prevents the growth of trees; want of trees does not prevent rain.'

"So much as to the arid regions As to the floods, Mr. Gannett observes that 'where forests are cut away, land is seldom left bare; it is cultivated or covered with bushes which hold the water quite as effectively as forests' Records covering a long series of years show that floods in American rivers are not greater now than they were in the past. 'The Ohio river,' he remarks, 'has been gauged continuously for many years, and these gauges show no appreciable change in regimen, whatever changes may have been made in the forest cover of its basin' He might with equal truth have made the same statement concerning the Mississippi. At the beginning of the nineteenth century, when Wisconsin and Minnesota were given over to solitude and Indians, there were floods in Louisiana as forminable as any of the worst that occurred toward the century's close, when the forests over the large areas had been felled and the spaces that they once occupied had been utilized for farming. A field of corn or wheat will hold the water as effectively as a grove of trees.

"It is pleasant to note these conclusions of science. It would be sad to be forced to believe that a man could not procure the material for constructing a house in territory near the head of a watershed without endangering the habitation and jeopardizing the lives of people down the stream."

HEAVY WIND STORMS.

On the evening of Tuesday, May 26th, a very severe wind, storm swept over a considerable portion of the western and central districts. The storm was wide spread, covering an area of more than one third of the state, and at many places the velocity of the wind was not very far short of a tropical hurricane. Reports from all points as to the characteristics of the storm clearly prove that it was a wind squall, or straight blow of unusual force and destructiveness, and not of the nature of a tornado, or "cyclone," as was set forth in the sensational headlines of the newspapers, and the associated press dispatches. From the tenor of these dispatches the people abroad must have received the impression that a whole brood of tornadoes had been incubated and let loose to devastate some of the fairest cities and towns in the doomed state of Iowa. If all the places visited by the storm of the 26th had been struck by veritable tornadoes the list of fatalities would have been in the thousands, and the loss of property would have amounted to millions. Happily for the people the elements are more merciful than the exaggerated reports make it appear.

The city of Des Moines received the onset of the storm at about 6 P. M. Every part of the city felt the shock and suffered some measure of damage, but the greatest destruction was wrought along the 'Coon river bottoms, where the bluffs at the south deflected and intensified the force of the northwest wind. A number of weak buildings were wrecked at that point, though the aggregate of loss was very small in comparison with the reports that were published. The worst effect of the storm was the death of a man and child, by the wrecking of a frail and very unsafe building in which they lived.

The city of Creston was struck at about 5:15 P. M. The reports of damage, as given in detail in the Creston papers, show that the storm swept over the entire city, and continued to blow for the period of twenty minutes. If it had been a tornado, the pathway of the funnel would not have been more than a block or two in width, and the force would have been expended in less than two minutes; but the loss of life and property within that narrow path would have been very great, and sufficient to justify the most stunning headlines in the reports

The same storm visited Corning, Brooks, and numerous places in the southwest and south central counties, causing a good deal of damage at all points.

On the evening of Monday, May 25th, the state institution for the feeble minded, at Glenwood, was struck by a wind storm similar in character and force to the one above described. It was a straight blow from the north, leaving no indications of the effects of a tornado. The force of the wind was sufficient to unroof and materially damage portions of the structures, and two of the inmates of one of the dormitories were killed. Numerous local squalls were noted in various parts of the state the same evening. The last decade in May was a period of unusual meteorological disturbances, winds, downpours and floods, but happily we have no evidence as yet that any part of the state was visited by a tornado. A number of lives were lost, however, by wind storms of sufficient force to wreck the weaker class of buildings. In the observers' notes severe storms are noted on other dates than the ones referred to above.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.95 inches; highest observed, 30.39 inches, at Davenport, Dubuque and Keokuk, on the 1st; lowest observed, 29.55 inches, at Dubuque, on the 27th; range for state, 0 84 inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 117 stations, was 61.6 degrees, which is 1 4° above normal. By sections the mean temperatures were as follows: Northern section, 60.4°; Central section, 61.9°; Southern section, 62.6°. The highest monthly mean was 65.2°, at Burlington; lowest monthly mean, 55.2°, at Estherville. The highest temperature reported was 91°, at Clinton, on the 20th; lowest temperature reported, 24°, at Bedford and Earlham, on the 1st and 3d. The average monthly maximum was 83 3°; average monthly minimum, 29.6°. Greatest daily range, 49°, at Larchwood; average of greatest daily ranges, 33.8°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 129 stations, was 8.55 inches, which is 4.52 cinhes above normal. The averages by sections were as follows: Northern section, 8.11 inches; Central section, 8.73 inches; Southern section, 8.80 inches. The largest amount reported was 15.45 inches, at Thurman; least amount reported, 2.88 inches, at Fort Madison. The greatest daily rainfall reported was 4.80 inches, at Thurman, on the 22d. Average number of days on which .01 of an inch or more was reported, 16.

WIND AND WEATHER.—Prevailing direction of the wind, southeast; highest velocity reported, 72 miles per hour, from the soutneast, at Sioux City, on the 21st. Average number of clear days, 9; partly cloudy, 12; cloudy, 10.

OBSERVERS' NOTES.

AFTON.—*N. W. Rowell.* Greater rainfall in May, 1903, than in any one month in eight years past; 11.90 inches. Frost and ice on 1st and 3d.

ALLERTON.—*Rex Shriver.* Rain has fallen 21 days in May; very little over half of corn crop planted at close of month; meadows and pastures good.

ALTA.—*David E. Hadden.* Severe wind squall about 8 P. M. on 22d, damaged some buildings, windmills and trees, southwest and west of town. Mean temperature of the month one degree above the normal of the preceding thirteen years. The precipitation (6.96 inches), is 2.82 inches in excess of the average during the same period. Thunderstorms occurred on thirteen days; maximum temperature, 79°, is the lowest recorded in thirteen years, except in May, 1892, when it only reached

74°. Last frost on May 3d, which is from two to three weeks earlier than usual.

AMANA.—*Conrad Schadt.* The river was 6 to 8 inches higher than last year. The last decade of May was very wet and little farm work could be done.

ATLANTIC.—*J. W. Love.* Heaviest rainfall (12.37 inches), of any month on record here. Soil very wet and much land under water; rain fell on 20 days.

AUDUBON.—*Frank Mott.* More than twice as much rain in this month as in May, 1902.

BONAPARTE.—*B. R. Vale.* Rainfall 4.30 inches; first half of month seasonable; last half constant rainfall and cold; little farm work possible during last eleven days.

BRITT.—*Geo. P. Hardwick.* Rainfall 6.89 inches; excessively cloudy—not one clear day; field work retarded; but half of corn planted at end of month; severe wind and lightning on 23d, damaging windmills and buildings.

CLINTON.—*Dr. Luke Roberts.* Rain 5.45, or .15 of an inch above normal. During first and second decades rain was needed to germinate seeds and for plant growth; after that rain was plentiful and storms retarded work in fields.

COLUMBUS JUNCTION.—*H. E. Simpson.* Clear, dry weather forepart of month, followed by excessively wet and cold weather.

CORNING.—*Jerome Smith.* A violent wind storm on 26th, at 5:15 P. M, changing from southwest to northwest, caused considerable damage to trees and windmills.

DECORAH.—*F. H. Baker.* On 26th a hard wind blew down barns, windmills and a great many trees.

EARLHAM.—*Geo. Phillips.* May was abnormally wet, with 11.60 inches of rain, on ground already saturated; 7.46 inches fell in the last week.

ESTHERVILLE.—*Earle W. Peterson.* On night of 22d a very hard wind swept the country south of this place, destroying some buildings and much property. Heavy rain of the 25th flooded the Des Moines river.

FOREST CITY.—*J. A. Peters.* Greatest rainfall during the month (10.17 inches) ever recorded here for May within ten years; 20 per cent of corn ground will not be plowed.

GRAND MEADOW.—*F. L. Williams.* Rainfall 8.33 inches. On 26th a fall of 3.16 inches raised all streams, washed cornfields and damaged railroads; farm work backward; hay crop good.

GREENFIELD.—*J G. Culver.* Rainfall 13.50 inches. It was less than normal up to 17th, and since that date it was excessive, with unusual number of thunderstorms, many of them severe. On night of 26th 1.64 inches fell in 46 minutes, and a total of 3.82 for the whole day; corn badly washed out.

GRUNDY CENTER.—*E. S. King.* A very wet month; 11.04 inches of rain; small grain, pastures and meadows very heavy growth.

GUTHRIE CENTER.—*W. F. Brann.* On the 26th a heavy thunderstorm and high wind, caused damage by lightning and wind.

HANLONTOWN.—*Miss G. M. Paschen.* Corn planting begun the 8th; hard windstorm on evening of the 22d; potatoes and peas in blossom May 26th.

HUMBOLDT.—*H. S. Wells.* Rain, 7.50. For the past five months the rainfall was 12 34 inches; for same period last year it was 7.69. Much corn not planted on June 1st.

LANSING.—*J. Ackerman.* The rain on 27th caused heavy floods in this section, doing thousands of dollars' worth of damage; small rivers out of banks, and it will be impossible to plant some of the richest lands.

LARRABEE.—*H. B. Strever.* Rain for month, 10.52 inches. Heavy hailstorm about 1 P. M. on 24th; poultry, pigs and young lambs were killed, and much damage to crops and trees. At this place hail lay on the ground four inches deep. Bottom lands were flooded, and some cattle were washed away and drowned.

MARSHALLTOWN.—*B. S. Jones.* Rain, 8.46 inches. On May 31st the Iowa river reached a point higher than last year's high water mark; it is believed to be the highest since 1881.

MONTICELLO.—*C. E. Heisey.* Corn planting much belated by wet weather. On the 25th lightning struck in three places, damaging three houses and burning one large barn.

MT. VERNON.—*Rev. J. W Hubbard.* Not the amount, but the persistency of the rain told; there being fourteen consecutive days of rainfall; prevailing winds easterly.

NEW HAMPTON.—*R. H. Gurley.* Heavy hailstorm on afternoon of 12th; violent windstorm on night of 22d caused damage to barns and windmills.

OLIN.—*Nathan Potter.* The month was favorable for farm work up to 25th, after which date all field work was suspended because of rains and floods.

OSKALOOSA.—*Joseph Boyd.* On night of 26th a heavy thunder and hailstorm passed over, the hailstones being as large as hickorynuts.

OTTUMWA —*Dr. W. B. LaForce.* The Des Moines river was 22 feet above low water mark on May 31st and June 1st, breaking all records.

PERRY.—*J. A. Harvey.* A terrible windstorm evening of 22d; rainfall this month, 11.41 inches.

RIDGEWAY.—*Arthur Betts.* This May was 2° above normal. Rainfall, 8.70 inches, or 0 89 of an inch less than the amount in May, 1902; many severe thunderstorms; 262 hours of sunshine; gale on 22d was the worst that ever visited this section, destructive to trees, windmills and buildings.

SPIRIT LAKE.—*W. C. Drummond.* Rainfall, 13.03 inches; last ten days of month brought 7.18 inches, causing the worst washout of bridges known in years.

STORM LAKE.—*L. C. Burdick.* Damaging hail and snowstorm about twenty miles north and west on 24th; small grain doing well.

TOLEDO.—*H. P. Giger.* Severe windstorm on 26th.

VILLISCA.—*C. E. Matteson.* Hail on 20th destroyed crops in a radius of three miles. Rainfall for the year to date, 19.33 inches, of which 13.66 fell in May.

WAUKEE.—*E. J. Leonard.* Rainfall for the month, 10.78 inches; May, last year, 3.42 inches; June, last year, 8.57 inches. So this month breaks the record of any month last year by 2.21 inches.

WEST BEND.—*Ph. Dorweiler.* Month remarkable for excess of rain. Roads very bad and crop prospect poor.

ERRATA IN MARCH REVIEW.

AFTON.—Mean temperature recorded 39.2° on page 8, should have been 40.0°. Mean maximum temperature recorded 50.3° on page 9, should have been 50.4°. Mean minimum temperature recorded 28.2° on page 9, should have been 29.6°. Total precipitation recorded .78 inch on pages 8 and 11, should have been .71 inch.

HAMPTON.—Mean temperature recorded 37.3° on page 7, should have been 37.6°. Mean maximum temperature recorded 46.1° on page 9, should have been 46.7°.

IDA GROVE.—Mean maximum temperature recorded 49.0 on page 9, should have been 49.1°.

IOWA FALLS.—Mean maximum temperature recorded 45.2° on page 9, should have been 45.3°. Maximum temperature on the 16th, page 9, should have been 47.0°. Maximum temperature on 24th, page 9, should have been 35 0°.

ODEBOLT.—Mean temperature recorded 39.0° on page 7, should have been 38 9°. Mean maximum temperature recorded 50.5° on page 10, should have been 50.2°.

OSCEOLA.—Mean temperature recorded 40.2° on page 8, should have been 41.6°. Mean maximum temperature recorded 50 0° on page 10, should have been 51.7°. Mean minimum temperature recorded 30.3° on page 10, should have been 31.6°.

VINTON.—Mean temperature recorded 39 3° on page 7, should have been 39.4°.

ALTA.—Total precipitation recorded .80 inch on page 7, should have been .81 inch.

WHITTEN.—Mean temperature recorded 33.2° on page 7, should have been 38.2°. Mean maximum temperature recorded 47.7° on page 10, should have been 47.8°.

MT. VERNON.—Mean temperature recorded 40.6° on page 7, should have been 40.5°. Mean maximum temperature recorded 51.2° on page 10, should have been 51.0°.

LARRABEE.—Mean temperature recorded 34.6° on page 7, should have been 34.8°. Mean minimum temperature recorded 24.0° on page 10, should have been 24 5°.

AMES.—Mean temperature recorded 38 6° on page 7, should have been 38.4°.

DENISON.—Mean temperature recorded 33.5° on page 7, should have been 38.5°.

LEON.—Precipitation on 22d, recorded .02 inch on page 11, should have been .20 inch. Precipitation on 23d, recorded .02 on page 11, should have been 20 inch. Total precipitation recorded 1 28 inches on page 8, should have been 1.86 inches. Total snow fall recorded 0 inches on page 8, should have been 6.0 inches.

TIPTON.—Precipitation on 23d, recorded 0, on page 12, should have been .20 inch. Total precipitation recorded 1.37 inches on page 7, should have been 1.57 inches.

ELDON.—Mean temperature recorded 45.0° on page 8, should have been 44.0°. Mean maximum temperature recorded 58.9° on page 9, should have been 56.7°. Mean minimum temperature recorded 31.0° on page 9, should have been 31.2°.

ERRATA IN APRIL REVIEW.

COLUMBUS JUNCTION.—Mean temperature recorded 52 3° on page 7, should have been 51.8°. Mean minimum temperature recorded 41.2° on page 8, should have been 40 2°.

EARLHAM.—Mean temperature recorded 50.0° on page 7, should have been 49.4°. Mean maximum temperature recorded 63.6° on page 8, should have been 62.6°. Maximum temperature on 24th, page 8, recorded 66.0°, should have been 60.0°.

MONTICELLO.—Mean temperature recorded 48.8° on page 6, should have been 48 4°. Mean maximum temperature recorded 63.9° on page 9, should have been 62.9°.

ODEBOLT.—Mean temperature recorded 48.0° on page 6, should have been 49.6°. Mean minimum temperature recorded 33 8° on page 9, should have been 37.1°.

AFTON.—Minimum temperature recorded 27.0° on the 30th, page 7, should have been 26.0° on the 4th.

ALGONA.—Minimum temperature recorded 25 0° on the 30th, on page 6, should have been 24 0° on the 4th.

HARLAN.—Minimum temperature recorded 25.0° on the 30th, page 6, should have been 24.0° on the 4th.

WASHINGTON.—Total precipitation recorded 3.82 inches on pages 7 and 11, should have been 3.79 inches. Daily precipitation recorded .05 inch on 19th, page 11, should have been .08 inch.

WASHTA.—Total precipitation recorded 1.85 inches on pages 6 and 11, should have been 1 95 inches.

WAVERLY.—Precipitation on 30th, of .05 inch on page 11, should have been .03 inch.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. JUNE, 1903. No. 6.

IOWA CROP REPORT JULY 1, 1903.

Reports from county and township crop reporters for July 1st have been tabulated, showing the following percentages of condition: Spring wheat, 88 per cent; corn, 77; oats, 87; barley, 89; rye, 98; flax, 85; meadows, 104; pastures, 107; potatoes, 96; apples, 70; plums, 49; grapes, 78.

Last year at corresponding date the percentages were as follows: Wheat, 97; corn, 92; oats, 95; rye, 98; barley, 97; flax, 99; potatoes, 108; meadows, 99; pastures, 107; apples, 65; grapes, 65.

A revised estimate of the area of corn planted this year shows 87 per cent, or an average decrease of 13 per cent, compared with the area planted in 1902.

JUNE TEMPERATURE AND RAINFALL.

The following table shows the mean temperatures and average rainfall for the state, for the month of June from 1890 to 1903, inclusive. The figures show that the month just closed was the coldest June on record for the period of 14 years, and also the driest except one, which was June 1894.

YEAR.	Temperature, degrees.	Rainfall, inches.
1890	72.7	7.76
1891	69.1	5.39
1892	69.2	5.19
1893	71.2	3.91
1894	73.2	2.67
1895	69.7	4.32
1896	69.1	3.11
1897	69.1	3.81
1898	71.4	4.72
1899	70.7	5.04
1900	69.7	3.98
1901	72.3	3.71
1902	65.2	7.16
1903	64.6	2.86
Average	69.8	4.54

WEATHER AND CROP CONDITIONS IN JUNE 1903.

The month of June as a whole was unseasonably cool and dry, the daily mean temperature being 5.6 degrees below normal, and the deficiency in the average rainfall 1.52 inches. The records show that it was the coldest June in the last fourteen years, and the driest, except one (June 1894). On the first of the month the soil was saturated by the excessive rains of the last decade in May, the rivers were at flood-tide, and many thousand acres of bottom lands were flooded. The change from this saturated condition was gradual, the drying process being retarded by light showers, cool and cloudy weather, with less than the normal amount of sunshine during the first decade. This was altogether more favorable than would have been a sudden change to hot and dry weather, causing an encrusted surface of the soil. The cool and dry weather prevalent the larger part of the month was favorable for wheat and oats, checking the tendency to rust and rank growth, but corn needed much warmer weather to quicken the germination and growth of this belated crop Notably good progress was made, however, in replanting the washed out fields, planting the previously saturated area, and cultivating the early planted corn on dry uplands. The seasonable weather prevalent about the close of the month caused a marked improvement in the appearance and prospects of this important staple, the early planted fields were fairly well cultiuated, and in size and color were much nearer the normal condition than was deemed possible at the outset. Clover cutting was begun near the middle of the month and the hay harvest was quite general at its close, with prospect of a very heavy yield of both clover and timothy. The minor crops, such as potatoes, garden truck and berries, were generally in excellent condition. Apples appeared to be doing better than was indicated earlier in the season. The prospects for all soil products were so much better at the close than at the first of the month that there was a general spirit of rejoicing over the brighter outlook.

NOTES AND COMMENTS.

Thunderstorms have been very frequent and unusually destructive to farm animals this season, and as in former years wire fences have served as efficient conductors for the deadly bolts. A case in point was reported from Jefferson county. Lightning struck a large maple tree, and from its base was conducted by a wire fence to a bunch of steers thirty rods distant. Five of the steers were prostrated by the shock, three being killed, and two badly injured. The insurance company paid $105.00 to adjust a loss which might have been prevented by use of ground wires costing less than a dime. This is a story oft-repeated, with some variations.

On the evening of July 2d, according to eastern news specials, after a period of intense heat, a terrific storm swept over New York City. In the upper part of the city the wind blew at one time at the rate of 72 miles an hour, causing an immense amount of damage. Three deaths were reported directly traceable to the force of the wind. The eastern papers and press dispatches called it a heavy gale, and that fairly described the windstorm. In the west, however, it is customary to term that sort of dis-

turbance "a deadly cyclone," or "an awful tornado," with stunning headlines in the newspapers. Those eastern scribes are rather moderate in their reports of such things, and it would be well if westerners would follow their example.

The *Scientific American* says that Point Reyes, an important United States weather bureau and storm signal station, located on the California coast some thirty-five miles north of San Francisco, holds the world's record for high, strong, continuous winds. Last year Point Reyes captured this honor from the weather stations of the earth, and again this month (May) has gone several notches higher on the meteorological scale. On May 18, 1902, the wind at Point Reyes attained a velocity of 102 miles and hour, and for several minutes was rushing along at the furious rate of 120 miles per hour. A fearful gale lasted for three whole days, and at one time the winds in a playful mood ripped the cups from the anemometer. This year, on May 14, the winds commenced to blow again with the greatest violence. For four days the velocity registered averaged more than sixty miles an hour. For nine days the average velocity was fifty-two miles an hour. The total number of miles recorded on the anemometer was 11,223 miles. This is the highest velocity of wind for the time on record in the world.

"It is very curious," said the old professor of physics, "to see how many market gardners there are to raise things under glass, make money out of the process, and yet do not know why their heating frames and their hothouses remain hot inside. Now, as a matter of fact, the heat mechanism of a hothouse depends on a well known proposition of physics. I suppose you are acquainted with the fact that the energy from the sun travels in the form of little waves. The energy does not come down to us in straight lines; it comes, as it were, in a zigzag manner, dancing from side to side as it comes along. If these waves are very short, light is the result; if they are a trifle longer, they take the form of heat. If the light waves strike anything on the way down they are very apt to be turned into heat. Now, the waves which form light are so short that they will readily pass through glass, but the waves which form heat are so long that they will not pass through. From this, therefore, you may see why a hothouse remains hot. The energy from the sun passes into the house through the glass roof in the form of light. Then it strikes the objects in the house and is turned to heat. But this heat cannot pass out through the glass. The heat waves are too long. So the light keeps coming in and the heat keeps accumulating, and soon the hothouse becomes very warm indeed, even on the coldest days in winter."—*Boston Globe*.

It is stated that the everglades of Florida are to be drained, thereby rescuing 600,000 acres of good, rich land from the swamp where it has been submerged as long as our knowledge of the peninsula recurs. Dr. Wiley of the Department of Agriculture places an approximate value of $300 an acre on this land and adds that it will be capable of producing more sugar than the entire island of Cuba. The everglades extend through the southern part of the peninsula, south of Lake Okeechobee, an immense body of water lying near the cen'er of the state. The region is flooded at intervals, but it is several feet above sea level and can be drained by digging an immense ditch to the ocean. This is not a difficult matter as the ground is soft. For that reason it may be a task to keep the ditch open. For cultivation waterflows are suggested. Rice, cane and tropical fruits can be grown, as the everglades are below the frost line. If undertaken, this gigantic scheme will at least have the result of adding a large tract to our agricultural estate. It is an experiment and $2,000,000 of Philadelphia capital is interested, according to the story.—*New York Commercial*.

THE PRAIRIE HOME.

Outward far the rolling landscape reaches,
Loamy billows capped with harvest foam,
Level is the view, and subtly teaches
Man to take the prairie for his home.

Here is beauty, here is silent power,
Here the hidden forces crux and rest,
Here dead centuries have shed their dower—
On the spreading prairies of the West!

Winds are roaming—man need never wander,
Born to earth, he has a rich estate;
Seedtime, harvest and his trust grows fonder,
Here he needs alone to work and wait.

—*Chas. W. Stevenson.*

EVOLUTION OF THE THERMOMETER.

It is probably not generally known that the thermometer was invented by Galileo. When we remember that we owe to this one man not only the foundations of physical science, but also in large measure the pendulum, the compass, the telescope and the microscope, it may lead to a certain amount of modesty in our appreciation of modern inventions.

Galileo, probably in 1596, invented the open air thermoscope. Ferdinand II., of Tuscany, first sealed the glass, making the instrument independent of atmospheric pressure. Many improvements were gradually made, especially in the endeavor to fix points on a definite scale, the freezing point of water being first used by Robert Hooke in 1664. Of the three thermometers still in use, Fahrenheit's thermometer was invented in 1709, Reaumur's instrument in 1730, and the scale of Celsius—the centigrade scale—in 1742. None of these thermometers, however, is now used in the form in which it was originally devised. It is a somewhat curious fact that the instrument constructed by the German, Fahrenheit, is used most exclusively by the English speaking people. That invented by the Frenchman, Reaumur, is used chiefly in the north of Europe, while that of the Swede, Celsius, is used in French speaking countries. The centigrade scale, the zero point of which is the freezing point of water, is now used nearly universally in scientific investigations. The main objection to its common use is the length of the degree, the interval between the freezing point and the boiling point of water being divided into 100 instead of 180 degrees, as on the Fahrenheit scale. This makes the length of a centigrade degree nearly twice—nine-fifths—that of the familiar Fahrenheit degree.—*Popular Science Monthly*.

A TYPHOON IN THE PHILIPPINES.

H. Phelps Whitmarsh in the *Atlantic Monthly:* Yesterday nature bore herself proudly; now she appears overwhelmed and tearful. The plumed bamboos which held themselves so haughtily are now spread and bent under the incessant beat of the rain, and cataracts run through their battered leaves. The fields have turned to lakes, the streams are rivers, the rivers are floods; and these roofs of bamboo and nipa are irrigating pipes guiding numberless jets inside the houses.

In the meantime the rain has grown heavier. At intervals cold gusts of wind are flung from the north and the horizon darkens with clouds more black than ever. The barometer, moreover, has fallen a degree. In these suspicious days of the colla, every white man looks at this sentinel of the atmosphere more often than a vain girl looks into a mirror. The barometer to me in my loneliness is a welcome companion. When it falls, I prepare myself for the worst, and when it rises I anticipate the end of the storm.

The rain falls heavier and heavier; the world, seen from my window, is a muddy flood and my house an ark. The barom-

eter is still falling. The dial hand already points to the remark "with winds from the northeast and northwest the baguio approaches." Soon I can hear the wind coming. With a sudden gust to which the house heels like a ship, it is upon us. A great guava tree falls with a crash outside, and the nipa shutters go flying to leeward. The wind converts the raindrops into projectiles which pierce the house at all points with the violence of hailstones.

Night falls early; dark, drenching and furious. "The waters are out," and the storm carries with it a terrible note. And the glass is still falling. Will it never end? Rumors of destruction come in from the forest at intervals of a minute, together with the crashings of torn branches and the blowings, it seems, of a hundred horns. Gusts of wind and water combined come howling over the flood and hurl themselves against the house. At each onset the building cracks and staggers more than ever like a storm-tossed craft.

But at last the monster seems to be seeking its prey in another direction, and turns slowly eastward, hungry for more ruins. Southward, then, unless the law of storms is wrong, it will cause the greatest ravages. The vortex, to which all the radii of this gigantic wheel of the baguio converge, will pass through the south of the archipelago.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.98 inches; highest observed, 30.44 inches, at Sioux City, on the 11th; lowest observed, 29.55 inches, at Sioux City on the 30th; range for state, 0.89 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 109 stations, was 64.6 degrees, which is 5.6° below normal. By sections the mean temperatures were as follows: Northern section 64.1 degree; central section 64.5 degrees; southern section 65.3 degrees. The highest monthly mean was 67.8° at Tipton; lowest monthly mean, 59.4° at Ogden. The highest temperature reported was 96°, at Cedar Rapids and Sigourney on the 26th and 30th; lowest temperature reported, 30°, at Denison, on the 4th. The average monthly maximum was 89.7°; average monthly minimum, 38.6°. Greatest daily range, 50° at Scranton; average of greatest daily ranges 34.1°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 125 stations, was 2.86 inches, which is 1.52 inches below normal. The averages by sections were as follows: Northern section, 2.84 inches; central section, 2.89 inches; southern section, 2.85 inches. The largest amount reported was 6.04 inches at Humboldt; least amount reported, .75 of an inch, at West Union. The greatest daily rainfall reported was 3.00 inches at Washta, on the 30th. Average number of days on which .01 of an inch or more was reported, 10.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 66 miles per hour, from the northwest, at Sioux City, on the 8th. Average number of clear days 13; partly cloudy, 10, cloudy, 7.

OBSERVERS' NOTES.

ALTA.—*David E. Hadden.* Compared with thirteen preceding Junes the month just closed was 5.4° cooler, and the precipitation was .91 of an inch below the normal.

AMANA.—*Conrad Schadt.* The Iowa river was at its highest on June 1st, being about six to eight inches above last year's flood mark.

BONAPARTE.—*B. R. Vale.* A seasonable month; too cool for corn till just at the close.

BRITT.—*Geo. P. Hardwick.* No serious storms except on morning of the last day, when high and damaging wind swept over south half of county; corn uneven and late; grain below average.

CLINTON.—*Dr. Luke Roberts.* Mean temperature 65.4°, which is 4.3° below normal, and 1.7° below June, 1902, which was then a record breaker as a cold June. The average of the first decade was 64°; second decade, 63.7°; third decade, 67.5°. Rainfall 1.66 inches, or 2.89 inches below normal. Very little fell after the 5th and crops were much in need of it before the close of the month.

COLUMBUS JUNCTION.—*J. B. Johnson.* On 1st and 2nd the Iowa river was higher than in 1881.

EARLHAM, R. F. D.—*Geo. Phillips.* Corn was smallest for years at close of month; small grain and grass never looked better.

ESTHERVILLE.—*Earle W. Peterson.* A severe windstorm swept through the northwestern part of Emmet county on afternoon of 24th; in its path, about three rods wide, all buildings were destroyed.

GRAND MEADOW.—*F. L. Williams.* The month was favorable to most crops; there were extreme variations between day and night temperatures.

HANLONTOWN.—*Miss G. M. Paschen.* There was frost on night of 11th which did some damage to corn and other tender vegetation on low ground.

HUMBOLDT.—*H. S. Wells.* Rainfall 6.04 inches; much low ground still unplowed; corn has made advance; haying begun; small fruit and apples good.

LARRABEE—*H. B. Strever.* Wet weather retarded field work first half of the month; frost on the 11th did little damage.

RIDGEWAY—*Arthur Betts.* Month was fine, with 333 hours of sunshine, though the temperature was 3 degrees below normal. I have been reporter since May, 1882, and never reported so small rainfall (1.22) for June. Northern lights were very beautiful on evening of 4th, passing beyond the zenith.

STOCKPORT—*C. L. Beswick.* Continued rainy weather the first six days and continued dry the last nine days of the month, with rain badly needed at close.

STORM LAKE—*L. E. Burdick.* Small grain rank; corn backward; potatoes commencing to rot. Rainfall for month 4.85 inches.

WASHTA—*H. L. Felter.* Rain 4.42 inches; a very heavy storm on night of 29th; lightning struck an elevator at Washta and burned it.

WAUKEE—*E. J. Leonard.* Rain 3.11 inches; month remarkably free from storms; only one heavy rain (1.61 inches) fell, on 18th; continuous northeast wind for nine days, from May 29th to June 6th.

WHITTEN—*Frank P. Butler, M. D.* Frost on morning of 12th but little damage resulting; rain on 30th was a great help to all vegetation, corn making rapid progress.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. JULY, 1903. No. 7.

IOWA CROP REPORT, AUGUST 1, 1903.

Reports from township and county crop correspondents of he Iowa Weather and Crop Service have been tabulated, showng the following estimates of the condition of the staple crops on August 1, 1903: Spring wheat, 82 per cent; corn, 73; oats, 77; millet, 96; flax, 84; buckwheat, 89; pastures, 104; sorghum, 84; potatoes, 80; apples, 65; grapes, 80.

At corresponding date last year the estimates were as follows: Spring wheat, 84; corn, 93; oats, 83; flax, 91; potatoes, 107; apples, 66.

WEATHER AND CROP CONDITIONS, JULY, 1903.

July was characterized by frequent and sudden alternations from high to low temperatures. The daily mean for the month was about two degrees below normal, the first decade being unusually warm, the second decade unseasonably cool, and the third decade bringing the two extremes of temperature. The average rainfall for the state, 4.83 inches, was .91 of an inch above the July normal. The distribution was very unequal, the average of the northern section being 6.49, the central section 5.28, and the southern section 2.73 inches. The heaviest amounts of rainfall were reported at stations in the N. E. district. The most destructive storm of the month occurred on the afternoon of the 20th, sweeping across the state on a direct line from Lyon and Osceola southward to Adams, Taylor and Ringgold, its pathway varying in width from one to eight miles. At numerous points along this line the storm was accompanied by high winds and very heavy hail, causing almost total loss of growing crops within an area of more than three hundred square miles.

In portions of the southern section drouthy conditions prevailed for many days, causing some detriment to growing crops; but the closing week brought relief in form of generous showers. On the whole the month was favorable for haymaking and harvesting of wheat, oats, barley and rye. The hay crop proved to be one of the best ever produced in the state, and the greater part of it was secured in excellent condition. Wheat and oats were generally harvested in good condition, but on account of the rust and blight the yield has been disappointing, though the quality of the grain will be greatly superior to the output of last year. The corn crop made fairly good progress during the month, though the temperature was somewhat unfavorable about half of the time. The early planted portion of the crop reached the earing stage while the late planted corn was generally small and unpromising. The outlook for the crop as a whole was not encouraging at the close of July. Reports indicated generally favorable prospects for late potatoes, early apples, grapes and vegetables. Millet, buckwheat, flax and sorghum were rated good in condition.

CROP AND WEATHER NOTES.

The St. Louis correspondent of the *Northwestern Miller* says that all the wheat arriving at St. Louis is of so high a milling quality that the millers feel elated over the bright prospects of having at least the quality, if not the quantity, of wheat to grind this year. The lower river boats are bringing in sacked lots and every sample shown so far has been fully up to milling grade, besides being hard and perfectly sound.

It really takes a most extraordinary year to beat in a crop way a country that raises some crops over an area 3,000 miles long and 2,000 miles wide, says the *Minneapolis Journal*. Of the wheat crop of 1902, 362,000,000 bushels were winter sown and 307,000,000 spring wheat. The lower Missouri valley produced about 184,000,000 bushels, the upper Mississippi and Red river valley 187,000,000; the Pacific coast 61,000,000; the Atlantic coast states 42,000,000, and the Ohio valley and lake states 132,000,000. It is not in the natural order of things that weather conditions will be such as to ruin both winter and spring wheat over such a large area and with such marked difference in climate.

A news special, dated Crawford, N. H., July 28th, notes a remarkable fall in the temperature in the region of the White Mountains, as follows: With three inches of snow on Mount Washington, trees prostrate along the Crawford Notch carriage road, and Jackson Village cut off from the outside world by the blowing down of the telegraph and telephone poles, the record of unseasonable weather during this unusual summer is broken to-day. At the Summit House, on Sunday evening at 8 o'clock, the thermometer registered 30 degrees. Yesterday morning it was only 16 degrees above zero. A terrific northwest gale blew all night, the equal of which the Summit dwellers say they have not seen in years. With the wind came snow, and fully three inches cover the mountain top.

Alfalfa is comparatively a new plant in this country, but in Asia it was known and cultivated before the dates of the most ancient history. It grew in abundance in Assyria and Persia, and at an early day found its way to southern Europe, and thence with the Spanish conquerors to Mexico and Peru. It was grown to some extent, but not appreciated, in the eastern states, long before it was recognized as of material value anywhere in this country. In portions of South America it has escaped from the fields and grows wild over large areas. It is now grown largely in all the arid and semi-arid regions of the

world, and is everywhere recognized as the most valuable forage plant known for all sections where rainfall is scant. But it is by no means confined to arid sections, but is grown and esteemed where rainfall is abundant. Its most perfect development, however, seems to be where it can get sufficient moisture by means of its long tap root, and does not have to depend upon rains.—*Exchange*.

CLIMATE OF THE NORTHWEST.

The northwest leads in the great variety of its climatic conditions. Far removed from ocean influences, it has a climate all its own and of the extreme sort. No monotony about it. We have a taste of all climates found anywhere on earth and some which are found nowhere else. It is nature's grand experimental laboratory, the place where Leyden jars, electric batteries, refrigerators, furnaces and retorts, manipulated by the great chemist of the universe, evolve and liberate the snow-capped cumuli cloud mountain surcharged with its awful voltage of electricity, and burden of tropical humidity; where is cradled the cyclone demon of the air, the laboratory combination of mysterious forces; where is set free the blizzard, the incarnated spirit of vast polar seas and mighty icebergs; a climate whose furnaces give an equatorial heat and a tropical summer, and whose refrigerators invest us with an arctic temperature in winter. Intermingled with these extremes are other types—serene and peaceful days when the earth smiles and blushes at the heavens' tender caress, nights so calm and silent that were it not for the night cry or the whippoorwill, the chir-r of a tree toad or the distant barking of a dog the star set heavens might seem to look down upon an uninhabited world. Under these forceful and constantly changing climatic conditions the very best there is in man is being brought out and developed; he becomes of necessity virile, energetic, aggressive; the dolce far niente of perennial sunshine is to him unknown, and so mid the storm and the great wind, the heat and the cold, the turmoil and calm, there is being evolved—there is nowhere else—a type of manhood and womanhood unexcelled on earth.—*J. S. Trigg*.

FLOOD LESSONS.

A large section of the middle west has been this season visited by floods of greater magnitude than have been known for sixty years. The resulting loss of life has been great and the destruction of property almost immeasurable. Some facts, which in a general way have been known, yet but little heeded, have been terribly emphasized as a result of these floods. One of them is that the settlement and improvement of a country tend to a quick release of excessive rainfall, the universal system of draining, tiling and ditching incident to the reclamation of all wet lands insuring the rapid movement of the water to the streams and rivers, these augmenting the flood in the seagoing streams with a cumulative effect. Another fact which has been made very plain is that the general effect of man's work on the country has been in the way of narrowing the original waterways and obstructing the natural outlets for flood waters. This has been brought about by the desire of municipalities and railways to curtail as much as possible the length of their bridges and the filling up of ancient ravines to secure valuable building sites, it being shown that a western city, one of the worst sufferers by the late flood, had actually narrowed the main channel of the river which passed through it 150 feet in the manner above indicated, besides having filled up and obliterated numerous gulches and bayous on the one-time river bottom which were the safety valves for the flood seasons of fifty years ago. Another fact developed, and one which more particularly concerns the farmer, is that his low lands, the marsh and bog of the pioneer days, which of late years he has broken up and cropped and not tile drained, are now well under way back to the primeval bog conditions and will remain unprofitable land for him until he can either get it seeded down or properly underdrained. The last lesson is that there is no visible or permanent change in progress of climatic conditions. These remain as they always have been, cycles or periods with a marked tendency toward extreme heat, cold, drouth or flood following each other with a certain fixity of purpose, but according to no regular known periodicity. The high water marks of 1903 will furnish plenty of material for future thought and study.—*J. S. Trigg*.

THE RELATIONS OF FORESTRY TO ZOOLOGY.

It has been pointed out recently by H. A. Surface, professor of Zoology at Pennsylvannia State College, that there is a direct and important connection between forestry and zoology, and he gives several examples of how this connection exists. Aside from the clearing of forest growths which naturally drives the denizens of the woods from the cleared localities, he finds that the effect of forest destruction on streams is a far-reaching one. Clear streams, flowing perpetually through wooded country, are the natural haunt of the trout; but if the country in which these streams rise or have their courses is destructively cut over, the streams themselves become intermittent, muddy, and in some cases only a succession of warm and slime-covered pools in midsummer. As such they are fit only for the lurking places of the mud-sucker and the carp. In the larger streams and rivers which, under natural conditions, are the homes of the desirable game fishes, the black bass and pickerel, which pass the winter in deep pools in a state of partial hibernation or quietude, the changes are more to be deplored when the watershed is deforested. Floods arising from the destruction of the trees bring down immense quantities of silt, "washings," sand, etc., and deposit them in the deep pools, where the current runs slower, so that the quiescent fish are covered and destroyed. Another disastrous result comes from the washing of the fishes out of their places of winter abode, dashing them against rocks and ice and in some cases leaving them stranded to gasp out their lives after the water subsides.

The setting aside of forest reserves will not only keep the forest and the beauty of the landscape, but will restore game and song birds to their original haunts, protect the wild animals, and preserve the most desirable fishes—the trout, bass, and pickerel.—*Exchange*.

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 29.96 inches; highest observed, 30.23 inches, at Dubuque, on the 31st; lowest observed, 29.53 inches, at Davenport, on the 17th; range for state, .70 inch.

TEMPERATURE.—The monthly mean temperature for the state, as shown by the records of 112 stations, was 72.9 degrees, which is 1.5° below normal. By sections the mean temperatures were as follows: Northern section, 71.0 degrees; central section, 72.9 degrees; southern section, 74.7 degrees. The highest monthly mean was 77.4°, at Keokuk; lowest monthly mean, 68.5°, at New Hampton. The highest temperature reported was 100°, at Thurman and Sigourney, on the 9th and 27th; lowest temperature reported, 40°, at Chester, on the 31st. The average monthly maximum was 92.7°; average monthly minimum, 46.4°. Greatest daily range, 39°, at Lansing, Clarinda, Earlham; average of greatest daily ranges, 31.3°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 124 stations, was 4.83 inches, which is .91 of an inch above normal. The averages by sections were as

follows: Northern section, 6.49 inches; central section, 5.28 inches; southern section, 2.73 inches. The largest amount reported was 12.72 inches at Elkader; least amount reported, .94 of an inch, at Belknap. The greatest daily rainfall reported was 5.12 inches, at Delaware, on the 10th. Average number of days on which .01 of an inch or more was reported, 9.

WIND AND WEATHER.—Prevailing direction of the wind, south; highest velocity reported, 48 miles per hour, from the northwest, at Sioux City, on the 1st. Average number of clear days, 17; partly cloudy, 9; cloudy, 5.

OBSERVERS' NOTES.

ALTA.—*David E. Hadden*. On the 20th a hailstorm lasting 7 minutes caused much damage west and southwest of town.

AMANA.—*Conrad Schadt*. Fine weather for harvesting and threshing; corn made good growth during month.

ATLANTIC.—*J. W. Love*. A severe storm of wind, rain and hail occurred at 4:30 P. M. on 20th, damaging crops, buildings, trees and electric lines.

BEDFORD.—*E. E. Healy*. A severe hailstorm on 20th destroyed corn in a wide belt.

BONAPARTE.—*B. R. Vale*. A very seasonable and satisfactory month; rain was needed at its close for corn and pastures.

BRITT.—*Geo. P. Hardwick*. A month of variable temperature, but no severe storms; wheat blighted and oats rusted badly.

CLINTON.—*Luke Roberts*. A good month for farmers. Rain 5.27 inches, which is 1.11 above normal. Mean temperature about normal; highest, 96°; lowest, 51°. Mean of first decade was 77.1°; second decade, 69.6°; third decade, 78.9°.

CORNING.—*Jerome Smith*. A destructive hailstorm on afternoon of the 20th, covered about one-third of the county.

CUMBERLAND.—*J. H. Reppert*. Much damage done to corn and small grain by wind and hail on 20th.

EARLHAM.—*Geo. Phillips*. Poorest show for corn crop for years; best hay crop.

FORREST CITY.—*J. A. Peters*. Harvesting grain begun on 25th, and about 80 per cent in shock by close of month. Early planted corn in silk.

FORT MADISON.—*Miss L. A. McCready*. July was a very dry month; no good rain between 5th of June and 29th of July. Oats very light and poor prospect for corn

GRAND MEADOW.—*F. L. Williams*. On 9th rain washed roads and fields badly; barley harvest begun on 14th; on 16th first field corn in tassel; oats badly rusted; wheat crop light.

GRINNELL.—*A. O. Price*. Fine month for harvest work; hay extra in yield and quality, secured in fine condition. Wheat, oats and barley in shock.

HANLONTOWN.—*Miss G. M. Paschen*. Haying commenced on 6th; barley harvested 13th; commenced oats harvest on 22d.

HUMBOLDT.—*H. S. Wells*. Rain, 5 39 inches; no high winds; corn and potatoes doing well.

OLIN.—*Nathan Potter*. First part of July was too wet for cultivating corn; last half of month all that could be desired for hay and grain harvest, but too cool for rapid growth of corn.

OSKALOOSA.—*Jos. Boyd*. A fine month for securing the hay crop.

RIDGEWAY.—*Arthur Betts*. A pleasant month; 358 hours of sunshine; growing weather. With good corn weather till September 15th, this part of Iowa will have a good corn crop.

WASHTA.—*W. L. Felter*. On July 3d water in small streams was highest ever known.

WAUKEE.—*E. J. Leonard*. Rain was well distributed through the month; heavy thunderstorms and high winds were lacking, and there has been very little uncomfortably hot weather.

LENOX.—*J. L. Hurley*. On the 20th a severe windstorm came with the hail, damaging windmills, barns and outbuildings. Two large barns north of town were blown to pieces and some parts scattered eighty rods. Corn almost a total failure in the hail strip from eight to twelve miles wide.

ERRATA IN MAY REVIEW.

ALBIA.—Mean maximum temperature recorded 69.9° on page 12, should have been 70.0°.

CLARINDA.—Mean temperature recorded 62.9° on page 11, should have been 63 0°. Mean maximum temperature recorded 74.0° on page 12, should have been 74.1°.

DELAWARE.—Total precipitation recorded 4.47 inches on pages 10 and 14, should have been 4.77 inches.

EARLHAM.—Mean temperature recorded 61.6° on page 11, should have been 60.0°. Mean maximum temperature recorded 74.2° on page 12, should have been 71.0°.

LANSING.—Mean temperature recorded 61 8° on page 10, should have been 62.0°. Mean maximum temperature recorded 73.3° on page 13, should have been 73.6°.

OSCEOLA.—Mean maximum temperature recorded 71.1° on page 13, should have been 71.2°.

BELATED REPORTS.

VILLISCA.—*June*. Mean temperature, 67.0; highest, 91° on the 30th; lowest, 42° an the 10th; greatest daily range, 33°. Total precipitation, 3.82 inches; greatest in 24 hours, 1.08 inches, on the 21st; prevailing direction, southwest. Number of clear days, 11; partly cloudy, 16; cloudy, 3; rainy, 10.

WEST BEND.—*June*. Mean temperature, 65.7°; highest, 88° on the 30th; lowest, 39° on the 11th; greatest daily range, 35°. Total precipitation, 3.03 inches; greatest in 24 hours, 1.72 inches on the 29th and 30th. Number of rainy days, 11.

BELLE PLAINE.—*June*. Mean temperature, 64.1° highest, 90° on the 30th; lowest, 38° on the 12th; greatest daily range, 30°. Total precipitation, 2 81 inches; greatest in 24 hours, 1.06 inches on the 22d; prevailing direction, southeast. Number of clear days, 15; partly cloudy, 12; cloudy, 3; rainy, 6.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. MCDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. AUGUST, 1903. No. 8.

WEATHER CROP CONDITIONS, AUGUST, 1903.

August was cooler than usual, with a large excess of rainfall, humidity and cloudiness. The daily mean temperature for the state was 69.1°, which is 3.1° below normal, and exactly the mean of August, 1902. There have been two colder Augusts in the past thirteen years—in 1890 and 1897. The average rainfall, 6.64 inches, was 3.43 inches above normal, and the heaviest state average in any August of which we have records. The southern section received the larger amount, an average of 8.74 inches, the greater part of which fell in the last week of the month, when it was much needed and beneficial, though some local damage resulted from excessive downpours. For the state there was an average of twelve clear days, and nineteen cloudy or partly cloudy. Considerable progress was made during the fair weather periods in threshing and other farm operations. Haymaking was continued throughout the month, when the weather permitted, securing a large amount of aftermath, wild hay, and second crop of clover for seed and fodder. More than the usual amount of plowing was done, with generally favorable conditions of soil for this work. Threshing returns indicated generally light and unsatisfactory yield of wheat, oats and barley; the yield of timothy seed has been unusually heavy. The development of the corn crop was all that could be expected under the prevalent weather conditions. At the close of the month the early planted corn, about forty per cent of the whole area, had reached the roasting ear stage, or a little beyond, giving promise of reaching maturity within twenty days, under favorable conditions. The balance of the crop was in various stages of growth, indicating need of very good ripening weather for a full month or more to place the bulk of it beyond danger of harm by frost. The outlook for the crop as a whole was at that time very unsatisfactory. The late potato crop made fair growth in dry and sandy soil, but there were reports of damage by rot in many localities. The crop of early and fall apples gave good returns, especially in the northern half of the state; but winter apples were very unpromising. Pasturage made a heavy growth, giving assurance of abundant fall feed for stock.

NOTES.

As the apple in prime condition will soon be here again, it is well to remember, says the cooking club, that this fruit contains a larger percentage of phosphorus than any other fruit or vegetable. This phosphorus is admirably adapted for renewing the essential nervous matter of the brain. The acids are also of great value for people of sedentary habits, whose livers are sluggish in action, these actions serving to eliminate from the body noxious matters, which if retained, would make the brain heavy and dull, or bring about jaundice or skin eruptions. Some such experience must have led to the custom of using apple sauce with roast pork and similar dishes. The malic acid of ripe apples, either raw or cooked, neutralizes any excess of chalky matter engendered by eating too much. Apples are useful as a disinfectant for the system, and have considerable value as an antidote for tobacco and liquor. Under all conditions and in all cases there is no fruit so beneficial or harmless as the apple.—*Exchange.*

There has been some speculation as to the cause of the crop deterioration which occurred just before harvest this year. The *Commercial West* notes the remarkable deterioration which cut the crop down from 800,000,000 bushels, the earliest optimistic report of the "probable" crop made by the government, to 625,000,000, the present estimate. It is well known, and has been noted before in the *Modern Miller*, that the deterioration was not caused by a series of calamities in the way of frosts, drouths or insects, and in searching for an explanation the *Commercial West* advances the novel theory that the sun's rays were absorbed in the atmosphere and plant life did not receive enough heat and light. The theory is credited to one Duvigneaud, of a Minneapolis grain commission company, who discovered that the July sun was not sufficient to give the usual actinic effects in camera work and that photographic plates were under-developed, where the usual amount of time was allowed. The theory is strengthened by a professor in the Smithsonian Institute, who claims that this year there has been an unusual decrease in the transparency of the atmosphere, probably due to volcanic dust from Mt. Pelee, or to an overdose of moisture in the atmosphere.—*Modern Miller.*

BENEFITS OF FALL PLOWING.

Cultivation is probably the most important feature connected with the handling of soils. Nature has placed large quantities of plant food in our soils, and it depends upon our skill and knowledge how far we can make use of and work this mine for the benefit of our crops. Cultivation is vital, and the subject is so wide that one scarcely knows where to begin. For spring grains I try to plow in the fall. When the furrows are well and evenly set up and are frozen, and when the frost comes out, fertilization takes place and the soil is left in a fine granulous condition. Plant food is liberated and a warm seed bed is formed. When plowing for spring grain is left until the spring, our teams are plowing when they should be surface cultivating and drilling in the seed. Every day's delay in getting in grain after the soil is dry enough to work means fewer bushels at

threshing time. Soil plowed in the spring, too, is colder on the surface than that plowed in the fall, which involves slower germination and vegetation. As to the proper depth to plow, it seems to me that is a question which each farmer must decide for himself, according to his own soil, conditions and crop requirements. If the soil of a given field is deep, say ten or twelve inches, and that field were plowed in the fall for spring grain, I would try to plow it about seven inches deep. But if by some mischance that field were not plowed until the spring I would plow it lighter, as the deeper the plowing the colder the surface turned up. If that field were plowed in the fall for mangels, I would try for about eight inches. But if the surface soil of this field is only six or seven inches deep, I would try to plow it only five or six inches deep. In other words, the depth of the soil, the time of plowing and the nature of the crop grown are all factors in determining how deep to plow. I do not wish to bring any subsoil to the surface if I can avoid it. Sometimes, however, the surface soil is so shallow that some of the subsoil must necessarily be brought to the surface in plowing. If I have a deep soil I want to give the roots of the plants liberal feeding grounds, because they will, if allowed, strike down deeply. As to the question of frequency of plowing, it appears to me that that also depends upon soils and circumstances. Heavy, compact soils require most plowing than lighter ones. Such soils tend to get hard and bake and become inert, and hence require the plow to open them and improve their mechanical condition. The plow, too, is the surest and quickest way to destroy many sorts of weeds. Where the land is clean and the soil will permit it, surface cultivation with a disc or spring tooth often forms better seed-bed than the use of the plow.—*A. W. Pearl, in Farmers' Review.*

RAIN AS A PURIFIER.

The health department has often called the attention of the public to the fact that rain is a great purifier, and there is some highly interesting testimony to the same effect in a recent number of the *London Lancet* which is fortified by references to recent examination and analysis.

Beginning with June 13th London had a continuous rainfall for five days, the total precipitation being estimated at 3.8 inches. On the third day of the period a supply of raindrops was secured for an investigation, and it was found that the solid matters contained therein amounted to 9.1 grains per gallon. Among the constituents noted were common salt, ammonium sulphate, organic ammonia, soot and suspended matters and nitrates. The *Lancet* assures us that the quantity of ammonia sulphate, .625 grains, was remarkable, and that its chief origin is the consumption of coal. Salt contributed .8 grains and soot and suspended matter 5 grains. With this analysis and an estimate of 6,437,229,860 gallons for the total rainfall over the London country area as the basis of the calculation, it is figured that the enormous downpour "represents the washing out of no less than 3,738 tons of solid impurities, of which 330 tons consisted of common salt, 267 tons of soot and suspended matters." Another interesting computation is given as follows: "Regarding the combustion of one ton of coal to produce 20 pounds of ammonium sulphate (a very fair average) the quantity of coal represented by the storm would be 29,904 tons."

The *Lancet* adds that besides the purification which is shown by the analysis there is a bacteriological purification also, which of course is a very important factor in the beneficient work of the rain.—*Chicago Record.*

ERRATA IN JUNE REVIEW.

FT. MADISON.—Total precipitation recorded 2.49 inches on pages 7 and 10, should have been 3.49 inches.

LANSING.—Mean minimum temperature recorded 51.2° on page 9 should have been 51.7°.

STUART.—Mean temperature recorded 64.2° on page 6, should have been 64.4°.

Mean maximum temperature recorded 73.4° on page 9, should have been 73.5°.

REPORT OF SPRING FLOODS.

REPORT SHOWS TOTAL LOSS FROM FLOODS WILL REACH $40,000,000.

WASHINGTON, D. C., September 2.—Dr. Frankenfield of the United States weather bureau has completed and sent to the printer an exhaustive report on the floods of the Missouri and Kaw rivers. The report is the most comprehensive thing of the kind ever attempted by the government.

His report will show that the spring floods of 1903 in the Missouri and Kaw rivers and upper Mississippi were the most destructive in the history of the country and were the greatest in the volume of water, with the exception of 1844. The fact that a lesser volume of water in 1903 created greater havoc is due to the narrowing of the channels of the river by the march of civilization up and down the water courses and the reclamation of lowlands. Dr. Frankenfield corrects an erroneous popular impression that forests make rains. He says that while they do not make rains, they are valuable in that they retain the moisture. In recent years the denuding of the forests makes it possible for the water to reach the water courses much quicker than when there were extensive forests This causes quicker rises in the water courses and enlarges the possibilities of destruction.

In support of the assertion that there was a greater volume of water in the flood of 1844 than in that at Kansas City of this year, Dr. Frankenfield says that the water was two feet higher at Kansas City than this year and three and a half feet higher at St. Louis. Recent years have seen the river at Kansas City reduced in width from 2,000 to 1,100 feet. This illustrates the contraction of the water course and the resultant increase in the speed of the current. There were sixteen bridges swept from their foundations by the Kaw river during this year's flood. Some of these were not more than 400 feet long and this is a further illustration of the contracting of the courses of streams. Present day construction of bridge approaches is tending all the time in the direction of solid embankments of masonry and these have the effect of a dam. This increases the back water and the height of the stream at these points.

The report asserts that the total loss from the floods in the upper river was in round numbers $40,000,000. This is neither speculative nor an estimate, but is based upon actual investigation by the observers of the weather bureau. The loss in the vicinity of Topeka, Des Moines and Kansas City was largely to crops, railroad rights of way and bridges, and to the commercial interests along the river. A loss of $11,500,000 was sustained between Hannibal and St. Louis on the Mississippi, and between Alton and Kansas City on the Missouri. The loss in the immediate vicinity of Kansas City was $15,500,000.

Usually the agricultural interests suffer greatest from the flood, but Dr. Frankenfield remarks that the high water of this year distributed its ravages with impartiality. The farming interests sustained about a third of the loss, the railroads another third and the balance was to the commercial interests of cities and the loss of personal property. The loss from the destruction and damaging of bridges alone amounted to $750,000. The total area overflowed by the spring floods was 3,500 square miles. As large an area has been overflowed before, but with less disastrous results. This year 320,000 acres of land in the "American" bottoms opposite St. Louis from Alton to the Kashaskia river were overflowed.

In the state of Missouri alone about 1,000,000 acres were submerged. The floods were severe tests to the levee system. On the Mississippi side the levees were badly broken from about Warsaw to Hamburg. The Hunt, Lima, Lake, Indian Grove and Sny levees suffered severely. The three first ran from Warsaw to the bluffs at Quincy, and the Sny continues the

chain to Hamburg for about fifty miles. The severe test applied to the Sny levee demonstrated its superiority for that sort of engineer construction work. It had a serious break in only one place and that was where the Alton railroad uses it as a right of way to get into Louisiana.

The Skunk river levee broke, putting 15,000 acres of land under water. Dr. Frankenfield says that a good portion of the water was drained off the land in time for late seeding and raising of fair crops. He comments on the great commercial loss because of the overflowing of large portions of the cities of Kansas City, Topeka and Des Moines. While this is not generally known, he asserts that in the city of Des Moines seven square miles were overflowed.—*Press Special.*

FARMERS AIDED BY SCIENCE.

No book is more certain of a large circulation than the "Year Book" of the Department of Agriculture. One of the most interesting articles in the new volume relates to the results of experiment station work. Our agricultural experiment stations now form the most complete system of agricultural research in the world and the results they attain are influencing our farmers to a large extent.

There are sixty of these stations, employing nearly 1,000 trained scientific and practical men; and they are in operation in every state and territory, including Alaska, Hawaii, Porto Rico and the Philippines. The stations have existed as a national enterprise for fourteen years and the outlay for agricultural investigation in that time has been at the rate of $1 for nearly $3,000 worth of farm products, which cannot be considered an extravagant outlay.

Here are some results of the work of the stations:

Our farmers spend over fifty million dollars a year for fertilizers and the stations therefore have given particular attention to this subject. Fraud and extravagant assertions about fertilizers have been largely eliminated from the business and thousands of farmers are buying fertilizers more intelligently and economically. They also know just what they are using in terms of nitrogen, phosphoric acid and potash with the reason for using them.

The annual loss to our farmers from waste of barnyard manure is estimated at seven million dollars. Many of the stations have given special attention to the economic use of manure on the farm, with the result that better methods for its care and use are being employed.

The successful introduction of Mansury barley, for which the Wisconsin station is mainly responsible, has increased the yield of barley over a wide region, with results worth millions of dollars.

Kaffir corn was introduced about fifteen years ago by the stations in California, Kansas and Oklahoma. It has been found specially suited to regions of scanty rainfall. The crop in Kansas alone in 1899 was valued at over six million dollars.

A variety of oats introduced by the Department of Agriculture and tested and improved by the Wisconsin and other stations has been widely distributed and is grown with an average yield wherever it is sown of from three to five bushels an acre.

The various macaroni wheats which have been tested under varying conditions by a number of the stations have proved so successful that the United States will probably produce all the macaroni it consumes in the course of a few years.

The investigations of the experiment stations in the southern states have convinced farmers that many varieties of forage plants may be more successfully grown in the south than was supposed and have laid the foundation for a wide development of the live stock and dairy industries of that region.

The Department of Agriculture and the Connecticut State Station, co-operating with local tobacco growers, have within the last three years demonstrated that a fine grade of Sumatra wrapper tobacco may be grown under shade in the Connecticut valley. Professor Whitney says that this discovery will increase the value of light lands of the Connecticut valley over 200 per cent.

Speaking of the work of the Minnesota station in breeding wheat, W. S. Harwood has recently written that it is not only quite possible, but is indeed an established fact, that wheats superior to the best the world has possessed may now be produced. By the use of the new wheats the crop of the hard wheat region of the northwest may be increased from three to five bushels to the acre.

The stations of the northwestern states have extended the limits of corn culture by proving, by careful selections of varieties and modified methods of culture, that this crop may be grown in regions heretofore believed to be unsuited to corn culture.

The stations have been prominent in the investigations which have led to the new system of forcing vegetables in the field and under glass for supplying the markets with fresh vegetables at all seasons of the year. For example, the winter culture of lettuce in eastern North Carolina is now yielding over $100,000 a year. The Ohio station discovered that onions started in the greenhouse or under frames from seed and then transplanted to the open field produced larger onions and earlier and heavier crops than by the usual methods of tillage and seeding. This discovery is changing the methods of onion culture.

These are only a few of the many ways in which the experiment stations are helping agriculture. Their investigations relating to protective measures against plant diseases and injurious insects, the storage and utilization of fodder crops, breeding and dairying, the protection of farmers against fraud and many other topics have been of the utmost value.—*New York Sun.*

CLIMATOLOGY OF THE MONTH OF AUGUST, 1903.

BAROMETER.—Mean pressure, 29.96 inches; highest observed, 30.19 inches, at Dubuque, Keokuk and Des Moines, on the 1st, 3d and 31st; lowest observed, 29.63 inches, at Sioux City, on the 24th; range for state, 0.56 inches.

TEMPERATURE.—The mean monthly temperature for the state, as shown by records of ninety-nine stations, was 69.1°, which is 3.1° below normal. By sections the mean temperatures were as follows: Northern section, 67.0°; Central section, 69.3°; Southern section, 70.9°. The highest monthly mean was 75.0°, at Logan; lowest monthly mean, 63.8°, at New Hampton. The highest temperature reported was 101°, at Logan, on the 24th; lowest temperature reported, 41°, at Ogden, on the 31st. The average monthly maximum was 91.6°; average monthly minimum, 47.3°. Greatest daily range, 45°, at Logan; average of greatest daily ranges, 31.4°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 110 stations, was 6.64 inches, which is 3.45 inches above normal. The averages by sections were as follows: Northern section, 5.51 inches; Central section, 5.67 inches; Southern section, 8.74 inches. The largest amount reported was 17.74 inches at Woodburn; least amount reported, 2.55 inches at Toledo. The greatest daily rainfall reported was 11.22 inches, at Chariton, on the 27th. Average number of days on which .01 of an inch or more was reported, 11.

WIND AND WEATHER.—Prevailing direction of the wind, southwest; highest velocity reported, 44 miles per hour, from the southeast, at Sioux City, on the 1st. Average number of clear days, 12; partly cloudy, 10; cloudy, 9.

OBSERVERS' NOTES.

ALTA.—*David E. Hadden.* Frequent and heavy rains during the month, with total of 6.28 inches; several destructive electric storms and some hail; bright aurora on evening of 21st.

AMANA.—*C. Schadt.* On the 1st 0.42 of an inch of rain fell in ten minutes—7:32 to 7:42 P. M. Weather has been too cool for corn, but favorable for harvest and threshing.

ATLANTIC.—*J. W. Love.* A very wet and cool August.

BELKNAP.—*A. W. Rankin.* Heavy rain, greatly needed, on 26th, 27th and 28th; damaging hailstorm on 28th.

BONAPARTE.—*B. R. Vale.* A cool but growing month; 7.53 inches of rain, but none too much; fall plowing begun and pastures improved.

BRITT —*Geo P. Hardwick.* Cool, with excessive cloudiness; no damaging winds; ground in good condition for plowing; much tiling being done.

CHARITON.—*C. C. Burr.* Rainfall in August 14.05 inches. The storm of the 27th (11.22 inches) was accompanied by excessive lightning and three barns were burned. The floods washed away bridges and covered lowlands, floating away hayricks which looked like steamboats going down the streams.

CLINTON.—*Dr. Luke Roberts.* Rainfall 4.79 inches, which is 1.77 above normal; mean temperature 2° below normal; no other August during the last twenty-five years gave a lower mean temperature; coldest day was the 30th; per cent of cloudiness high. It was not golden weather for maturing corn.

POSTVILLE. — *F. L. Williams.* The month was noted for cool nights and heavy rains; corn late and oats light.

HANLONTOWN.—*Miss G. M. Paschen.* Threshing from shock and fall plowing commenced on first of month; oats light, ranging from twenty to thirty-one pounds per bushel.

HOPEVILLE.—*M. T. Ashley.* About 5 P. M. on the 26th a terrific electrical storm occurred; three fires from effects of lightning were visible during the storm. The rainfall of the 26th and 27th made a total of 10.08 inches—the heaviest since this station was established.

JEFFERSON. — *Isaac Young.* Hail at Scranton on 14th destroyed several hundred acres of corn.

LEON.—*Millard F. Stookey.* The floods of the 26th and 27th swept away bridges and culverts, and damaged corn on bottom lands.

OLIN.—*Nathan Potter.* August has been cool, and the corn crop was delayed in ripening.

OSCEOLA.—*Mrs. S. Lewis.* Between 5:30 on the 26th and 5:30 on the 27th the amount of rainfall was 9.34 inches, of which amount 7.68 fell in thirteen hours.

RIDGEWAY.—*Arthur Betts.* The coolest August on record here, and the smallest daily range, but the mean minimum was lower in 1898 and 1902. There were 249 hours of sunshine, or 57 per cent. Pretty northern lights on 21st.

VILLISCA.—*C. E. Matteson.* An unusual month of thunderstorms and excessive rains and floods; much damage to crops on bottom lands.

WAUKEE.—*E. J. Leonard.* Cool and wet; rainfall, 9.33 inches; last year for August, 6.89 inches; farm work delayed and corn endangered by retarding its growth.

WOODBURN.—*C. B. McDonough.* Rainfall, 17.74 inches; greatest amount in twenty-four hours, 14.61, began at 6 P. M. on the 26th; much damage was done to railroad and country bridges.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. SEPTEMBER 1903. No. 9.

WEATHER AND CROP CONDITIONS.

September was cooler than usual, with some excess of rainfall, cloudiness and humidity. The daily mean temperature, 60.8° for the state, was 3.4° below normal. The average number of cloudy days was 10, and partly cloudy 6, with 14 days of clear skies and sunshine. On the whole the month was materially better in all the elements than September, 1902. Frosts were noted at numerous stations, in all districts, on 16th, 17th, 18th, 24th and 27th, ranging from light to heavy; but little damage resulted to farm crops except in quite limited areas. The main detriment caused by the cold and frosty period was the delay in bringing belated corn to full maturity. The period of most unfavorable weather and heaviest rainfall was from the 4th to the 16th. In the last half of the month there were about twelve days of ideal weather for maturing crops, harvesting, threshing and plowing. During this time corn made very good progress, and at the close of the month fully 80 per cent of the crop was well matured, the balance requiring one to two weeks of frostless weather and generally favorable conditions to make it safe. At the best there was but little expectation of bringing all of the belated portion of the crop to maturity, as some of it was still green and soft at the close of September. A considerable amount of the early corn was cut and put into shocks after the first appearance of frost. Fall pasturage was never better, and seldom as good at this time of the year. Fair progress has been made in harve ting the minor crops, and a good deal of second crop hay has been secured. Fall plowing is well advanced, much more than the usual acreage having been done with the soil in excellent conditlon. The potato harvest showed a very light yield, and much damage by rotting. The fall apple crop was fair, but winter apples are inferior in size and quality. On the whole September was a fairly satisfactory month, though below normal in tenperature and sunshine. The adverse features of the month were the natural sequence of the preceding abnormal spring and summer. There is much cause for congratulation and thankfulness, that under such unusual conditions the yield of staple crops will be sufficient to afford a liberal surplus for export to regions of less productiveness.

NOTES AND COMMENTS.

The weather records at Manila, P. I., show a total of 37 inches of rainfall in the month of June, 1903.

Abnormally wet seasons always insure poorer crops and smaller profits than abnormally dry ones. In a dry season a man is able to save what he raises, while in a wet one the loss is enormous on every hand.—*J. S. Trigg.*

Whi'e irrigation schemes are being promoted in the West, the Iowa farmer is making plans to tile his wet lands.

Corn experts are needed all along the northern limit of the corn belt to show to corn growers the folly of attempting to grow varieties of corn only suited to the more southern latitude of Kansas and Nebraska. One season with another, only corn which will mature in ninety or ninety-five days should be planted.—*J. S. Trigg.*

The health of the hog population of the country continues surprisingly good, says the *Chicago Live Stock World*. Sick pigs are abnormally scarce at market centers, an infallible indicator, and reports from producing districts are equally optimistic. The growing pig crop has doubtless not enjoyed a very strong diet. Old corn has been scarce and high priced and the new corn crop is late. Meanwhile the maturing pig has reveled in an abundance of clover, a condition that is largely responsible for his good health. Never before has such a wasteful abundance of this great legume been seen in the corn belt. A healthy pig, however, soon becomes invalided when allowed his fill of new corn, and at present prices there is every inducement to force him into market conditions as soon as grain is available. Because the porcine population is healthy now it does not follow that there is any assurance of a continuance of such conditions.

According to the bureau of statistics of the Department of Commerce, the value of the tropical and sub tropical products brought into the United States the past year was over $400,000,000. In 1895 the value of this class of merchandise imported was only $300,000,000; in 1875, $200,000,000, and in 1870, $140,000,000. Thus, the value of the tropical products brought into the country in the year just ended was about three times as much as in 1870, twice as much as in 1875, and one-third more than in 1895.

Tropical islands of the United States contributed nearly $50,000,000 worth of the $400,000,000 value of tropical products brought into the country last year. Over $26,000,000 of this was from Hawaii, more than $11,000,000 worth from the Philippines. In 1896 they contributed $19,000,000 worth to the tropical requirements of the country.

The hay crop of the United States in 1903, according to an estimate of the *Cincinnati Price Current*, has amounted to about 62,750,000 tons, which is about 3,000,000 tons larger than the crop of last year, and about 5,500,000 tons or nearly 10 per cent above the average of the past ten years. Compared to the

yield in 1902 this makes a shortage in the New England States of 3,847, and a gain in the group of states comprising New York, New Jersey, Pennsylvania, Ohio, Michigan and Indiana of 4.11 per cent, and in Illinois, Wisconsin, Missouri, Kansas and Nebraska a gain of 4.20 per cent. New York, Michigan and Indiana show slight losses, and New Jersey, Pennsylvania and Ohio slight gains.

Three New York firms have recently secured three African mahogany logs, all parts of the same tree, which brought at an auction sale in Liverpool the unprecedented sum for the produce of one tree of $15,728. The first measured 21 feet long, 38 inches deep at the butt and contained 1,386 square feet; the second's length was 23½ feet, depth at the butt, 44 inches, and it contained 2,441 feet; the length of the third was 25½ feet, it was 46 inches deep at the butt and contained 3,025 square feet. These logs are said to have produced the finest African mahogany veneers the United States has seen.

Dr. Kennedy, secretary of the Iowa Board of Health, says in a recent issue of the *Health Bulletin:* "We verily believe, and have often declared, from a personal experience and observation in Iowa covering more than forty-four years, that there is not a more invigorating and healthful climate in the world than in Iowa if people will only use common sense and observe the laws of hygiene in preparing to meet these frequent and sudden climatic and electrical manifestations. This is not said in the interests of any immigration company or commercial exchange, but is the honest conviction of the writer."

S. A. French, residing near Geneva, Franklin county, has succeeded in raising two crops of strawberries this season. The second crop was ripening October 5th and the berries are said to have a fine flavor and color.

The top of the building of the Philadelphia Hospital is to be used as a roof garden for the tuberculous patients. The hospital roof, 26 by 150 feet, is covered with a canvas roof, to which are attached sideflaps for use when protection from sun or rain is necessary, and will be fitted up with beds, so that the patients may be kept in the open air 24 hours of the day. Dr. Martin is quoted as saying that not only as a mere sleeping place and a space to work about in has this been planned. It is expected that flowers and shrubbery will be scattered on the roof, and that it will really be a garden, with walks and shade, attractive to the patients. In planning the construction of hospitals hereafter, will not architects have to allow for this excellent method of treating patients? And why only for the tuberculous? And why for the sick alone?—*American Medicine.*

THE RAINMAKER IN AUSTRALIA.

In connection with the droughts in Australia we have received abundant details of the efforts made to force rain from the unwilling clouds.

At a meeting of the Chamber of Commerce of Broken Hill, Thursday, July 2, the mayor submitted the formula given by Mr. J. J. Phelps, of Sydney, and his method was indorsed by several. The formula consists in using sulphuric acid and zinc. The hydrogen set free ascends with aqueous vapor "in spiral columns which are hollow when they reach the rainbelt in the atmosphere, and the cold air in that region rushes down to the warmer air below."

Any one can try this simple well-known chemical experiment for making hydrogen, but we have every assurance that no rain will result and no cold air will rush down and no rainbelt will be found in the atmosphere. This, in fact, was the experience of Mr. Allen and the Australian committee at Stephen Creek, which reported that "the experiments were not successful, owing to there being rather too much wind to allow the column of gas to ascend perpendicularly."

The failure of Mr. Allen was complete; the excuse was quite unphilosophical and unneccessary.

Previous to Mr. Allen's fiasco, a much more imposing attempt had been made by Dr. C. DeLacy McCarthy, who is said to be "a graduate of Trinity College, Dublin, who spoke with the utmost confidence on the question of the production of rain, saying: 'I will start to work on Wednesday, and you will have rain by Saturday.'"

The Government of South Australia, the Chamber of Commerce, and the water companies of Broken Hill had united in bearing the expense of a special train to bring Dr. McCarthy and five assistants and apparatus from Petersburg. He did not wish the details of his method known except that in general—

"He forces chemical fumes into the air for a great distance which create a vacuum in the fourth, fifth and sixth strata of air. The center of a heat storm is thus formed and the cold air descends, resulting in a heavy tropical rain The secret of the chemicals was given him by a man in America. He had improved on the system with the aid of a clever Japanese chemist. He changes his methods to suit varying conditions. It may require thirty-two hours of continuous work to achieve success. He produced rain in twenty-two hours in Victoria."

Dr. McCarthy delayed three days before beginning; meantime the sky clouded over and predictions were received from Mr. Barrachi, Director of the Meteorological Office, at Melbourne, forecasting rain within three days. McCarthy's experiments began on Wednesday, a furious dust storm prevailed with northwest winds; although the wind and dust were distressing, he announced that "the vacuum is working still further up," But the wind veered to the south and all chance of the predicted rain from the west seemed to disappear. Eventually, "on July 3, Dr. McCarthy suspended operations, saying that conditions were all against him." He expected to resume when favorable predictions should be published by the Meteorological Office.

A few days before this Mr. Rutter, with several local chemists, "Had sent up a column of hydrogen which was followed by clouds and light rain, and they felt certain that a heavy downpour would have resulted had they continued their efforts." Probably they realized that the clouds and light rain had nothing to do with their hydrogen gas.

In their extremity the Broken Hill people naturally clutched at the flimsiest straws, "listening even to Mr. F. J. Mars, engineer of the local electric light works, who urged that huge kites should be sent up carrying dynamite to be fired by electricity."

We have given much space to this interesting episode in the great Australian drought, as we hope it may prove to be the last occasion on which the rainmakers will attempt to delude the suffering people with their chemicals, their upper vacuum, their dynamite, and their false theories

The time has not yet come when man may plow the atmosphere for rain as he plows the soil for crops. If mines must be worked and towns built in arid regions, let the promoters of these schemes be required to build aqueducts and bore wells sufficient in advance to supply the needed water, not waiting until the droughts come and the people die. Every place on this globe has its rainy years and its dry years. Areas of cold and heat, wind and calm, rain and drought appear and move and disappear in regular succession. We must prepare for them and provide against disaster. We cannot control the weather, but we may control ourselves.—*U. S. Monthly Weather Review, July, 1903.*

UNPRODUCTIVE ACRES.

The unproductive acre on the farm is a different proposition rom the unproductive cow in the dairy. Both are bad leaks, ut with the cow which does not pay for her board regeneration s impossible, and she should be sent to the feed yard, but the nproductive acre cannot be thus got rid of and becomes a roblem involving regeneration. It may be a hillside, poor soil, washing badly, for which one of two things may be done—it can e got into grass and kept there, or it may be planted with fruit r forest trees. The acre may be a strip all round the line fence grown up to weeds and bramble. This should be reclaimed by breaking up and seeding down. It may be a wet acre in the middle of the field which a little job of tiling will reclaim, or, if this cannot be done, it would grow a lot of nice willows. Then it may be an acre and perhaps more which has been so starved and robbed that oats a foot high or ten bushel of corn is all it will produce, in which case seed down with clover and give it twenty-five loads of barnyard manure to the acre. There is still another acre bordering the public highway which should be so treated that it will produce a ton or more of good hay each year instead of a useless mass of weeds and rubbish. We would not be looking for more land until these unproductive acres were reclaimed and utilized if we were in your place. So far as the old cow is concerned, see that Chicago gets her and not your neighbor or the local butcher.—*J. S. Trigg.*

MODERN FARM LIFE.

In the course of a speech before the farmers of Whitman county, Washington, Gov. Henry McBride said: "Farm life is not what it was twenty-five years ago. You have more of the comforts and conveniences of life. You are not so isolated. The building of railroads, the extension of the telegraph and telephone systems, the construction of highways, and increased mail facilities have brought the farmer in closer touch with the world at large. The farmer of today, especially in localities covered by the free rural delivery system, receiving as he does his daily mail, is as well posted and can feel the great throbbing pulse of humanity as well as the dweller in the city.

"This is in utter contrast with the loneliness pervading farm life in former years—a loneliness that tempted many a boy and girl cityward when, in many instances, it would have been much better for them had they remained in their old homes. With the rapid advancement along material lines—with better schools—with greater opportunities for social intercourse—with the opening up of all the avenues of information, thus bringing it in closer touch with the great outside world, farm life has become more attractive, and there is no longer danger of the urban population increasing at the expense of the rural. And this is well; for an intelligent, contented, sturdy and self-reliant class devoted to agricultural pursuits is one of the chief bulwarks of any state or nation."

CLIMATOLOGY FOR THE MONTH OF SEPTEMBER, 1903.

BAROMETER.—Mean pressure, 30.03 inches; highest observed, 30.40 inches, at Sioux City, on the 23d; lowest observed, 29.45 inches, at Sioux City, on the 12th; range for state, 0.95 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 104 stations, was 60.8°, which is 3.4° below normal. By sections the mean temperatures were as follows: Northern section, 59.0°; Central section, 61.1°; Southern section, 62.4°; The highest monthly mean was 66.2°; at Belknap; lowest monthly mean, 56.9°; at Forest City. The highest temperature reported was 94°, at Logan, on the 1st; lowest temperature reported, 28°, at Larchwood, on the 16th. The average monthly maximum was 84.8°; average monthly minimum, 33.6°. Greatest daily range, 51°, at Clarinda and Marshalltown; average of greatest daily ranges, 34.8°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 116 stations, was 3.81 inches, which is 0.61 of an inch above normal. The averages by sections were as follows: Northern section, 3.94 inches; Central section, 3.46 inches; Southern section, 4.09 inches. The largest amount reported was 8.79 inches, at Larrabee; least amount reported, 1.42 inches, at Waukee. The greatest daily rainfall was 4.09 inches, at Larrabee, on the 11th and 12th. Average number of days on which .01 of an inch or more was reported, 10.

WIND AND WEATHER.—Prevailing direction of the wind, south; highest velocity reported, 42 miles per hour, from the northwest, at Sioux City, on the 26th. Average number clear days, 14; partly cloudy, 6; cloudy, 10.

OBSERVERS' NOTES.

ALLERTON.—*Rex Shriver.* Corn was uninjured by frost during the month and dried up rapidly

ALTA.—*David E. Hadden.* Unusually fierce lightning on morning and evening of 13th, with temperature at 40. First frost of season on 16th, mainly light, and killing only in exposed places; last decade of month brought ideal fall weather.

ATLANTIC.—*J. W. Love.* First frost on 16th, said to have been a benefit to corn; ducks fly southward on 13th.

BAXTER.— *W. T. Thorp.* No frost in this locality to do damage as yet.

BONAPARTE.—*B. R. Vale.* Rain 5.95 inches, following 5.44 the last six days of August. Too much moisture, but otherwise a seasonable month; vegetation luxuriant.

BRITT.—*Geo. P. Hardwick.* First half wet; last half more favorable to belated corn; whole season so cool and wet that

half a crop results; severe loss by hail on 13th in strip of country from east center to southwest corner.

CLEAR LAKE.—*John Cobb*. Quite hard frosts on 24th, but did not seem to kill anything.

EARLHAM, A. D.—*Geo. Phillips*. Corn made rapid progress last days of the month, and except a small area of very late planting was safe from danger of harm by frost.

ESTHERVILLE.—*Earle W. Peterson*. Up to last of month the corn remained unharmed by frost, and will be a better crop than was expected.

FOREST CITY.—*J. A. Peters*. Frosts on 18th and 24th did very little damage, and last week was favorable to corn.

GRAND MEADOW.—*F. L. Williams*. Many fields of corn still green, and frost did little damage; most of it safe at close of month; pastures extra good; oats proved the poorest crop ever raised here.

GREENFIELD.—*J. G. Culver*. No frost sufficient to injure the tenderest vegetation; 70 per cent of corn safe at close of month, and will have more sound corn than last year.

GRINNELL.—*A. O. Price*. No killing frosts during the month; pastures seldom better; fall plowing nearly finished and ground in fine condition.

GRUNDY CENTER.—*E. S. King*. All corn past frost; very little harm done by frosts on 17th, 18th, 24th and 27th; fall work well advanced.

HANLONTOWN.—*Miss G. M. Paschen*. Corn cutting began 21st and mostly finished by 30th; not as large acreage as last year; upland corn good well filled ears; potatoes light and subject to rot.

HARLAN.—*C. A. Reynolds*. September has been a very acceptable month in this vicinity.

HOPEVILLE.—*M. T. Ashley*. No frost except very light on 17th and 18th; no vegetation hurt; much green corn at close of month needing ten days to ripen.

HUMBOLDT.—*H. S. Wells*. Quite favorable weather for ripening corn; threshing completed and grain little damaged.

LARRABEE.—*H. B. Strever*. Heavy rainfall during first half of month; frost on 16th did considerable damage to late corn.

OGDEN.—*E. Sayre*. No frost to kill tender vines up to 30th; corn was then doing finely.

OLIN.—*N. Potter*. First and last of month favorable for maturing the corn crop; middle period cold and cloudy with frosts on 18th that did damage on low ground.

PACIFIC JUNCTION.—*H. H. McCartney*. Frost on 16th was not killing on account of continued cloudy weather; 40° always shows white frosts in this locality if clear and calm at time.

RIDGEWAY.—*Arthur Betts*. Month was two degrees warmer than September, 1902; last decade was fine; killing frost of 18th was general hereabout, with temperature 27° to 33°; about 90 per cent of corn fields were deadened, and will be much soft corn; we had 234 hours sunshine, or 63 per cent; aurora on 26th.

SAC CITY.—*J. A. Sodestrom*. No damage by frost on 16th.

STOCKPORT.—*C. L. Beswick*. An unusual month; only four days in which wind was not in south, southeast or southwest.

TOLEDO.—*H. P. Giger*. On 17th frost was averted by clouding over a little about midnight; other frosts did not seem to do much harm.

WAUKEE.—*E. J. Leonard*. Except the rainy period, 4th to 14th, the month was generally clear and cool; light frost on 18th and 24th did no damage; most of corn well matured, but late portion needs a little more time.

WEST BEND.—*Ph. Dorweiler*. First half month rainy, and last half fine; no killing frost.

WHITTEN.—*Dr. Frank P. Butler*. Frost on 17th and 24th did but little damage to corn; the crop has never been in better condition in this section; potatoes rotting and a poor crop; fall pastures excellent; much fall plowing down.

ERRATA IN JULY REVIEW.

BELLE PLAINE.—Total precipitation recorded 3.47 inches on pages 6 and 10, should have been 4.47 inches.

DECORAH.—Mean temperature recorded 71.8° on page 6, should have been 71.5°. Mean maximum temperature recorded 81.6° on page 8, should have been 81.1°.

ESTHERVILLE.—Total precipitation recorded 7.21 inches on pages 6 and 10, should have been 7.71 inches.

FOREST CITY.—Total precipitation recorded 3.78 inches on page 6, should have been 3.79 inches.

IDA GROVE.—Daily precipitation recorded .96 inch on 18th, on page 10, should have been .98 inch. Total precipitation recorded 4.43 inches on pages 6 and 10, should have been 4.31 inches.

WILTON JUNCTION.—Total precipitation recorded 6.37 inches on page 7, should have been 6.35 inches.

CLIMATOLOGICAL DATA FOR SEPTEMBER, 1903.

NORTHERN SECTION.

THE IOWA WEATHER AND CROP SERVICE

WAS ESTABLISHED BY ACT OF THE TWENTY-THIRD GENERAL ASSEMBLY, AND IS UNDER SUPERVISION OF THE

STATE BOARD OF AGRICULTURE,

CONSTITUTED AS FOLLOWS:

OFFICERS.

W. W. MORROW, PRESIDENT, Afton.
C. E. CAMERON, VICE-PRESIDENT, Alta.
G. D. ELLYSON, TREASURER, Des Moines.
JOHN C. SIMPSON, SECRETARY, Des Moines.

EX-OFFICIO DIRECTORS.

ALBERT B. CUMMINS, Governor of Iowa.
H. R. WRIGHT, Dairy Commissioner.
DR. J. I. GIBSON, State Veterinarian.

DISTRICT DIRECTORS.

First District—J. P. MANATREY, Fairfield.
Second District—C. W. PHILLIPS, Maquoketa.
Third District—W. C. BROWN, Clarion.
Fourth District—R. T. ST. JOHN, Riceville.
Fifth District—S. B. PACKARD, Marshalltown.
Sixth District—T. C. LEGOE, What Cheer.
Seventh District—M. J. WRAGG, Waukee.
Eighth District—JOHN LEDGERWOOD, Leon.
Ninth District—M. McDONALD, Bayard.
Tenth District—J. W. WADSWORTH, Algona.
Eleventh District—H. L. PIKE, Whiting.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. OCTOBER 1903. No. 10.

WEATHER AND CROP CONDITIONS.

October was an ideal autumn month. The mean temperature was slightly above and the rainfall below the normal, and the percentage of sunshine was higher than usual. The bulk of the rainfall came in the first seven days, and generally with but little disturbance of the elements. No trace of snow was reported during the month. The first general killing frost occurred on the 18th, at which time there was practically very little of value exposed to damage by freezing temperature. The greater portion of the late planted corn was fairly well matured before the middle of the month, and the percentage of soft and chaffy corn will be but little more than is found at the close of average seasons. Reports are received of very many fields planted as late as June 15th which were well ripened by October 10th and ready to be cribbed before the close of the month. The amount of fall plowing in the state at large is much greater than in recent years. A limited acreage of fall wheat and rye has been sown, and the conditions have been favorable for germination and growth, insuring a good stand. The fall pasturage was never better, being very green and succulent at the close of October. The dry weather was favorable for harvesting potatoes, apples, and all late maturing crops. The potato crop is generally light, with considerable damage by rot, though some localities report a fair yield. The yield of winter apples has been much below the average. Forage crops and garden truck have made excellent yield. As a whole October has been a remarkably fine month, making an exceptional record in view of the adverse weather conditions of the preceding season.

NOTES.

In the noted case of Frost vs. Corn, called for trial in the September term, the Clouds appeared as intervenors, causing postponement of the issue till the October term. And that "saved the bacon."

An interesting feature of Iowa's dairy exhibit at the World's Fair will be a statue in butter of John Stewart, the pioneer creamery man of this state. It will be life size, and will be kept frozen in a glass case throughout the summer.

The New York Sun estimates the value of the staple farm crops of America this year to be, in round numbers, $2,500,000,000. These figures do not include the large increment of value in the use of grain and forage for the production of beef, pork, mutton, dairy and poultry products, etc.

According to statistics compiled by the U. S. Commissioner of Education, the total enrollment of pupils in the common schools of the United States during the year was 15,925,887, or over 20 per cent of the entire population. The grand total of all educational institutions, public and private, is over 18,000,000 pupils. These astounding figures show the real greatness of this nation.

EXTRACTS FROM NATIONAL BULLETIN.

October, 1903, was warmer than usual in the Pacific coast and Rocky Mountain districts and over the northern and central portions of the country to the eastward, the average daily temperature excess ranging from 3° to 6° over the northern portion of the Lake region, in the upper Missouri Valley, over the western portions of the middle and northern Plateau districts and on the central and north Pacific coast. Nearly normal conditions prevailed in the Southern States, there being slight deficiencies in the south Atlantic and west Gulf districts.

There was less than the usual rainfall over the greater part of the Lake region, central Mississippi Valley, South Atlantic and east Gulf States, southern and western Texas, upper Missouri Valley, and generally throughout the Rocky Mountain and Pacific coast districts, the month being without appreciable rainfall in western North Dakota and in portions of New Mexico, Arizona, and southern California. The deficiency over a large part of the Lake region, east Gulf, and South Atlantic States ranged from 1 to more than 2 inches, while over the Florida Peninsula it was from 2 to more than 7 inches. In eastern Texas, portions of Kansas, southern Missouri, eastern Nebraska, Minnesota, the upper Ohio Valley, and in the middle Atlantic coast districts the rainfall was much heavier than usual, most of the districts named receiving from 4 to 6 inches, while in northern New York and the middle Atlantic coast districts amounts ranging from 6 to more than 12 inches are reported.

As a whole the month averaged mild and was generally favorable for farming operations, although plowing and fall seeding were delayed on account of dry soil, in portions of the central Mississippi and Ohio valleys, and late crops in the central and east Gulf States suffered from drought. The Middle Atlantic States experienced heavy rains and very high winds during the latter part of the first decade, causing damaging freshets in northern New Jersey and southeastern New York. Heavy and killing frosts occurred in the central and east Gulf and south Atlantic States from the 25th to the 28th, with freezing temperatures as far south as the northern portions of Mississippi, Alabama, Georgia and South Carolina.

SUN SPOTS AND ELECTRICAL STORMS.

British as well as American scientists attribute the electrical storms of October 31st to sun spots. The effect on the telegraph and telephone service was as noticeable in Great Britain, France and Switzerland as in the United States, and there were striking displays of aurora borealis in parts of Europe, as there were in Chicago on Saturday and Sunday nights.

Since the appearance of the great sun spot of February, 1892, the theory as to the relation of such spots to the earth has changed somewhat. In most particulars, however, the theories then advanced have been accepted. For example, it is conceded that during the prevalence of sun spots the earth's magnetism is intensified, and that auroral phenomena are more numerous.

The immense size of a sun spot which appeared in September, 1891, surprised astronomers. The enormous dimensions of the sun spot of February, 1892, were a still greater surprise, and there was that year greater interest in solar physics among scientists and students than in any previous year.

This sun spot, or aggregation of sun spots, was 148,500 miles in length and 87,750 miles in breadth, and covered an area of 10,000,000,000 square miles. It was visible to the naked eye for several days, and disturbed the people as greatly as it interested the astronomers.

There never was a better opportunity for observation, and then as now there was very general agreement that large spots on the sun were coincident with electric and magnetic disturbances on the earth. Since then experiments with the cathode ray and radium have led scientists to a better understanding of the relations between light and electrical phenomena.—*The Inter Ocean*.

THE RELATION BETWEEN BACTERIA AND SOIL.

An account of some interesting experiments made at the Agricultural Institute of Bonn-Poppelsdorf upon the nitrifying bacteria is contributed by Dr. Wohltmann to the last number of the Journal fur Landwirthschaft (Am. Mo. Rev. of Rev.)

All plants require nitrogen; but although an abundant supply exists free in the atmosphere, most of them are unable to use it, and depend upon what is found in chemical combination with other substances in the soil. If the soil is poor in nitrogenous compounds, there can not be a luxuriant growth of vegetation upon it. But peas, beans, and others of the family of leguminous plants contrive to form partnerships with certain kinds of bacteria which, in some way, act upon free nitrogen and change it chemically into compounds that can be used by the plants, and also change nitrogen compounds that are not available into compounds that can be used. These bacteria form nodules about as large as pin heads on the roots of the plants. On account of this characteristic, poor soil is often planted with peas, beans, etc, in order to enrich it by the compounds of nitrogen formed in this way.

Since 1898, the author has been making observations upon the appearance of these bacteria in the most varied soils of temperate, sub-tropical, and tropical climates, and has found that they are not constantly associated with plants of this family, but may either be present or entirely absent. For example, at the experiment station of Kwai, in East Africa, at an altitude of 1,650 meters above sea level, in a soil rich in humus and nitrogen, he found peas growing luxuriantly and blossoming, but without a single nodule on their roots. From these observations it seemed worth while to find out how the formation of root nodules varies in the most important cultivated plants according to the different soils and fertilizers used, and for this purpose about three hundred experiments were made with seedlings planted in eleven different kinds of soil common in the valley of the Rhine, and in soils mixed with three kinds of fertilizers.

In determining the effect of soil on the formation of nodules, the chief things considered were the condition of the plants, the amount of humus present, the amount of nitrogen, and the mineral constituents of the soil.

In general, the results supported the well-known rule that crude, uncultivated ground is poor in nodule-forming bacteria or lacks them entirely, and that the improved condition and productiveness of soil is correlated with increase of the bacteria, although there were some exceptions to this. With regard to the humus constituent of the soil, its warming and loosening properties act favorably for the development of nodule-forming bacteria, and the effect can be detrimental only when the amount of humus is very great. This is shown by certain chalky earths of the highlands, which, on account of their antiseptic properties, due to humus, may be free from bacteria.

The soils used for experimentation were made to vary greatly in the amount of nitrogen present, but, except for certain kinds of soil from the moors, it seemed that the amount of nitrogen made no difference with the presence or absence of these bacteria unassociated with plants. Rich nitrogenous earth formed by the decay of basaltic rocks was specially poor in them, and they were also lacking in poor alluvial soil and in red clay. Calcium carbonate and potassium phosphate in the soil exert a favorable influence upon the growth of the bacteria.

The author concludes that when the soil is rich in nitrogenous fertilizers, preferably ammonium nitrate, leguminous plants may be free from nodule-forming bacteria. Apparently, their association with the bacteria is not a necessity, but an expedient, and whenever there is a supply of nitrogenous matter in the soil they dispense with the bacteria and with the free nitrogen which the bacteria make available, and instead, use the nitrogen found in chemical combination in the soil. In that case, the plants would not make the soil richer in nitrogen, but would impoverish it like other cultivated plants. The presence or absence of nodules on the roots varies with the amount of nitrogen in available compounds in the soil, and the value of a fertilizer may be estimated from the number and size of the nodules upon the roots of the plants.—*Medical Herald*.

PROFESSOR PARVIN'S EARLY WEATHER RECORD.

The late Prof. Theo. S. Parvin was the pioneer voluntary meteorological observer in Iowa, and the records of his observations cover a full third of a century. He began the scientific study of the climate in 1839, at Muscatine, and continued the service at Iowa City after his removal to the latter place in 1860 to accept a professorship in the State University. In relation to his work in that line the *Cedar Rapids Republican* recently published the following interesting narration, by permission of Mr. Joseph Morcombe, who is engaged in writing the biography of Mr. Parvin:

"The journals to which reference is made and from which the best information is derived, reveal many new lines in which Mr. Parvin employed his industry. February 4, 1893, he notes revision of his meterological journal. This recalls to mind the fact that from his first residence in Iowa he made careful, daily observations of weather conditions. Several of the books containing these records are before us ruled into appropriate columns, containing several daily readings of the thermometer and barometer, direction and velocity of wind, hours of cloudiness and sunshine, etc. This was a purely voluntary labor, begun and kept up primarily for the benefit of the community and to disprove by actual figures the absurd stories current in the East of intense summer heat and arctic winters in the new territory beyond the Mississippi. The government had not then adopted the wise policy of stationing trained observers over the country to collect data and to forecast general conditions. The

Masonic Poet, Rob Morris, of genial memory, somewhere in his reminiscent writing, tells of visiting his friend Parvin at his Iowa home and gives a humorous account of the enthusiastic devotion which led his host, clad only in the robes of the night, and in a frigid temperature, through the guest chamber and into the freezing air outside that he might not neglect reading his instruments.

"But this unique meteorological record had a use and value of which its compiler had no idea when reading his observations day by day. Copies of these records, with summaries and averages, were regularly furnished to and carefully preserved by the Smithsonian Institution at Washington. These constituted the only accurate and available data of the kind. When the southerners at the outbreak of the civil war destroyed Harper's Ferry and captured the arsenal at that place, it was determined by the federal government to create a depot for war supplies, which would be secure alike from foreign and domestic foes. The island in the Mississippi between the cities of Davenport and Rock Island, formerly the site of Fort Armstrong, was the chosen spot. But this selection brought out opposition from other interested localities and for a time threatened the plans of the government with congressional disapproval. The strong argument of those opposed to Rock Island was that the Mississippi was closed by ice for nine months of the year. But it fortunately occured to some friends of the new location that Parvin's records were at hand and could not be gainsaid and accordingly these were procured from the Smithsonian institution. The truth triumphed and the present great arsenal was located at a point evidently designed by nature for such an institution. Among the letters preserved among Mr. Parvin's papers, and dating from those early years are several received from leading scientists of the time, testifying to the value of these observations."

VALUABLE CORN TESTS.

A news special from Ames states that the I. S. C. Department of Agronomy has begun some experimental work to test the shrinkage of corn stored in cribs, and also the germinating qualities of seed corn under various conditions as to selection, storage, temperature and humidity. In the most important test as to shrinkage, the corn will be in the average condition of the crop when placed in farmers' cribs. A crib having capacity to hold 6,000 pounds will be built upon scales; and will be weighed daily at the time of filling, and weekly thereafter for a full year. The object of the seed corn experiment is to determine the effect of artificial heat, the effect of cold, and the common methods in use among corn producers,

Corn in three stages of development will be used in the tests—mature, immature and mediumly developed corn. Each class of corn will be stored in different storage conditions. Corn will be stored in the corn cribs, the attic, seed rooms, closed oat bins, under artificial heat, in the green house, the cellar, buried in the ground and sealed in air tight glass jars. Some will be hung by the husks, some shelled and stored in sacks, some taken in the spring from the shock, and some that has been left on the surface of the ground. In all these ways seed corn is kept by different men. It is the plan to determine what is the best and most practical way for Iowa farmers. The producing value of the seed is what counts. In the spring the value of the seed will be tested.

CLIMATOLOGY OF THE MONTH OF OCTOBER, 1903.

BAROMETER.—Mean pressure, 30.08 inches; highest observed, 30.58 inches, at Dubuque, on the 26th; lowest observed, 29.19 inches, at Sioux City, on the 6th; range for state, 1.39 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 105 stations, was 52.2°, which is 0.3° above normal. By sections the mean temperatures were as follows: Northern section, 50.7°; Central section, 52.1°; Southern section, 53.8°. The highest monthly mean was 57.7°, at Belknap; lowest monthly mean, 47.2°, at Belle Plaine. The highest temperature reported was 90°, at Chariton, on the 3d; lowest temperature reported, 16°, at Earlham, on the 27th. The average monthly maximum was 80.4°; average monthly minimum, 25.4°. Greatest daily range, 57°, at Carroll; average of greatest daily ranges, 39.7°.

PRECIPITATION.—Average precipitation for the state, as shown by records of 115 stations, was 1.95 inches, which is 0.49 of an inch below normal. The averages by sections were as follows: Northern section, 2.12 inches; Central section, 1.78 inches; Southern section, 1.95 inches. The largest amount reported was 4.50 inches, at Harlan; least amount reported, 0.32 of an inch, at St. Charles. The greatest daily rainfall reported was 2.90 inches, at Ruthven, on the 6th. Average number of days on which .01 of an inch or more was reported, 5.

WIND AND WEATHER.—Prevailing direction of the wind, south; highest velocity reported, 58 miles per hour, from the west, at Sioux City, on the 7th. Average number of clear days, 19; partly cloudy, 6; cloudy, 6.

OBSERVERS' NOTES.

ALLERTON.—*Rex Shriver.* Heavy frosts of 18th, 24th and 27th killed vegetation generally, but corn was too well matured to be injured.

ALTA.—*David E. Hadden.* First week in October was wet and changeable; during balance of month this county enjoyed ideal Indian summer weather, clear, mellow and warm, which came opportunely for maturing corn and finishing fall work.

AMANA.—*Conrad Schadt.* Weather fine and pleasant, and corn had ample time to ripen; large part of crop husked and better than expected.

BONAPARTE.—*B. R. Vale.* Rain 3.78; a severe local storm and wind on night of 6th; warm weather since; much plowing done; pastures good; corn husking begun.

BRITT.—*Geo. P. Hardwick.* First half of month changeable but last half pleasant; corn being cribbed after 25th; pastures better than usual; potatoes scarce.

CLINTON.—*Dr. Luke Roberts.* Rainfall 1.85 inches, 0.55 below normal; temperature normal; sunshine in excess of normal; a good month for hardening corn and securing the crop and general outdoor work.

EARLHAM.—*Geo. Phillips.* The corn crop is 50 per cent be'ter than was thought possible sixty days ago.

CARROLL.—*Moses Simon.* A fine month; geraniums and other tender flowers still in bloom on 31st.

GRAND MEADOW.—*F. L. Williams.* First killing frost of season on 18th; corn ripened well and potatoes were fine; month was ideal for farm work.

GRUNDY CENTER.—*E. S. King.* More fall plowing than for years. Last half of month made fine corn; only about ten per cent soft.

HANLONTOWN.—*Miss G. M. Paschen.* Began husking corn on 23d, but some began about 14th; corn well dried out and promises a good yield.

JEFFERSON.—*Isaac Young.* Last half of month fine; considerable plowing and husking corn done.

OLIN.—*Nathan Potter.* October has been an ideal fall month; cribbing corn begun about 20th, and mostly in good condition.

PERRY.—*J. A. Harvey.* Total rainfall 2.35 inches; month very fine for the farmer.

RIDGEWAY. *Arthur Betts.* No rain after 17th, 241 hours of sunshine, or 72 per cent; second season of roses from 12th to 24th; roads dry and dusty; much hazy weather.

WAUKEE.—*E. J. Leonard.* Weather unusually fine, over two-thirds of the days absolutely cloudless; first killing frost here was on 9th and late corn was injured.

WEST BEND.—*Ph. Dorweiler.* An ideal month, the finest October on record.

WHITTEN.—*Frank P. Butler, M. D.* Twenty-one clear days, and the warmest October for years; this section has an immense corn crop and quality good; being rapidly harvested.

WILTON.—*J. M. Rider.* Last half of month very favorable for curing corn and farm work.

GRINNELL.—*A. O. Price.* Last half of month perfect; 90 per cent of fall plowing done; corn husking well advanced.

ERRATA IN AUGUST REVIEW.

BEDFORD.—Total precipitation recorded 7.46 inches on pages 8 and 11, should have been 9.46 inches.

CARROLL.—Mean temperature recorded 68.6° on page 7, should have been 68.7°.

COUNCIL BLUFFS.—Total precipitation recorded 13.09 inches on pages 8 and 11, should have been 15.09 inches.

EARLHAM.—Mean temperature recorded 67.8° on page 8, should have been 68.0°.

Mean minimum temperature recorded 56.2° on page 9, should have been 56.5°.

GUTHRIE CENTER.—Total precipitation recorded 5.65 inches on pages 7 and 11, should have been 5.05 inches.

WEST UNION.—Total precipitation recorded 6.19 inches on pages 7 and 12, should have been 6.14 inches.

BELATED REPORTS.

BELLE PLAINE.—September. Mean temperature, 58.8°, highest 84°, on the 3d; lowest 36°, on the 24th; greatest daily range 30°. Total precipitation, 3.79 inches; greatest in 24 hours, .90 inch. Number of clear days, 11; partly cloudy, 12; cloudy, 7; rainy, 10. Prevailing direction, southeast.

CHESTER.—September. Mean temperature, 57.8°; highest 82°, on the 3d; lowest 29°, on the 18th; greatest daily range, 33°. Total precipitation, 4.46 inches; greatest in 24 hours, 1.00 inch; prevailing direction, southwest. Number of clear days, 16; partly cloudy, 5; cloudy, 9; rainy; 14.

DENISON.—September. Mean temperature, 60.6°; highest 84°, on the 25th; lowest, 32°, on the 27th; greatest daily range, 38°. Total precipitation, 1.87 inches; greatest in 24 hours, .55 inch; prevailing direction, south. Number of rainy days, 8.

LEON.—September. Mean temperature, 62.4°; highest, 82°, on the 6th, 7th, 8th and 11th; lowest, 37°, on the 18th; greatest daily range, 32°. Total precipitation, 4.45 inches; greatest in 24 hours, 2.35 inches; prevailing direction, south. Number of clear days, 17; partly cloudy, 2; cloudy, 11; rainy, 11.

U. S. DEPARTMENT OF AGRICULTURE—WEATHER BUREAU.

MONTHLY REVIEW

OF THE

Iowa Weather and Crop Service.

VOLUME XIV. NOVEMBER 1903. No. 11.

IOWA CROPS—FINAL REPORT, 1903.

AVERAGE YIELD PER ACRE; TOTALS FOR THE STATE; CURRENT FARM PRICES, DEC. 1, 1903.

Following is a summary of crop reports from correspondents of the Iowa Weather and Crop Service, showing the average yield per acre and totals of staple soil products, and the average prices at the farms or nearest stations December 1, 1903. In this showing of the value of the season's output of grain, forage, etc, no reckoning is made of the increment in value gained by consumption of soil products on the farms in the production of beef, pork, mutton, horses, butter, poultry, eggs, etc. Usually the prices obtainable for the crops at the close of the season do not express more than two-thirds of the actual value of the staple products of the soil.

THE CORN CROP.—In estimating the output of this crop the most difficult problem is to determine the extent of loss of acreage caused by floods and adverse weather conditions in the season of planting and cultivating. As a result of inquiry and careful computation it appears that the corn area actually cultivated and harvested this season is approximately 7,398,310 acres. The returns of township assessors show that the area planted in 1902 was 8,925,068 acres, and by comparison it is shown that the reduction this season amounted to about 1,526,748 acres. The average yield per acre for the state this year was 31 bushels, and the aggregate product is estimated at 230,511,310 bushels. The average farm price on December 1st was 36 cents per bushel, making the aggregate value $82,984,071. Last year the product was much inferior in quality though much larger in amount, and the value was computed at $83,000,000. The yearly average for 13 years has been $69,633,000.

In respect to quality of the grain and actnal commercial value, the corn crop of this season is fully 20 per cent better than the output of 1902.

WHEAT.—Winter wheat acreage harvested 84,934 acres; yield per acre, 16 9 bushels. total yield, 1,435,380 bushels; average price 70 cents per bushel; total value $1,004,766. Spring wheat area harvested 752,488 acres; average yield 12.6 bushels per acre; total product 9,481,350 bushels; price per bushel 65 cents; total value $6,162,877. Aggregate value of wheat $7,167,643. Last year the value was $7,062,640. Average yearly value for past thirteen years, $10,524,000.

OATS.—The oats crop this season has been below the average in yield per acre and weight per bushel, as a result of adverse conditions. The area harvested was 3,822,882 acres; average yield 25.9 bushels per acre; total product, 99,012,660 bushels; aggregate value, at 30 cents per bushel, $29,703,798. Last season the product was 92,907,000 bushels, valued at $22,907. The average yearly output for thirteen years has been 117,118,000 bushels, and the value $25,420,000.

BARLEY.—Area harvested, 493,108 acres; yield per acre, 24 7 bushels; total product, 12,179,790 bushels; average price, 37 cents per bushel; total value, $4,506,522. The yield and value are about the thirteen-year average.

RYE.—Area harvested, 123 273 acres; average yield 15.6 bushels per acre; total product, 1,923,060 bushels; current price, 44 cents per bushel; total value, $846,146.

FLAX.—Area harvested, 40,823 acres; yield per acre, 8.7 bushels; total yield, 355,160 bushels; current farm price, 78 cents per bushel; total value, $277,024

POTATOES —Area harvested, 113,433 acres; average yield, 5.38 bushels per acre; total product, 6,082,694 bushels; average farm price, 75 cents per bushel; value of product, $4,562,020. The total yield is about half the 13 year average; total value about the average of the 13 year period.

HAY.—(Tame). Average yield per acre, 1.9 tons; total product, 5,216,404 tons; current farm price, 5.75 per ton; value of crop, $29,994,323

HAY.—(Wild). Yield per acre, 1.3 tons; total product, 1.191,345 tons; average price, $4.95 per ton; total value, $5,-897,157. The hay crop as a whole (tame and wild) is nearly 900,000 tons in excess of the 13 year average.

PASTURAGE.—This most important soil product has been at its best in the recent wet seasons, when the cereal crops have suffered much detriment from excessive moisture. It is not measurable by the ton or bushel, and its value can only be estimated approximately by considering it as the basis of stock growing and dairying. From this point of view it will be a conservative estimate to figure the output of pastures and all other grazing lands at an average of $300 per farm. This makes a total value of $68,000,000 for the state.

Corn fodder in shock and fields is worth at least $10,000,000.

Sorghum, broom corn and sweet potatoes are worth about $750,000.

TABULATED CROP SUMMARY.

Crops.	Total Products.	Farm Values Dec. 1.

NOVEMBER WEATHER AND CROPS.

November was unusually dry and seasonably warm, with ess than the average amount of atmospheric disturbance. Con- itions were favorable for farm operations, and excellent prog- ess was made in cribbing the corn crop in good condition. 'he cobs contained more than the usual amount of moisture, ut the dry weather and freezing temperature prevented damage y heating in the cribs. The small acreage of fall wheat and ye suffered no material injury from dry weather and freezing. 'he weather was highly favorable for stock feeding and pastures fforded good feed throughout the month. The supply of water or stock is ample for the winter.

NOTES AND COMMENTS.

All that is known about sun spots is that their appearance is lue to terrific disturbances in the solar photosphere and that hey are coincident with magnetic storms in the terrestrial at- nosphere. To say that the latter are caused by the former is a very loose way of stating the case. The two phenomena are evidently connected, and both are probably caused by an iden- ical and still undiscovered force of nature.—*Philadelphia Rec- ord*.

A San Francisco special dated November 7th, says: All hands stood aghast on the American bark Oregon while a tremendous waterspout, the mightiest ever reported, passed two miles astern of the vessel. The Oregon was then, September 12th, in south latitude 15 49 and longitude west 152.06 on her way from Newcastle, N. S. W., to this port with coal.

Captain Parker says there was a moderate breeze from the north and the air had a queer "feel" when the water two miles away was rushing and foaming up to an astounding height. This water eruption crossed the wake of the Oregon, and as it did so, rose higher and formed the spiral waterspout to the sky overhead. It was at least two miles high. Captain Parker es- timates that in its most slender part the waterspout was six feet through. He says that for fully a mile around the base of the waterspout there was a frightful surf, higher by far than any breakers seen on the beaches. "If it should have hap- pened to pass over the ship," says Captain Parker, "it would have torn masts and yards out of her and finally swamped her." Members of the crew were badly frightened during the progress of the unusual phenomenon.

Mr. Fred. M. Taylor, postmaster, Titusville, Fla., reports that on September 17th, during a thunderstorm shortly after sun- set, each electrical discharge was accompanied by small typical strokes of only a few inches in length between neighboring rain drops. These were synchronous with the main discharge, and when they struck the hands or face produced a sharp stinging ensation.—*U. S. Weather Review, September 1903*.

Cablegrams from Europe, dated Nov. 30th, brought reports of damaging storms of rain, snow and sleet, covering Italy, Bel- gium and Great Britain. The barometric depression at Rome was the lowest recorded at the government station for the past twenty-five years. The disturbance extended to the coast of Al- giers, where torrential rains, lasting thirty-four hours, caused great damage on land and sea.

In its insular possessions the United States has volcanoes to burn. The Philippines are abundantly supplied with them. Mayon, 8,970 feet high, has had twenty-two violent eruptions since 1776, destroying thousands of human lives and much prop- erty. One eruption, in 1897, continued nine months, and was quite destructive. Manila is frequently shaken by earthquakes radiating from volcanic centers.

What is the value of the product of the pastures and other grazing lands of the state? This is a problem to be solved by experts who have made a study of farm statistics. Our great herds of live stock obtain a large percentage of their living and growth in flesh by grazing in the pastures in spring and summer and in meadows and grain fields in other seasons of the year. This enormous output of the soil cannot be expressed in tons or bushels; it is marketed in form of beef, pork, mutton, wool, dairy products, etc. How much of the total value of the live stock industry should be credited to the grasses which are trans- formed into flesh? This is not an easy question.

THE AGRICULTURAL REPORT.

Secretary Wilson has submitted to the President his annual report of the Department of Agriculture for the year 1903, this being the seventh report made by Mr. Wilson since his accept- ance of that office.

Secretary Wilson reviews at length the production and ex- ports of American agricultural products. The increase in the exports of farm products for the half century ended in 1901, was from $147,000,000 at the outset to $952,000,000 in the closing year of the period. For the year 1903 the exports amounted to $878,000,000, an amount second only to the total for 1901.

Of grain and grain products, the export exceeded in value $221,000,000, and in the supply of animals, meats and meat products the value of exportation was $211,000,000.—Discussing the balance of trade, the secretary shows that the favorable bal- ance to the credit of this country is due entirely to the farmers. The balance of trade in favor of farm products during the last fourteen years, no year excepted, aggregated $4,806,000,000. In products other than those of the farm during the same period, the balance of trade was adverse to this country to the extent of $865,000,000. Our farmers not only canceled this immense ob- ligation, but placed $3,940,000,000 to the credit of the nation when the books of the international exchange were balanced. He concludes that "it is the farmers who have paid the foreign bond-holders."

Reviewing the magnitude of agricultural production, after giving the figures of the most important crops, Mr. Wilson states that the value of all farm products, not fed to live stock, for 1903 considerably exceeded their value in the census year, when it was given as $3,742,000,000.

According to the department's inventory of farm animals for January 1, 1903, the value of horses was over $1,000,000,000 and of mules nearly $200,000,000. The value of cattle of all kinds considerably exceeded $1,300,000,000, of sheep $168,000,- 000, and of hogs $365,000,000.

The secretary reports a gratifying extension in public educa- tion along meteorological lines. Regular courses of lectures or classes have been conducted by weather bureau officials in not less than twenty colleges and universities. Many of the repre- sentatives of this bureau have, moreover, delivered occasional addresses in other classes or colleges, and to teachers of schools. The demand for instruction on these subjects increases rapidly.

A distinct advance by the weather bureau is noted in the preparation of daily weather charts at their different levels, i. e., the sea level, and at the 3,500-foot and 10,000-foot planes. So far this improvement is confined to the barometric pressure, but it is most important to secure charts of the temperature on the two upper planes as well, and unfortunately these can be secured only by means of balloon and kite ascension.

PHYSIOLOGICAL EFFECTS OF DIMINISHED AIR PRESSURE.

In a communication published in *Science* for November, 1901 (page 696), Mr. H. H. Clayton, of Blue Hill Observatory, gives some observations on the number of his pulse-beats, noted during a recent ascent of Pike's Peak by railroad. The pulse increased from 78 beats per minute at Manitou (6,662 ft.) to 92 at the summit of the mountain (14,147 ft.). Mr. Clayton's note recalls some similar observations made by the writer in Peru in 1897, during two ascents of El Misti (19,200 ft.), then the site of the highest meteorological station in the world, established by Professor S. I. Bailey, and operated by the southern station of the Harvard College Observatory at Arequipa. Both ascents were made on mule-back, so that no physical exertion was necessary. The first ascent was on October 7th, the start being from the Observatory (8,050 ft.) on October 6th. Although provided with clinical thermometers and with a sphygmograph, the writer suffered so severely from mountain sickness that he made very little use of his instruments. His temperature at 5:30 P. M., October 5th, twelve hours before leaving Arequipa, was 98°.4; his respiration 24, and his pulse 90. On the summit of El Misti the body temperature was 96°.4; the respiration 34, and the pulse 110. Twelve hours after arrival at Arequipa the figures were 98°.0, 24 and 85 respectively. A rather unsatisfactory sphygmograph curve was obtained on the summit.

The second expedition to El Misti was made on November 9, 1897, and on this trip the writer suffered much less from mountain sickness than on the previous one. At an altitude of 15,700 feet a short walk of about 100 yards was taken to the instrument shelter. Two stops were necessary on the way, to get breath. An hour after this exercise, the pulse was 128, the body temperature 97.°.0 and the respiration 30. The corresponding figures twelve hours before leaving Arequipa were 91, 98°.6 and 20. The night was spent at 15,700 feet. The body temperature immediately after waking in the morning was 96°.2; the pulse 112, and the respiration 30. Twenty minutes after reaching the summit, the temperature was 97°.2, the pulse 120, and the respiration 32. In an hour and a half the respiration was 35, the pulse and temperature remaining the same. In two hours the temperature was 96°.8, the pulse 112, and the respiration 34. Three fairly good sphygmograph curves were obtained on the summit. These curves possess some interest as being, so far as I have been able to learn, the first, with possibly one exception, to be secured at so great an altitude as 19,200 feet. At any rate, no curve from so great an altitude was reproduced until a copy of one of these tracings from the Misti summit was printed in an article by the writer in the *Journal of the Boston Society of Medical Sciences* for June, 1898.

On the second expedition to El Misti the descent was begun two hours and a half after reaching the top. At the hut at the base of the mountain (15,700 ft.), after walking to and from the shelter, the pulse was 130, but the respiration had decreased to 30 One hour after arriving at Arequipa the temperature was 98° 2, the pulse 116, and the respiration 22, and twelve hours after arrival the pulse had fallen to 82—about the writer's normal at the Observatory—and the respiration to 22, the normal being 20.

In counting the pulse on the summit it was quite unnecessary to place the finger on the wrist. The heart-beats could plainly be *heard*.—*R. DeC. Ward, in Science.*

MISSOURI RIVER CLOSED DECEMBER 1.

The channel of the Missouri river at Sioux City was closed by ice December 1st, which date is about four days earlier than the average closing at that point for the past twenty-six years. The earliest date in that period is December 12, 1896, and the latest January 20, 1889. The following table, compiled from local records by the Journal of that city, is of interest:

YEAR.	DATE OF CLOSING.
1873	December 12
1879	November 30 and December 8
1880	November 18
1881	December 30
1882	November 21
1883	November 30
1884	November 22
1885	December 5
1886	November 19
1887	November 27
1888	January 20, (1889)
1889	November 21 and January 1 (1890)
1890	January 4 (1891)
1891	November 25 and December 25
1892	December 17
1893	November 20
1894	December 28
1895	November 29
1896	November 12
1897	November 27
1898	November 22
1899	December 20
1900	November 20
1901	December 17
1902	December 5
1903	December 1

CLIMATOLOGY OF THE MONTH.

BAROMETER.—Mean pressure, 30.14 inches; highest observed, 30.65 inches, at Dubuque, on the 20th; lowest observed, 29.38 inches, at Dubuque, on the 11th; range for state, 1.27 inches.

TEMPERATURE.—The monthly mean temperature for the state, as shown by records of 105 stations, was 34.2 degrees, which is 0.1 below normal. By sections the mean temperatures were as follows: Northern section, 32.2 degrees; Central section, 34.0 degrees; Southern section, 36.3 degrees. The highest monthly mean was 39.0 at Osceola and Red Oak; lowest monthly mean, 30.0, at Estherville. The highest temperature reported, was 76°, at Pacific Junction, on the 1st; lowest temperature reported, 5° below zero, at Carroll and Audubon, on the 18th and 26th. The average monthly maximum was 68.3; average monthly minimum, 3.1. Greatest daily range, 43, at Osceola; average of greatest daily ranges, 30.9.

PRECIPITATION.—Average precipitation for the state, as shown by records of 116 stations, was 0.52 of an inch, which is 0.85 of an inch below normal. The averages of sections were as follows: Northern section, 0.17 inch; Central section, 0.57 inch; Southern section, 0.82 inch. The largest amount reported was 1.74 inches, at Allerton; least amount reported, Trace, at Algona, Charles City, Forest City, Mason City, Northwood and Whitten. The greatest daily rainfall reported was 1.38 inches, at Washington, on the 10th and 11th. Average number of days on which .01 of an inch or more was reported, 3.

WIND AND WEATHER.—Prevailing direction of the wind, northwest; highest velocity reported, 43 miles per hour, from the northwest, at Sioux City, on the 9th. Average number of clear days, 13; partly cloudy, 8; cloudy, 9.

OBSERVERS' NOTES.

ALLERTON—*Rex Shriver*. Corn is nearly all in crib. The yield is fairly good but the quality is generally poor.

ALTA—*David E. Hadden*. November was comparatively dry and pleasant. The first snowfall of the season was on the 24th—amount one inch. Light aurora was noticed on the evening of 18th.

AMANA—*Conrad Schadt*. The weather was dry, affording sufficient time for the soft corn to dry out. Husking is about finished. Cold weather in the middle of month put a stop to plowing.

AUDUBON—*Geo. E. Kellogg*. First snow of the season fell on the 13th.

BONAPARTE—*B. R. Vale*. A dry and pleasant month. No storms and not excessively cold. Farm work progressed finely.

BRITT—*Geo. P. Hardwick*. Precipitation for the month, .05 inch, the least of any November during past seven years. Ground frozen after the 12th. The dry weather during the past weeks has been beneficial for unripe corn, nearly all of which has been gathered.

CHARLES CITY—*C. H. Priebe*. Unusually fine weather. Only a trace of snow during entire month.

CLINTON—*Luke Roberts* Rainfall, 0.78 inch, being a deficiency of 1.12 inches as compared with the normal. The mean and minimum temperature and the number of clear days were above normal. The first snow of the season fell on the 28th.

EARLHAM—*Geo. Phillips*. No snow on ground at close of month. Ten per cent of corn still in fields.

GRAND MEADOW (Postville P. O).—*F. L. Williams*. The month was very dry and favorable for farm work. Stock pastured all the month

GRUNDY CENTER—*E. S. King*. Corn all husked and fall work was never in better shape.

HANLONTOWN—*Miss G. M. Paschen*. The yield of corn averaged from 50 to 60 bushels per acre. Many farmers had finished husking by 21st.

JEFFERSON—*Isaac Young*. The ground froze on the 16th.

LEON—*M. F. Stookey*. The first snow of the season fell on the 13th.

MOUNT AYR—*A. F. Beard*. Thunder on the nights of 3d and 8th, and during the day of 4th.

OGDEN—*E. Saire*. The first snow of the season fell on the 24th, amount 1.00.

RIDGEWAY—*Arthur Betts*. Thunder showers on the 9th. Ground frozen since the 22nd.

WASHINGTON—*Wm. A. Cook*. The first snow fell on the 13th.

WHITTEN—*Dr. Frank P. Butler*. The first month in over six years that there has been no precipitation to record.

ERRATA IN SEPTEMBER REVIEW.

AUDUBON.—Total precipitation recorded 2.78 inches on page 8 and 11, should have been 2.79 inches.

COLLEGE SPRINGS.—Mean temperature recorded 62.7° on page 8, should have been 62.1°.

DOWS.—Total precipitation recorded 2.00 inches on page 7 and 11, should have been 2.02 inches.

ROCKWELL CITY.—Mean temperature recorded 65.6° on page 7, should have been 60.6°.

TIPTON —Total precipitation recorded 5.30 inches on page 7, should have been 5.36 inches.

OMAHA, NEB.—Mean temperature recorded 63.2° on page 8, should have been 63 0°. Mean maximum temperature recorded 73.2° on page 10, should have been 73 0°.

BELATED REPORTS.

DENISON.—October. Mean temperature 51.0°; lowest 22° on the 18th; greatest daily range 49°; total precipitation .89 inch; greatest in 24 hours .63 inch on the 6th; number of rainy days 2.

ESTHERVILLE.—October. Mean temperature 50.2°; highest 79° on the 20th; lowest 24° on the 27th, greatest daily range 45°; total precipitation 2.49 inches; greatest in 24 hours 1.70 inches on the 7th; prevailing direction, southeast; number of clear days 16, partly cloudy 5, cloudy 10, rainy 8.

FAYETTE.—October. Mean temperature 49.4°; highest 79° on the 3rd; lowest 18° on the 27th; greatest daily range 41°; total precipitation 1.73 inches; greatest in 24 hours .90 inch on the 6th; prevailing direction, southeast; number of clear days 20, partly cloudy 3, cloudy 7, rainy 5.

SHELDON.—October. Mean temperature 51.0°; highest 79° on the 19th; total precipitation 3.31 inches; greatest in 24 hours 2.35 inches on the 6th; number of rainy days 3.

SPIRIT LAKE.—October. Mean temperature 51.2°; lowest 28° on the 26th; total precipitation 4.00 inches; greatest in 24 hours 4 00 inches on the 5th and 6th; number of rainy days 1.

STOCKPORT.—October. Total precipitation 3.47 inches; greatest in 24 hours 1.40 inches on the 2nd; prevailing direction, northwest; number of clear days 20, partly cloudy 5, cloudy 6, rainy 4.

VILLISCA.—October. Mean temperature 50.6°; highest 82° on the 2nd; lowest 25° on the 25th; greatest daily range 38°; total precipitation 1 27 inches; greatest in 24 hours .60 inch on the 6th; prevailing direction, northwest; number of clear days 20, partly cloudy 9, cloudy 2, rainy 4.

WAPELLO.—October. Mean temperature 53.0°; highest 79° on the 3rd; lowest 27° on the 26th; greatest daily range 27°; total precipitation 2.05 inches; greatest in 24 hours .80 inch on the 6th; prevailing direction, southwest; number of rainy days 4.
