

# Iowa Leading Indicators Index January 2007

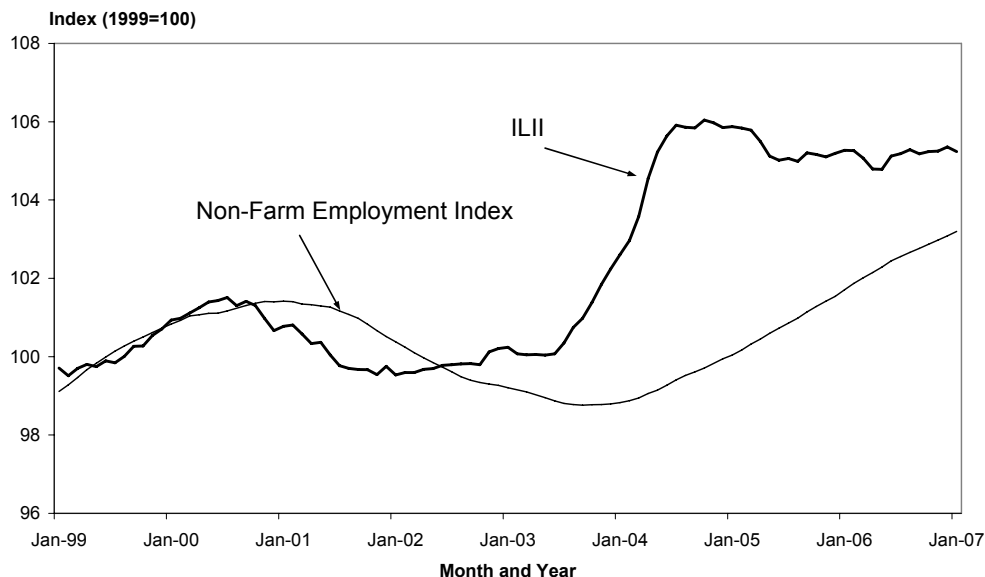

Iowa Department of Revenue  
Tax Research and Program Analysis Section

The Iowa Leading Indicators Index (ILII) fell 0.1% in January 2007. The Iowa non-farm employment coincident index increased by 0.1 percent in January, the 38<sup>th</sup> consecutive monthly increase.

The ILII's value in January fell to 105.2 (100=1999). The index increased a revised 0.1 percent in December, 0.0 percent in November, and 0.1 percent October after taking a 0.1 percent dip in September (percentage changes differ across months due to rounding). During the six-month span through January, the ILII increased less than 0.1 percent (a 0.1 percent annual rate). The six-month diffusion index (value of 50.0) reflects four of eight components increasing and the other four decreasing over the last half year.

In January, three of the eight Iowa Leading Indicators components increased. The positive contributors were the agricultural futures price index, the Iowa stock market index, and the yield spread. The negative contributors were unemployment claims, diesel fuel consumption, building permits, the new orders index, and average weekly manufacturing hours.

a. Percentage changes in the ILII do not always equal changes in the level of the ILII due to rounding.

b. A diffusion index measures the proportion of components that are rising based on the actual changes (not the standardized contributions to the ILII). Components experiencing increases greater than 0.05 percent are assigned a value of 1.0, components that experience changes less than an absolute value of 0.05 percent are assigned a value of 0.5, and components experiencing decreases greater than 0.05 percent are assigned a value of 0.0.

**Table 2. Iowa Leading Indicators Index Components: Six Month Overview**

Component Series Monthly Values <sup>a</sup>	2006					2007
	August	September	October	November	December	January
AFPI <sup>b</sup>						
Hog Profits (cents per pound)	13.8	14.2	14.2	14.0	13.1	13.3
Corn (cents per bushel)	234.7	237.9	246.3	259.9	272.4	287.1
Soybeans (cents per bushel)	596.5	593.7	595.2	600.8	608.0	618.3
Cattle Profits (cents per pound)	2.2	2.5	2.2	1.5	0.2	-0.6
Iowa Stock Market Index (10=1984-86)	52.14	52.85	53.76	54.51	55.23	56.13
Yield Spread (10-year less 3-month)	-0.21	-0.21	-0.32	-0.47	-0.41	-0.35
Building Permits	1,196	1,129	1,102	1,059	1,070	1,044
Average Weekly Unemployment Claims <sup>d</sup>	3,162	3,215	3,241	3,283	3,298	3,415
Average Weekly Manufacturing Hours	41.8	41.9	41.9	41.9	41.9	41.9
New Orders Index (percent)	58.8	58.4	58.9	57.8	56.0	55.3
Diesel Fuel Consumption (mil gallons)	55.32	55.18	55.03	55.48	55.70	55.38

a. For all component series except for the yield spread (the only national series) the values represent 12-month backward moving averages.

b. The Agricultural Futures Price Index is computed as the sum of the standardized symmetric percent changes in the four series, each weighted by the annual share of the commodity to Iowa cash farm income.

c. Arrows indicate the direction of the series' contribution to the ILII for the latest month.

d. Changes in unemployment claims are inverted when added to the ILII, thus a negative change in the series contributes positively to the index.

## ILII Components

- Agricultural futures price index: Composite measure of cattle, hogs, corn and soybeans futures prices weighted by the respective share of annual Iowa production value. Changes are calculated based on a 12-month moving average of the futures price series, where cattle and hogs series also incorporate estimates of break-even costs. During January 2007 this component contributed 0.10 percent to the ILII value with strong markets for both corn and soybean prices. The small increase in hog profits and notable drop in cattle profits were driven in large part by revised assumptions and methods by ISU for the calculation of break-even costs implemented in January 2007.
- Iowa stock market index: Capitalization-weighted index of 29 Iowa-based or Iowa-concentrated publicly-traded companies. Changes are calculated based on a 12-month moving average. During January 2007 this component contributed 0.09 percent to the ILII value as 16 of 29 companies and four of the 11 financial-sector companies gained value during the month.
- Yield spread: Difference between the yield on 10-year Treasury bonds and 3-month Treasury notes. During January 2007 the yield spread shrank as the long-term rate rose relatively more than the short-term rate. The yield spread, however, remained in negative territory. This component contributed 0.01 percent to the ILII value.
- Average weekly manufacturing hours: Weekly average of hours worked in the manufacturing sector in Iowa. Changes are calculated based on a 12-month moving average. During January 2007 this component contributed -0.01 percent to the ILII value. The monthly hours value for December was revised downward 3.2 hours which depressed the 12-month moving average for December by 0.4 hours and caused the significant revision in the December 2006 ILII.
- New orders index: Diffusion index measuring the share of purchasing managers in Iowa reporting increases in orders received for manufacturing output. Changes are calculated based on a 12-month moving average. During January 2007 this component contributed -0.04 percent to the ILII value. The monthly new orders index value for January reached 50 again after dipping below this expansion/contraction threshold for the previous two months; however, the 12-month average value used as the ILII component still dropped.
- Building permits: Number of total permits issued in Iowa for the construction of residential housing units. Changes are calculated based on a 12-month moving average. During January 2007 this component contributed -0.07 percent to the ILII value as the monthly count of permits fell sharply with the cold and snowy weather in January, pulling down the 12-month average.
- Diesel fuel consumption: Number of taxable gallons of diesel fuel sold in Iowa. Changes are calculated based on a 12-month moving average. During January 2007 this component contributed -0.09 percent to the ILII value as consumption fell.
- Average weekly unemployment claims: Weekly average of initial claims for unemployment insurance in Iowa. Changes are calculated based on a 12-month moving average and are inverted when added to the ILII. During January 2007 this component contributed -0.11 percent to the ILII value as the number of initial claims for the month was 40 percent above last year's and the 12-month moving average rose for the fifth straight month.

**Table 3. ILII Components and Standardization Factors**

Iowa Leading Indicator Components	Standardization Factor
Agricultural Futures Price Index	0.130
Iowa Stock Market Index	0.056
Yield Spread	0.236
Building Permits	0.030
Unemployment Claims	0.032
Average Weekly Hours	0.302
New Orders Index	0.053
Diesel Fuel Consumption	0.161

Source: Tax Research and Program Analysis Section, Iowa Department of Revenue, produced July 24, 2006. The standardization factors are the inverse of the standard deviation of the month-to-month changes in each component over the January 1999 to June 2006 period. These factors equalize the volatility of the contribution from each component and are normalized to 1. The month-to-month changes are based on 12-month moving averages for all components except the yield spread, which is the only national series. The yield spread and new orders index changes are simple arithmetic changes; month-to-month changes for the rest of the components are computed as symmetric percentage changes. The factors are updated annually during the summer.

## Comments

The Iowa Leading Indicators Index is designed to forecast the likely future direction of economic activity in the State of Iowa. The techniques used to build the ILII follow those used by The Conference Board to construct the national leading indicators index. A movement in the ILII for only one month does not produce a clear signal, rather it is necessary to consider the direction of the index over several consecutive months. The Conference Board considers a contraction signal in the national leading indicators index reliable when two conditions are met: 1. the index declines by at least two percent over a six month period (using an annual rate); and, 2. a majority of the individual components also decline over those six months (six-month diffusion index less than 50.0).

The Iowa Non-Farm Employment Coincident Index measures the change in non-farm employment of all workers in the State of Iowa. Changes are based on a 12-month moving average of employment and are computed as symmetric percentage changes. The index is designed to represent the current state of economic activity in Iowa.

The Employment Index and the ILII are constructed to have a value of 100 in the year 1999.
